## MC79M00 Series

## 500 mA Negative Voltage Regulators

The MC79M00 series of fixed output negative voltage regulators are intended as complements to the popular MC78M00 series devices.

Available in fixed output voltage options of $-5.0 \mathrm{~V},-8.0 \mathrm{~V},-12 \mathrm{~V}$ and -15 V , these regulators employ current limiting, thermal shutdown, and safe-area compensation, making them remarkably rugged under most operating conditions. With adequate heatsinking they can deliver output currents in excess of 0.5 A .

## Features

- No External Components Required
- Internal Thermal Overload Protection
- Internal Short Circuit Current Limiting
- Output Transistor Safe-Area Compensation
- Also Available in Surface Mount DPAK (DT) Package
- Pb-Free Packages are Available

## DEVICE TYPE/NOMINAL OUTPUT VOLTAGE

| Device | Nominal Output Voltage |
| :---: | :---: |
| MC79M05 | -5.0 V |
| MC79M08 | -8.0 V |
| MC79M12 | -12 V |
| MC79M15 | -15 V |

Figure 1. Representative Schematic Diagram

## ON Semiconductor ${ }^{\circledR}$

THREE-TERMINAL NEGATIVE FIXED VOLTAGE REGULATORS

STANDARD APPLICATION

A common ground is required between the input and the output voltages. The input voltage must remain typically 1.1 V more negative even during the high point of the input ripple voltage. XX These two digits of the type number indicate nominal voltage.

* $\mathrm{C}_{\text {in }}$ is required if regulator is located an appreciable distance from power supply filter. ** $\mathrm{C}_{\mathrm{O}}$ improve stability and transient response.

ORDERING INFORMATION
See detailed ordering and shipping information in the package dimensions section on page 6 of this data sheet.

MAXIMUM RATINGS $\left(T_{A}=25^{\circ} \mathrm{C}\right.$, unless otherwise noted.)

## MC79M00 Series

## Protection Diodes

When external capacitors are used with MC79M00 series regulator it is sometimes necessary to add protection diodes to prevent the capacitors from discharging through low current points into the regulator or from output polarity reversals. Generally, no protection diode is required for values of output capacitance less then $10 \mu \mathrm{~F}$. Figure 2 shows the MC79M15 with the recommended protection diodes.

- Opposite Polarity Protection

Diode D1 protects the regulator from output polarity reversals during startup, power off and short-circuit operation.

- Reverse-bias Protection

Diode D2 prevents output capacitor from discharging thru the MC79M15 during an input short circuit or fast switch off of power supply.

Figure 2. Protection Diodes
