# CAN Transceiver, High Speed, Low Power

### Description

The NCV7340 CAN transceiver is the interface between a controller area network (CAN) protocol controller and the physical bus and may be used in both 12 V and 24 V systems. The transceiver provides differential transmit capability to the bus and differential receive capability to the CAN controller.

The NCV7340 is a new addition to the CAN high–speed transceiver family and is an improved drop–in replacement for the AMIS–42665.

Due to the wide common-mode voltage range of the receiver inputs, the NCV7340 is able to reach outstanding levels of electromagnetic susceptibility (EMS). Similarly, extremely low electromagnetic emission (EME) is achieved by the excellent matching of the output signals.

### Features

- Compatible with the ISO 11898 Standard (ISO 11898–2, ISO 11898–5 and SAE J2284)
- Low Quiescent Current
- High Speed (up to 1 Mbps)
- Ideally Suited for 12 V and 24 V Industrial and Automotive Applications
- Extremely Low Current Standby Mode with Wakeup via the Bus
- Low EME Common–Mode Choke is No Longer Required
- Voltage Source via V<sub>SPLIT</sub> Pin for Stabilizing the Recessive Bus Level (Further EMC Improvement)
- No Disturbance of the Bus Lines with an Un-powered Node
- Transmit Data (TxD) Dominant Time-out Function
- Thermal Protection
- Bus Pins Protected Against Transients in an Automotive Environment
- Bus and V<sub>SPLIT</sub> Pins Short–Circuit Proof to Supply Voltage and Ground
- Logic Level Inputs Compatible with 3.3 V Devices
- Up to 110 Nodes can be Connected to the Same Bus in Function of Topology
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC–Q100 Qualified and PPAP Capable
- These are Pb–Free Devices

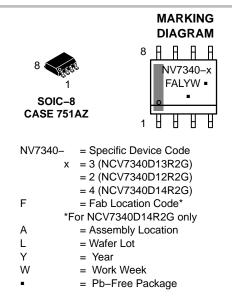

#### **Typical Applications**

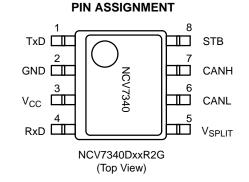

- Automotive
- Industrial Networks

## **Pin Description**

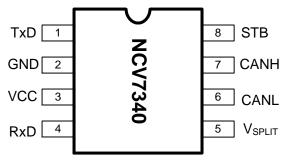

Figure 3. NCV7340 Pin Assignment

#### Table 2. PIN FUNCTION DESCRIPTION

Pin	Name	Description
1	TxD	Transmit data input; low input $\rightarrow$ dominant driver; internal pullup current
2	GND	Ground
3	VCC	Supply voltage
4	RxD	Receive data output; dominant transmitter $\rightarrow$ low output
5	V <sub>SPLIT</sub>	Common-mode stabilization output
6	CANL	Low-level CAN bus line (low in dominant mode)
7	CANH	High-level CAN bus line (high in dominant mode)
8	STB	Standby mode control input

#### FUNCTIONAL DESCRIPTION

#### **Operating Modes**

NCV7340 provides two modes of operation as illustrated in Table 3. These modes are selectable through pin STB.

Table 3.	OPERATING	MODES
----------	-----------	-------

F	Pin		Pin RXD				
s	тв	Mode	Low	High			
L	.ow	Normal	Bus dominant	Bus recessive			
Н	ligh	Standby	Wakeup request detected	No wakeup request detected			

#### **Normal Mode**

In the normal mode, the transceiver is able to communicate via the bus lines. The signals are transmitted and received to the CAN controller via the pins TxD and RxD. The slopes on the bus lines outputs are optimized to give extremely low EME.

#### Standby Mode

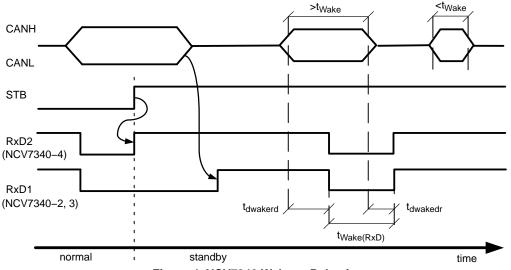

In standby mode both the transmitter and receiver are disabled and a very low-power differential receiver monitors the bus lines for CAN bus activity. The bus lines are terminated to ground and supply current is reduced to a minimum, typically 10  $\mu$ A. When a wake-up request is detected by the low-power differential receiver, the signal is first filtered and then verified as a valid wake signal after a time period of t<sub>dwakerd</sub>, the RxD pin is driven low by the transceiver to inform the controller of the wake-up request.

#### **Split Circuit**

The V<sub>SPLIT</sub> pin is operational only in normal mode. In standby mode this pin is floating. The V<sub>SPLIT</sub> can be connected as shown in Figure 2 or, if it's not used, can be left floating. Its purpose is to provide a stabilized DC voltage of 0.5 x V<sub>CC</sub> to the bus avoiding possible steps in the common-mode signal therefore reducing EME. These unwanted steps could be caused by an un-powered node on the network with excessive leakage current from the bus that shifts the recessive voltage from its nominal 0.5 x V<sub>CC</sub> voltage.

#### Wakeup

When a valid wakeup (dominant state longer than t<sub>Wake</sub>) is received during the standby mode the RxD pin is driven low. The wakeup detection is not latched: RxD returns to High state after twakedr when the bus signal is released back to recessive - see Figure 4. Wake-up behavior in case of a permanent dominant - due to, for example, a bus short represents the only difference between the circuit functional sub-versions listed in the Ordering Information table. When the standby mode is entered while a dominant is present on the bus, the "unconditioned bus wake-up" versions will signal a bus-wakeup immediately after the state transition (signal  $RxD_1$  in Figure 4). The other version will signal bus-wakeup only after the initial dominant is released (signal RxD<sub>2</sub> in Figure 4). In this way it's ensured, that a CAN bus can be put to a low-power mode even if the nodes have a level sensitivity to RxD pin and a permanent dominant is present on the bus.

#### **Overtemperature Detection**

A thermal protection circuit protects the IC from damage by switching off the transmitter if the junction temperature exceeds a value of approximately 160°C. Because the transmitter dissipates most of the power, the power dissipation and temperature of the IC is reduced. All other IC functions continue to operate. The transmitter off–state resets when the temperature decreases below the shutdown threshold and pin TxD goes high. The thermal protection circuit is particularly needed when a bus line short circuits.

#### **TxD Dominant Time-out Function**

A TxD dominant time–out timer circuit prevents the bus lines being driven to a permanent dominant state (blocking all network communication) if pin TxD is forced permanently low by a hardware and/or software application failure. The timer is triggered by a negative edge on pin TxD. If the duration of the low–level on pin TxD exceeds the internal timer value  $t_{dom(TxD)}$ , the transmitter is disabled, driving the bus into a recessive state. The timer is reset by a positive edge on pin TxD.

This TxD dominant time–out time  $(t_{dom(TxD)})$  defines the minimum possible bit rate to 40 kbps.

#### Fail Safe Features

A current–limiting circuit protects the transmitter output stage from damage caused by accidental short circuit to either positive or negative supply voltage, although power dissipation increases during this fault condition.

The pins CANH and CANL are protected from automotive electrical transients (according to ISO 7637; see Figure 5). Pins TxD and STB are pulled high internally should the input become disconnected. Pins TxD, STB and RxD will be floating, preventing reverse supply should the  $V_{CC}$  supply be removed.

## **ELECTRICAL CHARACTERISTICS**

#### Definitions

All voltages are referenced to GND (Pin 2). Positive currents flow into the IC. Sinking current means the current is flowing into the pin; sourcing current means the current is flowing out of the pin.

Symbol	Parameter	Conditions	Min	Max	Unit
V <sub>CC</sub>	Supply voltage		-0.3	+6	V
V <sub>CANH</sub>	DC voltage at pin CANH	$0 < V_{CC} < 5.25 V$ ; no time limit	-50	+50	V
V <sub>CANL</sub>	DC voltage at pin CANL	$0 < V_{CC} < 5.25 V$ ; no time limit	-50	+50	V
V <sub>SPLIT</sub>	DC voltage at pin V <sub>SPLIT</sub>	$0 < V_{CC} < 5.25 V$ ; no time limit	-40	+40	V
V <sub>TxD</sub>	DC voltage at pin TxD		-0.3	6	V
V <sub>RxD</sub>	DC voltage at pin RxD		-0.3	6	V
V <sub>STB</sub>	DC voltage at pin STB		-0.3	6	V
V <sub>esd</sub>	Electrostatic discharge voltage at all pins	Note 1 Note 2	-6 -500	6 500	kV V
	Electrostatic discharge voltage at CANH and CANL pins	Note 3	-12	12	kV
V <sub>schaff</sub>	Transient voltage, see Figure 5	Note 5	-150	100	V
Latchup	Static latchup at all pins	Note 4		120	mA
T <sub>stg</sub>	Storage temperature		-55	+150	°C
T <sub>A</sub>	Ambient temperature		-40	+125	°C
ΤJ	Maximum junction temperature		-40	+170	°C

#### Table 4. ABSOLUTE MAXIMUM RATINGS

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. Standardized human body model electrostatic discharge (ESD) pulses in accordance to EIA–JESD22. Equivalent to discharging a 100 pF capacitor through a 1.5 kΩ resistor.

Standardized charged device model ESD pulses when tested according to ESD-STM5.3.1–1999.

3. System human body model electrostatic discharge (ESD) pulses. Equivalent to discharging a 150 pF capacitor through a 330  $\Omega$  resistor.

4. Static latchup immunity: Static latchup protection level when tested according to EIA/JESD78.

5. Pulses 1, 2a, 3a and 3b according to ISO 7637 part 3. Verification by external test house.

#### **Table 5. THERMAL CHARACTERISTICS**

Symbol	Parameter	Conditions	Value	Unit
$R_{\theta JA_1}$	Thermal Resistance Junction-to-Air, 1S0P PCB (Note 6)	Free air	125	K/W
$R_{\theta JA_2}$	Thermal Resistance Junction-to-Air, 2S2P PCB (Note 7)	Free air	75	K/W

6. Test board according to EIA/JEDEC Standard JESD51-3, signal layer with 10% trace coverage.

7. Test board according to EIA/JEDEC Standard JESD51-7, signal layers with 10% trace coverage.

Table 6. CHARACTERISTICS V<sub>CC</sub> = 4.75 V to 5.25 V; T<sub>J</sub> = -40 to +150°C; R<sub>LT</sub> = 60  $\Omega$  unless specified otherwise.

Symbol	Parameter	Conditions	Min	Тур	Max	Unit
