## NID9N05ACL, NID9N05BCL

## Power MOSFET

### 9.0 A, 52 V, N-Channel, Logic Level, Clamped MOSFET w/ESD Protection in a DPAK Package

## Benefits

- High Energy Capability for Inductive Loads
- Low Switching Noise Generation

## Features

- Diode Clamp Between Gate and Source
- ESD Protection - HBM 5000 V
- Active Over-Voltage Gate to Drain Clamp
- Scalable to Lower or Higher $\mathrm{R}_{\mathrm{DS}(o n)}$
- Internal Series Gate Resistance
- AEC-Q101 Qualified and PPAP Capable
- These Devices are $\mathrm{Pb}-$ Free, Halogen Free/BFR Free and are RoHS Compliant

## Applications

- Automotive and Industrial Markets:

Solenoid Drivers, Lamp Drivers, Small Motor Drivers

## SAFE OPERATING AREA

The Forward Biased Safe Operating Area curves define the maximum simultaneous drain-to-source voltage and drain current that a transistor can handle safely when it is forward biased. Curves are based upon maximum peak junction temperature and a case temperature $\left(\mathrm{T}_{\mathrm{C}}\right)$ of $25^{\circ} \mathrm{C}$. Peak repetitive pulsed power limits are determined by using the thermal response data in conjunction with the procedures discussed in AN569, "Transient Thermal Resistance General Data and Its Use."

Switching between the off-state and the on-state may traverse any load line provided neither rated peak current ( $\mathrm{I}_{\mathrm{DM}}$ ) nor rated voltage ( $\mathrm{V}_{\mathrm{DSS}}$ ) is exceeded and the transition time $\left(\mathrm{t}_{\mathrm{r}}, \mathrm{t}_{\mathrm{f}}\right)$ do not exceed $10 \mu \mathrm{~s}$. In addition the total power averaged over a complete switching cycle must not exceed $\left(T_{J(M A X)}-T_{C}\right) /\left(R_{\theta J C}\right)$.

A Power MOSFET designated E-FET can be safely used in switching circuits with unclamped inductive loads. For
reliable operation, the stored energy from circuit inductance dissipated in the transistor while in avalanche must be less than the rated limit and adjusted for operating conditions differing from those specified. Although industry practice is to rate in terms of energy, avalanche energy capability is not a constant. The energy rating decreases non-linearly with an increase of peak current in avalanche and peak junction temperature.
Although many E-FETs can withstand the stress of drain-to-source avalanche at currents up to rated pulsed current ( $\mathrm{I}_{\mathrm{DM}}$ ), the energy rating is specified at rated continuous current ( $\mathrm{I}_{\mathrm{D}}$ ), in accordance with industry custom. The energy rating must be derated for temperature as shown in the accompanying graph (Figure 12). Maximum energy at currents below rated continuous $\mathrm{I}_{\mathrm{D}}$ can safely be assumed to equal the values indicated.
