LV52206XA

Bi-CMOS IC

Dual channel LED Boost Driver with PWM and 1-Wire Dimming

Overview

The LV52206XA is a high voltage boost driver for LED drive with 2 channels adjustable constant current sources.

Features

- Operating Voltage from 2.7V to 5.5V
- 1-Wire 32 level digital and PWM dimming
- Integrated 43V MOSFET
- 600kHz Switching Frequency

Typical Applications

- LED Display Backlight Control

Specifications

Absolute Maximum Ratings at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	$V_{CC\ max}$	V_{CC}	5.5	V
Maximum pin voltage1	$V1\ max$	SW	43	V
Maximum pin voltage2	$V2\ max$	Other pin	5.5	V
Allowable power dissipation	$Pd\ max$	$T_a = 25^\circ\text{C} *1$	1.30	W
Operating temperature	T_{opr}		-30 to +85	$^\circ\text{C}$
Storage temperature	T_{stg}		-55 to +125	$^\circ\text{C}$

*1 Mounted on a specified board: 70mm×70mm×1.2mm (4 layer glass epoxy)

Caution 1) Absolute maximum ratings represent the values which cannot be exceeded for any length of time.

Caution 2) Even when the device is used within the range of absolute maximum ratings, as a result of continuous usage under high temperature, high current, high voltage, or drastic temperature change, the reliability of the IC may be degraded. Please contact us for the further details.

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

Pin Function

PIN #	Pin Name	Description
A1	LEDO1	Constant current output _pin1.
A2	FCAP	Filtering capacitor terminal for PWM mode.
A3	VCC	Supply voltage
B1	LEDO2	Constant current output _pin2.
B2	PWM / SWIRE	1-wire control and PWM dimming input (active High).
B3	OVP	Output voltage sense connection for over voltage sensing.
C1	GND	Ground.
C2	GND	Ground.
C3	SW	Switch pin. Drain of the internal power FET.

Dimming Mode Selection

Dimming Mode is selected by a specific pattern of the SWIRE within Tsel (1ms) from the startup of the device every time. In order to startup the device, the SWIRE must keep high for longer than Ton.

PWM Mode

The dimming mode is set to PWM mode when it is not recognized as a digital mode within Tsel. To enter Digital Mode, the SWIRE is required keeping in low state for Tw1 (See Fig.4). If the PWM frequency is used faster than 6.6kHz, the dimming mode is set to PWM mode only. But slower than 6.6kHz, it is necessary to avoid entering the digital mode condition, such as SWIRE keeps high for longer than Tsel. PWM is enabled after Tdel from Tsel.

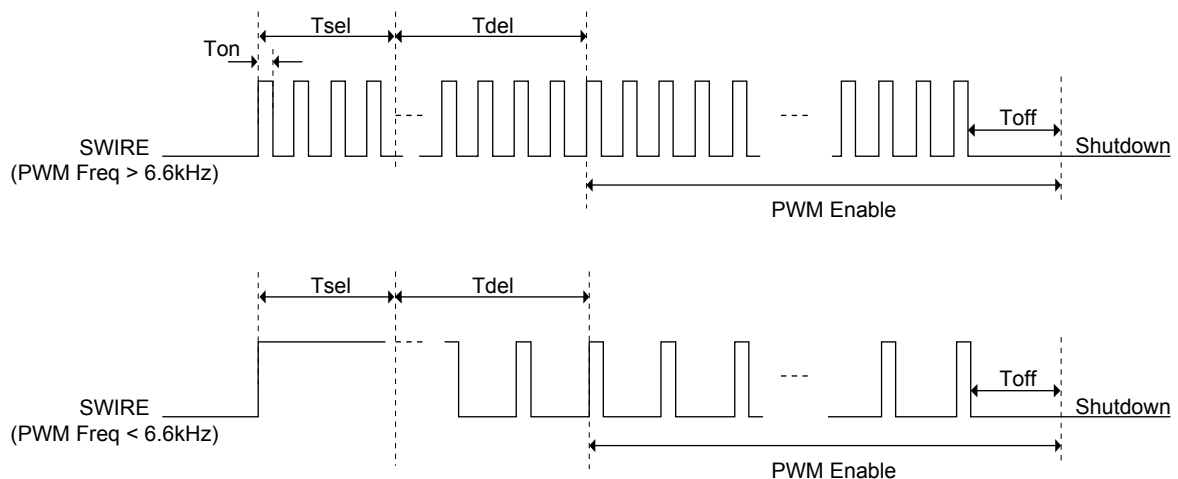

Fig3. SWIRE Timing Diagram in PWM mode

Digital Mode

To enter Digital Mode, SWIRE should be taken high for more than T_{w0} (100 μ s) from the first rising edge and keep low state for T_{w1} (260 μ s) before T_{sel} (1ms).

Fig4. SWIRE Timing Diagram in Digital mode

It is required sending the device address byte and the data byte to select V_{FB} . The bit detection is determined by the ratio of T_h and T_l (See Fig6). The start condition for the bit transmission required SWIRE high for at least T_{start} . The end condition is required SWIRE low for at least T_{end} . When data is not being transferred, SWIRE is set in the “H” state. These registers are initialized with POR (Power On Reset).

In the LV52206XA, the device address(DA7 to DA0) is specified as “01110011”. AKct is setting for the acknowledge response. If the device address and the data byte are transferred on $AKct=1$, the ACK signal is sent from the receive side to the send side. The acknowledge signal is issued when SWIRE on the send side is released and SWIRE on the receive side is set to low state.

Start up and Shutdown

The device becomes enabled when SWIRE is initially taken high. The dimming mode is determined within Tsel and the boost converter start up after Tdel. To place the device into shutdown mode, the SWIRE must be held low for Toff.

PWM MODE

Digital MODE

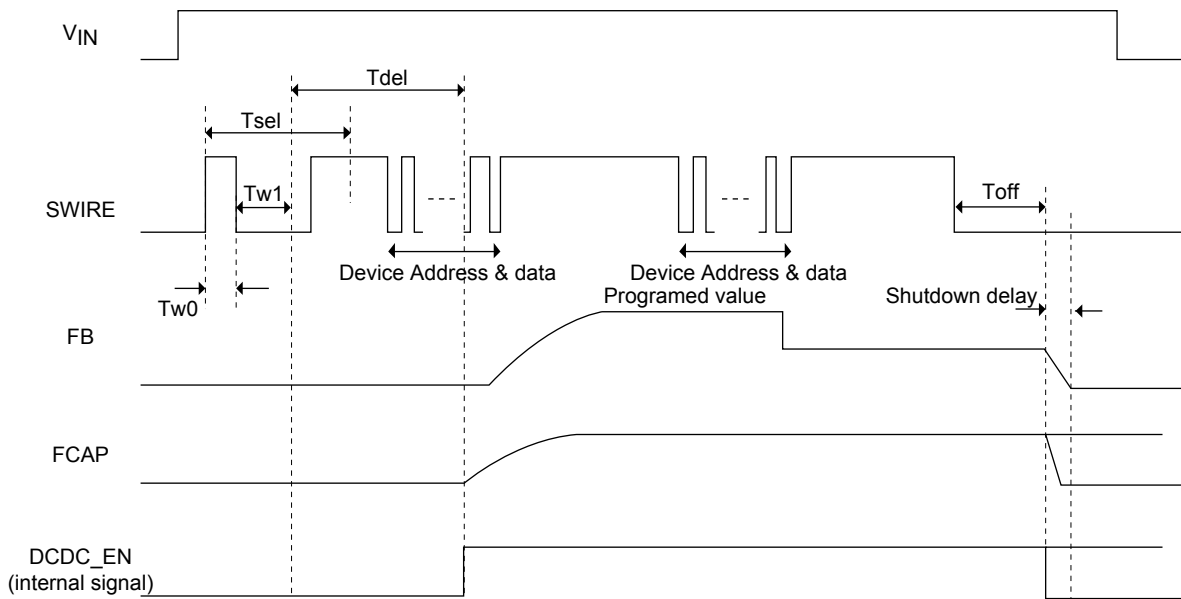

Fig7.Start up and shutdown diagram

Open LED Protection

If OVP terminal voltage exceeds a threshold V_{ovp} (38V typ) and LEDO terminal voltage less than 0.05V for 8 cycles, boost converter enters shutdown mode. In order to restart the IC, It is necessary to start it again from a shut down condition.

Over Current Protection

Current limit value for built-in power MOS is around 1A. The power MOS is turned off for each switching cycle when peak current through it exceeds the limit value.

Under Voltage Lock Out (UVLO)

UVLO operation works when V_{IN} terminal voltage is below 2.2V.

Thermal Shutdown

When chip temperature is too high, boost converter is stopped.
