Bi-CMOS LSI

## PWM Constant-Current Control Stepping Motor Driver

### Overview

The LV8773 is a 2-channel H-bridge driver IC, which supports forward, reverse, brake, and standby of a motor. It is ideally suited for driving brushed DC motors and stepping motors used in office equipment and amusement applications.

### Features

- BiCDMOS process IC
- Low on resistance (upper side : 0.3Ω ; lower side : 0.25Ω ; total of upper and lower : 0.55Ω ; Ta = 25°C, IO = 2A)
- Motor current selectable in two steps
- Output short-circuit protection circuit (selectable from latch-type or auto-reset-type) incorporated
- Unusual condition warning output pins
- No control power supply required

### Specifications

#### Absolute Maximum Ratings at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage	VM max		36	V
Output peak current	IO peak	tw ≤ 10ms, duty 20%	2.5	A
Output current	IO max		2	A
Logic input voltage	VIN		-0.3 to +6	V
EMO1/EMO2 input voltage	Vemo/Vemo2		-0.3 to +6	V
Allowable power dissipation	Pd max1	1 unit	3.0	W
	Pd max2	*	6.2	W
Operating temperature	Topr		-20 to +85	°C
Storage temperature	Tstg		-55 to +150	°C

\* Specified circuit board : 90.0mm×90.0mm×1.6mm, glass epoxy 2-layer board.

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

# LV8773

## Allowable Operating Ratings at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage range	VM		9 to 32	V
Logic input voltage	$V_{IN}$		0 to 5.5	V
VREF input voltage range	VREF		0 to 3	V

## Electrical Characteristics at $T_a = 25^\circ\text{C}$ , VM = 24V, VREF = 1.5V

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
Standby mode current drain	IMst	ST = "L"		100	400	$\mu\text{A}$
Current drain	IM	ST = "H", OE = "L", with no load		3.2	5	mA
VREG5 output voltage	Vreg5	$I_O = -1\text{mA}$	4.5	5	5.5	V
Thermal shutdown temperature	TSD	Design guarantee	150	180	200	$^\circ\text{C}$
Thermal hysteresis width	$\Delta\text{TSD}$	Design guarantee		40		$^\circ\text{C}$
<b>Motor driver</b>						
Output on resistance	Ronu	$I_O = 2\text{A}$ , Upper-side on resistance		0.3	0.4	$\Omega$

**Description of operation**

**(1) Chip enable function**

This IC is switched between standby and operating mode by setting the ST pin. In standby mode, the IC is set to power-save mode and all logic is reset. In addition, the internal regulator circuit and charge pump circuit do not operate in standby mode.

ST	Mode	Internal regulator	Charge pump
Low or Open	Standby mode	Standby	Standby
High	Operating mode	Operating	Operating

**(2) Output control logic**

input		output		mode
DC11(21)	DC12(22)	OUT1(2)A	OUT1(2)B	
L	L	OFF	OFF	Stand-by
H	L	H	L	CW ( Forward )
L	H	L	H	CCW ( reverse )
H	H	L	L	brake

**(3) Blanking period**

If, when exercising PWM constant-current chopping control over the motor current, the mode is switched from decay to charge, the recovery current of the parasitic diode may flow to the current sensing resistance, causing noise to be carried on the current sensing resistance pin, and this may result in erroneous detection. To prevent this erroneous detection, a blanking period is provided to prevent the noise occurring during mode switching from being received. During this period, the mode is not switched from charge to decay even if noise is carried on the current sensing resistance pin.

This IC is the blanking time is fixed at approximately 2μs.

**(4) Chopping frequency setting**

For constant-current control, this IC performs chopping operations at the frequency determined by the capacitor (Cchop) connected between the CHOP pin and GND.

The chopping frequency is set as shown below by the capacitor (Cchop) connected between the CHOP pin and GND.

$$F_{chop} = I_{chop} / (C_{chop} \times V_{tchop} \times 2) \text{ (Hz)}$$

$I_{chop}$  : Capacitor charge/discharge current, typ 10μA

$V_{tchop}$  : Charge/discharge hysteresis voltage ( $V_{tup} - V_{tdown}$ ), typ 0.5V

For instance, when Cchop is 220pF, the chopping frequency will be as follows :

$$F_{chop} = 10\mu A / (220pF \times 0.5V \times 2) = 45.4kHz$$

(5) Setting constant-current control

When the current of the motor reaches up to a set current by setting the output current, this IC does the short brake control by the automatic operation so that the current should not increase more than it.

Based on the voltage input to the VREF pin and the resistance connected between RF and GND, the output current that is subject to the constant-current control is set using the calculation formula below :

$$I_{OUT} = (VREF/5)/RF \text{ resistance}$$

\* The above setting is the output current at 100% of each excitation mode.

The voltage input to the VREF pin can be switched to two-step settings depending on the statuses of the ATT.

Attenuation function for VREF input voltage

ATT	Current setting reference voltage attenuation ratio
Low	100%
High	50%

The formula used to calculate the output current when using the function for attenuating the VREF input voltage is given below.

$$I_{OUT} = (VREF/5) \times (\text{attenuation ratio})/RF \text{ resistance}$$

Example : At VREF of 1.5V, a reference voltage setting of 100% (ATT = L) and an RF resistance of 0.3Ω, the output current is set as shown below.

$$I_{OUT} = 1.5V/5 \times 100\%/0.3\Omega = 1.0A$$

If, in this state, ATT = H will be as follows :

$$I_{OUT} = 1.0A \times 50\% = 500mA$$

(6) Typical current waveform in each excitation mode when stepping motor parallel input control  
 2-phase excitation (CW mode)

1-2 phase excitation full torque (CW mode)

(7) Output short-circuit protection function

This IC incorporates an output short-circuit protection circuit that, when the output has been shorted by an event such as shorting to power or shorting to ground, sets the output to the standby mode and turns on the warning output in order to prevent the IC from being damaged. In the channels 1 and 2 operate independently. (Even if the output of channel 1 has been short-circuited, channel 2 will operate normally.)

(7-1) Output short-circuit protection operation changeover function

Changeover to the output short-circuit protection of IC is made by the setting of EMM pin.

EMM	State
Low or Open	Latch method
High	Auto reset method

(7-2) Latch type

In the latch mode, when the output current exceeds the detection current level, the output is turned OFF, and this state is held.

The detection of the output short-circuited state by the IC causes the output short-circuit protection circuit to be activated.

When the short-circuited state continues for the period of time set using the internal timer (approximately  $2\mu\text{s}$ ), the output in which the short-circuiting has been detected is first set to OFF. After this, the output is set to ON again as soon as the timer latch time ( $T_{cem}$ ) described later has been exceeded, and if the short-circuited state is still detected, all the outputs of the channel concerned are switched to the standby mode, and this state is held.

This state is released by setting ST to low.

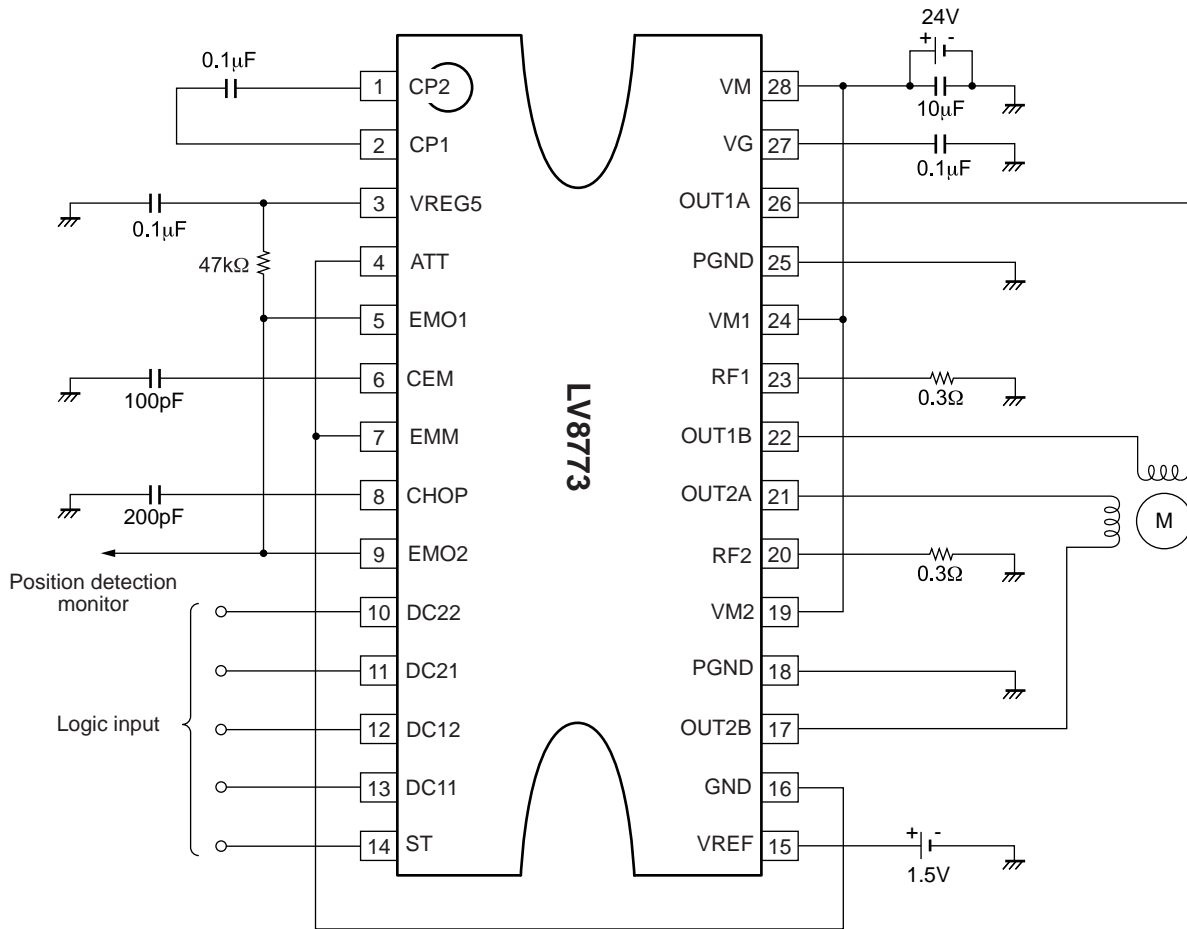

# LV8773

## Application Circuit Example

- Stepping motor driver circuit

The formulae for setting the constants in the examples of the application circuits above are as follows :

Constant current (100%) setting

When  $V_{REF} = 1.5V$

$$I_{OUT} = V_{REF} / 5 / R_F \text{ resistance} \\ = 1.5V / 5 / 0.3\Omega = 1.0A$$

Chopping frequency setting

$$f_{chop} = I_{chop} / (C_{chop} \times V_{tchop} \times 2) \\ = 10\mu A / (220pF \times 0.5V \times 2) = 45.4kHz$$

Timer latch time when the output is short-circuited

$$T_{cem} = C_{cem} \times V_{tcem} / I_{cem} \\ = 100pF \times 1V / 10\mu A = 10\mu s$$

## LV8773

- DC motor driver circuit (Constant current control function is used.)

The formulae for setting the constants in the examples of the application circuits above are as follows :

Constant current limit (100%) setting

When  $V_{REF} = 1.5V$

$$I_{limit} = V_{REF} / 5 / R_F \text{ resistance} \\ = 1.5V / 5 / 0.3\Omega = 1.0A$$

Chopping frequency setting

$$F_{chop} = I_{chop} / (C_{chop} \times V_{tchop} \times 2) \\ = 10\mu A / (220pF \times 0.5V \times 2) = 45.4kHz$$

Timer latch time when the output is short-circuited

$$T_{cem} = C_{cem} \times V_{tcem} / I_{cem} \\ = 100pF \times 1V / 10\mu A = 10\mu s$$
