1. Starting T_J = 25°C, V_{DS} = 20 V, I_{AS} = 64 A, L = 480 μH.
2. These values are based on Thermal simulations and PV level measurements.
   These values assume a single MOSFET is on, and the test condition for referenced temperature is "Chip Center".
   This means that the DT is measured between the T_J of each MOSFET and the temperature of the case located immediately under the center of the chip.

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

3. All MOSFETs have same die size and R$_{DS(ON)}$. The different R$_{DS(ON)}$ values listed in the datasheet are due to the different access points available inside the module for R$_{DS(ON)}$ measurement. While the high side MOSFETs (Q1, Q2, Q3) have source sense wire bonds, the low side MOSFETs (Q4, Q5, Q6) do not have source sense wire bonds, thus resulting in higher R$_{DS(ON)}$ values.
