## Dual Supply, 2-Bit Voltage Translator / Isolator for I²C Applications <br> FXMAR2102

## Description

The FXMAR2102 is a high-performance configurable dual-voltage-supply translator for bi-directional voltage translation over a wide range of input and output voltages levels. The FXMAR2102 also works in a push- pull environment.

It is intended for use as a voltage translator between $\mathrm{I}^{2} \mathrm{C}$-Bus compliant masters and slaves. Internal $10 \mathrm{k} \Omega$ pull-up resistors are provided.

The device is designed so the A port tracks the $\mathrm{V}_{\mathrm{CCA}}$ level and the B port tracks the $\mathrm{V}_{\mathrm{CCB}}$ level. This allows for bi-directional $\mathrm{A} / \mathrm{B}$-port voltage translation between any two levels from 1.65 V to 5.5 V . $\mathrm{V}_{\mathrm{CCA}}$ can equal $\mathrm{V}_{\mathrm{CCB}}$ from 1.65 V to 5.5 V . Either $\mathrm{V}_{\mathrm{CC}}$ can be powered-up first. Internal power-down control circuits place the device in 3 -state if either $\mathrm{V}_{\mathrm{CC}}$ is removed.

The two ports of the device have automatic direction-sense capability. Either port may sense an input signal and transfer it as an output signal to the other port.

## Features

- Bi-Directional Interface between Any Two Levels: 1.65 V to 5.5 V
- No Direction Control Needed
- Internal $10 \mathrm{k} \Omega$ Pull-Up Resistors
- System GPIO Resources Not Required when OE Tied to VCCA
- $\mathrm{I}^{2} \mathrm{C}$ Bus Isolation
- $\mathrm{A} / \mathrm{B}$ Port $\mathrm{V}_{\mathrm{OL}}=175 \mathrm{mV}$ (Typical), $\mathrm{V}_{\mathrm{IL}}=150 \mathrm{mV}, \mathrm{I}_{\mathrm{OL}}=6 \mathrm{~mA}$
- Open-Drain Inputs / Outputs
- Works in Push Pull Environment
- Accommodates Standard-Mode and Fast-Mode I ${ }^{2} \mathrm{C}$-Bus Devices
- Supports $I^{2} \mathrm{C}$ Clock Stretching \& Multi-Master
- Fully Configurable: Inputs and Outputs Track $\mathrm{V}_{\mathrm{CC}}$
- Non-Preferential Power-Up; Either $\mathrm{V}_{\mathrm{CC}}$ Can Power-Up First
- Outputs Switch to 3-State if Either $\mathrm{V}_{\mathrm{CC}}$ is at GND
- Tolerant Output Enable: 5 V
- Packaged in 8-Terminal Leadless MicroPak ${ }^{\text {TM }}$ ( $1.6 \mathrm{~mm} \times 1.6 \mathrm{~mm}$ ) and Ultrathin MLP ( $1.2 \mathrm{~mm} \times 1.4 \mathrm{~mm}$ )
- ESD Protection Exceeds:
- B Port: 8 kV HBM ESD (vs. GND \& vs. $\mathrm{V}_{\mathrm{CCB}}$ )
- All Pins: 4 kV HBM ESD (per JESD22-A114)
- 2 kV CDM (per JESD22-C101)

|  |  | Charged Device Mode, JESD22-C101 | - | 2 |  |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.
2. $I_{0}$ absolute maximum rating must be observed.

RECOMMENDED OPERATING CONDITIONS

| Symbol | Parameter |  | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {CCA }}, \mathrm{V}_{\text {CCB }}$ | Power Supply Operating |  | 1.65 | 5.50 | V |
| $\mathrm{V}_{\mathrm{IN}}$ | Input Voltage (Note 3) | A-Port | 0 | 5.5 | V |
|  |  | B-Port | 0 | 5.5 |  |
|  |  | Control Input (OE) | 0 | $\mathrm{V}_{\text {CCA }}$ |  |
| $\Theta_{\mathrm{JA}}$ | Thermal Resistance | 8-Lead MicroPak | - | 279 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
|  |  | 8-Lead Ultrathin MLP | - | 302 |  |
| $\mathrm{T}_{\mathrm{A}}$ | Free Air Operating Temperature |  | -40 | +85 | ${ }^{\circ} \mathrm{C}$ |

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.
3. All unused inputs and $\mathrm{I} / \mathrm{O}$ pins must be held at $\mathrm{V}_{\mathrm{CCI}}$ or GND . $\mathrm{V}_{\mathrm{CCI}}$ is the $\mathrm{V}_{\mathrm{CC}}$ associated with the input side.

## FUNCTIONAL DESCRIPTION

## Power-Up / Power-Down Sequencing

FXM translators offer an advantage in that either $\mathrm{V}_{\mathrm{CC}}$ may be powered up first. This benefit derives from the chip design. When either $\mathrm{V}_{\mathrm{CC}}$ is at 0 V , outputs are in a high-impedance state. The control input (OE) is designed to track the $\mathrm{V}_{\mathrm{CCA}}$ supply. A pull-down resistor tying OE to GND should be used to ensure that bus contention, excessive currents, or oscillations do not occur during power-up/-down. The size of the pull-down resistor is based upon the current-sinking capability of the device driving the OE pin.

The recommended power-up sequence is:

1. Apply power to the first $\mathrm{V}_{\mathrm{CC}}$.
2. Apply power to the second $\mathrm{V}_{\mathrm{CC}}$.
3. Drive the OE input HIGH to enable the device.

The recommended power-down sequence is:

1. Drive OE input LOW to disable the device.
2. Remove power from either $\mathrm{V}_{\mathrm{CC}}$.
3. Remove power from the other $\mathrm{V}_{\mathrm{CC}}$.

NOTE:
4. Alternatively, the OE pin can be hardwired to $\mathrm{V}_{\mathrm{CCA}}$ to save GPIO pins. If OE is hardwired to $\mathrm{V}_{\mathrm{CCA}}$, either $\mathrm{V}_{\mathrm{CC}}$ can be powered up or down first.

## APPLICATION CIRCUIT

Figure 4. Application Circuit

## APPLICATION NOTES

The FXMAR2102 has open-drain I/Os and includes a total of four $10 \mathrm{k} \Omega$ internal pull-up resistors $\left(\mathrm{R}_{\mathrm{PU}}\right)$ on each of the four data I/O pins, as shown in Figure 4. If a pair of data $I / O$ pins $\left(A_{n} / B_{n}\right)$ is not used, both pins should disconnected, eliminating unwanted current flow through the internal RPUs. External RPUs can be added to the I/Os to reduce the total RPU value, depending on the total bus capacitance. The designer is free to lower the total pull-up resistor value to meet the maximum $\mathrm{I}^{2} \mathrm{C}$ edge rate per the $\mathrm{I}^{2} \mathrm{C}$ specification (UM10204 rev. 03, June 19, 2007). For example, according to the $\mathrm{I}^{2} \mathrm{C}$ specification, the maximum edge rate ( $30 \%-70 \%$ ) during Fast Mode ( $400 \mathrm{kbit} / \mathrm{s}$ ) is 300 ns . If the bus capacitance is approaching the maximum 400 pF , a lower total $\mathrm{R}_{\mathrm{PU}}$ value helps keep the rise time below 300 ns (Fast Mode). Likewise, the $\mathrm{I}^{2} \mathrm{C}$ specification also specifies a minimum Serial Clock Line High Time of 600 ns during Fast Mode ( 400 kHz ). Lowering the total RPU also helps increase the SCL High Time. If the bus capacitance approaches 400 pF , it may make sense to use the FXMA2102, which does not contain internal RPUs. Then calculate the ideal external $\mathrm{R}_{\mathrm{PU}}$ value.

## NOTE:

5. Section 7.1 of the $\mathrm{I}^{2} \mathrm{C}$ specification provides an excellent guideline for pull-up resistor sizing.

## Theory of Operation

The FXMAR2102 is designed for high-performance level shifting and buffer / repeating in an $\mathrm{I}^{2} \mathrm{C}$ application. Figure 1 shows that each bi-directional channel contains two series-Npassgates and two dynamic drivers. This hybrid architecture is highly beneficial in an $\mathrm{I}^{2} \mathrm{C}$ application where auto-direction is a necessity.

For example, during the following three $\mathrm{I}^{2} \mathrm{C}$ protocol events:

- Clock Stretching
- Slave's ACK Bit (9th bit $=0)$ following a Master's Write Bit ( $8^{\text {th }}$ bit $=0$ )
- Clock Synchronization and Multi-Master Arbitration

The bus direction needs to change from master-to-slave to slave-to-master without the occurrence of an edge. If there is an $\mathrm{I}^{2} \mathrm{C}$ translator between the master and slave in these examples, the $\mathrm{I}^{2} \mathrm{C}$ translator must change direction when both A and B ports are LOW. The Npassgates can accomplish this task very efficiently because, when both A and B ports are LOW, the Npassgates act as a low-resistive short between the A and B ports.

Due to $\mathrm{I}^{2} \mathrm{C}$ 's open-drain topology, $\mathrm{I}^{2} \mathrm{C}$ masters and slaves are not push/pull drivers. Logic LOWs are "pulled down" (Isink), while logic HIGHs are "let go" (3-state). For example, when the master lets go of SCL (SCL always comes from the master), the rise time of SCL is largely determined by the RC time constant, where $\mathrm{R}=\mathrm{RPU}$ and $\mathrm{C}=$ the bus capacitance. If the FXMAR2102 is attached to the master [on the A port] and there is a slave on the B port,
the Npassgates act as a low-resistive short between both ports until either of the port's $\mathrm{V}_{\mathrm{CC}} / 2$ thresholds are reached. After the RC time constant has reached the $\mathrm{V}_{\mathrm{CC}} / 2$ threshold of either port, the port's edge detector triggers both dynamic drivers to drive their respective ports in the LOW-to-HIGH (LH) direction, accelerating the rising edge. The resulting rise time resembles the scope shot in Figure 5. Effectively, two distinct slew rates appear in rise time. The first slew rate (slower) is the RC time constant of the bus. The second slew rate (much faster) is the dynamic driver accelerating the edge.

If both the A and B ports of the translator are HIGH , a high-impedance path exists between the A and B ports because both the Npassgates are turned off. If a master or slave device decides to pull SCL or SDA LOW, that device's driver pulls down ( $\mathrm{I}_{\text {sink }}$ ) SCL or SDA until the edge reaches the A or B port $\mathrm{V}_{\mathrm{CC}} / 2$ threshold. When either the A or B port threshold is reached, the port's edge detector triggers both dynamic drivers to drive their respective ports in the HIGH-to-LOW (HL) direction, accelerating the falling edge.

Figure 5. Waveform C: $\mathbf{6 0 0} \mathrm{pF}$, Total $\mathrm{R}_{\mathrm{PU}}: \mathbf{2 . 2} \mathbf{~ k} \Omega$

## $\mathrm{V}_{\mathrm{OL}}$ vs. $\mathrm{I}_{\mathrm{L}}$

The $\mathrm{I}^{2} \mathrm{C}$ specification mandates a maximum $\mathrm{V}_{\mathrm{IL}}$ ( $\mathrm{I}_{\mathrm{OL}}$ of 3 mA ) of $\mathrm{V}_{\mathrm{CC}} \cdot 0.3$ and a maximum $\mathrm{V}_{\mathrm{OL}}$ of 0.4 V . If there is a master on the A port of an $\mathrm{I}^{2} \mathrm{C}$ translator with a $\mathrm{V}_{\mathrm{CC}}$ of 1.65 V and a slave on the $\mathrm{I}^{2} \mathrm{C}$ translator B port with a $\mathrm{V}_{\mathrm{CC}}$ of 3.3 V , the maximum $\mathrm{V}_{\mathrm{IL}}$ of the master is $(1.65 \mathrm{~V} \mathrm{x} 0.3)$ 495 mV . The slave could legally transmit a valid logic LOW of 0.4 V to the master.

If the $\mathrm{I}^{2} \mathrm{C}$ translator's channel resistance is too high, the voltage drop across the translator could present a $\mathrm{V}_{\mathrm{IL}}$ to the master greater than 495 mV . To complicate matters, the $\mathrm{I}^{2} \mathrm{C}$ specification states that 6 mA of $\mathrm{I}_{\mathrm{OL}}$ is recommended for bus
capacitances approaching 400 pF . More $\mathrm{I}_{\mathrm{OL}}$ increases the voltage drop across the $\mathrm{I}^{2} \mathrm{C}$ translator. The $\mathrm{I}^{2} \mathrm{C}$ application benefits when $\mathrm{I}^{2} \mathrm{C}$ translators exhibit low $\mathrm{V}_{\mathrm{OL}}$ performance.

Figure 6 depicts typical FXMAR2102 Vol performance vs. the competition, given a $0.4 \mathrm{~V}_{\mathrm{IL}}$.

Figure 6. Device Comparison

## $\mathbf{I}^{2} \mathbf{C}$-Bus Isolation

The FXMAR2102 supports $I^{2} \mathrm{C}$-Bus isolation for the following conditions:

- Bus isolation if bus clear
- Bus isolation if either $\mathrm{V}_{\mathrm{CC}}$ goes to ground

## Bus Clear

Because the $\mathrm{I}^{2} \mathrm{C}$ specification defines the minimum SCL frequency of DC, the SCL signal can be held LOW forever; however, this condition shuts down the $\mathrm{I}^{2} \mathrm{C}$ bus. The $\mathrm{I}^{2} \mathrm{C}$ specification refers to this condition as "Bus Clear". In Figure 7; if slave \#2 holds down SCL forever, the master and slave \#1 are not able to communicate because the FXMAR2102 passes the SCL stuck-LOW condition from
slave \#2 to slave \#1 and as the master. However, if the OE pin is pulled LOW (disabled), both ports (A and B) are 3 -stated. This results in the FXMAR2102 isolating slave \#2 from the master and slave \#1, allowing full communication between the master and slave \#1.
$V_{C C}$ to $G N D$
If slave \#2 is a camera that is suddenly removed from the $\mathrm{I}^{2} \mathrm{C}$ bus, resulting in $\mathrm{V}_{\mathrm{CCB}}$ transitioning from a valid $\mathrm{V}_{\mathrm{CC}}$ ( $1.65 \mathrm{~V}-5.5 \mathrm{~V}$ ) to 0 V ; the FXMAR2102 automatically forces SCL and SDA on both its A and B ports into 3-state. Once $\mathrm{V}_{\mathrm{CCB}}$ has reached 0 V , full $\mathrm{I}^{2} \mathrm{C}$ communication between the master and slave \#1 remains undisturbed.

15. AC characteristics are guaranteed by design and characterization.
16. Skew is the variation of propagation delay between output signals and applies only to output signals on the same port $\left(A_{n}\right.$ or $\left.B_{n}\right)$ and switching with the same polarity (LOW-to-HIGH or HIGH-to-LOW) (see Figure 15). Skew is guaranteed; not production tested.

## FXMAR2102

CAPACITANCE ( $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$.)

| Symbol | Parameter | Condition | Typ | Unit |
| :---: | :--- | :--- | :---: | :---: |
| $\mathrm{C}_{\mathrm{IN}}$ | Input Capacitance Control Pin (OE) | $\mathrm{V}_{\mathrm{CCA}}=\mathrm{V}_{\mathrm{CCB}}=\mathrm{GND}$ | 2.2 | pF |
| $\mathrm{C}_{\mathrm{I} / \mathrm{O}}$ | Input/Output Capacitance, $\mathrm{A}_{\mathrm{n}}, \mathrm{B}_{\mathrm{n}}$ | $\mathrm{V}_{\mathrm{CCA}}=\mathrm{V}_{\mathrm{CCB}}=5.0 \mathrm{~V}, \mathrm{OE}=\mathrm{GND}$ | 13 | pF |

Figure 8. AC Test Circuit

Table 1. PROPAGATION DELAY TABLE (Note 17)

| Test | Input Signal | Output Enable Control |
| :---: | :---: | :---: |
| $\mathrm{t}_{\text {PLH }}, \mathrm{t}_{\text {PHL }}$ | Data Pulses | $\mathrm{V}_{\mathrm{CCA}}$ |
| $\mathrm{t}_{\text {PZL }}\left(\mathrm{OE}\right.$ to $\left.\mathrm{A}_{\mathrm{n}}, \mathrm{B}_{\mathrm{n}}\right)$ | 0 V | LOW to HIGH Switch |
| $\mathrm{t}_{\text {PLZ }}\left(\mathrm{OE}\right.$ to $\left.\mathrm{A}_{\mathrm{n}}, \mathrm{B}_{\mathrm{n}}\right)$ | 0 V | HIGH to LOW Switch |

17. For $t_{\text {PZL }}$ and $t_{\text {PLZ }}$ testing, an external $2.2 \mathrm{k} \Omega$ pull-up resister to $\mathrm{V}_{\mathrm{CCO}}$ is required in order to force the $\mathrm{I} / \mathrm{O}$ pins high while OE is Low because when OE is low, the internal $10 \mathrm{k} \Omega$ RPUs are decoupled from their respective VCC's.

Table 2. AC LOAD TABLE

| $\mathbf{V}_{\text {cco }}$ | $\mathbf{C}_{\mathrm{L}}$ | $\mathbf{R}_{\mathrm{L}}$ |
| :---: | :---: | :---: |
| $1.8 \pm 0.15 \mathrm{~V}$ | 50 pF | NC |
| $2.5 \pm 0.2 \mathrm{~V}$ | 50 pF | NC |
| $3.3 \pm 0.3 \mathrm{~V}$ | 50 pF | NC |
| $5.0 \pm 0.5 \mathrm{~V}$ | 50 pF | NC |
