MOSFET – Power, N-Channel, POWERTRENCH[®]

100 V, 80 A, 9 m Ω

FDH3632, FDP3632, FDB3632

Features

- $R_{DS(ON)} = 7.5 \text{ m}\Omega$ (Typ.), $V_{GS} = 10 \text{ V}$, $I_D = 80 \text{ A}$
- Q_g (tot) = 84 nC (Typ.), V_{GS} = 10 V
- Low Miller Charge
- Low Q_{rr} Body Diode
- UIS Capability (Single Pulse and Repetitive Pulse)
- These Devices are Pb-Free and are RoHS Compliant

Applications

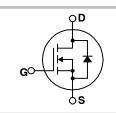

- Synchronous Rectification
- Battery Protection Circuit
- Motor Drives and Uninterruptible Power Supplies
- Micro Solar Inverter

Thermal Resistance vs. Mounting Pad Area

The maximum rated junction temperature, TJM, and the thermal resistance of the heat dissipating path determines the maximum allowable device power dissipation, PDM, in an application. Therefore the application's ambient temperature, TA (°C), and thermal resistance $R_{\theta JA}$ (°C/W) must be reviewed to ensure that T_{JM} is never exceeded. Equation 1 mathematically represents the relationship and serves as the basis for establishing the rating of the part.

$$\mathsf{P}_{\mathsf{DM}} = \frac{(\mathsf{T}_{\mathsf{JM}} - \mathsf{T}_{\mathsf{A}})}{\mathsf{R}_{\Theta\mathsf{JA}}} \tag{eq. 1}$$

In using surface mount devices such as the TO-263 package, the environment in which it is applied will have a significant influence on the parts current and maximum power dissipation ratings. Precise determination of PDM is complex and influenced by many factors:

- 1. Mounting pad area onto which the device is attached and whether there is copper on one side or both sides of the board.
- 2. The number of copper layers and the thickness of the board.
- 3. The use of external heat sinks.
- 4. The use of thermal vias.
- 5. Air flow and board orientation.
- 6. For non steady state applications, the pulse width, the duty cycle and the transient thermal response of the part, the board and the environment they are in.

ON Semiconductor provides thermal information to assist the designer's preliminary application evaluation. Figure 21 defines the $R_{\theta JA}$ for the device as a function of the top copper (component side) area. This is for a horizontally positioned FR-4 board with 1 oz copper after 1000 seconds of steady state power with no air flow. This graph provides the necessary information for calculation of the steady state junction temperature or power dissipation. Pulse applications can be evaluated using the ON Semiconductor device Spice thermal model or manually utilizing the normalized maximum transient thermal impedance curve.

Thermal resistances corresponding to other copper areas can be obtained from Figure 21 or by calculation using Equation 2 or 3. Equation 2 is used for copper area defined in inches square and equation 3 is for area in centimeter square. The area, in square inches or square centimeters is the top copper area including the gate and source pads.

$$R_{\Theta JA} = 26.51 + \frac{19.84}{(0.262 + Area)}$$
 (eq. 2)

Area in in².

$$R_{\Theta JA} = 26.51 + \frac{128}{(1.69 + Area)}$$
 (eq. 3)

Area in cm².
