Analog Multiplexers/ Demultiplexers

High-Performance Silicon-Gate CMOS

MC74HC4051A, MC74HC4052A, MC74HC4053A

The MC74HC4051A, MC74HC4052A and MC74HC4053A utilize silicon–gate CMOS technology to achieve fast propagation delays, low ON resistances, and low OFF leakage currents. These analog multiplexers/demultiplexers control analog voltages that may vary across the complete power supply range (from V_{CC} to V_{EE}).

The HC4051A, HC4052A and HC4053A are identical in pinout to the metal-gate MC14051AB, MC14052AB and MC14053AB. The Channel-Select inputs determine which one of the Analog Inputs/Outputs is to be connected, by means of an analog switch, to the Common Output/Input. When the Enable pin is HIGH, all analog switches are turned off.

The Channel–Select and Enable inputs are compatible with standard CMOS outputs; with pullup resistors they are compatible with LSTTL outputs.

These devices have been designed so that the ON resistance (R_{on}) is more linear over input voltage than R_{on} of metal–gate CMOS analog switches.

For a multiplexer/demultiplexer with injection current protection, see HC4851A and HC4852A.

Features

- Fast Switching and Propagation Speeds
- Low Crosstalk Between Switches
- Diode Protection on All Inputs/Outputs
- Analog Power Supply Range ($V_{CC} V_{EE}$) = 2.0 to 12.0 V
- Digital (Control) Power Supply Range (V_{CC} GND) = 2.0 to 6.0 V
- Improved Linearity and Lower ON Resistance Than Metal–Gate Counterparts
- Low Noise
- In Compliance with the Requirements of JEDEC Standard No. 7A
- Chip Complexity: HC4051A 184 FETs or 46 Equivalent Gates HC4052A – 168 FETs or 42 Equivalent Gates HC4053A – 156 FETs or 39 Equivalent Gates
- NLV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC–Q100 Qualified and PPAP Capable
- These Devices are Pb–Free, Halogen Free/BFR–Free and are RoHS Compliant

MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V _{CC}	Positive DC Supply Voltage (Referenced to GND) (Referenced to V _{EE})	0.5 to +7.0 0.5 to +14.0	V
V _{EE}	Negative DC Supply Voltage (Referenced to GND)	-7.0 to +5.0	V
V _{IS}	Analog Input Voltage	V _{EE} – 0.5 to V _{CC} + 0.5	V
V _{in}	Digital Input Voltage (Referenced to GND)	-0.5 to V _{CC} + 0.5	V
I	DC Current, Into or Out of Any Pin	±25	mA
PD	Power Dissipation in Still Air, SOIC Package† TSSOP Package†	500 450	mW
T _{stg}	Storage Temperature Range	-65 to +150	°C
TL	Lead Temperature, 1 mm from Case for 10 Seconds SOIC or TSSOP Package	260	°C

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high–impedance circuit. For proper operation, V_{in} and V_{out} should be constrained to the range GND $\leq (V_{in} \text{ or } V_{out}) \leq V_{CC}$.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V_{CC}). Unused outputs must be left open.

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

†Derating: SOIC Package: -7 mW/°C from 65° to 125°C

TSSOP Package: -6.1 mW/°C from 65° to 125°C

RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter		Min	Max	Unit
V _{CC}	Positive DC Supply Voltage	(Referenced to GND) (Referenced to V _{EE})	2.0 2.0	6.0 12.0	V
V_{EE}	Negative DC Supply Voltage, Output (Referenced to GND)		-6.0	GND	V
V _{IS}	Analog Input Voltage		V_{EE}	V _{CC}	V
V _{in}	Digital Input Voltage (Referenced to GND)		GND	V _{CC}	V
V _{IO} *	Static or Dynamic Voltage Across Switch			1.2	V
T _A	Operating Temperature Range, All Package Types		-55	+125	°C
t _r , t _f	Input Rise/Fall Time (Channel Select or Enable Inputs)	$V_{CC} = 2.0 V$ $V_{CC} = 3.0 V$ $V_{CC} = 4.5 V$ $V_{CC} = 6.0 V$	0 0 0 0	1000 600 500 400	ns

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond

the Recommended Operating Ranges limits may affect device reliability. *For voltage drops across switch greater than 1.2 V (switch on), excessive V_{CC} current may be drawn; i.e., the current out of the switch may contain both V_{CC} and switch input components. The reliability of the device will be unaffected unless the Maximum Ratings are exceeded.

APPLICATIONS INFORMATION

The Channel Select and Enable control pins should be at V_{CC} or GND logic levels. V_{CC} being recognized as a logic high and GND being recognized as a logic low. In this example:

$$V_{CC} = +5V = logic high$$

GND = 0V = logic low

The maximum analog voltage swings are determined by the supply voltages V_{CC} and V_{EE} . The positive peak analog voltage should not exceed V_{CC} . Similarly, the negative peak analog voltage should not go below V_{EE} . In this example, the difference between V_{CC} and V_{EE} is ten volts. Therefore, using the configuration of Figure 15, a maximum analog signal of ten volts peak-to-peak can be controlled. Unused analog inputs/outputs may be left floating (i.e., not connected). However, tying unused analog inputs and outputs to V_{CC} or GND through a low value resistor helps minimize crosstalk and feed-through noise that may be picked up by an unused switch.

Although used here, balanced supplies are not a requirement. The only constraints on the power supplies are that:

$$V_{CC} - GND = 2 \text{ to } 6 \text{ volts}$$

$$V_{EE} - GND = 0 \text{ to } -6 \text{ volts}$$

$$V_{CC} - V_{EE} = 2 \text{ to } 12 \text{ volts}$$

and
$$V_{EE} \leq GND$$

When voltage transients above V_{CC} and/or below V_{EE} are anticipated on the analog channels, external Germanium or Schottky diodes (D_x) are recommended as shown in Figure 16. These diodes should be able to absorb the maximum anticipated current surges during clipping.
