FAN3988

USB/Charger and Over-Voltage Detection Device

Features

- Charger/USB Detection Device
- Charger/USB Device Detection Flag
- Over-/Under-Voltage Detection Flag
- V_{BUS} Supply: 2.7 V to 20 V
- C_{ON} of 1.5 pF
- 6-Lead MicroPak™ MLP Package

Applications

- Mobile Phones
- Handheld Devices

Description

The FAN3988 is a USB-connection-monitoring device used to determine if a standard USB device or a battery-charging device is connected.

The FAN3988 sets the FLAG1 pin to logic HIGH or LOW as an indicator to the system controller that a standard USB device or a charger is connected to the USB port. The FAN3988 also monitors the V_{BUS} for over- or under-voltage conditions. The FLAG2 pin is set LOW if V_{BUS} is less than 3.3 V or greater than 6.0 V.

The FAN3988 is packaged in a very small 6-lead MicroPak™ MLP package suitable for small board space applications, such as mobile phones.

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Application Information

Std 15K pull-down on D- input and 1.5K pull-up on D+ by USB transceiver.

Figure 7.   Typical Application System with USB Transceiver

With USB Transceiver (Figure 7)

The FAN3988 sets the FLAG1 pin to logic HIGH or LOW as an indicator to the system controller that a standard USB device or a charger is connected to the USB port. The FAN3988 also monitors the V_{BUS} for over- or under-voltage conditions. The FLAG2 pin is set LOW if V_{BUS} is less than 3.3 V or greater than 6.0 V.

In a standard USB configuration, there is a switch in the USB transceiver that is always ON in the full-speed mode. It is ON during the transition from full-speed mode to high-speed mode and is turned off after enumeration is complete.

In a condition where D+ and D- are shorted when a charger is plugged into the USB port, the USB switch is ON and pulled to V_{DD}, which is about 3.3 V, making both D+ and D- HIGH and flag1 set HIGH – indicating that a charging device is connected to the port.

In a condition where D+ and D- are connected to a standard USB device, the D+ is pulled to V_{DD} and D- is set LOW (due to the 15 kΩ pull-down in the USB transceiver) and flag1 is LOW.

If D+ and D- are open (floating), D+ is pulled to V_{DD} and D- floats LOW, which makes flag1 LOW.

Without USB Transceiver (Figure 8)

The FAN3988 sets the FLAG1 pin to logic HIGH or LOW as an indicator to the system controller that a standard USB device or a charger is connected to the USB port. The FAN3988 also monitors the V_{BUS} for over- or under-voltage conditions. The FLAG2 pin is set LOW if V_{BUS} is less than 3.3 V or greater than 6.0 V.

In a condition where a USB transceiver is not incorporated or there is a switch between the USB port and the FAN3988, external resistors must be used to set the correct input logic states on the D+ D- inputs. A 5 MΩ pull-down on the D- line and a 1 MΩ pull-up to V_{DD} (system supply) on the D+ line are recommended.

When a condition exists where a charger is plugged into the USB port (D+ D- shorted), the voltage divider of 1 MΩ and 5 MΩ puts a voltage of 2.75 V on the D+ D- inputs and flag1 is HIGH, indicating a charger is connected to port.

In a condition where the USB port is connected to a standard USB device, the D+ input is pulled up to V_{DD} (system supply) in parallel with the 1.5 kΩ on a USB transceiver with a parallel R value of 1.497 kΩ. The D- input is connected to a 15 kΩ pull-down by the USB device and in parallel with 5 MΩ with a parallel R value of 14.955 kΩ. This condition makes flag1 LOW.

If D+ and D- are open (floating), D+ is pulled to V_{DD} (system supply) and D- floats LOW, which makes flag1 LOW.
