MC74LVX8051

Analog Multiplexer/ Demultiplexer
High−Performance Silicon−Gate CMOS

The MC74LVX8051 utilizes silicon−gate CMOS technology to achieve fast propagation delays, low ON resistances, and low OFF leakage currents. This analog multiplexer/demultiplexer controls analog voltages that may vary across the complete power supply range (from V_{CC} to GND).

The LVX8051 is similar in pinout to the high−speed HC4051A and the metal−gate MC14051B. The Channel−Select inputs determine which one of the Analog Inputs/Outputs is to be connected, by means of an analog switch, to the Common Output/Input. When the Enable pin is HIGH, all analog switches are turned off.

The Channel−Select and Enable inputs are compatible with standard CMOS outputs; with pull−up resistors they are compatible with LSTTL outputs.

This device has been designed so that the ON resistance (R_{on}) is more linear over input voltage than R_{on} of metal−gate CMOS analog switches.
Features

- Fast Switching and Propagation Speeds
- Low Crosstalk Between Switches
- Diode Protection on All Inputs/Outputs
- Analog Power Supply Range (V_{CC} − GND) = 2.5 to 6.0 V
- Digital (Control) Power Supply Range (V_{CC} − GND) = 2.5 to 6.0 V
- Improved Linearity and Lower ON Resistance Than Metal−Gate Counterparts
- Low Noise
- In Compliance With the Requirements of JEDEC Standard No. 7A
- Chip Complexity: LVX8051 − 184 FETs or 46 Equivalent Gates
- These Devices are Pb−Free and are RoHS Compliant

MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V_{CC}	Positive DC Supply Voltage　　(Referenced to GND)	–0.5 to +7.0	V
V_{IS}	Analog Input Voltage	–0.5 to V_{CC} + 0.5	V
V_{in}	Digital Input Voltage (Referenced to GND)	–0.5 to V_{CC} + 0.5	V
I	DC Current, Into or Out of Any Pin	± 20	mA
P_D	Power Dissipation in Still Air,　　SOIC Package†　　TSSOP Package†	500　450	mW
T_{stg}	Storage Temperature Range	–65 to +150	°C
T_L	Lead Temperature, 1 mm from Case for 10 Seconds	260	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.
†Derating:　SOIC Package: –7 mW/°C from 65° to 125°C
　　　　　　TSSOP Package: –6.1 mW/°C from 65° to 125°C

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high–impedance circuit. For proper operation, V_{in} and V_{out} should be constrained to the range GND $\leq$ (V_{in} or V_{out}) $\leq$ V_{CC}.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V_{CC}). Unused outputs must be left open.

RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Min	Max	Unit
V_{CC}	Positive DC Supply Voltage　　　(Referenced to GND)	2.5	6.0	V
V_{IS}	Analog Input Voltage	0.0	V_{CC}	V
V_{in}	Digital Input Voltage (Referenced to GND)	GND	V_{CC}	V
V_{IO}*	Static or Dynamic Voltage Across Switch		1.2	V
T_A	Operating Temperature Range, All Package Types	– 55	+ 85	°C
t_r, t_f	Input Rise/Fall Time (Channel Select or Enable Inputs)　　　　　　　　　　　　V_{CC} = 3.3 V ± 0.3 V　　　　　　　　　　　　V_{CC} = 5.0 V ± 0.5 V	0　0	100　20	ns/V

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.
*For voltage drops across switch greater than 1.2 V (switch on), excessive V_{CC} current may be drawn; i.e., the current out of the switch may contain both V_{CC} and switch input components. The reliability of the device will be unaffected unless the Maximum Ratings are exceeded.

APPLICATIONS INFORMATION

The Channel Select and Enable control pins should be at V_{CC} or GND logic levels. V_{CC} being recognized as a logic high and GND being recognized as a logic low. In this example:

$$V_{CC} = +5V = \text{logic high}$$
$$GND = 0V = \text{logic low}$$

The maximum analog voltage swing is determined by the supply voltage V_{CC}. The positive peak analog voltage should not exceed V_{CC}. Similarly, the negative peak analog voltage should not go below GND. In this example, the difference between V_{CC} and GND is five volts. Therefore, using the configuration of Figure 15, a maximum analog signal of five volts peak−to−peak can be controlled. Unused analog inputs/outputs may be left floating (i.e., not connected). However, tying unused analog inputs and outputs to V_{CC} or GND through a low value resistor helps minimize crosstalk and feedthrough noise that may be picked up by an unused switch.

Although used here, balanced supplies are not a requirement. The only constraints on the power supplies are that:

$$V_{CC} - GND = 2 \text{ to } 6 \text{ volts}$$

When voltage transients above V_{CC} and/or below GND are anticipated on the analog channels, external Germanium or Schottky diodes (D_x) are recommended as shown in Figure 16. These diodes should be able to absorb the maximum anticipated current surges during clipping.
