Please note: As part of the Fairchild Semiconductor integration, some of the Fairchild orderable part numbers will need to change in order to meet ON Semiconductor's system requirements. Since the ON Semiconductor product management systems do not have the ability to manage part nomenclature that utilizes an underscore (_), the underscore (_) in the Fairchild part numbers will be changed to a dash (-). This document may contain device numbers with an underscore (_). Please check the ON Semiconductor website to verify the updated device numbers. Required Specifications

1. When the true and complement LVDS outputs (having a 75Ω connected between outputs) are connected to 3.75 kΩ resistors and the common point of those 3.75 kΩ resistors are connected to a voltage source that sweeps from 0 to 2.4V, the DC V_{OD} and ΔV_{OD} are still maintained (see Figure 1).
2. When the true and complement LVDS outputs (having a 5 pF capacitor attached between outputs) are connected with 37.5Ω resistors each to common point, then the common point does not vary by more than 150 mV under all process, temperature and voltage conditions when the outputs switch either from LOW-to-HIGH or from HIGH-to-LOW (see Figure 2).
3. Pull-down resistors are required on Enable (EN_0 and EN_1) and select (SEL_0 and SEL_1) inputs.
4. Fail safe protection on the outputs that draw less than 20 μA of current (worst case) on the LVDS inputs. In this condition, if the input is in fail safe selected to OUT_{0+}/OUT_{0-} (say) and the outputs are Enabled then OUT_{0+} = HIGH and OUT_{0-} = LOW. This prevents noise from being amplified when the connection is broken.
5. In the disabled state the outputs can go beyond V_{CC} but there should be no appreciable leakage (see I_{OZD} and I_{OFF} specifications)
