2 and 4-Channel Low Capacitance ESD Protection Arrays

Product Description

The CM1224 family of diode arrays has been designed to provide ESD protection for electronic components or subsystems requiring minimal capacitive loading. These devices are ideal for protecting systems with high data and clock rates or for circuits requiring low capacitive loading. Each ESD channel consists of a pair of diodes in series which steer the positive or negative ESD current pulse to either the positive (V_P) or negative (V_N) supply rail. A Zener diode is embedded between V_P and V_N, offering two advantages. First, it protects the V_{CC} rail against ESD strikes, and second, it eliminates the need for a bypass capacitor that would otherwise be needed for absorbing positive ESD strikes to ground. The CM1224 will protect against ESD pulses up to ± 8 kV per the IEC 61000–4–2 standard.

These devices are particularly well-suited for protecting systems using high-speed ports such as USB 2.0, IEEE1394 (Firewire[®], iLink^m), Serial ATA, DVI, HDMI and corresponding ports in removable storage, digital camcorders, DVD-RW drives and other applications where extremely low loading capacitance with ESD protection are required.

The CM1224 family of devices has lead-free finishing in a small package footprint.

Features

- Two or Four Channels of ESD Protection
- Provides ESD Protection to IEC61000-4-2 Level 4 ±8 kV Contact Discharge
- Low Channel Input Capacitance of 0.7 pF Typical
- Minimal Capacitance Change with Temperature and Voltage
- Channel Input Capacitance Matching of 0.02 pF Typical is Ideal for Differential Dignals
- Zener Diode Protects Supply Rail and Eliminates the Need for External By-pass Capacitors
- Low Clamping Voltage (V_{CLAMP}) at 10 V
- Low Dynamic Resistance (R_{DYN}) at 1.08 Ω
- Each I/O Pin Can Withstand Over 1000 ESD Strikes
- Available in SOT and MSOP Lead-free Packages
- These Devices are Pb-Free and are RoHS Compliant

Applications

- USB2.0 Ports at 480 Mbps in desktop PCs, Notebooks and Peripherals
- IEEE1394 Firewire[®] Ports at 400 Mbps / 800 Mbps
- DVI Ports, HDMI Ports in Notebooks, Set Top Boxes, Digital TVs, LCD Displays
- Serial ATA Ports in Desktop PCs and Hard Disk Drives
- PCI Express Ports

APPLICATION INFORMATION

Design Considerations

To realize the maximum protection against ESD pulses, care must be taken in the PCB layout to minimize parasitic series inductances on the Supply/ Ground rails as well as the signal trace segment between the signal input (typically a connector) and the ESD protection device. Figure 3 illustrates an example of a positive ESD pulse striking an input channel. The parasitic series inductance back to the power supply is represented by L_1 and L_2 . The voltage V_{CL} on the line being protected is:

$V_{CL} = Fwd \ voltage \ drop \ of \ D_1 + V_{SUPPLY} + L_1 \ x \ d(I_{ESD}) \ / \ dt + L_2 \ x \ d(I_{ESD}) \ / \ dt$

where I_{ESD} is the ESD current pulse, and V_{SUPPLY} is the positive supply voltage.

An ESD current pulse can rise from zero to its peak value in a very short time. As an example, a level 4 contact discharge per the IEC61000–4–2 standard results in a current pulse that rises from 0 to 30 Amps in 1ns. Here $d(I_{ESD})/dt$ can be approximated by $\Delta I_{ESD}/\Delta t$, or $30/(1 \times 10^{-9})$. So just 10 nH of series inductance (L₁ and L₂ combined) will lead to a 300 V increment in V_{CL}!

Similarly for negative ESD pulses, parasitic series inductance from the V_N pin to the ground rail will lead to drastically increased negative voltage on the line being protected.

The CM1224 has an integrated Zener diode between V_P and V_N . This greatly reduces the effect of supply rail inductance L_2 on V_{CL} by clamping V_P at the breakdown voltage of the Zener diode. However, for the lowest possible V_{CL} , especially when V_P is biased at a voltage significantly below the Zener breakdown voltage, it is recommended that a 0.22 μ F ceramic chip capacitor be connected between V_P and the ground plane.

As a general rule, the ESD Protection Array should be located as close as possible to the point of entry of expected electrostatic discharges. The power supply bypass capacitor mentioned earlier should be as close to the V_P pin of the Protection Array as possible, with minimum PCB trace lengths to the power supply, ground planes and between the signal input and the ESD device to minimize stray series inductance.

MECHANICAL DETAILS

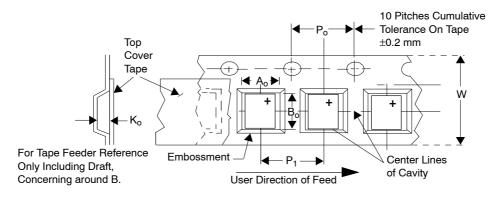

The CM1224 is available in SOT143–4, SOT23–6 and MSOP–10 packages with lead–free finishing. The various package drawings are presented below.

SOT143-4, SOT23-6 and MSOP-10 Mechanical Specifications

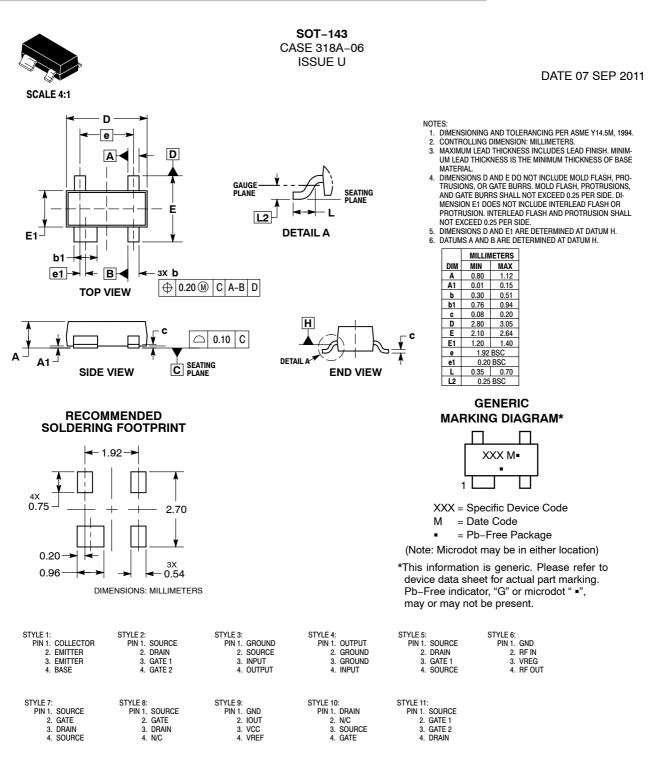

The CM1224–02SR devices are supplied in 4-pin SOT143 packages, the CM1224–04SO devices are packaged in 6-pin SOT23 and the CM1224–04MR in 10-lead MSOP packages. Dimensions are presented below.
