## LV52204MU

## Bi-CMOS IC

## LED Boost Driver with PWM and 1-Wire Dimming

## Overview

The LV52204MU is a high voltage boost driver for LED drive. LED current is set by the external resistor R1 and LED dimming can be done by changing FB voltage with PWM or 1-Wire.

## Features

- Operating Voltage from 2.7 V to 5.5 V
- Integrated 40 V MOSFET
- 1-Wire 32 level digital and PWM dimming
- 600 kHz Switching Frequency

UDFN6 $2 \times 2,0.65$ P

## Typical Applications

- LED Display Backlight Control

## Specifications

Absolute Maximum Ratings at $\mathrm{Ta}=25^{\circ} \mathrm{C}$

| Parameter | Symbol | Conditions | Ratings | Unit |
| :---: | :---: | :---: | :---: | :---: |
| Maximum supply voltage | $\mathrm{V}_{\text {CC }}$ max | $\mathrm{V}_{\mathrm{CC}}$ | 5.5 | V |
| Maximum pin voltage1 | V1 max | SW | 40 | V |
| Maximum pin voltage2 | V2 max | Other pin | 5.5 | V |
| Allowable power dissipation | Pd max | $\mathrm{Ta}=25^{\circ} \mathrm{C} * 1$ | 2.05 | W |
| Operating temperature | Topr |  | -30 to +85 | ${ }^{\circ} \mathrm{C}$ |
| Storage temperature | Tstg |  | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |

*1 Mounted on a specified board: $70 \mathrm{~mm} \times 50 \mathrm{~mm} \times 1.2 \mathrm{~mm}$ (4 layer glass epoxy)
Caution 1) Absolute maximum ratings represent the values which cannot be exceeded for any length of time.
Caution 2) Even when the device is used within the range of absolute maximum ratings, as a result of continuous usage under high temperature, high current, high voltage, or drastic temperature change, the reliability of the IC may be degraded. Please contact us for the further details.

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

Recommendation Operating Condition at $\mathrm{Ta}=25^{\circ} \mathrm{C}$

| Parameter | Symbol | Conditions | Ratings | Unit |
| :--- | :--- | :--- | ---: | :---: |
| Supply voltage range 1 | $V_{\text {CC }}$ op | $V_{\text {CC }}$ | 2.7 to 5.5 | V |
| PWM frequency | Fpwm | PWM MODE | 300 to 100 k | Hz |

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

Electrical Characteristics Analog block at $\mathrm{Ta}=25^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{CC}}=3.6 \mathrm{~V}$, unless otherwise specified

| Parameter | Symbol | Conditions | Ratings |  |  | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | min | typ | max |  |
| Standby current dissipation | ${ }^{\text {I CC }} 1$ | SHUTDOWN |  | 0 | 5 | $\mu \mathrm{A}$ |
| DC/DC current dissipation | ${ }^{1} \mathrm{CC}{ }^{2}$ | $\mathrm{V}_{\text {OUT }}=30 \mathrm{~V}, \mathrm{I}$ LED $=20 \mathrm{~mA}$ |  |  | 1 | mA |
| FB voltage | Vfb | PWM duty 100\% | 0.19 | 0.2 | 0.21 | V |
| FB pin leak current | Ifb |  |  |  | 1 | $\mu \mathrm{A}$ |
| OVP voltage | Vovp | SW | 37 | 38 | 39 | V |

## Block Diagram

## Pin Connections

## Pin Function

| PIN \# | Pin Name |  |
| :---: | :--- | :--- |
| 1 | FB | Feedback pin. |
| 2 | FCAP | Filtering capacitor terminal for PWM mode. |
| 3 | GND | Ground |
| 4 | SW | Switch pin. Drain of the internal power FET. |
| 5 | SWIRE | 1-wire dimming control and PWM dimming input (active High). |
| 6 | VCC | Supply voltage. |
|  | Expose-pad | Connect to GND on PCB. |

## LED Current Setting

LED current is set by an external resistor connected between the FB pin and ground.

$$
\mathrm{I}_{\mathrm{LED}}=\mathrm{V}_{\mathrm{FB}} / \mathrm{R}_{\mathrm{FB}}
$$

The $\mathrm{V}_{\mathrm{FB}}$ can be controled by two dimming modes, PWM Mode or Digital Mode.In PWM mode, PWM input is converted into a near DC current by the internal resistor R that was equivalent to $60 \mathrm{k} \Omega( \pm 10 \%)$ and the external capacitor $\mathrm{C}_{\mathrm{FCAP}}$ as a low pass filter with a cut-off frequency $\mathrm{fc}=1 / 2 \pi \mathrm{R}_{\mathrm{FCAP}}$. The $\mathrm{V}_{\mathrm{FB}}$ can be adjusted by altering the duty cycle of the PWM signal (See Fig.1).

$$
\mathrm{V}_{\mathrm{FB}}=200(\mathrm{mV}) \times \text { PWM Duty }(\%)
$$

On the other hand, $\mathrm{V}_{\mathrm{FB}}$ can be selected one from among 32steps in Digital Mode (See Fig.2).

Fig1. VFB vs. PWM Duty (PWM mode)

Fig2. VFB vs. Data Register Value (Digital mode)

## Dimming Mode Selection

Dimming Mode is selected by a specific pattern of the SWIRE within Tsel (1ms) from the startup of the device every time. In order to startup the device, the SWIRE must keep high for longer than Ton.

## PWM Mode

The dimming mode is set to PWM mode when it is not recognized as a digital mode within Tsel. To enter Digital Mode, the SWIRE is required keeping in low state for Tw1 (See Fig.4). If the PWM frequency is used faster than 6.6 kHz , the dimming mode is set to PWM mode only. But slower than 6.6 kHz , it is necessary to avoid entering the digital mode condition, such as SWIRE keeps high for longer than Tsel. PWM is enabled after Tdel from Tsel.

Fig3. SWIRE Timing Diagram in PWM mode

## LV52204MU

## Digital Mode

To enter Digital Mode, SWIRE should be taken high for more than Tw0 $(100 \mu \mathrm{~s})$ from the first rising edge and keep low state for $\mathrm{Tw} 1(260 \mu \mathrm{~s})$ before $\mathrm{Tsel}(1 \mathrm{~ms})$.

Fig4. SWIRE Timing Diagram in Digital mode
It is required sending the device address byte and the data byte to select $\mathrm{V}_{\mathrm{FB}}$. The bit detection is determined by the ratio of Th and Tl (See Fig6). The start condition for the bit transmission required SWIRE high for at least Tstart. The end condition is required SWIRE low for at least Tend. When data is not being transferred, SWIRE is set in the "H" state. These registers are initialized with POR (Power On Reset).
In the LV52204MU, the device address (DA7 to DA0) is specified as "01110010". D7 is setting for the acknowledge response. If the device address and the data byte are transferred on $\mathrm{D} 7=1$, the ACK signal is sent from the receive side to the send side. The acknowledge signal is issued when SWIRE on the send side is released and SWIRE on the receive side is set to low state. D6 and D5 need to send 0. D4 to D0 allow to changing the FB voltage.

|  | Register | BIT | Description |

## LV52204MU

## Start up and Shutdown

The device becomes enabled when SWIRE is initially taken high.The dimming mode is determined within Tsel and the boost converter start up after Tdel. To place the device into shutdown mode, the SWIRE must be held low for Toff.

PWM MODE

Digital MODE

Fig7.Start up and shutdown diagram

## LV52204MU

## Open LED Protection

If SW terminal voltage exceeds a threshold Vovp ( 38 V typ) for 8 cycles, boost converter enters shutdown mode. In order to restart the IC, SWIRE signal is required again.

## Over Current Protection

Current limit value for built-in power MOS is around 0.7 A . The power MOS is turned off for each switching cycle when peak current through it exceeds the limit value.

## Under Voltage Lock Out (UVLO)

UVLO operation works when $\mathrm{V}_{\mathrm{IN}}$ terminal voltage is below 2.2 V .

## Thermal Shutdown

When chip temperature is too high, boost converter is stopped.
