# **5 V ECL 8-Bit Ripple Counter**

# MC10E137

#### Description

The MC10E137 is a very high speed binary ripple counter. The two least significant bits were designed with very fast edge rates while the more significant bits maintain standard ECLinPS<sup>™</sup> output edge rates. This allows the counter to operate at very high frequencies while maintaining a moderate power dissipation level.

The device is ideally suited for multiple frequency clock generation as well as a counter in a high performance ATE time measurement board.

Both asynchronous and synchronous enables are available to maximize the device's flexibility for various applications. The asynchronous enable input, A\_Start, when asserted enables the counter while overriding any synchronous enable signals. The E137 features XORed enable inputs, EN1 and EN2, which are synchronous to the CLK input. When only one synchronous enable is asserted the counter becomes disabled on the next CLK transition; all outputs remain in the previous state poised for the other synchronous enable or A\_Start to be asserted to re-enable the counter. Asserting both synchronous enables causes the counter to become enabled on the next transition of the CLK. If EN1 (or EN2) and CLK edges are coincident, sufficient delay has been inserted in the CLK path (to compensate for the XOR gate delay and the internal D-flip flop setup time) to insure that the synchronous enable signal is clocked correctly, hence, the counter is disabled.

All input pins left open will be pulled LOW via an input pulldown resistor. Therefore, do not leave the differential CLK inputs open. Doing so causes the current source transistor of the input clock gate to become saturated, thus upsetting the internal bias regulators and jeopardizing the stability of the device.

The asynchronous Master Reset resets the counter to an all zero state upon assertion.

The V<sub>BB</sub> pin, an internally generated voltage supply, is available to this device only. For single-ended input conditions, the unused differential input is connected to V<sub>BB</sub> as a switching reference voltage. V<sub>BB</sub> may also rebias AC coupled inputs. When used, decouple V<sub>BB</sub> and V<sub>CC</sub> via a 0.01  $\mu$ F capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V<sub>BB</sub> should be left open.

#### Features

- Differential Clock Input and Data Output Pins
- V<sub>BB</sub> Output for Single-Ended Use
- Synchronous and Asynchronous Enable Pins
- Asynchronous Master Reset
- PECL Mode Operating Range:
  - $V_{CC} = 4.2 \text{ V}$  to 5.7 V with  $V_{EE} = 0 \text{ V}$
- NECL Mode Operating Range:
  - $V_{CC} = 0$  V with  $V_{EE} = -4.2$  V to -5.7 V
- Internal Input 50 kΩ Pull-down Resistors
- Transistor Count = 330 devices
- ESD Protection:

\*For additional marking information, refer to Application Note <u>AND8002/D</u>.

#### **ORDERING INFORMATION**

Device	Package	Shipping
MC10E137FNG	PLCC-28	37 Units/Tube
	(Pb-Free)	

- Human Body Model: > 2 kV
- Machine Model: > 200 V
- Meets or Exceeds JEDEC Spec EIA/JESD78 IC Latchup Test
- Moisture Sensitivity Level: 3 (Pb-Free)
  - For Additional Information, see Application Note <u>AND8003/D</u>
- Flammability Rating: UL 94 V-0 @ 0.125 in, Oxygen Index: 28 to 34
- These Devices are Pb-Free, Halogen Free and are RoHS Compliant
