3.3 V Zero Delay Clock Buffer

NB2309A

The NB2309A is a versatile, 3.3 V zero delay buffer designed to distribute high–speed clocks. It accepts one reference input and drives out nine low–skew clocks. It is available in a 16 pin package.

The -1H version of the NB2309A operates at up to 133 MHz, and has higher drive than the -1 devices. All parts have on-chip PLL's that lock to an input clock on the REF pin. The PLL feedback is on-chip and is obtained from the CLKOUT pad.

The NB2309A has two banks of four outputs each, which can be controlled by the Select inputs as shown in the Select Input Decoding Table. If all the output clocks are not required, Bank B can be three-stated. The select inputs also allow the input clock to be directly applied to the outputs for chip and system testing purposes.

Multiple NB2309A devices can accept the same input clock and distribute it. In this case the skew between the outputs of the two devices is guaranteed to be less than 700 ps.

All outputs have less than 200 ps of cycle-to-cycle jitter. The input and output propagation delay is guaranteed to be less than 350 ps, and the output to output skew is guaranteed to be less than 250 ps.

The NB2309A is available in two different configurations, as shown in the ordering information table. The NB2309A1 is the base part. The NB2309A11H is the high drive version of the -1 and its rise and fall times are much faster than -1 part.

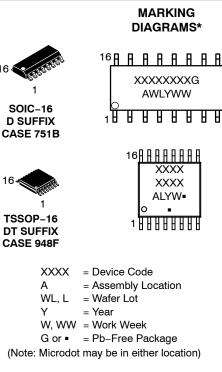

Features

- 15 MHz to 133 MHz Operating Range, Compatible with CPU and PCI Bus Frequencies
- Zero Input Output Propagation Delay
- Multiple Low-Skew Outputs
- Output-Output Skew Less than 250 ps
- Device-Device Skew Less than 700 ps
- One Input Drives 9 Outputs, Grouped as 4 + 4 + 1
- Less than 200 ps Cycle-to-Cycle Jitter is Compatible with Pentium® Based Systems
- Test Mode to Bypass PLL
- Accepts Spread Spectrum Clock at the Input
- Available in 16 Pin, 150 mil SOIC and 4.4 mm TSSOP
- 3.3 V Operation, Advanced 0.35 µ CMOS Technology
- Guaranteed Across Commercial and Industrial Temperature Ranges
- These Devices are Pb–Free, Halogen Free/BFR Free and are RoHS Compliant

6. All parameters specified with loaded outputs in PLL-Mode.

Zero Delay and Skew Control

All outputs should be uniformly loaded to achieve Zero Delay between input and output. Since the CLKOUT pin is the internal feedback to the PLL, its relative loading can adjust the input–output delay. For applications requiring zero input–output delay, all outputs, including CLKOUT, must be equally loaded. Even if CLKOUT is not used, it must have a capacitive load equal to that on other outputs, for obtaining zero–input–output delay.
