AX-SIGFOX MINISTAMP AX-SIGFOX ANTSTAMP

Ultra-Low Power, AT Command Controlled, Sigfox® Compliant Modules

ON Semiconductor®

www.onsemi.com

Overview

The AX-SIGFOX modules are ultra-low power module solutions for a node on the Sigfox network with both up- and down-link functionality. The AX-SIGFOX modules connect to the customer application using a logic level RS232 UART. AT commands are used to send frames and configure radio parameters.

The AX-SIGFOX module comes in two flavors

- AX-SIGFOX MINISTAMP with 50 Ω Antenna Port
- AX-SIGFOX ANTSTAMP with On-board -5 dBi Chip Antenna

Functionality and Ecosystem

- Sigfox up-link and down-link functionality controlled by AT commands
- The AX-SIGFOX modules are part of a whole development and product ecosystem available from ON Semiconductor for any Sigfox requirement. Other parts of the ecosystem include
 - ◆ AX-Sigfox ultra-low power, AT command controlled, Sigfox compliant transceiver IC
 - ◆ Ready to go AX-Sigfox development kit with fully functional AX-Sigfox module including Sigfox subscription
 - ◆ Sigfox Ready certified reference design for the AX-Sigfox IC
 - ◆ AX-Sigfox API IC for customers wishing to write their own application software based on the ON Semiconductor Sigfox Library

General Features

- 18.2 x 22 x 3 mm³ without chip antenna, 18.2 x 39.7 x 3 mm³ with chip antenna
- Supply range from 1.8 V to 3.3 V
- -40°C to 85°C
- Temperature sensor
- Supply voltage measurements
- 10 GPIO pins
 - ◆ 4 GPIO pins with selectable voltage measure functionality, differential (1 V or 10 V range) or single ended (1 V range) with 10 bit resolution

- ◆ 2 GPIO pins with selectable sigma delta DAC output functionality
- ◆ 2 GPIO pins with selectable output clock
- ◆ 3 GPIO pins selectable as SPI master interface

Power Consumption

- Ultra-low power consumption
 - ◆ Charge required to send a Sigfox OOB packet at 14 dBm output power: 0.29 C
 - ◆ Deepsleep mode current: 500 nA
 - ◆ Sleep mode current: 1.6 μA
 - ◆ Standby mode current : 0.5 mA
 - ◆ Continuous radio reception at 869.525 MHz: 13 mA
 - ◆ Continuous radio transmission at 868.130 MHz for 14 dBm output power: 51 mA
 - ◆ for 0 dBm output power: 21 mA
- The output power of AX-SIGFOX modules can be programmed in 1 dB steps from 0 dBm – 14 dBm. They are optimized for best power efficiency at 14 dBm output power. For modules optimized for other output power values e.g 0 dBm transmission with 10 mA please contact us.

High Performance Narrow-band Sigfox Receiver

- Carrier frequency 868.525 MHz
- Data-rate 600 bps
- Sensitivity: -126 dBm @ 600 bps, 869.525 MHz, GFSK
- 0 dBm maximum input power

Highly Efficient Transmitter

- Carrier frequency 868.13 MHz
- Data-rate 100 bps PSK
- Maximum output power 14 dBm
- Power level programmable in 1 dBm steps from 0 dBm to 14 dBm

Regulatory

- Sigfox Ready certified
- EN 300 220

AX-SIGFOX-MODS

About the Sigfox Technology

Sigfox uses an Ultra Narrow Band (UNB) based radio technology to connect devices to its global network. The usage of UNB is key to providing a scalable, high-capacity network, with very low energy consumption, while maintaining a simple and easy to rollout star-based cell infrastructure.

The network operates in the globally available ISM bands (license-free frequency bands) and co-exists in these frequencies with other radio technologies, but without any risk of collisions or capacity problems.

Sigfox currently uses the most popular European ISM band on 868 MHz (as defined by ETSI and CEPT) as well

as 902 MHz in the USA (as defined by the FCC), depending on specific regional regulations.

Sigfox only acts as a transport channel, pushing the data towards the customer's IT system.

An important advantage provided by the use of the narrow band technology is the flexibility it offers in terms of antenna design. On the network infrastructure end it allows the use of small and simple antennas, but more importantly, it allows devices to use inexpensive and easily customizable antennas.

The Sigfox protocol is compatible with existing transceivers and is actively being ported to a growing number of platforms.

(Note that the actual product comes with a metal cap)

PINOUT

Figure 2. Pinout Drawings (Top View)

Table 1. PIN FUNCTION DESCRIPTION

Pin	Name	Function
1*	GND	Ground
2*	NC	Do not connect
3*	NC	
4*	NC	
5*	GND	Ground
6*	ANT50Ω	50 Ω antenna port
7*	GND	Ground
8*	NC	Do not connect
9	NC	
10	GPIO8	General purpose IO
11	GPIO7	General purpose IO, selectable SPI functionality (MISO)
12	GPIO6	General purpose IO, selectable SPI functionality (MOSI)
13	GPIO5	General purpose IO, selectable SPI functionality (SCK)
14	GPIO4	General purpose IO, selectable ΣΔ DAC functionality, selectable clock functionality
15	CPU_LED	Module activity status, enabled whenever the module is running
16	RADIO_LED	Radio activity status
17	VTCXO	TCXO enable (used to control the on-board TCXO)
18	GPIO9	General purpose IO and wake-up from deepsleep
19	UART_TX	UART used to communicate with the module at a bitrate of 9600 baud, no parity, 8 data bits and one stop bit.
20	UART_RX	
21	RX_LED	Radio receive activity status
22	TX_LED	Radio transmit activity status
23	NC	Do not connect
24	NC	
25	VDD	Power Supply
26	GND	Ground
27	RESET_N	Optional reset (active low). Do not connect the pin if not used.
28	GND	Ground
29	GPIO0	General purpose IO, selectable ADC functionality, selectable ΣΔ DAC functionality, selectable clock functionality
30	GPIO1	General purpose IO, selectable ADC functionality

AX-SIGFOX-MODS

Table 1. PIN FUNCTION DESCRIPTION

Pin	Name	Function
31	GPIO2	General purpose IO, selectable ADC functionality
32	NC	Do not connect
33	NC	
34	GPIO3	General purpose IO, selectable ADC functionality

NOTE: All digital pins are Schmitt trigger inputs, digital input and output levels are LVCMOS/LVTTL compatible. Pins GPIO[3:0] must not be driven above VDD, all other digital inputs are 5 V tolerant.
All GPIO pins and UART_RX start-up as inputs with pull-up.

Dimensions

All dimensions in millimeter.

Figure 3. Dimensions (mm)

The area under the modules must be covered in solder stop. To guarantee good antenna performance with the AX-SIGFOX ANTSTAMP, the left part of the module must

remain free from any copper (i.e. no ground plane and no traces).

AX-SIGFOX-MODS

SPECIFICATIONS

Table 2. SUPPLIES

Symbol	Description	Condition	Min	Typ	Max	Units
T _{AMB}	Operational ambient temperature		-40	27	85	°C
VDD	Supply voltage		1.8	3.0	3.3	V
I _{DS}	Deep sleep mode current	AT\$P=2		500		nA
I _{SLP}	Sleep mode current	AT\$P=1		1.6		μA
I _{STDBY}	Standby mode current			0.5		mA

Continuous Receive

----------------------	--	---------------	--	------	--	----

Transmit at 14 dBm Output Power / Receive (Note 2)

I _{TXMODAVG_14}	Modulated transmitter current			51.0		mA
Q _{SFX_OOB_14}	Charge to send a Sigfox out of band message	AT\$S0		0.28		C
Q _{SFX_OOB_14}	Charge to send a bit	AT\$SB=0		0.19		C
Q _{SFX_OOB_14}	Charge to send a bit with downlink receive message	AT\$SB=0,1		0.33		C
Q _{SFX_LFR_14}	Charge to send the longest possible Sigfox frame (12 byte)	AT\$SF=00112233445566778899aabb		0.37		C
Q _{SFX_LFR_14}	Charge to send the longest possible Sigfox frame (12 byte) with downlink receive	AT\$SF=00112233445566778899aabb,1		0.46		C

Transmit at 0 dBm Output Power / Receive (Notes 1 and 2)

I _{TXMODAVG_14}	Modulated Transmitter Current			21.0		mA
Q _{SFX_OOB_0}	Charge to send a Sigfox out of band message	AT\$S0		0.12		C
Q _{SFX_OOB_0}	Charge to send a bit	AT\$SB=0		0.08		C
Q _{SFX_OOB_0}	Charge to send a bit with downlink receive message	AT\$SB=0,1		0.14		C
Q _{SFX_LFR_0}	Charge to send the longest possible Sigfox frame (12 byte)	AT\$SF=00112233445566778899aabb		0.27		C
Q _{SFX_LFR_0}	Charge to send the longest possible Sigfox frame (12 byte) with downlink receive	AT\$SF=00112233445566778899aabb,1		0.29		C

1. The output power of AX-SIGFOX modules can be programmed in 1 dB steps from 0 dBm – 14 dBm. They are optimized for best power efficiency at 14 dBm output power. For modules optimized for other output power values e.g. 0 dBm transmission with 10 mA please contact us.
2. Antenna gain not included.

AX-SIGFOX-MODS

Typical Current Waveform

Figure 4. Typical Current Waveform for a Maximum Length Frame with Downlink Receive at 14 dBm Output Power

Battery Life Calculation Example

Scenario for example calculation:

- 2 AAA Alkaline batteries in series
- One OOB frame transmission per day at 14 dBm output power
- Four maximum length frames with downlink receive per day at 14 dBm output power
- Device in sleep mode when no other activity
- Neglecting battery self discharge

2 AAA alkaline capacity	1500 mAh * 3600 s/h	5400 C
Sleep charge per day	1.6 μ A * 86400 s	0.14 C/day
OOB frame transmission		0.28 C/day
Frame transmission with downlink	4 * 0.46 C/day	1.84 C/day
Total Charge consumption		2.26 C/day
Battery life		6.5 Years

T _{ERR_CAL}	Temperature error			± 2		°C

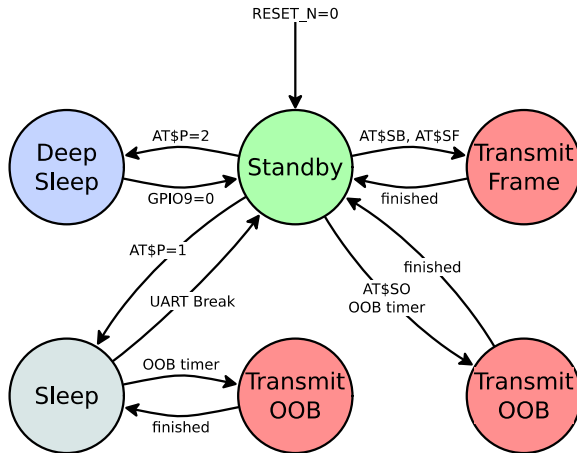

AX-SIGFOX-MODS

COMMAND INTERFACE

Serial Parameters: 9600, 8, N, 1

The AX-SIGFOX modules use the UART (pins UART_TX, UART_RX) to communicate with a host and use a bitrate of 9600 baud, no parity, 8 data bits and one stop bit.

Power Modes State Diagram

Standby Mode

After Power-Up and after finishing a Sigfox transmission, the AX-SIGFOX modules enter Standby mode. In Standby mode, AX-SIGFOX modules listen on the UART for commands from the host. Also, OOB frames are transmitted whenever the OOB timer fires. To conserve power, the AX-SIGFOX modules can be put into Sleep mode or turned off (Deep Sleep mode) completely.

Sleep Mode

The command **AT\$P=1** is used to put the AX-SIGFOX modules into Sleep mode. In this mode, only the wakeup timer for out-of-band messages is still running. To wake up the AX-SIGFOX module from Sleep mode, toggle the UART_RX pin, e.g. by sending a break (break is an RS232 framing violation, i.e. at least 10 bit durations low). When an Out of Band (OOB) message is due, AX-SIGFOX modules automatically wake up to transmit the message, and then return to Sleep mode.

It is strongly recommended to put AX-SIGFOX modules into sleep mode when they are not being used.

Deep Sleep Mode

In Deep Sleep mode, the AX-SIGFOX modules are completely turned off. Deep Sleep mode can be activated with the command **AT\$P=2**. To wake-up from Deep Sleep mode the pin GPIO9 is pulled to GND.

When using Deep Sleep mode, two things should be kept in mind:

Everything is turned off, timers are not running at all and all settings are lost (use **AT\$WR** to save settings to flash before

entering Deep Sleep mode). Out-of-band messages will therefore not be sent.

The pins states are frozen in Deep Sleep mode. The user must ensure that this will not result in conditions at the module boundary that draw a lot of current.

AT Commands

Numerical Syntax

hexdigit ::= [0-9A-Fa-f]
hexnum ::= "0x" hexdigit+
decnum ::= "0" [1-9] [0-9]*
octnum ::= "0" [0-7]+
binnum ::= "0b" [01]+
bit ::= [01]
optnum ::= "-1"
frame ::= (hexdigit hexdigit)+
uint ::= hexnum | decnum | octnum | binnum
uint_opt ::= uint | optnum

Command Syntax

A command starts with 'AT' (note that everything is case sensitive!), continues with the actual command followed by parameters (if any) and ends with any kind of whitespace (space, tab, newline etc.)

If incorrect syntax is detected ("parsing error") all input is ignored up until the next whitespace character.

Also note that any number can be entered in any format (Hexadecimal, Decimal, Octal and binary) by adding the corresponding prefix ('0x', '0', '0b'). The only exception is the 'Send Frame' command (**AT\$SF**) which expects a list of hexadecimal digits without any prefix.

Return Codes

A successful command execution is indicated by sending 'OK'. If a command returns a value (e.g. by querying a register) only the value is returned.

Examples

Bold text is sent to AX-SIGFOX module.

Here, we execute command 'I' to query some general information.

AT\$I=0

AXSEM AT Command Interface

This sends a Sigfox frame containing { 0xAA : 0xBB : 0x12 : 0x34 } without waiting for a response telegram:

AT\$SF=aabb1234

OK

This sends a Sigfox frame containing { 0x00 : 0x11 : 0x22 : 0x33 : 0x44 }, then waits for a downlink response telegram, which in this example contains { 0xAA : 0xBB : 0xCC : 0xDD }.

AT\$SF=0011223344,1

OK

RX=AA BB CC DD

AX-SIGFOX-MODS

The 'CB' command sends out a continuous pattern of bits, in this case 0xAA = 0b10101010:

```
AT$CB=0xAA,1
OK
```

This transitions the device into sleep mode. Out-of-band transmissions will still be triggered. The UART is powered

down. The module can be woken up by a low level on the UART signal, i.e. by sending break.

```
AT$P=1
OK
```

Table 7. COMMANDS

Command	Name	Description												
AT	Dummy Command	Just returns 'OK' and does nothing else. Can be used to check communication.												
AT\$SB=bit[,bit]	Send Bit	Send a bit status (0 or 1). Optional bit flag indicates if AX-SIGFOX module should receive a downlink frame.												
AT\$SF=frame[,bit]	Send Frame	Send payload data, 1 to 12 bytes. Optional bit flag indicates if AX-SIGFOX module should receive a downlink frame.												
AT\$SO	Manually send out of band message	Send the out-of-band message.												
AT\$uint?	Get Register	Query a specific configuration register's value. See chapter "Registers" for a list of registers.												
AT\$uint=uint	Set Register	Change a configuration register.												
AT\$IF=uint	Set TX Frequency	Set the output carrier macro channel for Sigfox frames.												
AT\$IF?	Get TX Frequency	Get the currently chosen TX frequency.												
AT\$DR=uint	Set RX Frequency	Set the reception carrier macro channel for Sigfox frames.												
AT\$CW=uint,bit[,uint_opt]	Continuous Wave	<p>To run emission tests for Sigfox certification it is necessary to send a continuous wave, i.e. just the base frequency without any modulation. Parameters:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Name</th> <th>Range</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Frequency</td> <td>800000000–999999999, 0</td> <td>Continuous wave frequency in Hz. Use 868130000 for Sigfox or 0 to keep previous frequency.</td> </tr> <tr> <td>Mode</td> <td>0, 1</td> <td>Enable or disable carrier wave.</td> </tr> <tr> <td>Power</td> <td>0–14</td> <td>dBm of signal Default: 14</td> </tr> </tbody> </table>	Name	Range	Description	Frequency	800000000–999999999, 0	Continuous wave frequency in Hz. Use 868130000 for Sigfox or 0 to keep previous frequency.	Mode	0, 1	Enable or disable carrier wave.	Power	0–14	dBm of signal Default: 14
Name	Range	Description												
Frequency	800000000–999999999, 0	Continuous wave frequency in Hz. Use 868130000 for Sigfox or 0 to keep previous frequency.												
Mode	0, 1	Enable or disable carrier wave.												
Power	0–14	dBm of signal Default: 14												
AT\$CB=uint_opt,bit	Test Mode: TX constant byte	<p>For emission testing it is useful to send a specific bit pattern. The first parameter specifies the byte to send. Use '-1' for a (pseudo-)random pattern. Parameters:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Name</th> <th>Range</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Pattern</td> <td>0–255, -1</td> <td>Byte to send. Use '-1' for a (pseudo-)random pattern.</td> </tr> <tr> <td>Mode</td> <td>0, 1</td> <td>Enable or disable pattern test mode.</td> </tr> </tbody> </table>	Name	Range	Description	Pattern	0–255, -1	Byte to send. Use '-1' for a (pseudo-)random pattern.	Mode	0, 1	Enable or disable pattern test mode.			
Name	Range	Description												
Pattern	0–255, -1	Byte to send. Use '-1' for a (pseudo-)random pattern.												
Mode	0, 1	Enable or disable pattern test mode.												
AT\$T?	Get Temperature	Measure internal temperature and return it in 1/10 th of a degree Celsius.												
AT\$V?	Get Voltages	Return current voltage and voltage measured during the last transmission in mV.

T	Pin is driven by clock or DAC (GPIO pin 0 and 4 only)																							
AT:Pn=?	Get GPIO Pin Range	<p>Print a list of possible modes for a pin. The table below lists the response.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: left;">Pin</th> <th style="text-align: left;">Modes</th> </tr> </thead> <tbody> <tr> <td>P0</td> <td>0, 1, Z, U, A, T</td> </tr> <tr> <td>P1</td> <td>0, 1, Z, U, A</td> </tr> <tr> <td>P2</td> <td>0, 1, Z, U, A</td> </tr> <tr> <td>P3</td> <td>0, 1, Z, U, A</td> </tr> <tr> <td>P4</td> <td>0, 1, Z, U, T</td> </tr> <tr> <td>P5</td> <td>0, 1, Z, U</td> </tr> <tr> <td>P6</td> <td>0, 1, Z, U</td> </tr> <tr> <td>P7</td> <td>0, 1, Z, U</td> </tr> <tr> <td>P8</td> <td>0, 1, Z, U</td> </tr> <tr> <td>P9</td> <td>0, 1, Z, U</td> </tr> </tbody> </table>	Pin	Modes	P0	0, 1, Z, U, A, T	P1	0, 1, Z, U, A	P2	0, 1, Z, U, A	P3	0, 1, Z, U, A	P4	0, 1, Z, U, T	P5	0, 1, Z, U	P6	0, 1, Z, U	P7	0, 1, Z, U	P8	0, 1, Z, U	P9	0, 1, Z, U
Pin	Modes																							
P0	0, 1, Z, U, A, T																							
P1	0, 1, Z, U, A																							
P2	0, 1, Z, U, A																							
P3	0, 1, Z, U, A																							
P4	0, 1, Z, U, T																							
P5	0, 1, Z, U																							
P6	0, 1, Z, U																							
P7	0, 1, Z, U																							
P8	0, 1, Z, U																							
P9	0, 1, Z, U																							

AX-SIGFOX-MODS

Table 7. COMMANDS

Command	Name	Description															
AT:Pn=mode	Set GPIO Pin	Set the GPIO pin mode. For a list of the modes see the command AT:Pn?															
AT:ADC Pn[-Pn[(1V 10V)]]?	Get GPIO Pin Analog Voltage	Measure the voltage applied to a GPIO pin. The command also allows measurement of the voltage difference across two GPIO pins. In differential mode, the full scale range may also be specified as 1 V or 10 V. Note however that the pin input voltages must not exceed the range 0..VDD. The command returns the result as fraction of the full scale range (1 V if none is specified). The GPIO pins referenced should be initialized to analog mode before issuing this command.															
AT:SPI[(A B C D)]=bytes	SPI Transaction	<p>This command clocks out <i>bytes</i> on the SPI port. The clock frequency is 312.5 kHz. The command returns the bytes read on MISO during output. Optionally the clocking mode may be specified (default is A):</p> <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>Mode</th> <th>Clock Inversion</th> <th>Clock Phase</th> </tr> </thead> <tbody> <tr> <td>A</td> <td>normal</td> <td>normal</td> </tr> <tr> <td>B</td> <td>normal</td> <td>alternate</td> </tr> <tr> <td>C</td> <td>inverted</td> <td>normal</td> </tr> <tr> <td>D</td> <td>inverted</td> <td>alternate</td> </tr> </tbody> </table> <div style="margin-left: 20px;"> </div> <p>Note that SEL, if needed, is not generated by this command, and must instead be driven using standard GPIO commands (AT:Pn=0 1).</p>	Mode	Clock Inversion	Clock Phase	A	normal	normal	B	normal	alternate	C	inverted	normal	D	inverted	alternate
Mode	Clock Inversion	Clock Phase															
A	normal	normal															
B	normal	alternate															
C	inverted	normal															
D	inverted	alternate															
AT:CLK=freq,reffreq	Set Clock Generator	Output a square wave on the pin(s) set to T mode. The frequency of the square wave is $(freq / 2^{16}) \times reffreq$. Possible values for reffreq are 20000000, 10000000, 5000000, 2500000, 1250000, 625000, 312500, 156250. Possible values if freq are 0...65535.															
AT:CLK=OFF	Turn off Clock Generator	Switch off the clock generator															
AT:CLK?	Get Clock Generator	Return the settings of the clock generator. Two numbers are returned, freq and reffreq.															
AT:DAC=value	Set $\Sigma\Delta$ DAC	Output a $\Sigma\Delta$ DAC value on the pin(s) set to T mode. Parameter value may be in the range -32768...32767. The average output voltage is $(1/2 + value / 2^{17}) \times VDD$. An external low pass filter is needed to get smooth output voltages. The modulation frequency is 20 MHz. A possible low pass filter choice is a simple RC low pass filter with R = 10 k Ω and C = 1 μ F.															
AT:DAC=OFF	Turn off $\Sigma\Delta$ DAC	Switch off the DAC															
AT:DAC?	Get $\Sigma\Delta$ DAC	Return the DAC value															

Table 8. REGISTERS

Number	Name	Description	Default	Range	Units
300	Out Of Band Period	AX-SIGFOX module sends periodic static messages to indicate that they are alive. Set to 0 to disable.	24	0-24	hours
302	Power Level	The output power of the radio.	14	0-14	dBm
