1.8V/2.5V/3.3V, LVCMOS Peak EMI Reduction Clock Generator

Product Description

P3MS650103H device is a spread spectrum frequency modulator clock generator with 1.8 V/2.5 V/3.3 V LVCMOS output designed specifically for clock frequencies between 15 MHz and 60 MHz. P3MS650103H reduces electromagnetic interference (EMI) at the clock source, allowing system wide reduction of EMI of all clock dependent signals. The device allows significant system cost savings by reducing the number of circuit board layers, ferrite beads, and shielding that are traditionally required to pass EMI regulations.

P3MS650103H accepts an LVCMOS input from an external reference clock and locks to a 1x modulated clock output. P3MS650103H goes to power down mode for power save when no clock is present on CLKIN pin. ModOUT goes 'low' in power down mode.

P3MS650103H operates over -20°C to +85°C and is available in a 4 Pin WDFN, (1.2mmX1.0mm) Package.

Features

- Peak EMI Reduction Clock Generator with LVCMOS Output
- Supply Voltage and Input / Output Clock Frequency Range
 - 1.6 V 2.0 V: 15 MHz 30 MHz

2.3 V – 3.6 V: 15 MHz – 60 MHz ±0.45% @ 24 MHz

- Frequency Deviation: ±0.45⁴
 Power Down current less than 1 µA
- 4-pin WDFN (1.2mmX1.0mm) Package
- Output Drive Current: 1.8 V: 8 mA

2.5 V/3.3 V: 16 mA

- Operating temperature range: -20°C to +85°C
- These Devices are Pb–Free, Halogen Free/BFR Free and are RoHS Compliant

Applications

• P3MS650103H is targeted towards consumer electronic applications like mobile Phones, tablets, net books and MIDs

PCB Layout Recommendation

For optimum device performance, following guidelines are recommended.

- Dedicated V_{DD} and GND planes.
- The device must be isolated from system power supply noise. A 0.1µF and a 2.2 µF decoupling capacitor should be mounted on the component side of the board as close to the VDD pin as possible. No vias should be used between the decoupling capacitor and VDD pin. The PCB trace to VDD pin and the ground via should be kept as short as possible. All the VDD pins should have decoupling capacitors.
- In an optimum layout all components are on the same side of the board, minimizing vias through other signal layers.

A typical layout is shown in the figure below.
