

FUSB308B

USB Type-C Port Controller with USB-PD

Description

The FUSB308B targets system designers looking to implement up to four USB Type-C port controllers (TCPC) with USB-PD capabilities.

This solution provides integrated Type-C Rev 1.3 detection circuitry enabling manual attach/detach detection. Time critical Power Delivery functionality is handled autonomously, offloading the μ Processor or Type-C Port Manager (TCPM).

The FUSB308B complies with the USB-PD Interface Specification Rev 1.0 as a TCPC for a standardized interface with TCPM.

Features

- USB-PD Interface Specification Rev 1.0 Ver. 1.2 Compatible
- USB Type-C Rev 1.3 Compatible
- USB-PD Rev3.0 Ver. 1.2 Compatible
- Sink Transmit
- Extended Data Messages (Chunked)
- Dual-Role Functionality
 - ◆ Manual Type-C Detection
 - ◆ Automatic DRP Toggling
- USB-PD Interface Specification Support
 - ◆ Automatic GoodCRC Packet Response
 - ◆ Automatic Retries of Sending Packet
 - ◆ All SOP* Types Supported
- 2 VBUS Sources Control
- Integrated 3 W Capable VCONN to CCx Switch
- 10-bit VBUS ADC
- Programmable GPIOs
- 4 Selectable I²C Addresses
- Packaging: 16 Pin QFN

Applications

- Desktops
- Wall Adapters
- Automotive

Table 2. PIN DESCRIPTION

Name	Type	Description
USB TYPE-C CONNECTOR INTERFACE		
CC1	I/O	Type-C connector Configuration Channel (CC) pins. Initially used to determine when an attach has occurred and what the orientation of the insertion is. Functionality after attach depends on mode of operation detected. Operating as a host: – Sets the allowable charging current for VBUS to be sensed by the attached device
CC2	I/O	– Used to communicate with devices using USB BMC Power Delivery – Used to detect when a detach has occurred Operating as a device: – Indicates what the allowable sink current is from the attached host – Used to communicate with devices using USB BMC Power Delivery
GND	Ground	Ground
VBUS	Power	VBUS supply pin for attach and detach detection when operating as an upstream facing port (Device)
POWER INTERFACE		
VDD	Power	Input supply voltage
GPIO2	3-State CMOS I/O	General Purpose I/O
VCONN	Power Switch	Regulated input to be switched to correct CC pin as VCONN to power USB3.1 fully featured cables, powered accessories or dongles bridging Type C to other video or audio connectors
SIGNAL INTERFACE		
SCL1/SDA2 (Note 1)	Open-Drain I/O	I ² C serial clock/data signal to be connected to the I ² C master
SDA1/SCL2 (Note 1)	Open-Drain I/O	I ² C serial clock/data signal to be connected to the I ² C master
INT_N	Open-Drain Output	Active LOW open drain interrupt output used to prompt the processor to read the I ² C register bits
ORIENT/I2C_ADDR (Note 1)	3-State CMOS Output	Selects I ² C Address on Power up and then becomes a General Purpose CMOS Output
MUX_SEL0	3-State CMOS Output	MUX Selection Output 0
MUX_SEL1	3-State CMOS I/O	MUX Selection Output 1
GPIO1	3-State CMOS I/O	General Purpose I/O
VBUS SOURCE INTERFACE		
SRC_HV	CMOS Output	Controls High Voltage Source Path Load Switch (Active High)
SRC	CMOS Output	Controls external VBUS Source Load Switch on/off. (Active High)

1. A different I2C address is used depending on which SDA and SCL are used and the state of ORIENT/I2C_ADDR at power up.

Power Up, Initialization and Reset

When power is first applied to VDD or VBUS, the FUSB308B goes through its POR sequence to load up all the default values in the register map, read all the fuses so that the trimmed values are available when VDD or VBUS is in its valid range. A software reset can be executed by writing SW_RES to 1 in RESET Register.

This executes a full reset of the FUSB308B similar to POR where all the I2C registers go to their default state.

When powered down, the FUSB308B will present an Open on both CC lines.

The FUSB308B will present Rp, ROLECTRL= 0x05 when VDD is present

Programmable GPIOx

The FUSB308B has two programmable GPIOs. These can be programmed to be Inputs, CMOS Outputs or Open Drain Outputs. To configure them, the TCPM writes to GPIO1_CFG and GPIO2_CFG. If the GPIO is configured as an input, its logic value can be read in GPIO_STAT and ALERT_VD registers.

FUSB308B

Standard Outputs

The FUSB308B implements the Orientation and DP Mux Selection Standard Outputs as indicated in STD_OUT_CAP register.

To configure the Orientation, and Mux selection, the TPCM writes to STD_OUT_CFG.

I²C Interface

The FUSB308B includes a full I²C slave controller. The I²C slave fully complies with the I²C specification version 6 requirements. This block is designed for fast mode plus signals.

Examples of an I²C write and read sequence are shown in Figure 4 and Figure 5 respectively.

Figure 4. I2C Write Example

NOTE: If Register is not specified Master will begin read from current register. In this case only sequence showing in Red bracket is needed.

From Master to Slave	S Start Condition	NA NOT Acknowledge (SDA High)	RD Read =1
From Slave to Master	A Acknowledge (SDA Low)	WR Write = 0	P Stop Condition

Figure 5. I2C Read Example

I²C Address Selection

I²C Slave addresses can be changed by configuring the I2C_ADDR_GPO input on power up with a pull-up or pull-down resistor and routing the SCL and SDA lines according to Table 3.

Interrupt Operation

The INT_N pin is an active low, open drain output which indicates to the host processor that an interrupt has occurred in the FUSB308B which needs attention. The INT_N pin is asserted after power-up or device reset RESET.SW_RES

set to 1b (due to ALERTLI_PORT_PWR and PWRSTAT.TCPC_INIT).

When an interruptible event occurs, INT_N is driven low and is high-Z again when the processor clears the interrupt by writing a 1 to the corresponding interrupt bit position. Writing a 0 to an interrupt bit has no effect.

A processor firmware has additional control of INT_N through individual event mask bits which can be set or cleared to enable or disable INT_N from being driven low when each event occurs.

Table 3. I²C ADDRESSES

I2C_ADDR	SCLx/SDAx	Slave Address							
		Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

1	SCL2/SDA2	1	0	1	0	0	1	1	R/W

I²C Idle Mode

Entering I²C Idle Mode

The FUSB308B does not need to enter I²C Idle Mode in order to save power. Entering this mode has no effect on I²C function. The FUSB308B can enter idle mode if 0xFF is written to the COMMAND register. Once in Idle mode, the FUSB308B will not set the PWRSTAT.TCPC_INIT to one.

Exiting I²C Idle Mode

The FUSB308B will exit I²C Idle mode when any I²C communication is addressed to the slave. The ALERTL.I_PRT_PWR interrupt will be set and no PWRSTAT bits will be set.

The device's I²C block is always on without power penalties.

VCONN Control

The FUSB308B integrates a CCx to VCONN switch with programmable OCP capability via the VCONN_OCP register. If PWRCTRL.VCONN_PWR is set to 0, the standard VCONN current limit is used (210.5 mA). If PWRCTRL.VCONN_PWR is set to 1, the programmable VCONN_OCP is used.

The VCONN switch can be enabled via the PWRCTRL register bits EN_VCONN and TCPC_CTRL.ORIENT bits (for CC1/2 selection).

A VCONN valid voltage is monitored and reported on PWRSTAT.VCONN_VAL. The valid voltage threshold is fixed at 2.4 V.

Type-C Manual Mode Detection

The CC pull up (Rp) or pull down (Rd) resistors and DRP toggle are setup via the ROLECTRL register. If a TCPM wishes to control Rp/Rd directly, it can write ROLECTRL.DRP = 0b and the desired ROLECTRL bits [3:0] (CC1/CC2).

The FUSB308B can autonomously toggle the Rp/Rd by setting ROLECTRL.DRP = 1b and the starting value of Rp/Rd in ROLECTRL.bits [3:0]. DRP toggling starts by writing to the COMMAND register

If ROLECTRL.DRP = 1b, the only allowed values for CC1/CC2 in ROLECTRL bits [3:0] are Rp/Rp or Rd/Rd.

When ROLECTRL bits 3:0 are set to Open and ROLECTRL.DRP = 0b, the PHY and CC comparators are powered down.

The FUSB308B updates the CCSTAT register on a Connect, Disconnect, a change in ROLECTRL.DRP or a change (tTCPCFilter debounced) on the CC1 or CC2 wire.

The TCPM reads CCSTAT upon detecting an interrupt and seeing the ALERTL.I_CCSTAT = 1. The FUSB308B indicates the DRP status, the DRP result, and the current CC status in this register.

The FUSB308B will set CCSTAT.LOOK4CON = 0b when it has stopped toggling as a DRP.

The TCPM reads the CCSTAT.LOOK4CON to determine if the FUSB308B is toggling Rp/Rd when operating as a DRP, it then reads CCSTAT.CON_RES to determine if the FUSB308B is presenting an Rp or Rd and read the CCSTAT.CC1_STAT and CCSTAT.CC2_STAT to determine the CC1 and CC2 states.

The FUSB308B debounces the CC lines for tTCPCfilter before reporting the status on CCSTAT. The TCPM must complete the debounce as defined in Type-C Specification.

BMC Power Delivery

The Type-C connector allows USB Power Delivery (PD) to be communicated over the connected CC pin between two ports. The communication method is the BMC Power Delivery protocol and is used for many different reasons with the Type-C connector. Possible uses are outlined below.

- Negotiating and controlling charging power levels
- Alternative Interfaces such as MHL, Display Port
- Vendor specific interfaces for use with custom docks or accessories
- Role swap for dual-role ports that want to switch who is the host or device
- Communication with USB3.1 full featured cables

The FUSB308B integrates a thin BMC PD client which includes the BMC physical layer and packet buffers which allows packets to be sent and received by the host software through I²C accesses.

Receive State Machine

The TCPM can setup the desired types of messages to be received by the FUSB308B via the RXDETECT register. This register defaults to 0x00 (Receiver disabled) upon power up, reset, Hard Reset transmission and reception, and upon detecting a cable disconnect. A message is not received unless it is first enabled. Figure 6 shows the FUSB308B receive state machine.

Upon a successfully transmitting GoodCRC, the RXSTAT register is updated with the type of message received and the TCPM is alerted via ALERTL.I_RXSTAT bit (see transition from PRL_Rx_Send_GoodCRC to PRL_Rx_Report_SOP* in Figure 6). The total number of bytes in the receive buffer RXDATA is stored in RXBYTECNT This number includes the header bytes that are stored in RXHEADL and RXHEADH and the RXSTAT register.

The RXBYTECNT, RXSTAT registers and the internal receive buffer will be cleared after the ALERTL.I_RXSTAT bit is cleared.

The FUSB308B will automatically transmit a GoodCRC message for valid enabled messages within tTransmit.

A received message is valid when:

FUSB308B

- It is not a GoodCRC message
- The calculated CRC is correct
- The SOP* type is enabled

The makeup of the GoodCRC message is formed by the received SOP* type and the contents of MSGHEADR register.

When an expected GoodCRC message or a Hard Reset signaling is received, they will not be replied with a

GoodCRC message (see Note 2 in Figure 6). If a GoodCRC message received was not expected due to the SOP* type or mismatched Message ID, the receive state machine will not send a GoodCRC message and will transition to PRL_Rx_Report SOP* to inform the TCPM.

If a Hard Reset message is received, the FUSB308B will reset the RXDETECT preventing the reception of future messages until the TCPM re-enables it.

2. This indication is sent by the PHY when a message has been discarded due to CC being busy, and after CC becomes idle again (see USB PD Spec).
3. Messages do not include Hard Reset or Cable Reset signals or expected GoodCRC messages (GoodCRC messages are only expected after the FUSB308B PHY has received the tx message and the FUSB308B Tx state-machine is in the PRL_Tx_Wait_for_PHY_response state).

Figure 6. Receive State Machine

Transmit State Machine

To transmit a message, the TCPM must first write the entire message in the following registers: TXHEADL, TXHEADH, TXBYTECNT and the TXDATA.

The actual transmission starts when the TCPM writes the TRANSMIT register.

The TRANSMIT register is where the message selection is done and it must be written once per transmission.

The TRANSMIT and TXBYTECNT will be reset after executing a successful or failed transmission.

If the TRANSMIT.RETRY_CNT is set to a number greater than 0, the FUSB308B will automatically retry sending the same message if a GoodCRC is not received

within tCRCReceiveTimer. An automatic retry is not performed when sending Hard-Resets, Cable-Resets, or BIST Carrier Mode 2 signaling.

The TCPM must not write the TRANSMIT register again until ALERTL.I_TXSUCC, I_TXFAIL, I_TX_DISC have been asserted and cleared.

The TCPM will not write the TRANSMIT register to request a transmission other than a Hard reset until it has cleared all received message alerts. If a TRANSMIT is written when ALERTL.I_RXSTAT = 1 or ALERTL.I_RXHRDRST = 1, the transmit request is discarded and ALERTL.I_TX_DISC is asserted.

FUSB308B

Hard Reset/ Cable Reset State Machine

The TCPM will write the TRANSMIT register to initiate the Hard Reset/Cable Reset state machine, see Figure 8. If the FUSB308B is in the middle of a transmission when instructed to send a Hard or Cable reset, it will set the ALERTL.I_TXDISC bit and send the hard reset signaling as soon as possible. The FUSB308B implements the HardResetCompleteTimer. A Hard Reset or Cable Reset

will be attempted until the HardResetCompleteTimer times out. After a successful transmission or timeout, the FUSB308B will indicate that a Hard Reset or Cable Reset has been sent by asserting both ALERTL.I_TXSUCC and ALERTL.I_TXFAIL registers simultaneously. The bits in RXDETECT and RXBYTECNT will be reset to disable PD message passing after a Hard Reset is received or transmitted.

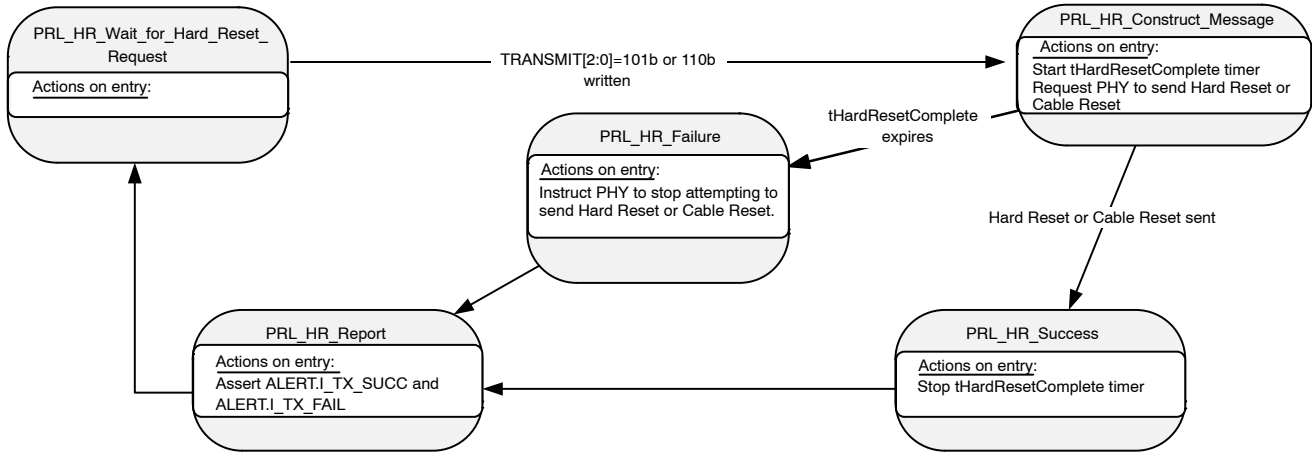

Figure 8. Hard Reset and Cable Reset State Machine

Automatic GoodCRC Response

Power Delivery packets require a GoodCRC acknowledge packet to be sent for each received packet where the calculated CRC is the correct value. This calculation is done by the FUSB308B.

The FUSB308B will automatically send the GoodCRC control packet in response to alleviate the local processor from responding quickly to the received packet. Once the GoodCRC packet is sent the FUSB308B will trigger the ALERTL.I_RXSTAT interrupt.

The following sequence of events occur internally within the FUSB308B without processor intervention when it is determined that the receive message has the correct CRC. If the host processor attempts a packet transmission during an Automatic GoodCRC response, the FUSB308B will set the ALERTL.I_TXDISC bit interrupting the processor. The processor should only transmit a new packet once ALERTL.I_TXSUCC or ALERTL.I_TX_FAIL has been received.

It is assumed that the processor will set the PWRCTRL.ORIENT to specify which channel USB-PD traffic will be transmitted or received.

BIST Mode

Bist Transmit

The FUSB308B will transmit Bist Carrier Mode 2 signaling when directed by the TCPM via TRANSMIT

register. The FUSB308B will exit Bist Mode after tBISTContMode timer expires.

Bist Receive

When the FUSB308B is in Bist receive mode via TCPC_CTRL register, it will acknowledge these packets with a GoodCRC and automatically flush the buffer to allow for thousands of packets to be received without filling the receive buffer. Bist Receive mode will exit on a cable disconnect or a Hard Reset received.

VBUS Source Control

The FUSB308B has two source path controls (SRC and SRC_HV). The secondary Source path control will be used to provide higher voltages on VBUS after a PD contract has been established. The primary source path is used for sourcing vsafe5V only.

The TCPM will initiate the transition from SRC to SRC_HV by writing 1000_1000b to the COMMAND register. The FUSB308B will enable SRC_HV and then disable the SRC I/O.

When transitioning from a high voltage source to vsafe5V, the TCPM will write 0111_0111b to the COMMAND register.

FUSB308B

Voltage Transitions

The FUSB308B has two source control ports: SRC and SRC_HV. There are two ways to transition between SRC and SRC_HV as seen in Figure 9 through Figure 12.

NOTE: Transitioning from HV on SRC to vSafe5v also on SRC can be done by using Voltage Alarm Low.
Power supply is responsible for transitioning voltages to meet USB PD spec- no discharge necessary.

Figure 12. Transition to High Voltage using SRC Controlled Path VBUS

VBUS Monitoring and Measurement

The FUSB308B can monitor the presence of VBUS and will report it on PWRSTAT.VBUS_VAL and interrupt ALERT.I_PORT_PWR.

VBUS_VAL is set according to VBUS thresholds in $vVBUS_{thr}$.

The FUSB308B also supports a more precise voltage measurement via an on-board ADC. The voltage on VBUS is measured at a rate of $tVBUS_{sample}$ and it is reported on VBUS_VOLTAGE_L/H register. The precision of the measurement is $\pm 2\%$ with a resolution of 25 mV LSB.

In addition to providing the μ Processor an accurate measurement of VBUS, the measurement in VBUS_VOLTAGE will be used when monitoring various user defined thresholds:

- Voltage alarms in registers VALARMLCFG and VALARMHCFG
- VBUS Disconnect Threshold in registers VBUS_SNK_DISC and VBUS_SNK_DISC
- VBUS Stop Discharge Threshold in registers VBUS_STOP_DISC and VBUS_STOP_DISC

The FUSB308B implements Low and High VBUS Voltage Alarms that can be programmable via VALARMLCFG and VALARMHCFG respectively. If the High or the Low thresholds are crossed, the FUSB308B will signal an interrupt on ALERT.I_VBUS_ALARM_HI or ALERT.I_VBUS_ALARM_LO respectively. These alarms can be disabled by writing PWRCTRL.DIS_VALARM to one.

ALERT.I_PORT_PWR is asserted if the bit-wise AND of PWRSTAT and PWRSTAMSK results in any bits that have the value 1.

VBUS Discharge

Manual Discharge

There are two types of manual discharge circuits implemented: A bleed discharge for low current and a force discharge. The bleed discharge can be manually enabled by writing a one to register bit PWRCTRL.EN_BLEED_DISCH. When enabled, the bleed discharge provides a low current load on VBUS of 7 KW (max.) via R_BLEED. The force discharge is used to quickly discharge VBUS to v_{Safe0V} by applying a dynamic load to VBUS via R_FULL_DISCH. The force discharge can be manually enabled by writing a one to register bit PWRCTRL.FORCE_DISCH. When R_FULL_DISCH is applied, the maximum slew rate allowed for discharging VBUS does not exceed $v_{SrcSlewNeg}$ 30 mV/ μ s as it is specified in the USB-PD spec.

Automatic discharge bit PWRCTRL.AUTO_DISCH must be disabled before enabling force discharge.

Automatic Source Discharge after a Disconnect

Automatic discharge can be enabled by setting PWRCTRL.AUTO_DISCH register bit. When in Source mode the FUSB308B will fully discharge VBUS to v_{Safe5V} (max.) within t_{Safe5V} and to v_{Safe0V} within t_{Safe0V} when a Disconnect occurs. The FUSB308B is in Source mode when the SRC output is asserted.

The FUSB308B in Source mode will detect a Disconnect if the CCSTAT.CCx_STAT field for the monitored CC pin indicates SRC.Open and enable the FULL Discharge pull-down device. The monitored CC pin is specified by TCPC_CTRL.ORIENT.

Figure 13. VBUS Auto Discharge as Source

FUSB308B

Discharge during a Connection

The discharge functions can be manually activated via the PWRCTRL.FORCE_DISCH register. The discharge

pull-down is specified by R_{FULL_DISCH} . The FUSB308B will automatically disable discharge when VBUS reaches VBUS_STOP_DISC threshold.

Figure 14. Source Discharge During a Connection

Watchdog Timer

The watchdog timer functionality is enabled whenever TCPC_CTRL.EN_WATCHDOG is set to 1b. The watchdog timer should only be enabled after an attach when the device is in Attached.Src, Attached.Snk or Apply.ROLECONTROL states. The watchdog timer starts when any of the interrupts that are not masked in the Alert register are set or when the INTB pin is asserted. The watchdog timer is cleared on an I2C access by the TCPM

(either read or write). If the INTB pin is still asserted after this I2C access, the watchdog timer will reinitialize and start monitoring again until all of the Alerts are cleared or until the INTB pin is de-asserted.

When the watchdog timer expires, the FUSB308B will immediately disconnect the CC terminations by setting ROLE_CONTROL bits 3..0 to 1111b, disable all SRC/SRC_HV or SNK outputs, discharge VBUS to vSafe0V, and set FAULT_STATUS.I2CInterfaceError.

18. Reset values are loaded on either VBUS or VDD power up.

19. Rp value is defined in B5..4 when performing the DRP toggling as well as when a connection is resolved.

20. The FUSB308B toggles CC1 & CC2 after receiving a.LOOK4CON and until a connection is detected. Upon connection, the FUSB308B resolves to either an Rp or Rd and report the CC1/CC2 State in the CCSTAT register. The FUSB308B will continue to present the resolved Rd or Rp regardless of any changes voltage on the CC wires.

21. When CCx_TERM bits are set to Open and DRP = 0, the PHY and CC comparators will power down.

22. If DRP = 1, .LOOK4CON starts toggling with the value set in CC1_TERM/CC2_TERM. If CC1_TERM/CC2_TERM is different than Rp/Rp or Rd/Rd, the COMMAND will be ignored.

24. Setting this bit in a Source FUSB308B triggers the following actions upon disconnection detection:

1. Disable sourcing power over Vbus
2. VBUS discharge

25. Sourcing power over Vbus shall be disabled before or at same time as starting VBUS discharge.

26. Setting this bit in a Sink FUSB308B triggers the following action upon disconnection detection:

1. VBUS discharge

27. The FUSB308B will automatically disable discharge once the voltage on VBUS is below vSafe0V (max.).

28. Bleed Discharge is a low current discharge to provide a minimum load current if needed.
