## FPF2283CUCX

# 28 V / 7 A Rated OVP with Ultra Low On-resistance Switch and Moisture Detection 

## Description

FPF2283C is a super OVP with ultra low on-resistance single channel switch controlled by external logic pin or $\mathrm{I}^{2} \mathrm{C}$ interface. The device contains an N-MOSFET that can operate over an input voltage range of 2.8 V to 28 V and can support a maximum continuous current of 10 A .

When the input voltage exceeds the over-voltage threshold, the internal FET is turned off immediately to prevent damage to the protected downstream components. When in detection mode, the internal current source and ADC can be used to calculate the resistance on VIN for moisture detection.

FPF2283CUCX is available in a small 20 bumps WLCSP package and operate over the free-air temperature range of $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

## Features

- Over-voltage Protection Up to +28 V
- Internal Low $\mathrm{R}_{\mathrm{DS}(\text { on) }}$ NMOS Transistors: Typical $7.5 \mathrm{~m} \Omega$
- Programmable Over-voltage Lockout (OVLO)
- Externally Adjustable via ADJ Pin
- Programmable via I ${ }^{2}$ C Interface
- Active-low Enable Pin for Device
- Super Fast OVLO Response Time: Typical 50 ns
- $I^{2} \mathrm{C}$ Communication with System
- 8-bits ADC for Moisture Detection on VIN
- Short Circuit Protection and Auto-restart
- Over Temperature Protection (Thermal Shutdown)
- +40 V Surge Capability Base on IEC61000-4-5
- System Level ESD Base on IEC61000-4-2
- 8 kV Contact Discharge
- 15 kV Air Gap Discharge
- Robust ESD Performance
- 3.5 kV Human Body Model (HBM)
- 1 kV Charged Device Model (CDM)

## Typical Applications

- Mobile Phones
- PDAs
- GPS

## Function Description

## General

FPF2283CUCX is an OVP power switch to protect next stage system which is optimized to lower voltage working condition. The device includes ultra low on-resistance power FET ( $7 \mathrm{~m} \Omega$ ) and super fast OVP response time ( 50 ns ).

The device integrates moisture detection function to detect the resistance on VIN side. The communication with processor can be done via $\mathrm{I}^{2} \mathrm{C}$ interface.

## Power MOSFET

The FPF2283CUCX integrates an N -type MOSFET with $8 \mathrm{~m} \Omega$ resistance. The power FET can work under $2.8 \mathrm{~V} \sim$ 23 V and up to 7 A DC current capability.

## Power Supply

The FPF2283CUCX is supplied by both VIN and VDD. When both VDD and VIN drop below threshold, the entire chip will stop working. When only VDD drops, detection mode will not be working anymore.

## Enable Control

The ENB pin is active low control of FPF2283CUCX with $1 \mathrm{M} \Omega$ pull down resistor. When ENB is tight to ground or floating, the device is alive and ready to be configured by internal registers. When ENB is HIGH, the device will be turned off entirely including the power switch.

## Under Voltage Lockout

FPF2283CUCX power switch will be turned off when the voltage on VIN is lower than the UVLO threshold VIN_UV_F.

Whenever VIN voltage ramps up to higher than $\mathrm{V}_{\text {IN_UV_R }}$, the register 0 x 01 will be reset to default value and the power FET will be turned on automatically after $t_{\text {DEB }}$ de-bounce time if there is no OV or OT condition.

## Over Voltage Lockout

The power FET will be turned off whenever VIN voltage higher than $\mathrm{V}_{\text {IN_OVLO }}$. The value of $\mathrm{V}_{\text {IN_OVLO }}$ can be set by external resistor ladder or by internal registers via $\mathrm{I}^{2} \mathrm{C}$ communication.

When $\mathrm{V}_{\mathrm{ADJ}} \leq 0.15 \mathrm{~V}$ or OV MODE $=1, \mathrm{~V}_{\text {OVLO }}$ is decided by internal registers. When $\mathrm{V}_{\mathrm{ADJ}}>0.3 \mathrm{~V}$ and OV_MODE $=0$, the power switch will be turned off once $\mathrm{V}_{\text {ADJ }}>\mathrm{V}_{\text {OVLO_TH. }}$. The external resistor ladder can be decided according to the following equation:

$$
\begin{equation*}
\mathrm{V}_{\mathrm{IN}_{-} \mathrm{OVLO}}=\mathrm{V}_{\mathrm{OVLO}} \mathrm{TH} \times\left(1+\frac{\mathrm{R} 1}{\mathrm{R} 2}\right) \tag{eq.1}
\end{equation*}
$$

where R1 and R2 are the resistors in Figure 1.
INTB will be triggered to ground when OV event appears. At the meantime, OV_FLG will be set to 1 and latched.

## Hard Short Protection

When the VOUT is short to ground, the power switch will be turned off to protect the system and power supply. If
hard-short condition keeps, the switch will be turned off and re-try again after $\mathrm{t}_{\mathrm{HS}}$ _RST.

## Thermal Shutdown

When the device is in the switch mode, to protect the device from over temperature, the power switch will be turned off when the junction temperature exceeds $\mathrm{T}_{\mathrm{SD}}$. INTB will be triggered to ground. At the meantime, OT_FLG will be set to 1 and latched. The switch will be turned on again when temperature drop below $\mathrm{T}_{\mathrm{SD}}-\mathrm{T}_{\mathrm{SH}}$.

## Interrupt

The processor recognizes interrupt signals by observing the INTB signal of FPF2283CUCX, which is active LOW and open-drain. Interrupts are masked during VIN or VDD power up. The INTB pin is default floating in preparation for an interrupt.
By default, when the following event occurs, INTB transitions LOW: Over Voltage Lockout, Over Current Protection, Over Temperature Protection, Over TAG of VIN, Detection Timeout, Power Switch turned on, Power applied on VIN.

When the following event occurs, INTB transitions HIGH: Read clear, Interrupt time-out, tDET start, Power down, Hardware disable; ENB pin is pulled.

## Moisture detection

FPF2283CUCX provide a Moisture Detection, or called resistance detection, feature to help the system detect any risk on VBUS. The detection can be setup via $I^{2} \mathrm{C}$ bus.

The Moisture Detection includes two parts:

1. A programmable current source which will be applied to VIN;
2. An 8-bits ADC to detect the voltage on VIN.

While the voltage value is read via $\mathrm{I}^{2} \mathrm{C}$, resistance between VIN and GND can be calculated through the formula:

$$
\begin{equation*}
\mathrm{R}_{\mathrm{VIN}}=\frac{\mathrm{V}_{\mathrm{VIN}}}{\mathrm{I}_{\mathrm{SRC}}} \tag{eq.2}
\end{equation*}
$$

Where $\mathrm{V}_{\text {VIN }}$ is a value can be looked up from the value of register 0x08.

The Moisture Detection will be implemented during $t_{\text {DET }}$. $t_{\text {DET }}$ is only valid when all the following conditions met:

1. The register DET_EN is set to 1 ' b 1 ;
2. The status is under detecting period according to $\mathrm{t}_{\text {BLNK }}$ and $\mathrm{t}_{\text {DET }}$ set by register 05 h .
The moisture detection will only be available when external supply VDD is applied. The detection result can be used to decide if there is significant leakage on VBUS or other power line. The programmable current source is convenient for different measurement range and for different input capacitance.
The moisture detection function makes it possible for system to find out the abnormal condition on USB connector
before power source is applied. It provides a safer way than temperature detection to prevent huge leakage burning connector.

## $1^{2} \mathrm{C}$ interface

FPF2283CUCX allows $\mathrm{I}^{2} \mathrm{C}$ communication to program the registers. Registers will control the OVP, I ISC and ADC for moisture detection. $\mathrm{I}^{2} \mathrm{C}$ communication is only valid when VDD supply is higher than 1.5 V . The $\mathrm{I}^{2} \mathrm{C}$ of

FPF2283CUCX has 3 modes for different speed. Different speed has different power consumption level.

The device has its slave address for $\mathrm{I}^{2} \mathrm{C}$ communication with fixed length of 7-bits (7'b1101100).

## Register Mapping

There are registers integrated in FPF2283CUCX. The registers can be used to control the device or get the status information. Register table is followed:

| Address | Description | Defaul t Value | Bit[7] | Bit[6] | Bit[5] | Bit[4] | Bit[3] | Bit[2] | Bit[1] | Bit[0] |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0x00 | ID Register |  | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 |
| $0 \times 01$ | Enable Register | 00 h | SW_ENB | DET_EN | Reserved | Reserved | Reserved | Reserved | Reserved | Reserved |
| 0x02 | Detection status Register | 00 h | PON_STS | TAG_STS | TMO_STS | SW_STS | Reserved | Reserved | Reserved | Reserved |
| $0 \times 03$ | Switch Flag Register | 00 h | Reserved | Reserved | Reserved | Reserved | Reserved | OV_FLG | HS_FLG | OT_FLG |
| 0x04 | Interrupt mask register | 00 h | PON_MSK | TAG_MSK | TMO_MSK | SW_MSK | Reserved | OV_MSK | HS_MSK | OT_MSK |
| 0x05 | Working Mode | 30 h | Reserved | RNG2 | RNG1 | RNGO | OV_MODE | Reserved | OV1 | OVO |
| $0 \times 06$ | Isource to VIN | 00 h | Reserved | Reserved | Reserved | Reserved | ISRC3 | ISRC2 | ISRC1 | ISRCO |
| $0 \times 07$ | Isource Working Time | 00 h | TDET3 | TDET2 | TDET1 | TDET0 | TBLK3 | TBLK2 | TBLK1 | TBLK0 |
| $0 \times 08$ | $\begin{gathered} \text { Voltage on VIN } \\ (0 \mathrm{~V} \sim 2.04 \mathrm{~V}, \\ 8 \mathrm{mV} \text { LSB }) \end{gathered}$ | 00 h | VIN7 | VIN6 | VIN5 | VIN4 | VIN3 | VIN2 | VIN1 | VINO |
| 0x09 | Set Tag of VIN | FF h | TH_VIN7 | TH_VIN6 | TH_VIN5 | TH_VIN4 | TH_VIN3 | TH_VIN2 | TH_VIN1 | TH_VIN0 |

## Identification Register

Address: 00h, Bit [7:0]
Type: Read Only
Description: Vendor ID and Revision ID

| Bit Name | Bit \# | Value |  |
| :---: | :---: | :---: | :--- |
| VID | $7: 3$ | 5'b00001 | Vendor ID for customer recognition |
| RID | $2: 0$ | $3^{\prime}$ b001 | Revision ID |

## Enable Register

Address: 01h, Bit [7:6]
Default Value: 2'b00
Type: Read / Write
Function: Control the working mode of FPF2283CUCX

| Bit Name | Bit \# | Value | Description |
| :---: | :---: | :---: | :---: |
| SW_ENB | 7 | 0 (Default) | Written by processor via $\mathrm{I}^{2} \mathrm{C}$ or cleared during POR. <br> Turned on the power switch if UV, OV, Hard Short, OT condition cleared and detection not being implemented. |
|  |  | 1 | Written by processor via $\mathrm{I}^{2} \mathrm{C}$. Power switch OFF. |
| DET_EN | 6 | 0 (Default) | Written by processor via $\mathrm{I}^{2} \mathrm{C}$ or cleared during POR. <br> Moisture Detection is not applied until the state of this bit changed. The detection related registers will not be reset. |
|  |  | 1 | Written by processor via $\mathrm{I}^{2} \mathrm{C}$. <br> Moisture Detection turned on. If VIN voltage is lower than VIN_UVLO_F, ISRC and ADC will be applied on VIN in DEET, which is defined by register 04h. |

NOTE: The status 2'b01 is invalid. Any writing action 2'b01 to these two bits will be looked as invalid writing and not executed.

The register SW_ENB is an active-low control bit for the Switch Mode. Writing SW_ENB to 1 will turn off the power FET in any case, while writing it to 0 will switch the device into Switch Mode. In Switch Mode, the power FET will be turned on if no over stress condition is detected for at least $t_{\text {DEB }}$.

The register DET_EN is an active-high control bit for the Detection Mode. When DET_EN $=0$, the moisture detection setup (including $I_{\text {SRC }}$ and $\overline{A D C}$ ) will not be implemented. When DET_EN = 1, the device will enter the detection mode. During Detection Mode, current source and ADC will work according to the setup in register 0x06 and 0x07.

## Detection Status Register

Address: 02h, Bit [7:0]
Default Value: 3'b000
Type: Read

| Bit Name | Bit \# | Value | Description |
| :---: | :---: | :---: | :---: |
| PON_STS | 7 | 0 (Default) | Initialed by POR or set by function defined. Indicate the condition that VIN is lower than $\mathrm{V}_{\text {IN_UVLO_F }}$ |
|  |  | 1 | Set by FPF2283CUCX. <br> The voltage on VIN is higher than VIN UVLO R when ENB is low. |
| TAG_STS | 6 | 0 (Default) | Initialed by POR or cleared when the value in register 08h is smaller than the value in 09h. |
|  |  | 1 | Set by FPF2283CUCX. The value in register 08h is larger than the value in 09h. |
| TMO_STS | 5 | 0 (Default) | Initialed by POR or cleared when tDET begins. Refer to diagram. |
|  |  | 1 | Set by FPF2283CUCX during tBLNK. Refer to diagram. |
| SW_STS | 4 | 0 (Default) | Initialed by POR or cleared when the power switch is turned off when ENB tight low. |
|  |  | 1 | Set by FPF2283CUCX. The power switch is turned on when ENB tight low. |

PON_STS is a register bit indicates the power on status. Unless ENB pin is pulled down to ground, a logical ' 0 ' means VIN voltage is lower than UVLO threshold, while a logical ' 1 ' means VIN voltage is higher than UVLO level. An interrupt will be sent out when VIN rises above UVLO level.

TAG_STS is a "target reached" indicate register for moisture Detection Mode. When the device is in this mode, it will monitor VIN voltage. Once VIN is higher than the threshold level (set by register 0x09) during Detection

Mode, TAG_STS will be set to 1 and interrupt signal will be triggered via INTB pin.
TMO_STS is a status register for "time-out" situation. During Detection Mode, it will suggest if the device is in "detection" period or "blank" period. When it is in "detection" period, TMO_STS will be 0 . When it is in "blank" period, TMO_STS will be 1. Every time the status is switched from "detection" period to "blank" period, interrupt signal will be sent our via INTB pin. Figure $x$ is a reference timing diagram for that.

Figure 7. TMO_STS and Related Interrupt

SW_STS is a status register for power switch. It indicates if the power FET is on or off. When the FET is in conducting condition, SW_STS is 1 . When the FET is in isolating condition, SW_STS is 0 . Every time the power FET is turned on, interrupt signal will be triggered.

## Power Switch FLAG Register

Address: 03h, Bit [2:0]
Default Value: 3'b000
Type: Read / Clear

| Bit Name | Bit \# | Value |  |
| :---: | :---: | :---: | :--- |
| OV_FLG | 2 | 0 (Default) | Initialed by POR. Be 0 as long as VIN is lower than $V_{\text {OVLO. }}$ |
|  |  | 1 | Set and latched by FPF2283CUCX when ENB is logical LOW and VIN is higher than $\mathrm{V}_{\text {OVLO }}$. |
| HS_FLG | 1 | 0 (Default) | Initialed by POR. Be 0 as long as VOUT is high enough. |
|  |  | 1 | Set and latched by FPF2283CUCX and kept until this byte been read. |
| OT_FLG | 0 | 0 (Default) | Initialed by POR. Be 0 as long as the junction temperature is lower than TSDN. |
|  |  | 1 | Set and latched by FPF2283CUCX when the junction temperature is higher than $\mathrm{T}_{\text {SDN. }}$ |

OV_FLAG is a flag indicator for over voltage protection. When the device is in Switch Mode, SW_ENB $=0$, power switch will be turned off and OV_FLG will be latched to 1 when VIN $>\mathrm{V}_{\text {OVLO }}$. Interrupt will also be asserted in this case. VovLO is decided by the register byte $0 x 03$ and external resistor ladder (Figure 1). The action of reading $0 x 02$ will reset OV_FLG and INTB although they might be triggered again if VIN is still under over voltage stress.

HS_FLG is a flag indicator for hard short circuit protection. When the device is in Switch Mode, SW_ENB $=0$, power switch will be turned off and HS_FLG will be latched to 1 and INTB will be asserted, when the VOUT encounters hard-short to ground. The action of reading 0x02 will reset HS_FLG and de-asserted INTB. However, the power switch will keep OFF for $\mathrm{t}_{\mathrm{HS}}$ RST. After $\mathrm{t}_{\mathrm{HS}}$ RST, the switch will be re-started again. If the short condition still exists, the device will be turned off again.

OT_FLG is a flag indicator for over temperature protection. When the device is in Switch Mode, SW_ENB $=0$, power switch will be turned off and OT_FLG will be latched to 1 when the device junction temperature exceed $\mathrm{T}_{\text {SDN }}$. The action of reading $0 x 02$ will reset OT_FLG although it might be triggered to 1 again if the temperature is still high.

Figure 8. Timing for OVLO Trip Without

Figure 9. Timing for Power Switch Thermal Shutdown

## Mask Register

Address: 04h, Bit [7:0]
Default Value: 8'h00
Type: Write / Read

| Bit Name | Bit \# | Value | Description |
| :---: | :---: | :---: | :---: |
| PON_MSK | 7 | 0 (Default) | Initialed by POR or set by function defined. Interrupt responding to PON_STS is normal. |
|  |  | 1 | Set by $\mathrm{I}^{2} \mathrm{C}$. <br> The interrupt INTB will not be triggered because of PON_STS. |
| TAG_MSK | 6 | 0 (Default) | Initialed by POR or set by function defined. Interrupt responding to TAG_STS is normal. |
|  |  | 1 | Set by $\mathrm{I}^{2} \mathrm{C}$. <br> The interrupt INTB will not be triggered because of TAG_STS. |
| TMO_MSK | 5 | 0 (Default) | Initialed by POR or set by function defined. Interrupt responding to TMO_STS is normal. |
|  |  | 1 | Set by $\mathrm{I}^{2} \mathrm{C}$. <br> The interrupt INTB will not be triggered because of TMO_STS. |
| SW_MSK | 4 | 0 (Default) | Initialed by POR or set by function defined. Interrupt responding to SW_STS is normal. |
|  |  | 1 | Set by $\mathrm{I}^{2} \mathrm{C}$. <br> The interrupt INTB will not be triggered because of SW_STS. |
| Reserved | 3 | 0 (Default) | Do not use |
| OV_MSK | 2 | 0 (Default) | Initialed by POR or set by function defined. Interrupt responding to OV_FLG is normal. |
|  |  | 1 | Set by $\mathrm{I}^{2} \mathrm{C}$. <br> The interrupt INTB will not be triggered because of OV_FLG. |
| HS_MSK | 1 | 0 (Default) | Initialed by POR or set by function defined. Interrupt responding to HS_FLG is normal. |
|  |  | 1 | Set by $\mathrm{I}^{2} \mathrm{C}$. <br> The interrupt INTB will not be triggered because of HS_FLG. |
| OT_MSK | 0 | 0 (Default) | Initialed by POR or set by function defined. Interrupt responding to OT_FLG is normal. |
|  |  | 1 | Set by $\mathrm{I}^{2} \mathrm{C}$. <br> The interrupt INTB will not be triggered because of OT_FLG. |

The mask registers will control the interrupt assert behavior. By default, the $0 x 04$ is all 0 . If one bit of it is written to 1 , the relevant STS bit or FLG bit will not trigger INTB when they flip to 1. For example, when SW_MSK=0, interrupt will be asserted if SW_STS turns from 0 to 1 . However, if SW_MSK=1, interrupt will not be asserted by this process.

## Register for OVP Internal Threshold

Address: 05h, Bit [1:0]
Default Value: 2'b00
Type: Read / Write
Function: Define the center of rising trigger level of OVP, see the description followed

| OV [1:0] | Data | Internal OVP Threshold |
| :---: | :---: | :---: |
| Define the <br> internal Over <br> Voltage Lockout <br> center value | 2'b00 | 6.8 V |
|  | 2'b01 | 11.5 V |
|  | 2 'b10 | 17.0 V |

## Register for OVP Internal Threshold Offset

Address: 05h, Bit [6:4]
Default Value: 3'b011
Type: Read / Write
Function: Define the offset of OVP from center value, see the description followed

| RNG [6:4] | Data | Internal OVP offset |
| :---: | :---: | :---: |
| Define the OVP <br> offset | 3'b000 | -600 mV |
|  | 3'b001 | -400 mV |
|  | 3'b010 | -200 mV |
|  | 3'b011 | 0 mV |
|  | 3'b100 | 200 mV |
|  | 3'b101 | 400 mV |
|  | 3'b110 | 600 mV |
|  | 3'b111 | 800 mV |

When OV_MODE $=0$ or $\mathrm{V}_{\mathrm{ADJ}}<0.15 \mathrm{~V}$, the OVLO level will be decided by external resistor divider (Equation 1). When OV_MODE = 1, the OVLO level will be decided by register 0x05. [OV1:OV0] will decide the OVP level center value and RNG[6:4] will decide the offset value.

For example, when $0 x 06=8$ 'h19 ([OV1:OV0] $=2^{\prime} \mathrm{b} 01$, RNG[6:4]=3'b001, OV_MODE=1), the OVP level of VIN can be calculated as $\mathrm{V}_{\mathrm{OVLO}}=11.5 \mathrm{~V}-0.4 \mathrm{~V}=11.1 \mathrm{~V}$.

## Register for $I_{\text {SRC }}$ Current Value

Address: 06h, Bit [3:0]
Default Value: 4’b0000
Type: Read / Write
Function: Define current source amplitude

| ISRC [3:0] | Data | ISRC Value |
| :---: | :---: | :---: |
| Define Source Current value | 4'b0000 | $0 \mu \mathrm{~A}$ |
|  | 4'b0001 | $1 \mu \mathrm{~A}$ |
|  | 4'b0010 | $2 \mu \mathrm{~A}$ |
|  | 4'b0011 | $3 \mu \mathrm{~A}$ |
|  | 4'b0100 | $4 \mu \mathrm{~A}$ |
|  | 4'b0101 | $5 \mu \mathrm{~A}$ |
|  | 4'b0110 | $10 \mu \mathrm{~A}$ |
|  | 4'b0111 | $20 \mu \mathrm{~A}$ |
|  | 4'b1000 | $50 \mu \mathrm{~A}$ |
|  | 4'b1001 | $100 \mu \mathrm{~A}$ |
|  | 4'b1010 | $200 \mu \mathrm{~A}$ |
|  | 4'b1011 | $500 \mu \mathrm{~A}$ |
|  | 4'b1100 | 1 mA |
|  | 4'b1101 | 2 mA |
|  | 4'b1110 | 5 mA |
|  | 4'b1111 | 10 mA |

The internal current source value can be set via $\mathrm{I}^{2} \mathrm{C}$. The register $0 x 06$ can decide it by the above table.

The current source is powered by VDD. It could be used to set the measurement range. In the case that capacitance on VIN is large, a large ISRC could be applied firstly. After the voltage change becomes smoothly, smaller ISRC can be used to save the standby consumption.

## Register for ISRC Pulse

Address: 07h, Bit [7:4]
Default Value: 4'b0000
Type: Read / Write
Function: Define $t_{\text {DET }}$, see the description followed

| TDET [3:0] | Data | ISRC Pulse Width |
| :---: | :---: | :---: |
| Define pulse width $t_{\text {DET }}$ of the current source applied on VIN | 4'b0000 | $200 \mu s$ |
|  | 4'b0001 | $400 \mu \mathrm{~s}$ |
|  | 4'b0010 | 1 ms |
|  | 4'b0011 | 2 ms |
|  | 4'b0100 | 4 ms |
|  | 4'b0101 | 10 ms |
|  | 4'b0110 | 20 ms |
|  | 4'b0111 | 40 ms |
|  | 4'b1000 | 100 ms |
|  | 4'b1001 | 200 ms |
|  | 4'b1010 | 400 ms |
|  | 4'b1011 | 1 s |
|  | 4'b1100 | 2 s |
|  | 4'b1101 | 4 s |
|  | 4'b1110 | 10 s |
|  | 4'b1111 | Always ON |

Register for ISRC Blank Time
Address: 07h, Bit [3:0]
Default Value: 4'b0000
Type: Read / Write
Function: define $\mathrm{t}_{\mathrm{BLNK}}$, see the description followed

| TBLK [3:0] | Data | ISRC Apply Period |
| :---: | :---: | :---: |
| Define Period tpD of Detection | 4'b0000 | Single Pulse |
|  | 4'b0001 | 10 ms |
|  | 4'b0010 | 20 ms |
|  | 4'b0011 | 50 ms |
|  | 4'b0100 | 100 ms |
|  | 4'b0101 | 200 ms |
|  | 4'b0110 | 500 ms |
|  | 4'b0111 | 1 s |
|  | 4'b1000 | 2 s |
|  | 4'b1001 | 3 s |
|  | 4'b1010 | 6 s |
|  | 4'b1011 | 12 s |
|  | 4'b1100 | 30 s |
|  | 4'b1101 | 60 s |
|  | 4'b1110 | 120 s |
|  | 4'b1111 | 300 s |

NOTE: It should be noticed, when $0 \times 07$ is set to 8 'hFO (conflict as single pulse and always ON ), always on mode will be dominating.

The detection mode period will be decided by above table and following diagram:

Figure 10. Timing for Detection Period Setup

## Register for Detection Target

Address: 09h, Bit [7:0]
Default Value: 8'b00
Type: Read / Write
Function: Define the threshold of moisture detection. This register can be written to a threshold value for 0 V to 2.04 V with $8 \mathrm{mV} /$ step. During detection, once the voltage on VIN exceed the value set by $0 x 09$, the interrupt will be asserted and register TAG_STS (bit[6] of register 0x02) will be set to 1 . By doing that, processor will know when the low resistance condition has disappeared before proceed to the next action.

Figure 11. Timing for TAG_STS and Register 0x09 (TAG_DIR = 0)

## APPLICATIONS INFORMATION

## Overview of $\mathrm{I}^{2} \mathrm{C}$

The $I^{2} \mathrm{C}$ bus supports bi-directional communications via two signal lines: the SDA (data) line and SCL (clock) line. A combination of these two signals is used to transmit and receive communication start/stop signals, data signals, acknowledge signals, and so on. Both the SCL and SDA signals are held at high level whenever communications are not being performed.

The starting and stopping of communications will be controlled at the rising edge or falling edge of SDA while SCL is at high level. During data transfers, data changes that occur on the SDA line are performed while the SCL line is at low level, and on the receiving side the data is captured while the SCL line is at high level. In either case, the data is transferred via the SCL line at a rate of one bit per clock pulse.

## Starting and Stopping $\mathrm{I}^{2} \mathrm{C}$

START condition: SDA level changes from high to low while SCL is at high level
STOP condition: SDA level changes from low to high while SCL is at high level

## Repeated START condition (RESTART condition)

## Data Transfer and Acknowledge Responses during $\mathrm{I}^{2} \mathrm{C}$ Communication

Data transfers are performed in 8-bit (1 byte) units once the START condition has occurred. There is no limit on the amount (bytes) of data that are transferred between the START condition and STOP condition. The address auto increment function operates during both write and read operations.

Updating of data on the transmitter (transmitting side)'s SDA line is performed while the SCL line is at low level. The receiver (receiving side) captures data while the SCL line is at high level.

When transferring data, the receiver generates a confirmation response (ACK signal, low active) each time an 8 -bit data segment is received. If there is no ACK signal from the receiver, it indicates that normal communication has not been established. (This does not include instances where the master device intentionally does not generate an ACK signal.)
Immediately after the falling edge of the clock pulse corresponding to the $8^{\text {th }}$ bit of data on the SCL line, the
transmitter releases the SDA line and the receiver sets the SDA line to low (= acknowledge) level.

After transmitting the ACK signal, if the Master remains the receiver for transfer of the next byte, the SDA is released at the falling edge of the clock corresponding to the $9^{\text {th }}$ bit of data on the SCL line. Data transfer resumes when the Master becomes the transmitter.
When the Master is the receiver, if the Master does not send an ACK signal in response to the last byte sent from the slave, it indicates to the transmitter that data transfer has ended. At that point, the transmitter continues to release the SDA and awaits a STOP condition from the Master.

## Slave Address

The $I^{2} \mathrm{C}$ bus device does not include a chip select pin such as is found in ordinary logic devices. Instead of using a chip select pin, slave addresses are allocated to each device and the receiving device responds to communications only when its slave address matches the slave address in the received data.
All communications begin with transmitting the [START condition] + [slave address (+ R/W specification)]. The receiving device responds to this communication only when the specified slave address it has received matches its own slave address. Slave addresses have a fixed length of 7 -bits ( 7 'b1101100). See table for the details. An R/W bit is added to each 7 -bits slave address during 8 -bits transfers.

| Operation | Transfer <br> data | Slave Address |  |  |  |  |  |  | R/W bit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| Read |  | 1 | 1 | 0 | 1 | 1 | 0 | 0 | 1 (=Read) |
| Write |  |  |  |  |  |  |  |  | 0 (=Write) |

## Input Decoupling ( $\mathrm{C}_{\text {in }}$ )

A ceramic or tantalum at least $0.1 \mu \mathrm{~F}$ capacitor is recommended and should be connected close to the FPF2283CUCX package. Higher capacitance and lower ESR will improve the overall line and load transient response.

## Output Decoupling ( $\mathrm{C}_{\text {out }}$ )

The FPF2283CUCX is a stable component and does not require a minimum Equivalent Series Resistance (ESR) for the output capacitor. The minimum output decoupling value is $0.1 \mu \mathrm{~F}$ and can be augmented to fulfill stringent load transient requirements.

## Enable Operation

The enable pin ENB will turn the device on or off without $\mathrm{I}^{2} \mathrm{C}$ communication. The threshold limits are covered in the
electrical characteristics table in this data sheet. The turn-on/turn-off transient voltage being supplied to the enable pin should exceed a slew rate of $10 \mathrm{mV} / \mu$ s to ensure correct operation. If the enable function is not to be used then the pin should be connected to Ground.

## Thermal Considerations

As power in the FPF2283CUCX increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and the ambient temperature affect the rate of junction temperature rise for the part. When the FPF2283CUCX has good thermal conductivity through the PCB, the junction temperature will be relatively low with high power applications. The
maximum dissipation the FPF2283CUCX can handle is given by:

$$
\begin{equation*}
P_{D(\text { MAX })}=\frac{\left[T_{J(M A X)}-T_{A}\right]}{R_{\theta J A}} \tag{eq.3}
\end{equation*}
$$

Since $\mathrm{T}_{\mathrm{J}}$ is not recommended to exceed $125^{\circ} \mathrm{C}$, then the FPF2283CUCX soldered on $645 \mathrm{~mm}^{2}, 1 \mathrm{oz}$ copper area, the power dissipated by the FPF2283CUCX can be calculated from the following equations:

$$
\begin{equation*}
P_{D} \approx V_{\text {in }} \cdot\left(I_{Q} @ I_{\text {out }}\right)+I_{\text {out }}^{2} \cdot r_{\text {on }} \tag{eq.4}
\end{equation*}
$$

## Hints

$V_{\text {in }}$ and $V_{\text {out }}$ printed circuit board traces should be as wide as possible. Place external components, especially the input capacitor and TVS, as close as possible to the FPF2283CUCX, and make traces as short as possible.
