Is Now Part of

ON Semiconductor®

To learn more about ON Semiconductor, please visit our website at
www.onsemi.com

Please note: As part of the Fairchild Semiconductor integration, some of the Fairchild orderable part numbers will need to change in order to meet ON Semiconductor's system requirements. Since the ON Semiconductor product management systems do not have the ability to manage part nomenclature that utilizes an underscore (_), the underscore (_) in the Fairchild part numbers will be changed to a dash (-). This document may contain device numbers with an underscore (_). Please check the ON Semiconductor website to verify the updated device numbers. The most current and up-to-date ordering information can be found at www.onsemi.com. Please email any questions regarding the system integration to Fairchild_questions@onsemi.com.

FPF34891 / FPF34892
SIDO Over-Voltage Protection Load Switch

Features

- Single Input Dual Output (SIDO) Switch
  - V_{BUS} to V_{OUT} Path
  - V_{BUS} to BAT Path
- Surge Protection under IEC 61000-4-5
  - V_{BUS}: ±100 V
- Input Voltage Range
  - V_{BUS}: 2.7 V ~ 13.5 V
- Max. Continuous Current Capability
  - V_{OUT} Path: 3.5 A
  - BAT Path: 6 A
- Ultra Low On-Resistance
  - V_{OUT} Path: Typ. 28 mΩ
  - BAT Path: Typ. 33 mΩ
- Selectable OVLO for V_{OUT} Path
- Programmable OVLO for V_{BAT}
- Over-Voltage Protection (OVP)
  - V_{OUT} Path: 13.9 V ± 400 mV (FPF34891)
  - V_{OUT} Path: 10.4 V ± 300 mV (FPF34892)
  - V_{OUT} Path: 5.8 V ± 200 mV (OVSEL = GND)
  - BAT Path: 5.8 V ± 200 mV
- Active LOW Control for V_{BUS} to V_{OUT} Path
- Active HIGH Control for V_{BUS} to BAT Path
- CMOS Output PowerGOOD for VBUS to BAT Path
- RCB for VBUS to BAT Path
- Over-Temperature Protection (OTP)

Description

The FPF3489x features a Single Input Dual Output (SIDO) power switch, which offers surge protection and Over-Voltage Protection (OVP), to protect downstream components and enhancing overall system robustness.

Channel one (V_{BUS} to V_{OUT}) is an active-low, 28 V/3.5 A rated, power MOSFET switch with an internal clamp supporting ±100 V surge protection, fixed OVP at 5.8V when OVSEL is tied to GND or 13.9V (FPF34891) / 10.4V (FPF34892) when OVSEL is floating.

Channel two (V_{BUS} to BAT) is an active-high, 5 V/6 A rated, power MOSFET, fixed OVP at VBUS is 5.8 V (±200 mV) and Reverse Current Blocking (RCB) during its OFF State. OVLO at BAT can be programmed by external resistors. The Over-Voltage status will be latched and FLAG will signal the fault by pulling low. To re-start this channel from OVLO, EN2 need to be toggled from LOW to HIGH.

The FPF3489x is available in a 28-bump, 1.67 mm x 2.96 mm Wafer-Level Chip-Scale Package (WL-CSP) with 0.4 mm pitch.

Applications

- Mobile Handsets and Tablets
- Wearable Devices

Pin Definitions

Name	Bump	Type	Description
VBUS	B3, C2, C3, C4, D2, D3, D4, E2, E3, E4, F2, F3, F4	Input/Supply	Power Switch Input and Device Supply
VOUT	B1, B2, C1	Output	Power Switch Output to Load
BAT	D1, E1, F1, G1	Output	Power Switch Output to Battery
OVBAT	A3	Input	Over-Voltage Lockout on BAT Adjustment Pin
EN2	B4	Input	Active HIGH. Channel 2, VBUS to BAT path only. Internal pull-down resistor of 1 MΩ is included.
EN1	A4	Input	Active LOW. Channel 1, VBUS to VOUT path only. Internal pull-down resistor of 1 MΩ is included.
OVSEL	A2	Input	OVSEL Floating, OVP 13.9 V (FPF34891) or 10.4 V (FPF34892); OVSEL = GND, OVP 5.8V.
FLAG	A1	Output	Active HIGH PowerGOOD output for VBUS to BAT path. CMOS output requiring no external bias. HIGH: VBUS to BAT path is ON and in normal state. LOW: VBUS to BAT path is OFF due to EN2=LOW, UVLO, OVLO, thermal shutdown or device shutdown
GND	G2, G3, G4	GND	Ground

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Symbol	Parameters		Min.	Max.	Unit
VBUS	VBUS to GND & VBUS to VOUT = GND or Float		-2[1]	28	V
VOUT	VOUT to GND		-0.3	V_{BUS}+0.3	V
BAT	BAT to GND		-0.3	6.0	V
OVBAT	OVBAT to GND			6	V

Operation and Application Description

Input Capacitor

To limit the voltage drop on the input supply caused by transient inrush current when the switches turns, a capacitor must be placed in between the VBUS and GND pins. A high-value capacitor on C_{IN} can be used to reduce the voltage drop in high-current applications.

Under-Voltage Lockout (UVLO)

The under-voltage lockout turns the switches off if the input voltage drops below the lockout threshold. With the enable pins, EN1 & EN2, active, the input voltage rising above the UVLO threshold releases the lockout and enables the switches.

Thermal Shutdown

The thermal shutdown protects the die from internally or externally generated excessive temperature. During an over-temperature condition, the switch is turned off. The switch automatically turns on again if the temperature of the die drops below the threshold temperature.

FLAG Reporting

To indicate the status of channel 2, push-pull output FLAG signal high (typical 1.8V) when channel 2 is turned on. FLAG will output low when channel 2 is turned off.

Over-Voltage Lockout

To protect the system, FPF3489x provide multi level over voltage protection.

For channel 1 (VBUS to VOUT), 3 different levels can be chosen. When OVSEL is tied to GND, OVP will be triggered once VBUS voltage is higher than typical 5.8V. With OVSEL floating, OVP will be triggered when VBUS voltage is higher than typical 13.9V (FPF34891) or 10.4V (FPF34892). FLAG voltage will output low until the over voltage condition disappears.

For channel 2 (VBUS to BAT), both VBUS and BAT voltage will be monitored. Once VBUS voltage is higher than typical 5.8V, channel 2 will be turned off and output low at FLAG pin until VBUS drop below 5.65V (typical). Once BAT voltage is higher than pre-set value (set by external resistors), channel 2 will be turned off and output low at FLAG pin. This status will be latched even after BAT voltage drop to lower than OVP value. To re-active the switch, EN2 need to be toggled.

The OVLO level on BAT can be pre-set by connecting external resistor ladder to the OVBAT pin. Equation (1) can produce the desired trip voltage and resistor values.

$$V_{BAT\_OVLO} = V_{OVLO\_TH} \times [1 + R1/R2] \quad (1)$$

Recommended minimum R1 = 1 MΩ to reduce leakage and screen unexpected glitch.
