Please note: As part of the Fairchild Semiconductor integration, some of the Fairchild orderable part numbers will need to change in order to meet ON Semiconductor's system requirements. Since the ON Semiconductor product management systems do not have the ability to manage part nomenclature that utilizes an underscore (\_), the underscore (\_) in the Fairchild part numbers will be changed to a dash (-). This document may contain device numbers with an underscore (\_). Please check the ON Semiconductor website to verify the updated device numbers. The most current and up-to-date ordering information can be found at <a href="www.onsemi.com">www.onsemi.com</a>. # FSB70250

# Motion SPM® 7 Series

#### **Features**

- UL Certified No. E209204 (UL1557)
- · High Performance PQFN Package
- 500 V R<sub>DS(on)</sub> = 3.4 Ω(Max) FRFET MOSFET 3-Phase Inverter with Gate Drivers and Protection
- Separate Open-Source Pins from Low-Side MOSFETs for Three-Phase Current-Sensing
- Active-HIGH Interface, Works with 3.3 / 5 V Logic, Schmitt-trigger Input
- · Optimized for Low Electromagnetic Interference
- HVIC Temperature-Sensing Built-In for Temperature Monitoring
- HVIC for Gate Driving with Under-Voltage Protection and Interlock Function
- Isolation Rating: 1500 V<sub>rms</sub> / min.
- Moisture Sensitive Level (MSL) 3
- · RoHS Compliant

# Application

 3-Phase Inverter Driver for Small Power AC Motor Drives

### **General Description**

The FSB70250 is an advanced Motion SPM® 7 module providing a fully-featured, high-performance inverter output stage for AC Induction, BLDC and PMSM motors. These modules integrate optimized gate drive of the built-in MOSFETs (FRFET® technology) to minimize EMI and losses, while also providing multiple on-module protection features including under-voltage lockouts, thermal monitoring, fault reporting and interlock function. The built-in one HVIC translates the incoming logic-level gate inputs to the high-voltage, high-current drive signals required to properly drive the module's internal MOSFETs. Separate open-souce MOSFET terminals are available for each phase to support the widest variety of control algorithms.

#### 2nd Notes

<sup>1.</sup> BV<sub>DSS</sub> is the absolute maximum voltage rating between drain and source terminal of each MOSFET inside Motion SPM<sup>®</sup> 7 product. V<sub>PN</sub> should be sufficiently less than this value considering the effect of the stray inductance so that V<sub>PN</sub> should not exceed BV<sub>DSS</sub> in any case.

<sup>2.</sup> toN and toFF include the propagation delay of the internal drive IC. Listed values are measured at the laboratory test condition, and they can be different according to the field applications due to the effect of different printed circuit boards and wirings. Please see Figure 3 for the switching time definition with the switching test circuit of Figure 4.

<sup>3.</sup>  $V_{TS}$  is only for sensing-temperature of module and cannot shutdown MOSFETs automatically.

<sup>4.</sup> The fault-out pulse width  $t_{FOD}$  depends on the capacitance value of  $C_{FOD}$  according to the following approximate equation :  $C_{FOD} = 24 \text{ x } 10^{-6} \text{ x } t_{FOD} [F]$ 

### **Recommended Operating Condition**

$R_{\theta JCB}$	Junction to Case Botton Thermal Resistance	Single MOSFET Operating Condition (3rd Notes 1)	-	1.2	-	°C/W

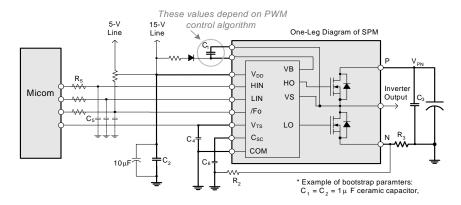

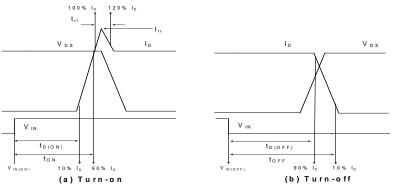

Figure 2. Recommended MCU Interface and Bootstrap Circuit with Parameters

#### 3rd Notes:

- 1.  $R_{\theta JCB}$  is simulation value with application board layout. (Please refer user's guide SPM7 series)
- 2. Parameters for bootsrap circuit elements are dependent on PWM algorithm. For 15 kHz of switching frequency, typical example of parameters is shown above.
- 3. RC coupling(R<sub>5</sub> and C<sub>5</sub>) at each input (indicated as dotted lines) may be used to prevent improper input signal due to surge noise. Signal input of SPM<sup>®</sup> is compatible with standard CMOS or LSTTL outptus.
- 4. Bold lines should be short and thick in PCB pattern to have small stray inductance of circuit, which results in the reduction of surge voltage.

#### 4th Notes:

- 1. RC-coupling ( $R_5$  and  $C_5$ ,  $R_2$  and  $C_6$ ) and  $C_1$ ,  $C_5$ ,  $C_7$ ,  $C_8$  at each input of Motion SPM $^{\odot}$ 7 product and MCU are useful to prevent improper input signal caused by surge-noise.
- 2. Ground-wires and output terminals, should be thick and short in order to avoid surge-voltage and malfunction of HVIC.
- 3. All the filter capacitors should be connected close to Motion SPM 7 product, and they should have good characteristics for rejecting high-frequency ripple current.
