

Is Now Part of

ON Semiconductor®

To learn more about ON Semiconductor, please visit our website at <u>www.onsemi.com</u>

Please note: As part of the Fairchild Semiconductor integration, some of the Fairchild orderable part numbers will need to change in order to meet ON Semiconductor's system requirements. Since the ON Semiconductor product management systems do not have the ability to manage part nomenclature that utilizes an underscore (_), the underscore (_) in the Fairchild part numbers will be changed to a dash (-). This document may contain device numbers with an underscore (_). Please check the ON Semiconductor website to verify the updated device numbers. The most current and up-to-date ordering information can be found at www.onsemi.com. Please email any questions regarding the system integration to Fairchild_questions@onsemi.com.

Features

- On Resistance: 5Ω Typical, V_{DDC}=2.7V
- f_{toggle}: >75MHz

SEMICONDUCTOR

- Low On Capacitance: 6pF Typical
- Low Power Consumption: 2µA Maximum
- Supports Secure Digital (SD), Secure Digital I/O (SDIO), and Multimedia Card (MMC) Specifications
- Supports 1-Bit / 4-Bit Host Controllers (V_{DDH1/H2}=1.65V to 3.6V) Communicating with High-Voltage (2.7-3.6V) and Dual-Voltage Cards (1.65-1.95V, 2.7-3.6V)
 - V_{DDC}=1.65 to 3.6V, V_{DDH1/H2}=1.65 to 3.6V
- 24-Lead MLP and UMLP Packages

Applications

- Cell Phone, PDA, Digital Camera, Portable GPS, and Notebook Computer
- LCD Monitor, TV, and Set-Top Box

Description

The FSSD07 is a 2:1 multiplexer that allows dual Secure Digital (SD), Secure Digital I/O (SDIO), and Multimedia Card (MMC) host controllers to share a common peripheral. The host controllers can be equal to, greater than, or less than peripheral card supply with minimal power consumption. This configuration enables dual host CMD, CLK, and D[3:0] signals to be multiplexed to a common peripheral.

The architecture includes the necessary bi-directional data and command transfer capability for single high-voltage cards or dual-voltage supply cards. The clock path is a uni-directional buffer.

Typical applications involve switching in portables and consumer applications: cell phones, digital cameras, home theater monitors, set-top boxes, and notebooks.

HIGH	LOW	1CMD, 1CLK, 1DAT[3:0] connected to CMD, CLK, DAT[3:0]
HIGH	HIGH	2CMD, 2CLK,2DAT[3:0] connected to CMD, CLK, DAT[3:0]
LOW	Х	CMD, DAT[3:0] ports high impedance; CLK is function of selected nCLK

Functional Description

The FSSD07 enables the multiplexing of dual ASIC / baseband processor hosts to a common peripheral card or module, providing bi-directional support of the dualvoltage SD/SDIO or MMC cards available in the marketplace. Each host SDIO port has its own supply rail, such that hosts with different supplies can be interfaced to a common peripheral module or card. The peripheral card supply must be equal to or greater than the host(s) to minimize power consumption. The independent V_{DDC} , V_{DDH1} , and V_{DDH2} are defined by the supplies connected from the application Power Management ICs (PMICs) to the FSSD07. The clock path is a uni-directional buffered path rather than a bidirectional switch port. The supplies (V_{DDC}, V_{DDH1}, and V_{DDH2}) have an internal termination resistor (typically $3M\Omega$) to ensure the supply rails internally do not float if the application turns off one or all of these sources.

CMD, DAT Bus Pull-ups

The CMD and DAT[3:0] ports do not have, internally, the system pull-up resistors as defined in the MMC or SD card system bus specifications. The system bus pull-up must be added external to the FSSD07. The value, within the specific specification limits, is a function of the individual application and type of card or peripheral connected. For SD card applications, the R_{CMD} and R_{DAT} pull-ups should be between 10k Ω and 100k Ω . For MMC applications, the R_{CMD} pull-ups should be between 4.7k Ω and 100k Ω , and the R_{DAT} pull-ups between 50k Ω and 100k Ω . The card-side CMD and DAT[3:0] outputs have a circuit that facilitates incident wave switching, so the external pull-up resistors ensure retention of the output high level.

The OE pin can be used to place the CMD and DAT[3:0] into high-impedance mode during power-up sequencing or when the system enters IDLE state (*see IDLE State CMD/DAT Bus "Parking"*).

CLK Bus

The 1CLK and 2CLK inputs are bi-state buffer architectures, rather than a switch I/O, to ensure 52MHz incident wave switching. Since most host controllers also have a clock enable register bit to enable or disable the system clock when in IDLE mode, the CLK output is not disabled by the OE pin. Instead, the CLK output is a function of whichever host controller clock is selected by the S pin.

Consequently, there is always a clock path connected between the selected host and the card. The state of the CLK pin is a function of the selected host controller nCLK output pin, which facilitates retaining clock duty cycle in the system or performing read / wait operations.

IDLE State & Power-Up CMD/DAT Bus "Parking"

The SD and MMC card specifications were written for a direct point-to-point communication between host controller and card. The introduction of the FSSD07 in that path, as an expander, requires that the functional operation and system latency not be impacted by the switch characteristics. Since there are various card formats, protocols, and configurable controllers, an OE pin is available to facilitate a fast IDLE transition for the CMD/DAT[3:0] outputs. Some controllers, rather than placing CMD/DAT into high-impedance mode, pull the outputs HIGH for a clock cycle prior to going into high-impedance mode (referred to as "parking" the output). Some legacy controllers pull their outputs HIGH versus high impedance.

If the OE pin is pulled HIGH and the controller places its command and data outputs into high-impedance (driving nCMD/nDAT[3:0]), the FSSD07 CMD/DAT[3:0] output rise time is a function of the RC time constant through the switch path. Pulling OE LOW puts the switches into high impedance, disabling communication from the host to card, and the CMD/DAT[3:0] outputs are pulled HIGH by the system pull-up resistors chosen for the application. This mechanism facilitates power-up sequencing by holding OE LOW until supplies are stable and communication between the host(s) and card is enabled.

Power Optimization

Since the FSSD07 has multiple supplies (V_{DDC} , V_{DDH1} , and V_{DDH2}), the control signals have been referenced to the card peripheral side (V_{DDC}). To minimize power consumption, current paths between supplies are isolated when one or more supplies are not present. This includes the configuration of the removal of V_{DDC} with host controller supplies remaining present.

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Symbol	Parameter	Conditions	Min.	Max.	Unit
V _{DDC}	Card Supply Voltage		-0.5	4.6	V
V _{DDH1} ,V _{DDH2}	Host Controller Supply Voltage		-0.5	4.6	V
M	Switch I/O Voltage ⁽¹⁾	1DAT[3:0], 2DAT[3:0], 1CMD, 2CMD Pins	-0.5	V _{DDx} ⁽²⁾ + 0.3V (4.6V maximum)	V
V _{SW}	Switch i/O Voltage	DAT[3:0], CMD Pins	-0.5	V _{DDx} ⁽²⁾ + 0.3V (4.6V maximum)	V
V _{CNTRL}	Control Input Voltage ⁽¹⁾	S, OE	-0.5	4.6	V

ESD		All Other Pins		5	
	Charged Device Model, JEDEC-JES		2		

Notes:

1. The input and output negative ratings may be exceeded if the input and output diode current ratings are observed.

2. V_{DDx} references the specific SDIO port V_{DD} rail (i.e. V_{DDH1}, V_{DDH2}, V_{DDC}).

Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to Absolute Maximum Ratings.
