2.5 V/3.3 V SiGe Differential Receiver/Driver with Variable Output Swing

Description

The NBSG16VS is a differential receiver/driver targeted for high frequency applications that require variable output swing. The device is functionally equivalent to the EP16VS device with much higher bandwidth and lower EMI capabilities. This device may be used for applications driving VCSEL lasers.

Inputs incorporate internal 50 Ω termination resistors and accept NECL (Negative ECL), PECL (Positive ECL), LVTTTL, LVCMOS, CML, or LVDS. The output amplitude is varied by applying a voltage to the V_{CTRL} input pin. Outputs are variable swing ECL from 100 mV to 750 mV amplitude, optimized for operation from $V_{CC} - V_{EE} = 3.0$ V to 3.465 V.

The V_{BB} and V_{MM} pins are internally generated voltage supplies available to this device only. The V_{BB} is used as a reference voltage for single-ended NECL or PECL inputs and the V_{MM} pin is used as a reference voltage for LVCMOS inputs. For single-ended input operation, the unused complementary differential input is connected to V_{BB} or V_{MM} as a switching reference voltage. V_{BB} or V_{MM} may also rebias AC-coupled inputs. When used, decouple V_{BB} and V_{MM} via a 0.01 μ F capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{BB} and V_{MM} outputs should be left open.

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lpm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

28. Measured using a 500 mV source, 50% duty cycle clock source. All loading with $50\ \Omega$ to $V_{CC} - 2.0\text{ V}$. Input edge rates 40 ps (20% – 80%).

29. $t_{SKEW} = |t_{PLH} - t_{PHL}|$ for a nominal 50% differential clock input waveform. See Figure 14.

30. $V_{INPP(MAX)}$ cannot exceed $V_{CC} - V_{EE}$ (applicable only when $V_{CC} - V_{EE} < 2600\text{ mV}$).

31. Conditions include input amplitude of 500 mV and $V_{CTRL} = V_{CC} - 2\text{ V}$. Minimum output amplitude guarantee of 100 mV (see Output P–P Spec in Figure 8), 80 mV at -40°C .
