About this manual

■　Organization

These specifications provide important information for users of the MN63Y3214N1, including an overview and descriptions of functions.

■　Manual Configuration

Each section of this manual consists of a title, main text, and notes. The layout and definition of each section are shown below.

■　Finding Desired Information

This manual provides two methods for finding desired information quickly and easily.

1. Consult the table of contents at the front of the manual to locate desired titles.
2. Chapter names are located at the top outer corner of each page, and section titles are located at the bottom outer corner of each page.

Chapter 1　Overview

1.1 Features

MN63Y3214N1 is an LSI for RFID (Radio Frequency Identification), which features the following:

· Built-in 8-Kbit non-volatile memory with fast write and low power consumption.

· RF interface compliant with JISX6319-4 (212 kbps / 424 kbps), ISO/IEC14443 TypeA(106 kbps), and ISO/IEC14443 TypeB (106 kbps / 212 kbps / 424kbps) of the 13.56-MHz contactless IC card standards.

· Serial interface compatible with I2C (400 kHz)

· Batteryless RF communication

· Three communication modes of RF, serial, and tunnel (Tunnel mode allows communications between reader/writer and host CPU via this LSI.)

· Access Restriction function of RF communication by password.

· Supply voltage range: 1.7 V to 3.6 V

1.2 Block Diagram

Figure 1-1 shows a block diagram.

This RFID provides RF interface for contactless communication with external reader/writer, serial interface for contact communication with external host, control logic for command processing and various controls, 2-Kbit transmit/receive buffer for RF communication, and 8-Kbit non-volatile memory.
Figure 1-1 Block Diagram

1.3 Operation Mode

This RFID provides three operation modes of RF communication, serial communication, and tunnel.

Figure 1-2 gives the overview of each operation mode.

RF communication mode

This mode is used for communication between reader/writer and RFID. Reader/writer is the master and RFID is the slave. Key commands are read and write commands to non-volatile memory of RFID. This mode allows batteryless operations that use only the power supplied from the antenna of reader/writer.

For more information about RF communication mode, see Chapter 4   RF Communication Mode.

Serial communication mode

This mode is used for communication between host and RFID. Host is the master and RFID is the slave. Key commands are read and write commands to non-volatile memory of RFID. This mode requires a power supply to the supply voltage pin (VDDEX) of RFID.

For more information about serial communication mode, see Chapter 5   Serial Communication Mode.

Tunnel mode

This mode is used for communication between reader/writer and host via RFID. Reader/writer is the master and host is the slave. Key commands are read and write commands to host. This mode requires a power supply to the supply voltage pin (VDDEX) of RFID.

For more information about serial communication mode, see Chapter 7   Tunnel Mode.

Additionally, for state transition diagram in each operation mode, see Section 8.2   State Transition Diagram in Operation Mode.

RF communication mode

Serial communication mode

Tunnel mode
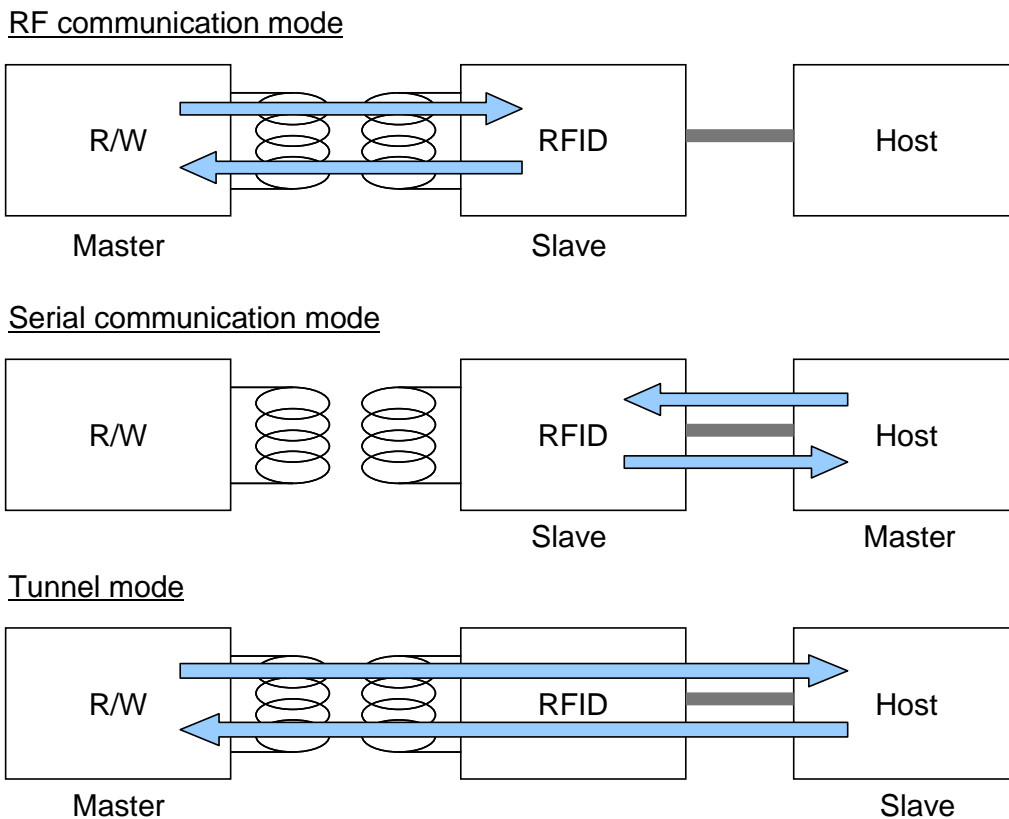

Figure 1-2   Operation Mode

1.4 Password Protected Communication Function

This RFID provides an access restriction function to prevent access from illegal readers/writers.

Figure 1-3 depicts its functionality in each operation mode.

With RF communication mode, it can restrict the access from readers/writers by password, and no access restriction communications are available

Serial communication mode and Tunnel mode allows only plaintext communication.

Chapter 2 Pin Descriptions

2

2.1 List of Pins

Table 2-1 shows a list of pins of this RFID and Figure 2-1 illustrates the pin assignments of this RFID.

Figure 2-2 illustrates the outside drawing of module

Caution: The dimensions of module may be changed, Please identify it on delivery specifications.

Table 2-1 List of Pins

Pin No.	Name	I/O	Output type	Description
1	N.C.	-	-	Non connection
2	VDDEX	-	Power	Contact power supply (Apply 1.7 V through 3.6 V.)
3	SDA	I/O	Open Drain	Host interface (I2C: 400 kHz)
4	VSS	-	GND	Ground
5	NIRQ	Output	Open Drain	Interrupt request output
6	SCL	Input	-	Host interface (I2C: 400 kHz)
Connector : BL509N series (TAIWAN SUNCAGEY INDUSTRIAL CO., Ltd.)

2.2 Pin Descriptions

Ground (VSS)

A reference power supply pin. Connect to the ground of the host CPU.

Contact power supply (VDDEX)

A contact power supply pin. Apply a "high" voltage to this pin when communicating data between the host CPU and RFID.

Host interface I2C (SDA, SCL)

I2C is an N-ch open drain pin, so should be pulled up to VDDEX externally. It is available between the frequencies 1 kHz and 400 kHz. Start the access Constant time(t_{Boot}) after applying VDDEX. For more information about t_{Boot}, see the Product Standards.

Interrupt request (NIRQ)

An N-ch open drain pin to request an interrupt to the host and should be pulled up externally.

2.3 Connection Example

Figure 2-3 gives a connection example.

This example shows that the host's GPIO controls the RFID's VDDEX. In this case, when not using serial communication, turning VDDEX off allows the consumption current of the RFID to be turned off. In addition, it is also possible to supply a voltage to VDDEX directly from the power supply, not from the host's GPIO.

The SDA (IO) and NIRQ pins are open-drain output. Pull up these pins to the same voltage level as the power supply of the host.

In addition, in the figure 2-3 Connection Example, Leakage current flows by the pull-up of a NIRQ terminal.

It is not concerned with ON/OFF of VDDEX but the leakage current about below 0.1μA (actual measurement) flows into a NIRQ terminal.

Figure 2-3 Connection Example

Chapter 3 Memory Map

3

3.1 Block Configuration

Figure 3-1 illustrates the block configuration of 8Kbit non-volatile memory.

This LSI consists of 64 non-volatile memory blocks. The size of a block is 16 bytes.

The memory consists of two areas: user and system areas.

The system area stores RF-communication-related parameters and memory-access-control-related data, etc.

Block	Area	Type
0	16-bytes non-volatile memory	User area
1	16-bytes non-volatile memory	
2	16-bytes non-volatile memory	
3	16-bytes non-volatile memory	
…	…	
56	16-bytes non-volatile memory	
57	16-bytes non-volatile memory	
58	16-bytes non-volatile memory	
59	16-bytes non-volatile memory	
60	16-bytes non-volatile memory	System area
61	16-bytes non-volatile memory	
62	16-bytes non-volatile memory	
63	16-bytes non-volatile memory

Figure 3-2 Physical Memory Map

3.3 System Area

This section describes the system area.

3.3.1 Parameter Specifications

Each parameter of the system area is shown below.

All addresses and block numbers used in this section correspond to the physical address in Figure 3-2.

■　RORF (4 bytes)

RORF, SECURITY, and ACC of HW1 are an area to specify whether read/write or read-only is to be used in accessing the block by memory access commands in RF communication mode. Table 3-1 and Table 3-2 describe ACC, RORF and SECURITY setting, and Table 3-3 describe setting bits and corresponding block numbers. By default, all values are 0. Set all reserved bits to 0.

Table 3-1 RORF and SECURITY Setting at ACC="0"

Value		Meaning -	
SECURITY	RORF	Bef. Password Authentication	Aft. Password Authentication
0	0	READ/WRITE	READ/WRITE
0	1	READ ONLY	READ ONLY
1	0	Cannot Access	READ/WRITE
1	1	Cannot Access	READ ONLY

Table 3-2 RORF and SECURITY Setting at ACC="1"

Value		Meaning -	
SECURITY	RORF	Bef. Password Authentication	Aft. Password Authentication
0	0	READ/WRITE	READ/WRITE
0	1	READ ONLY	READ ONLY
1	0	Cannot Access	READ/WRITE
1	1	READ ONLY	READ/WRITE

Table 3-3 RORF Setting Bits and Corresponding Block Numbers

Address	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
0x03F0	Block16-19	Block12-15	Block8-11	Block4-7	Block3	Block2	Block1	Block0
0x03F1	Block48	Block44-47	Block40-43	Block36-39	Block32-35	Block28-31	Block24-27	Block20-23
0x03F2	Block56	Block55	Block54	Block53	Block52	Block51	Block50	Block49
0x03F3	Reserved	Reserved	Reserved	Reserved	Reserved	Block59	Block58	Block57

Note:　The default value of an ACC parameter is "0".

■   SECURITY (4 bytes)

For detail of SECURITY, refer to Table 3-1 and Table 3-2.

Table 3-4 shows SECURITY setting bits and corresponding block numbers. By default, all values are 0. Set all reserved bits to 0.

Table 3-4   SECURITY Setting Bits and Corresponding Block Numbers

Address	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
0x03F8	Block16-19	Block12-15	Block8-11	Block4-7	Block3	Block2	Block1	Block0
0x03F9	Block48	Block44-47	Block40-43	Block36-39	Block32-35	Block28-31	Block24-27	Block20-23
0x03FA	Block56	Block55	Block54	Block53	Block52	Block51	Block50	Block49
0x03FB	Reserved	Reserved	Reserved	Reserved	Reserved	Block59	Block58	Block57

■   ROSI (4 bytes)

ROSI is an area to specify whether read/write or read-only is to be used in accessing the block by memory access commands in serial communication mode. Table 3-5 describes ROSI setting, and Table 3-6 shows ROSI setting bits and corresponding block numbers. By default, all values are 0. Set all reserved bits to 0.

Table 3-5 ROSI Setting

Value	Meaning
0	Read/Write
1	Read only

Table 3-6 ROSI Setting Bits and Corresponding Block Numbers

Address	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
0x03F4	Block16-19	Block12-15	Block8-11	Block4-7	Block3	Block2	Block1	Block0
0x03F5	Block48	Block44-47	Block40-43	Block36-39	Block32-35	Block28-31	Block24-27	Block20-23
0x03F6	Block56	Block55	Block54	Block53	Block52	Block51	Block50	Block49
0x03F7	Reserved	Reserved	Reserved	Reserved	Reserved	Block59	Block58	Block57

■   HW1 (2 bytes)

HW1 is an area to store various setting data related to the hardware of this RFID.

Table 3-7 describes the HW1 parameter.

For the setting of the ACC, see Table 3-1 and Table 3-2, for the setting of the SWTX, see

Table 3-8 and for the setting of the TYPBSPD, see Table 3-9.

For the setting of the IDMSEL, see Table 3-10, and for the setting of RFSPD, see Table 3-11, and for the setting of RFTYPE, see Table 3-12. For the setting of the I2C_SLV, see Table3-13. Set all reserved bits to 0.

Table 3-7 HW1 Parameters

Address	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0x03EE	ACC	SWTX	TYPBSPD	IDMSEL	PFSPD	RFTYPE		
0x03EF	Reserved	I2C_SLV						

Table 3-8 S(WTX) setting

bit6	Meaning
0	S(WTX) Block invalid(default)
1	S(WTX) Block valid

Table 3-9 TYPBSPD setting

Bit5	Meaning
0	Do not set
1	Limited data rare to 106, 212, 424 kbps for ISO/IEC14443 TypeB communication.

Note:　A TYPBSPD parameter is certainly setting it as "1".

The setting of TYPBSPD is valid when RFSPD is set to "0"

Table 3-10　IDMSEL Setting for Selecting IDM Data

Bit 4	Meaning
0	Use the fixed values (All-0) as JISX6319-4 PICC identifier or ISO/IEC14443 TypeA/B PICC. Values written in the system area are not used. (default)
1	Use the values written in the system area as JISX6319-4 PICC identifier or ISO/IEC14443 TypeA/B PICC.

Table 3-11 RFSPD parameter

Bit3	Meaning
0	No limit data rate for ISO/IEC14443 TypeB, JISX6319-4
1	Limited data rare to 106kbps for ISO/IEC14443 TypeB, and 212 kbps for JISX6319-4 communication (default)

Note:　A RFSPD parameter is certainly setting it as "0".

Table 3-12 RFTYPE Setting for Selecting RF Communication Protocol

Bit 2	Bit1	Bit 0	Meaning
0	0	1	Use JISX6319-4 only. (ISO/IEC14443 TypeA/B interface disabled)
0	1	0	Use ISO/IEC14443 TypeB only. (JISX6319-4, ISO/IEC14443 TypeA interface disabled)
0	1	1	Use JISX6319-4 and ISO/IEC14443 TypeB. (Automatic protocol detection, ISO/IEC14443 TypeA interface disabled)
1	0	0	Use ISO/IEC14443 TypeA only. (JISX6319-4 and ISO/IEC14443 TypeB interface disabled)
1	1	0	Use ISO/IEC14443 TypeA/B. (Automatic protocol detection, JISX6319-4 interface disabled)
1	1	1	Use JISX6319-4 and ISO/IEC14443 TypeA/B. (Automatic protocol detection) (default)
Others			Do not set

Table 3-13 I2C_SLV Setting for Specifying I2C Slave Address

Address	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Default value	1	0	1	0	1	0	0

■   TNPRM (1 byte)

TNPRM is an area to store various setting data related to timeout in TUNNEL Mode.

For more information about this parameter, see Section 7.3.4 Timeout.

Table 3-14 describes the TNPRM parameter.

Table 3-14 TNPRM Parameters

Address	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0x03FC	QWT				AWT			

■   QWT

QWT specifies the maximum wait time until the RFID receives a QUERY command from the host after it sends an IRQ to the host during tunnel mode operation.

QWT is determined using the following formula.

$$\text{Maximum wait time for QUERY command} = T \times 2^{QWT}$$

T: Typ. 1024 µs (±33%)

QWT: 0 to 8 (default: 4; typ. approximately 16 ms)

When this field is set to a value other than 0 to 8, a default value will be applied.

■   AWT

AWT specifies the maximum wait time until the RFID receives an ANSWER command from the host after it sends a response to the QUERY command to the host during tunnel mode operation.

AWT is determined using the following formula.

$$\text{Maximum wait time for ANSWER command} = T \times 2^{AWT}$$

T: typ. 1024 µs (±33%)

AWT: 0 to 12 (default: 7; typ. approximately 131 ms)

When this field is set to a value other than 0 to 12, a default value will be applied.

Note: T includes an error of ±33%. Set the QWT and AWT values in consideration of the error.

■ HW2 (1 byte)

HW2 is an area to store various setting data related to the hardware of this RFID.

Table 3-15 describes the HW2 parameter. INTWT and RESWT are parameters related to timeout in I2C communication. For the setting of IRQSEL for IRQ notification, see Table 3-16.

Table 3-15   HW2 Parameters

Address	Bit 7	Bit 6	Bit 5	Bit 4	Bi t3	Bit 2	Bit 1	Bit 0
0x03FD	INTWT		RESWT		IRQSEL			

■ INTWT

INTWT specifies the maximum wait time between the SCL clock edges in I2C communication.

INTWT is determined using the following formula. See 5.2.6 Time Chart.

$$\text{Maximum wait time between SCL clock edge} = T \times 2^{INTWT}$$

T: Typ. 6.16ms (±33%)

INTWT: 0 to 3 (default:2; typ. approximately 25ms)

■ RESWT

RESWT specifies the maximum wait time from the start of response to the command (NIRQ = L) until slave transmission request input in I2C communication. And in addition, it is applied to the maximum wait time between each access in divided access.

RESWT is determined using the following formula. See 5.2.6 Time Chart.

$$\text{Maximum wait time for starting response} = T \times 2^{RESWT}$$

T: Typ. 24.6ms(±33%)

RESWT: 0 to 3: (default:2, typ. approximately 98 ms)

Note: T includes an error of ±33%. Set the INTWT and RESWT values in consideration of the error.

■　IRQSEL

IRQSEL is used for IRQ notification to add the condition of generating an interrupt to the NIRQ pin.

Setting IRQSEL allows an additional interrupt to be generated in addition to a normal host command processing complete interrupt and tunnel mode interrupt.

There are four user-selectable additional interrupt sources, reader/writer magnetic-field detection, RF transmission completion interrupt, RF writing interrupt, or RF reading interrupt.

In addition, RF reading interrupt can set a range of access target area by IRQBS and IRQBE.

RF writing interrupt generates an interrupt when writing is started to non-volatile memory.

RF reading interrupt generates an interrupt when the response transmission for non-volatile memory access is completed.

For more information about interrupt source, see Chapter 6　Interrupt Generation Function.

The IRQSEL settings are as follows.

Table 3-16　IRQSEL Setting

Bit	Meaning
Bit3	Generate an interrupt on RF writing. (*1)
Bit2	Generate an interrupt on RF reading (*2,*3)
Bit1	Generate an interrupt when RF transmission is completed.
Bit0	Generate an interrupt when a magnetic field is detected.

(*1) The interrupt NIRQ is generated when writing is started to non-volatile memory.

(*2) The interrupt NIRQ is generated at the time the non-volatile memory read response

　　　transmissions is completed

(*3) The target block of non-volatile memory read out can be set by IRQBS, IRQBE

For the set value of each bit of IRQSEL, interrupt generation is disabled when setting 0 (non-selective), and enabled when setting 1.

By default, the value of IRQSEL is 0.

■　SC (2 bytes)

SC is used as the JISX6319-4 system code (2 bytes). For more information about system code, see Section 4.2.5.1　System Code.

Table 3-17 SC Parameters

Address	0x03E0	0x03E1
JISX6319-4 system code (2 bytes)	D0	D1
Default	0xAA	0xFF

■　IDM (8 bytes)

IDM is used as JISX6319-4 PICC (Proximity IC Card) identifier (8 bytes). The PUPI (Pseudo-Unique PICC Identifier) (4 bytes) of ISO/IEC14443 TypeA/B is shared with the lower 4 bytes of the JISX6319-4 PICC identifier. For information about JISX6319-4 PICC identifier, see Section 4.2.5.2　　PICC (Proximity IC Card)

Identifier, and for information about ISO/IEC14443 TypeA/B PUPI, see Section 4.3.8.1 PUPI.

Table 3-18 IDM Parameters

Address	0x03E2	0x03E3	0x03E4	0x03E5	0x03E6	0x03E7	0x03E8	0x03E9
JISX6319-4 PICC identifier (8 bytes)	D0	D1	D2	D3	D4	D5	D6	D7
Default	0x02	0xFE	0x00	0x00	0x00	0x00	0x00	0x00
ISO/IEC14443TypeA/B PUPI (4 bytes)	Reserved				D0	D1	D2	D3
Default	-	-	-	-	0x00	0x00	0x00	0x00

Note: In order to validate the value written in the system area IDM, the HW parameter's IDMSEL must be set to 1. See Table 3-10.

■　PMM (2 bytes)

Of the JISX6319-4 response time descriptor (8 bytes), PMM is an area (2 bytes) to specify maximum wait time for the response to READ/WRITE commands. See Section 4.2.5.3 .

Table 3-19 PMM Parameters

Address	0x03EA	0x03EB
JISX6319-4 Response time descriptor (2 bytes)	D0	D1
Default	0xFF	0xFF

■　AFI (1 byte)

AFI is an area to specify AFI (Application Family Identifier) of ISO/IEC14443 TypeA/B. See Section 4.4.8.1 AFI.

Table 3-20 AFI Parameters

Address	0x03EC
ISO/IEC14443 TypeA/B AFI (1 byte)	D0
Default	0x00

■　HW3 (1 byte)

HW3 is an area to specify FWI (Frame Waiting time Integer) of ISO/IEC14443 TypeA/B and WTXM (waiting time extension multiplier).

See Section 4.3.8.2 FWI (Frame Waiting time Integer), and Section 4.3.8.3 WTXM (waiting time extension multiplier) for WTXM

Table 3-21　HW3 parameter

Address	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
0x03ED	FWI				WTXM			

	(Default = 0x8)	(Default : 0x4)

■   IRQBS

IRQBS set the top block address of non-volatile memory to be interrupted, on RF reading interruption.

The value between 0x00 to 0x3F is available to be set

If other value than mentioned above is set, a default value (0x00) will be applied.

Table 3-22 IRQBS parameter

Address	0x03D5
IRQBS	D0
Default	0x00

■   IRQBE

IRQBS set the end block address of non-volatile memory to be interrupted, on RF reading interruption.

The value between 0x00 to 0x3F is available to be set

If other value than mentioned above is set, a default value (0x00) will be applied.

In addition, when the value to be set is IRQBE < IRQBS, the same value as IRQBS will be applied for IRQBE.

Table 3-23 IRQBE parameter

Address	0x03D6
IRQBE	D0
Default	0x3F

An interrupt on RF reading will be generated when any block of non-volatile memory set by IRQBS and IRQBE to be readout.

■   HWCF

It is a system reserved area. Set reserved bits to 0x02. (default value is 0x00)

Table 3-24 HWCF parameter

Address	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
0x03D7	Reserved							

■   CONFIG

See the Administrator's Manual.

3.3.2 Enabling System Area

In order to enable parameters in the system area, CFEN and BCC (see the Administrator's Manual) of the system area must be set to valid values. If CFEN and BCC are not set to valid values, default values defined by each parameter will be applied.

Table 3-25 lists the setting application timings after rewriting parameters in the system area while CFEN and BCC are enabled. New parameter setting is applied to RORF, ROSI, and SECURITY immediately after rewriting, and applied to other parameters after turning power supply ON from OFF, or applied to other parameters after the self-reset by the WREG command of the serial communication.

Table 3-25 Parameter Application Timing

	A timing at which new parameter setting is applied after rewriting parameters when CFEN and BCC is enabled.
RORF	Apply immediately after rewrites.
ROSI	Apply immediately after rewrites.
SECURITY	Apply immediately after rewrites.
IRQBS	After rewrites, Apply after turning power ON from OFF or self-reset.
IRQBE	After rewrites, Apply after turning power ON from OFF or self-reset.
HW1	After rewrites, Apply after turning power ON from OFF or self-reset.
TNPRM	After rewrites, Apply after turning power ON from OFF or self-reset.
HW2	After rewrites, Apply after turning power ON from OFF or self-reset.
SC	After rewrites, Apply after turning power ON from OFF or self-reset.
IDM	After rewrites, Apply after turning power ON from OFF or self-reset.
PMM	After rewrites, Apply after turning power ON from OFF or self-reset.
AFI	After rewrites, Apply after turning power ON from OFF or self-reset.
HW3	After rewrites, Apply after turning power ON from OFF or self-reset.
CONFIG	See the Administrator's Manual.

Note: Power OFF means power supplies from both VDDEX and RF interface are OFF.

3.4　Address Correspondence

Figure 3-3 presents the physical address and the corresponding address of each communication mode.

Physical address		Serial communication mode	RF communication mode	
			JISX6319-4	ISO/IEC14443
Block0	0x0000	0x0000	Block No. 0	D0	0x0000

Chapter 4 RF Communication Mode

4

4.1 RF Communication Mode Sequence

Figure 4-1 illustrates the sequence in RF communication mode. Each sequence is described below.

SNo.1: A reader/writer sends an RF communication mode command to the RFID.

SNo.2: Once the RFID receives the RF communication mode command described in SNo.1, it processes the command and then sends the result to the reader/writer as the response to the command.
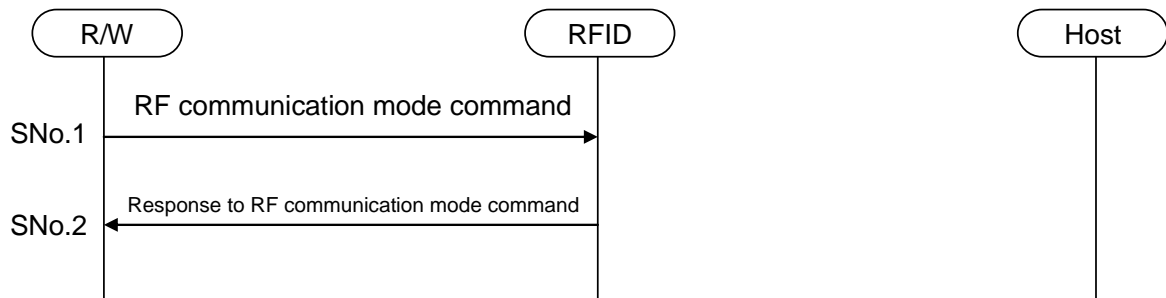

Figure 4-1 RF Communication Mode Sequence

4.2 JISX6319-4 Specification

This section describes the JISX6319-4 specification of this RFID.

4.2.1 Communication Specifications

Table 4-1 shows the JISX6319-4 specification of this RFID.

Table 4-1 JISX6319-4 Communication Specification

Carrier frequency		13.56 MHz
Modulation mode, Bit encoding	R/W→RFID	ASK10%, Manchester encoding
	RFID→R/W	Load modulation, Manchester encoding
Data rate		212 kbps / 424 kbps
Character transmission		· MSB-first · Data (8 bits) · No start bit · No parity bit · No stop bit · No spare time between characters

4.2.2 Frame Format

Figure 4-2 illustrates the JISX6319-4 frame format and Table 4-2 defines the fields.
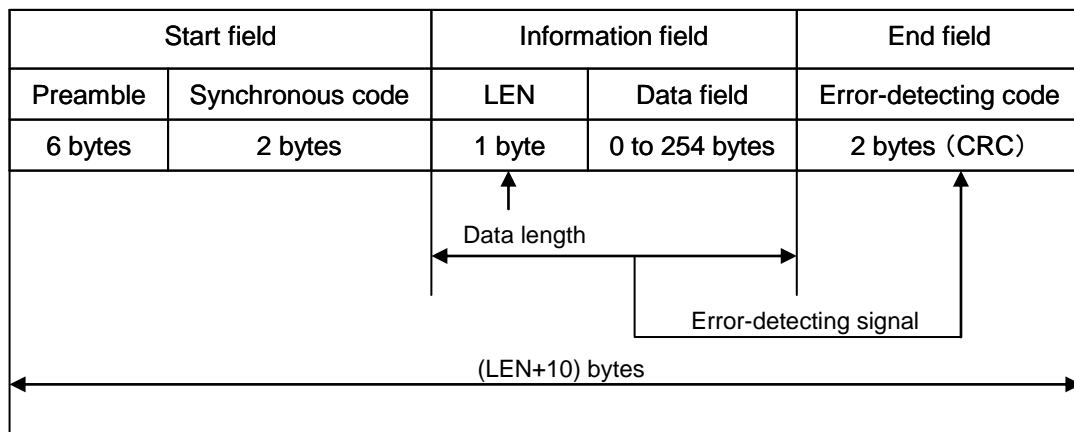

Figure 4-2 JISX6319-4 Frame Format

Table 4-2 JISX6319-4 Field Definition

Field name	Byte length	Definition
Preamble	6	0x000000000000
Synchronous code	2	0xB24D
LEN	1	n (data field length) + 1
Data field	n	Command message or Response message
Error-detecting code	2	Initial value: 0000, CRC (Generating polynomial: $X^{16}+X^{12}+X^5+1$)

4.2.3 State Transition Diagram

Figure 4-3 shows the state transition diagram for the JIX6319-4 PICC of this RFID.
Figure 4-3 State Transition Diagram of JISX6319-4 PICC

4.2.4 Flow Chart

Figure 4-4 gives the flow chart for JIX6319-4 command processing of this RFID.
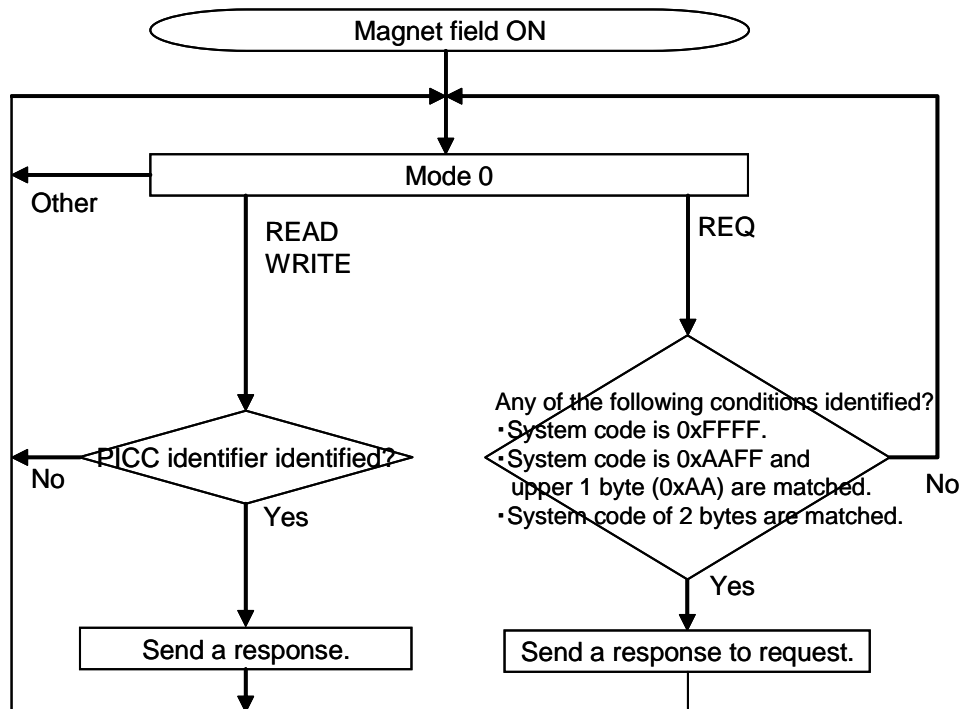

Figure 4-4 JISX6319-4 Flow Chart of Command Processing

4.2.5 Various Settings

This section describes the parameter settings and operation specifications based on JISX6319-4 for this RFID.

4.2.5.1 System Code

System code is a parameter specified by the REQ command that is used to identify the RFID. Figure 4-5 shows the system code. The value of the SC parameter of system area is applied for system code.

The response operation to the REQ command by system code is shown in Table 4-3.

System code

D0	D1
SC	
Figure 4-5 System Code

Table 4-3 Response to REQ Command by System Code

REQ command System code setting value	RFID's response to REQ command
0xFFFF	Responds regardless of the system area SC setting
0xAAFF	When the value of the upper 1 byte of the SC system area is 0xAA, the RFID responds regardless of the value of the lower 1 byte.
Other	Responds only when the setting value of the REQ command's system code matches the value specified in the system area SC (and does not respond in other cases).

4.2.5.2 PICC (Proximity IC Card) Identifier

The PICC (Proximity IC Card) identifier is a data used to identify RFID, and is included in the response to the REQ command. Figure 4-6 illustrates the PICC identifier's format. For The PICC identifier (8 bytes), the system area IDM is applied

PICC identifier

D0	D1	D2	D3	D4	D5	D6	D7
IDM							
Figure 4-6   PICC Identifier Format

4.2.5.3 Response Time Descriptor

The response time descriptor is used to specify the maximum wait time until the RFID sends a response after reader/writer sends a command, and is included in the response to the REQ command. Figure 4-7 illustrates the response time descriptor's format. In hardware, D0, D1, and D7 bytes are set to FFh and D2 to D4 bytes are set to 00h.

The PMM parameter values of the system area are applied to the response time calculation parameters D5 and D6 bytes

Table 4-4 shows the response time calculation parameter and corresponding command.

Response time descriptor

D0	D1	D2	D3	D4	D5	D6	D7
0xFF	0xFF	0x00	0x00	0x00	PMM		0xFF

Response time calculation parameter
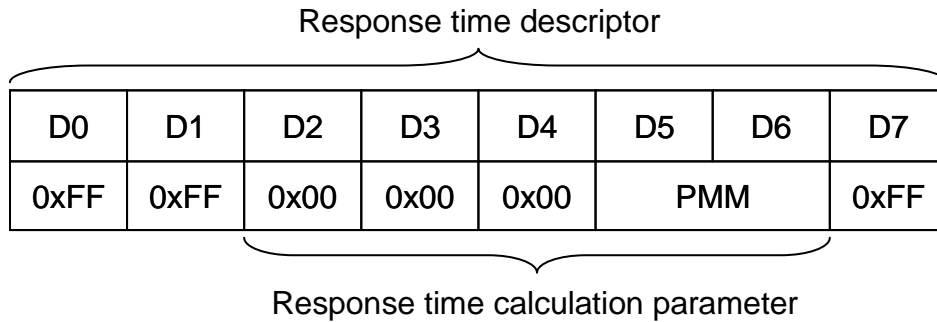

Figure 4-7 Response Time Descriptor Format

Table 4-4 Response Time Calculation Parameter and Corresponding Command

Response time calculation parameter	Command
D5	READ
D6	WRITE

Figure 4-8 shows the response time calculation parameter's format.

msb   lsb

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Exponent E		Real number B			Real number A		
Figure 4-8 Response Time Calculation Parameter Format

The response time is calculated by the following formula:

$$\text{Response time} = T \times [(B + 1) \times n + (A + 1)] \times 4^E$$

T: $256 \times 16/fc$ (approx. 0.302 ms)

n: No. of blocks or No. of files of command parameter.

4.2.5.4 Anti-collision

JISX6319-4 uses the time slot method for anti-collision (prevention of collision). This RFID always responds according to the first slot.

4.2.5.5 Service

This RFID does not implement the concept of service based on JISX6319-4.

However, it is possible to specify multiple services using a command service list. Table 4-5 shows the available maximum number of services. When specifying multiple services in the service list, the values of service list must be set to the same value.

Table 4-5 Maximum Numbers of Services

Command	Maximum No. of services
READ	15
WRITE	11

Note: The RFID responds with an error when multiple services are not set to the same service file value.

4.2.5.6 Block

JISX6319-4 uses data of 16-byte blocks. Block number is used to specify each block. Figure 4-9 shows the block element of 2 bytes and Figure 4-10 shows the block element of 3 bytes. All of bits 6 to 4 of byte D0 for access mode setting should be set to 0 in this RFID; otherwise the RFID responds with an error.

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Definition	-	Access mode			Order of service code				Block number							
This RFID's setting value	1	0	0	0	Don't care				Block number designation							
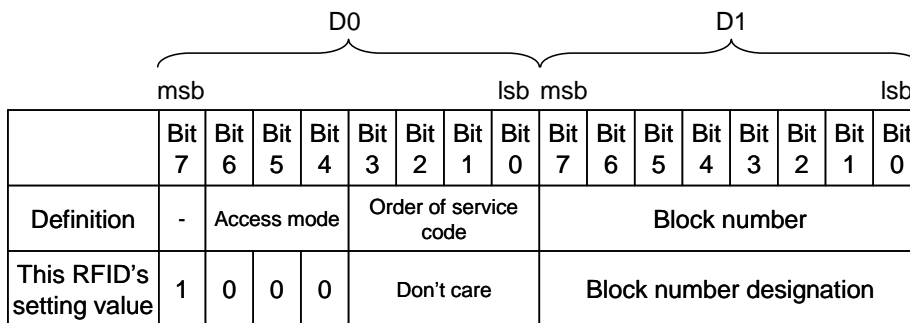

Figure 4-9 Block Element of 2 Bytes

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Definition	-	Access mode			Order of service code				Block number															
This RFID's setting value	0	0	0	0	Don't care				Block number designation								0	0	0	0	0	Mode setting		
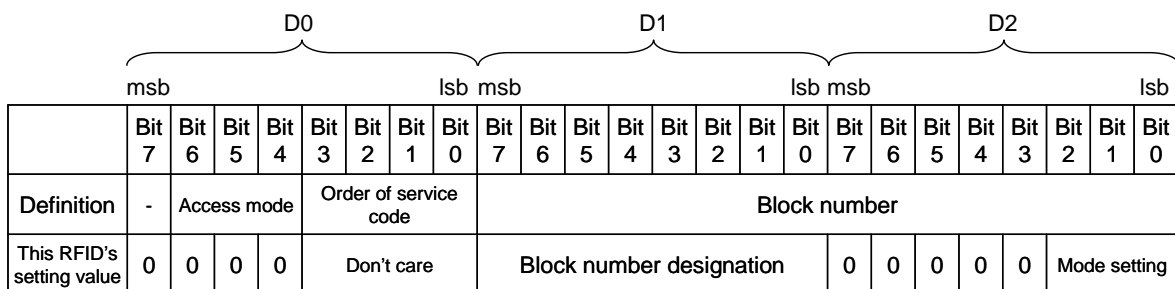

Figure 4-10 Block Elements of 3 Bytes

This RFID uses a block number to specify tunnel mode and VERIFY mode (only on the write command). Table 4-6 shows the mode settings. Bits 2 to 0 of byte D2 in 3-byte block element format are used. All of bits 7 to 3 of byte D2 should be set to 0; otherwise the RFID responds with an error.

Table 4-6 Mode Settings

Block element format	Byte D2 of block No.			Meaning
	Bit 2	Bit 1	Bit 0	Communication mode
2 bytes	-	-	-	RF communication mode
3 bytes	0	0	0	
	0	0	1	VERIFY mode (on the write command)
	1	0	0	TUNNNEL mode
	Others			prohibited

Table 4-7 shows the available maximum number of blocks. For READ command, the number is 15. The maximum number of blocks for WRITE command depends on the number of services.

Table 4-7 Maximum Numbers of Blocks

Command	Communication mode	No. of services	Maximum No. of blocks
READ	RF communication mode, Tunnel mode	1 to 15	15
WRITE	RF communication mode, Tunnel mode	1 to 8	12
		9 to 11	11
	VERIFY mode	1 to 11	1

4.2.5.7 Block List

For tunnel mode, how to specify block list is slightly different from the JISX6319-4 specification. Figure 4-11 shows the block list referenced from this RFID.

(1) Plaintext communication in RF communication mode: The block number of block list can be set freely. The RFID references to all block numbers.

(2) Plaintext communication in tunnel mode: The block number of block list should be set in ascending order. The RFID checks that the block number is set in ascending order and if not, it responds with an error.

Note: When specifying multiple blocks, communication mode (RF communication mode/ tunnel mode) for all blocks should be configured to the same setting; if not, the RFID responds with an error.

Note: When setting block numbers in ascending order, set to 0x00 following the block number 0xFF (and set to 0x01 following 0x00). Mode setting (bits 2 to 0 of byte D2) for all blocks should be set to the same value.

(1) Plaintext Communication in RF Communication mode	No. of blocks	Block list					
	m	Block element 1 (Block No. a)	Block element 2 (Block No. b)	Block element 3 (Block No. c)	··· Block element (m -2) (Block No. d)	Block element (m -1) (Block No. e)	Block element m (Block No. f)

Block number can be set freely.

(2) Plaintext Communication in tunnel mode	No. of blocks	Block list					
	m	Block element 1 (Block No. a)	Block element 2 (Block No. a+1)	Block element 3 (Block No. a+2)	··· Block element (m -2) (Block No. a+m -3)	Block element (m -1) (Block No. a+m -2)	Block element m (Block No. a+m -1)

Set the first block.   Set the block numbers in ascending order from the first block.

Figure 4-11 Block List Referenced from this RFID

4.2.5.8 Status Flag

Table 4-8 lists the meanings of status flags.

Table 4-8 Status Flag

Status flag 1	Status flag 2	Meaning	Description
0x00	0x00	Normal end	Terminated normally.
0xFF	0x50	Tunnel mode error	No response from the host
0xFF	0x51	Tunnel mode error	The host responded with an error.
0xFF	0xA1	Service count specification error	The number of service files was out of the specification.
0xFF	0xA2	Block count specification error (*)	The number of blocks was out of the specification.
0xFF	0xA3	Service count specification error	Some settings for multiple services were different from the specification.
0xFF	0xA5	Block specification error	・ Illegal access mode setting (except All-0) ・ Illegal mode setting (RFU setting) ・ Block number was specified outside non-volatile memory. ・ Ascending order was not used to specify block numbers in tunnel mode.
0xFF	0x60	Self-diagnosis error (*)	・ Write access to non-volatile memory-Read-Only area (RORF setting) ・ Access to password protected area without password authentication (SECURITY setting)

(*) For more information about these errors, see the Administrator's Manual.

4.2.6 Command

Table 4-9 lists the JISX6319-4 commands supported by this RFID.

Subsequent sections describe each command in detail.

Table 4-9 JISX6319-4 Command List

Name	Code	Description
REQ	0x00	Reader/writer identifies RFID with this command.
READ	0x06	Reads data of RFID from reader/writer or, in tunnel mode, reads data of the host from reader/writer.
WRITE	0x08	Writes data to RFID from reader/writer or, in tunnel mode, writes data to the host from reader/writer.
VERIFY	0x08	Perform the password authentication. This command is applied when the VERIFY mode is specified by WRITE command

4.2.6.1 REQ

■   Purpose

Reader/writer identifies RFID with this command.

■   Command message

● Format

Command code	System code	Request code	Timeslot
1 byte	2 bytes	1 byte	1 byte

● Data field

Field	Setting	Remarks
Command code	0x00	
System code	・ 0xFFFF: Identifies all RFIDs. ・ 0xAAFF: Identifies RFID compliant with JIXS6319-4, regardless of category. ・ Other: The RFID corresponding to the specified system code responds.	
Request code	・ 0x00: No request ・ 0x01: Additional system code request ・ 0x02: Additional transmission protocol capability request	When values other than the values on the left column are set, the RFID treats this field as 0x00 (no request)
Timeslot	0x00: One slot	This RFID always treats this field as 0x00.

■   Response message

● Format

Response code	PICC identifier	Response time descriptor	Request data
1 byte	8 bytes	8 bytes	0 or 2 bytes

● Data field

Field	Output value	Remarks
Response code	0x01	
PICC identifier	See 4.2.5.2 PICC (Proximity IC Card) Identifier.	
Response time descriptor	See 4.2.5.3 Response Time Descriptor	
Request data	・ Request code 0x00: Request data 0 bytes (No additional data) ・ Request code 0x01: Adds system code. ・ Request code 0x02: 0x0083 (212 kbps, 424 kbps, automatic data rate detection supported) *1	*1) Response for that RFSPD parameter setting is 0 When the RFSPD setting is 1, "0x0001" will be applied (212kbps supported, automatic data rate detection Non-supported)

4.2.6.2 READ

■   Purpose

Reads data of RFID from reader/writer or, in tunnel mode, reads data of the host from reader/writer.

■   Command message

● Format

Command code	PICC identifier	No. of service file identifiers (k)	List of service file identifiers	No. of blocks (m)	Block list
1 byte	8 bytes	1 byte	2×k bytes	1 byte	2×m or 3×m bytes

● Data field

Field	Setting	Remarks
Command code	0x06	
PICC identifier	PICC identifier acquired by REQ command described in Section 4.2.6.1 REQ.	
No. of service file identifiers (k)	Number of service files Setting range: 0x01(1) to 0x0F(15)	When the range other than the range on the left column is set, the RFID responds with an error.
List of service file identifiers	Don't care (Setting example: 0x0900)	When specifying multiple services, the RFID responds with an error if all service files are not set to the same value.
No. of blocks (m)	Number of blocks specified in block list Setting range: ・ Plaintext communication in RF communication mode: 0x01(1) to 0x0F(15) ・ Other: 0x01(1) to 0x0F(15)	When the range other than the range on the left column is set, the RFID responds with an error.
Block list	Block list of data to be read For information about how to set, see the following: ・ 4.2.5.6 Block ・ 4.2.5.7 Block List	

■   Response message

●   Format

Response code	PICC identifier	Status flag 1	Status flag 2	No. of blocks (m)	Block data
1 byte	8 bytes	1 byte	1 byte	1 byte	16×m byte

●   Data field

Field	Output value	Remarks
Response code	0x07	
PICC identifier	See 4.2.5.2 PICC (Proximity IC Card) Identifier.	
Status flag 1	See 4.2.5.8 Status Flag	
Status flag 2	See 4.2.5.8 Status Flag.	
No. of blocks (m)	Number of blocks specified by the command	Omitted when the status is not "Normal end"
Block data	See 4.2.5.7 Block List.	Omitted when the status is not "Normal end"

4.2.6.3 WRITE

■　Purpose

Writes data to RFID from reader/writer or, in tunnel mode, writes data to the host from reader/writer.

■　Command message

●　Format

command code	PICC identifier	No. of service file identifiers (k)	List of service file identifiers	No. of blocks (m)	Block list	Block data
1 byte	8 bytes	1 byte	2×k bytes	1 byte	2×m or 3×m bytes	16×m bytes

●　Data field

Field	Setting	Remarks
Command code	0x08	
PICC identifier	PICC identifier acquired by REQ command described in Section 4.2.6.1	
No. of service file identifiers (k)	Number of service files Setting range: 0x01(1) to 0x0B(11)	When the range other than the range on the left column is set, the RFID responds with an error.
List of service file identifiers	Don't care (Setting example: 0x0900)	When specifying multiple services, the RFID responds with an error if all service files are not set to the same value.
No. of blocks (m)	Number of blocks specified in block list Setting range: ・ No. of service files is 1 to 8: 0x01(1) to 0x0C(12) ・ No. of service files is 9 to 11: 0x01(1) to 0x0B(11)	When the range other than the range on the left column is set, the RFID responds with an error.
Block list	Block list of data to be written For information about how to set, see the following: ・ 4.2.5.6　Block ・ 4.2.5.7　Block list	Set the RF communication mode or tunnel mode
Block data	See 4.2.5.7　Block list	

Note) The VERIFY command limits the number of blocks of the WRITE command, a block list, and block data settings. See 4.2.6.4 VERIFY for detail.

■　Response message

●　Format

Response code	PICC identifier	Status flag 1	Status flag 2
1 byte	8 bytes	1 byte	1 byte

● Data field

Field	Output value	Remarks
Response code	0x09	
PICC identifier	See 4.2.5.2 PICC (Proximity IC Card) Identifier.	
Status flag 1	See 4.2.5.8 Status Flag.	
Status flag 2	See 4.2.5.8 Status Flag.	

4.2.6.4   VERIFY

■   Purpose

Perform the password authentication.

■   Command message

● Format

Command code	PICC identifier	No. of service file identifiers (k)	List of service file identifiers	No. of blocks (m)	Block list	Block data
1 byte	8 bytes	1 byte	2×k bytes	1 byte	2×m or 3×m bytes	16×m bytes

● Data field

Field	Setting	Remarks
Command code	0x08	
PICC identifier	PICC identifier acquired by REQ command described in Section 4.2.6.1	
No. of service file identifiers (k)	Number of service files Setting range: 0x01(1) to 0x0B(11)	When the range other than the range on the left column is set, the RFID responds with an error.
List of service file identifiers	Don't care (Setting example: 0x0900)	When specifying multiple services, the RFID responds with an error if all service files are not set to the same value
No. of blocks (m)	0x01	When the range other than the range on the left column is set, the RFID responds with an error.
Block list	0x000001	Set the VERIFY mode
Block data	16 bytes	

Note) The VERIFY command control the number of blocks of the WRITE command, a block list, and block data settings as shown above.

■　　Response message

●　Format

Response code	PICC identifier	Status flag 1	Status flag 2
1 byte	8 bytes	1 byte	1 byte

●　Data field

Field	Output value	Remarks
Response code	0x09	
PICC identifier	See 4.2.5.2　PICC (Proximity IC Card) Identifier.	
Status flag 1	See 4.2.5.8　Status Flag.	
Status flag 2	See 4.2.5.8　Status Flag.	

4.2.7 NDEF

This RFID is based on Type3 Tag and Type4 Tag of NFC Forum and supports data exchange of a NDEF format.

This section explains Type3 Tag.

In addition, 4.3.10 NDEF explains Type4 Tag of NFC Forum.

Data exchange of NDEF can be performed by performing a predetermined setup to the user area of non-volatile memory.

Please refer to the applicable written standards of NFC Forum for the details of NDEF.

4.2.7.1 MEMORY MAP

The memory map at the time of NDEF use is shown in Fig. 4-12

Attribute Information Block is arranged to Block0.

NDEF file is arranged from Block1 to Block59.

Block	Address	0x0	0x1	0x2	0x3	0x4	0x5	0x6	0x7	0x8	0x9	0xA	0xB	0xC	0xD	0xE	0xF
0	0x0000	Attribute Information Block																
1	0x0010																
2	0x0020																
3	0x0030																
4	0x0040																
5	0x0050																
6	0x0060																
7	0x0070																
8	0x0080																
9	0x0090																
10	0x00A0																
11	0x00B0																
12	0x00C0																
13	0x00D0	NDEF data area (message area)																
14	0x00E0																
15	0x00F0																
16	0x0100																
17	0x0110																
18	0x0120																
19	0x0130																
20	0x0140	When using in common by Type3 tag and Type4 Tag																
21	0x0150	When using it only by Type3 Tag																
22	0x0160																
23	0x0170																
:	:																
58	0x03A0																
59	0x03B0																
60	0x03C0	System Area																
61	0x03D0																
62	0x03E0	SC															
63	0x03F0																

Figure 4-12 The memory map at the time of NDEF use. (NFC Forum Type3 Tag)

4.2.7.2 Setup of System Code (SC)

In order to use NDEF of Type3 Tag, It is necessary to set value "0x12FC." on a system code(SC).

4.2.7.3 Setup of Attribute Information Block

Attribute Information Block(AIB) is arranged to Block0.

Explanation and the example of a setting of AIB are shown in Table 4-10.

Table 4-10 The example of a setting of Attribute Information Block (AIB)

Physical address	Size	Value	Contents	Supplement
0x0000	1Byte	0x10	Mapping Version	Please set up according to the NDEF standard version to apply.
0x0001	1Byte	0x0F	Nbr (The number of the maximum block of one read command)	Please set up 0x0F in this RFID.
0x0002	1Byte	0x0B	Nbw (The number of the maximum block of one write command)	Please set up 0x0B in this RFID.
0x0003 ～0x0004	2Byte	0x0018	Nmaxb (T The number of maximum block of NDEF data which can handle this RFID)	
0x0005 ～0x0008	4Byte	0x00000000	Intact area	Please set 4 bytes of 0x00 to all.

0x0009	1Byte	0x00	WriteF
			  0x00: Write-in completion
			  0x0F: Under a write-in advance
				Please set "0x0F" before the writing of a NDEF message, and Please set "0x00" after all the writing of a NDEF message completed.

0x000A	1Byte	0x01	RW-Flag
			  0x00: AIB is read-only.
			  0x01: Read and write are possible for AIB.	

0x000B ～0x000D	3Byte	0x000003	Ln (NDEF message length)	0x000003 = 3Byte (The value to a setting example of a setting of Table 4-11)
0x000E ～0x000F	2Byte	0x0046	Checksum	The sum of data level to address 0x0000 - 0x000D

4.2.7.4　NDEF FILE

An empty NDEF file is shown in Table 4-11 as an example of a setting of a NDEF file.

Table 4-11 The example of a setting of a NDEF file (An empty NDEF file)

Physical address	Size	Value	Contents	Supplement
0x0010 ～0x0012	3Byte	0xD00000	NDEF Message	A mentioned value is a value which shows an empty message.

4.3 ISO/IEC14443 TypeA Specification

This section describes the ISO/IEC14443 TypeA specification.

4.3.1 Communication Specification

Table 4-12 ISO/IEC14443 TypeA Communication Specification

Carrier frequency		13.56 MHz
Modulation mode, Bit coding	R/W→RFID	ASK100%, modified Miller
	RFID→R/W	106 kbps: OOK modulation, Manchester encoding (848 kHz subcarrier)
Data rate		106 kbps
Character transmission		(1) Short Frame ・LSB First ・Data (7 bits) (2) Standard Frame ・LSB First ・Data (8 bits) ・Odd parity bit (1 bit)

4.3.2 Frame Format

Figure 4-13 and figure 4-14 illustrates the ISO/IEC14443 TypeA frame format. Two kinds of format of a short frame and standard frame are supported. S(Start of Communication) is added in front of a data field, and E (End of Communication) is added to end of a data field.

On the standard frame format, P(Odd parity bit) is added between the bytes
Figure 4-13 ISO/IEC14443 TypeA Short Frame Format
Figure 4-14 ISO/IEC14443 TypeA Standard Frame Format

In Figure 4-15, the ISO/IEC14443-4 block format is shown in as Figure 4-14 Standard Frame Format.
This RFID does not support CID and NAD of the first field, so adding them is prohibited.

First field			Information field	Last field
PCB	[CID]*	[NAD]*	INF	ECD
1 byte	1 byte	1 byte	0 to 253 bytes (when CID and NAD are omitted)	2 bytes（CRC）

•CID and NAD: Not supported by this RFID
(Adding CID and NAD is prohibited.)

Error-detecting signal

Frame size
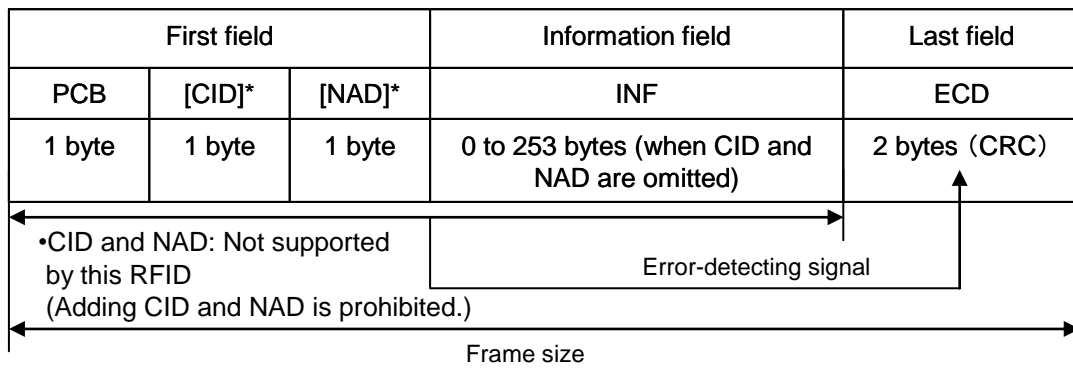

Figure 4-15 ISO/IEC14443-4 Block Format

4.3.3 Protocol Control

PCB (Protocol Control Byte) shown in Figure 4-15 and Table 4-13 is provided for ISO/IEC14443-4 protocol control, and used to send information necessary for data transmission control. This protocol has 3 block types. Table 4-13 lists the definition of block type. This RFID's protocol control specification is given in Table 4-14

Figure 4-16, Figure 4-17, and Figure 4-18 illustrate I-block, R-block, and S-block coding, respectively.

Table 4-13 Block Type

Block name	Definition
I-block	Used to send the information of application layer.
R-block	Used to send ACK (Acknowledge) or NAK (NegativeAcknowlege). R-block does not include INF field. An R-block corresponding to the last reception block will be sent.
S-block	Used to send control information. The following 2 types are provided: 1. Wait time extension request (WTX) 2. DESELECT command

Table 4-14 Protocol Control Specification

Item	Description	By this RFID
CID (Card Identifier)	First field parameter of ISO/IEC14443-4 frame (optional). Used to identify RFID.	Not supported
NAD (Node Address)	First field parameter of ISO/IEC14443-4 frame (optional). Used to establish a logical channel.	Not supported
Chaining	Used to transmit/receive divided data	Supported
ACK/NCK response	Used to send ACK (Acknowledge) or NAK (NegativeAcknowlege).	Supported
WTX	Used to extend the wait time for response from RFID	Supported
DESELECT command	Used to deselect the RFID.	Supported

b8	b7	b6	b5	b4	b3	b2	b1
0	0	0		0	0	1	

— Block number
— Set to 1. (0: No response)
— NAD enable/disable. Set to 0 (NAD disable). (1: No response)
— CID enable/disable. Set to 0 (CID disable). (1: No response)
— Setting to 1 enables chaining.
— Set to 0. (1: No response)
— I-block
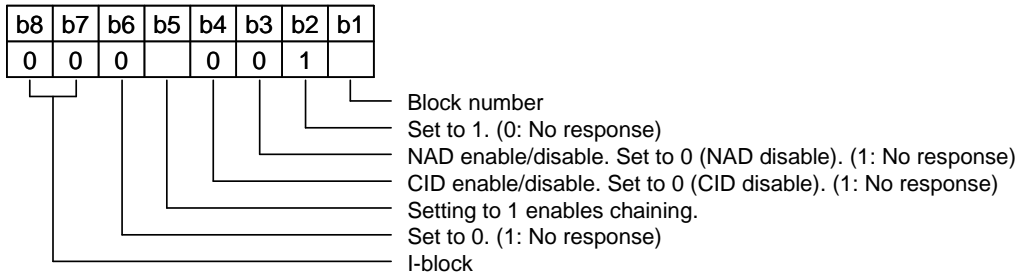

Figure 4-16 I-block Coding

— Set to 0. (1: No response)
— Set to 1. (0: No response)
— Set to 0. (1: No response)
— CID enable/disable. Set to 0 (CID disable).
— (00)b : DESELECT, (11)b : WTX
  (No response, except (00)b, (11)b)
— S-Block

Figure 4-18 S-block Coding

4.3.4 Block Control

The block number rule for ISO/IEC14443-4 I-block is given in Table 4-15. The block control rule and whether to be supported by this RFID are shown in Table 4-16.

Table 4-15 Block Number Rules

Applied to	No.	Rule
Reader/ Writer	RuleA	Set the initial value of reader/writer block number to 0 whenever activating RFID.
	RuleB	When I-block or R(ACK) block whose block number is equal to the current one is received, toggle the current block number before sending the block number to RFID.
RFID	RuleC	Set the initial value of RFID block number to 1 whenever activating RFID.
	RuleD	When I-block is received, toggle the current block number before sending the block.
	RuleE	When R(ACK) block whose block number is not equal to the current one is received, RFID toggles the current block number before sending the block. When R(NAK) is received, do not toggle the block number.

Table 4-16 Block Control Rule

Applied to	No.	Rule	By this RFID
Reader/ Writer and RFID	Rule1	Send the first block from reader/writer.	Supported
	Rule2	When I-block indicating chaining is received, send an affirmative response to the block, with R(ACK) block.	Supported
	Rule3	S-block is used only for pair. Send a response to S(...)block whenever S(...)block is requested.	DESELECT WTX supported
Reader/ Writer	Rule4	When an illegal block is received or FWT timeout occurs, send R(NAK) block (except while RFID is in chaining or when S(DESELECT) is executed).	-
	Rule5	When an illegal block is received or FWT timeout occurs while RFID is in chaining, send R(ACK) block.	-
	Rule6	When R(ACK) block is received and its block number is not equal to the block number of reader/writer, re-send the last I-block.	-
	Rule7	When R(ACK) block is received and its block number is equal to the block number of reader/writer, continue chaining.	-
	Rule8	When a response to S(DESELECT) is not sent with no error, re-send S(DESELECT) or ignore the RFID.	-
RFID	Rule9	RFID can send S(WTX) block, instead of I-block or R(ACK) block.	Supported
	Rule10	When I-block not indicating chaining is not received, send an affirmative response.	Supported
	Rule11	When R(ACK) or R(NAK) block is received and its block number is equal to the block number of RFID, re-send the last frame.	Supported
	Rule12	When R(NAK) block is received and its block number is not equal to the block number of RFID, send R(ACK).	Supported
	Rule13	When R(ACK) block is received and its block number is not equal to the block number of RFID and RFID is in chaining, continue chaining.	Supported

4.3.5 Upper Command Format

The upper commands (SELECT, READ, WRITE) are compliant with the APDU (Application Protocol Data Unit) format of ISO/IEC7816-4.

Figure 4-19 shows the command APDU format. Table 4-17 shows the command APDU field definition. Figure 4-20 gives the response APDU format. Table 4-18 gives the response APDU field definition.

The command APDU format shown in Figure 4-19 and the response APDU format shown in Figure 4-20 are configured in the information field INF of the ISO/IEC14443-4 block format shown in Figure 4-15.

CLA	INS	P1	P2	Lc	Data	Le
Class byte	Instruction byte	Param byte	Param byte	Lc field	Data byte (Lc bytes)	Le field
Figure 4-19 Command APDU Format

Table 4-17　Command APDU Field Definition

Field name	Byte length	Definition

Status word 2	1	Status information

Panasonic

4.3.6 State Transition Diagram

Notes
- In any state of IDLE,READY,ACTIVE,PROTOCOL,HALT,READY* or ACTIVE*, if RF-off or disabled RF communication happens, it transits to the POWER_OFF state.
- NVB: NVB matched, nNVB: NVB unmatched
- UID: UID matched, nUID: UID unmatched

(*) Enabled or Disabled RF communication is set in the WREG command of serial communication mode. The initial state is "Enabled RF communication"

Figure 4-21 State Transition Diagram for Operation Based on ISO/IEC14443 TypeA

4.3.7 Flow Chart

Figure 4-22 Flow Chart of Command Processing Based on ISO/IEC14443 TypeA

4.3.8 Various Settings

This section describes the parameter settings and operation specifications based on ISO/IEC14443 TypeA for this RFID.
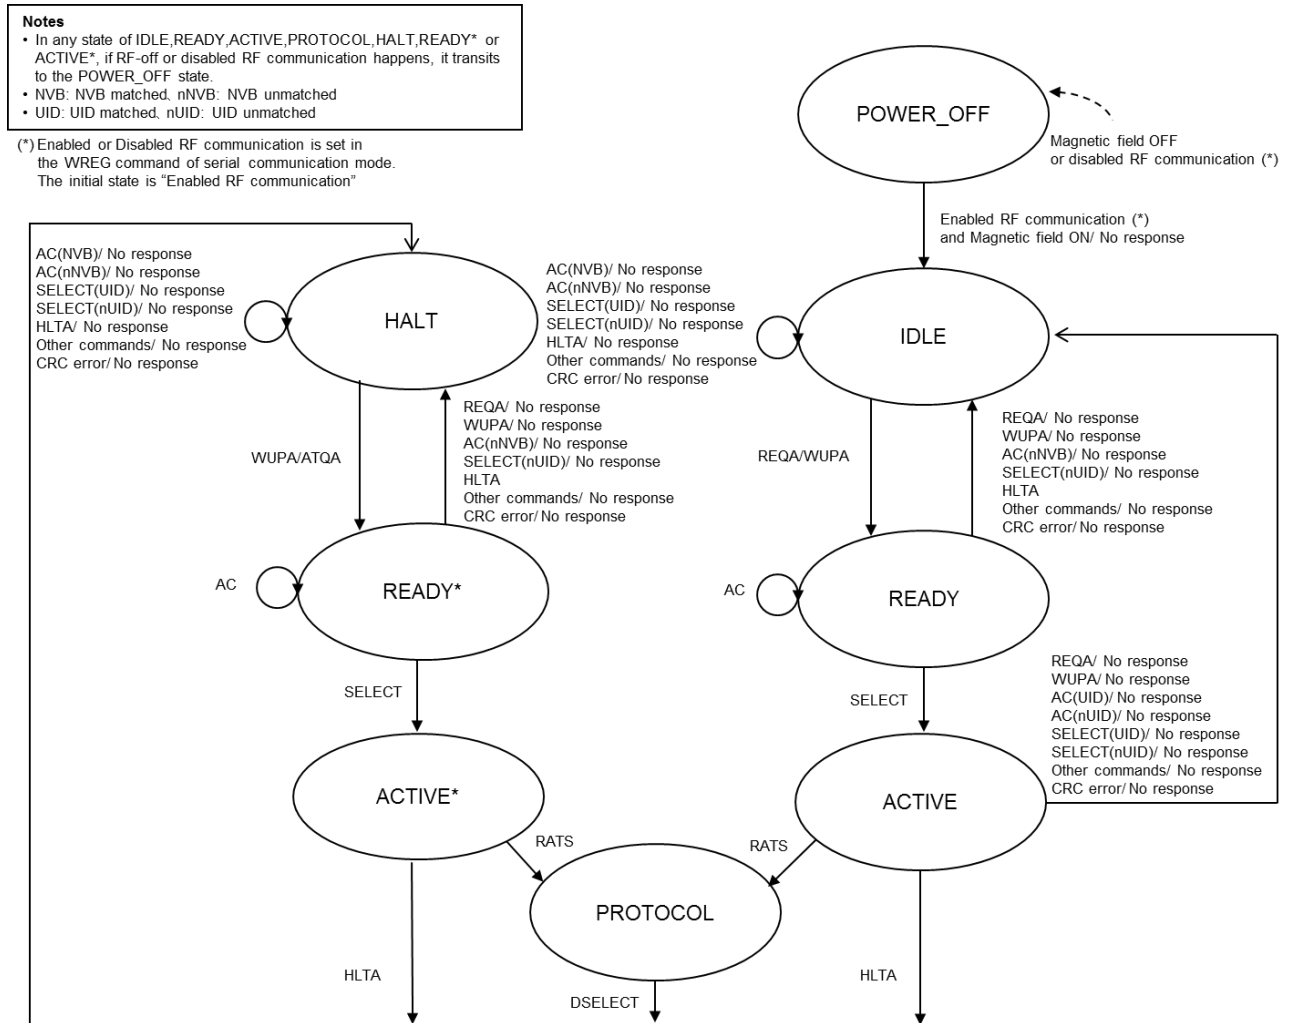

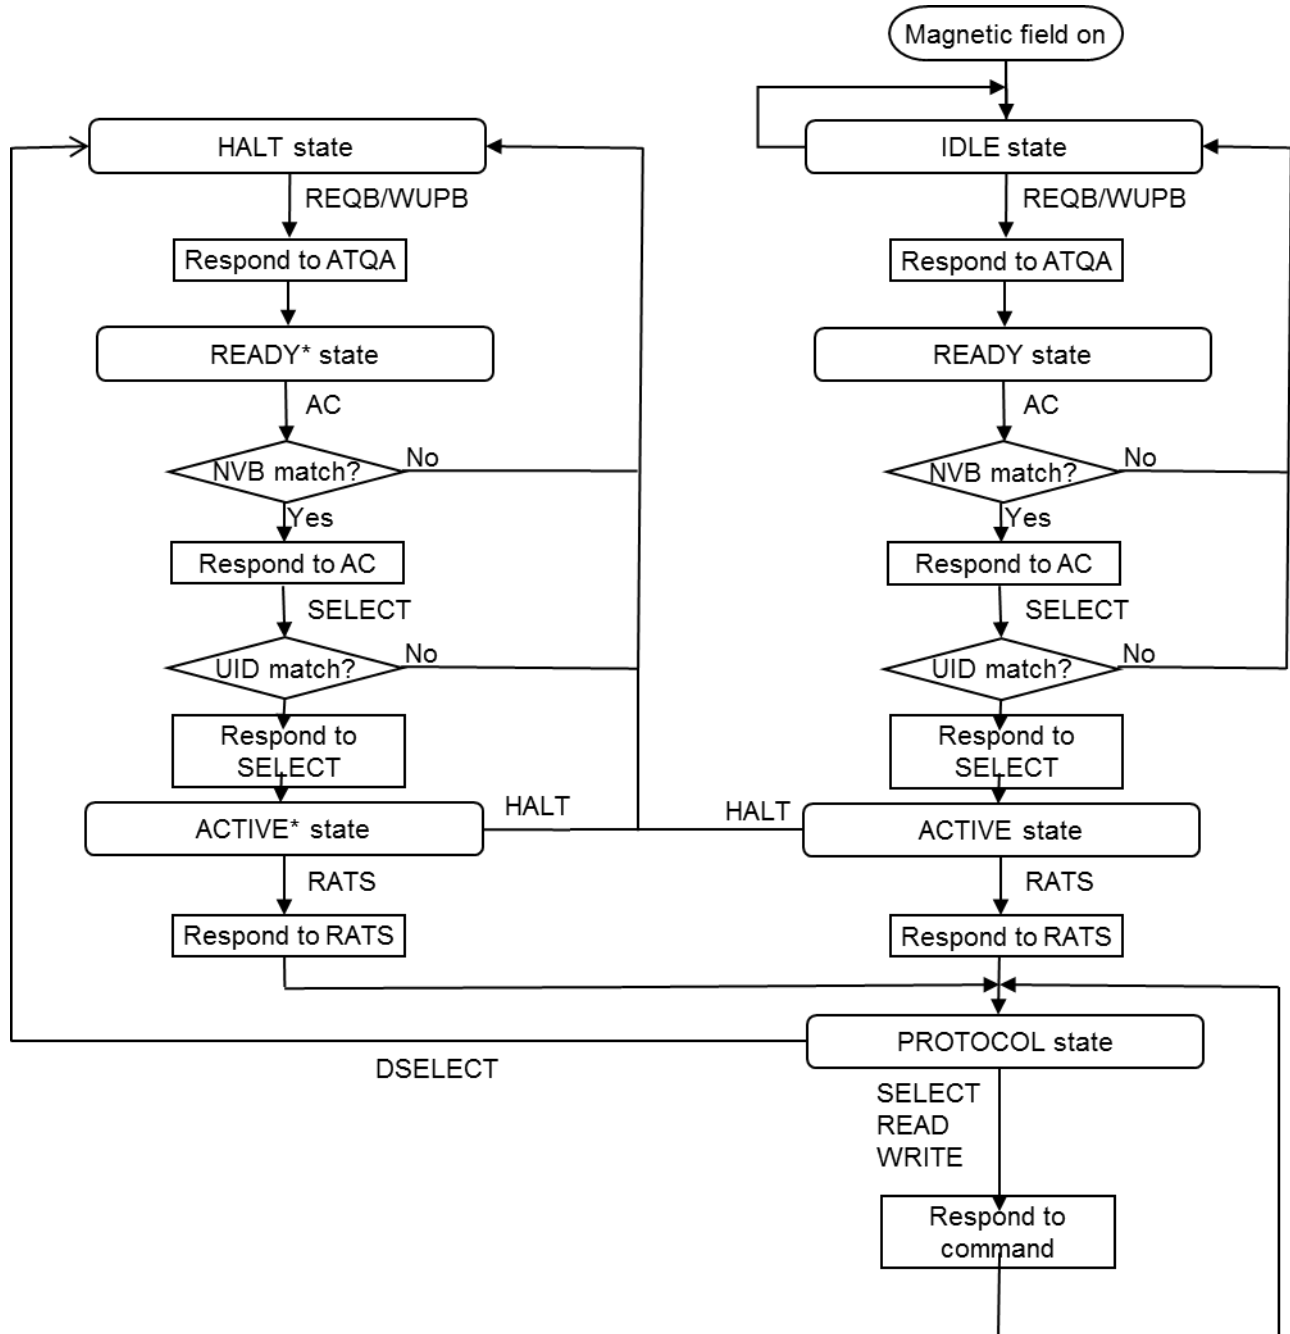

4.3.8.1 PUPI (Pseudo-Unique PICC Identifier)

Figure 4-23 shows the format of PUPI (Pseudo-Unique PICC Identifier). PUPI is an identifier of PICC (Proximity IC Card). The value of PUPI is set in the lower 4 bytes of the system area IDM.

PUPI

| D0	D1	D2	D3
Lower 4 bytes of IDM			

Figure 4-23 PUPI Format

4.3.8.2 FWI (Frame Waiting Time Integer)

Figure 4-24 shows the format of FWI (Frame Waiting time Integer). FWI is used to specify the maximum wait time until the PICC sends a response after receiving a command. The value of FWI is set in the upper 4 bytes of the system area HW3.

msb   lsb

bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
FWI				WTXM			
Figure 4-24 FWI Format

The maximum wait time is calculated by the following formula:

$$\text{Maximum wait time} = T \times 2^{FWI}$$

T: $256 \times 16/fc$ (fc = 13.56 MHz, approx. 0.302 ms)

FWI: 0 to 14 (integer)

The maximum wait time ranges from approximately 0.302 ms (min.; FWI = 0) to approximately 4.949 s (max; FWI = 14).

4.3.8.3 WTXM (waiting time extension multiplier)

Figure 4-24 shows the format of WTXM (waiting time extension multiplier). The S(WTX) block which require an extension of the frame waiting time of PICC consists of 2 bytes, and the lower 6bit of second byte set the WTMX.

On this RFID, the upper 2bits of WTXM specified by NFC forum are fixed to 0, and the lower 4bits of WTXM are set in the lower 4 bits of the system area HW3.

Waiting time to be requested is as follows.

"Time corresponding to the set value of FWI" x "Setting of WTXM"

4.3.8.4 File System

This RFID is compliant with the command specification of ISO/IEC7816-4 standards, but does not implement the file system functionality of the standards. However, in order to ensure the compatibility with communication to reader/writer, the SELECT command to select files is set to "Normal response" when specifying the given parameters. For information about how to set the parameters of the SELECT command, see 4.3.9.6   SELECT.

4.3.8.5 Address

In ISO/IEC14443 TypeA (command is compliant with ISO/IEC7816-4), the addresses of READ and WRITE commands are specified by bytes P1 and P2 of the command APDU. (See Section 4.3.5   Upper Command Format)

Figure 4-25 shows the address specification format. Set bit 7 of byte P1 to 0; setting to 1 cause an error.

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Definition	-	Start address														
This RFID's setting value	0	Mode setting			Start address designation											
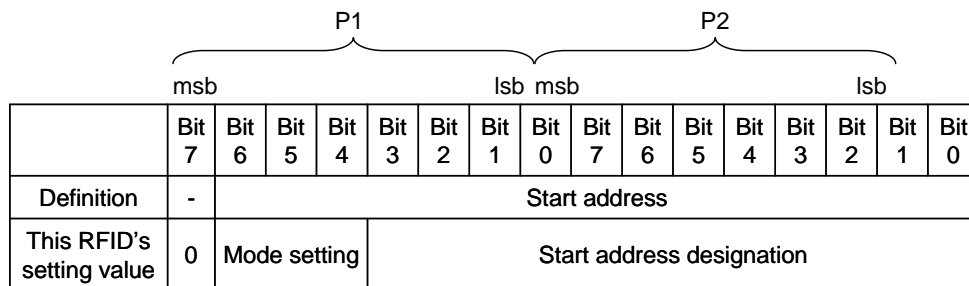

Figure 4-25 Address Specification

This RFID uses address to specify communication in tunnel mode. Table 4-19 shows mode settings including communication in tunnel mode with bits 6 to 4 of byte P1.

Table 4-19 Mode Settings

Byte P1			Meaning
Bit 6	Bit 5	Bit 4	Communication mode
0	0	0	RF communication mode
1	0	0	Tunnel mode
Others			Reserved (Setting this field causes an error.)

In addition, Table 4-20 shows the setting unit for address by communication mode.

Table 4-20 Setting Units for Address

Setting unit for address (n: integer)
1×n bytes

4.3.8.6 Data

All "DATA" of READ and WRITE command are considered as actual data.

Figure 4-26 Data Block Structure

4.3.8.7 Status Word

Table 4-21 Status Word lists the meaning of statuses.

Table 4-21 Status Word

| SW1	SW2	Meaning	Description
0x90	0x00	Normal end	Terminated normally.
0x50	0x00	Tunnel mode error	No response from the host
0x51	0x00	Tunnel mode error	The host responded with an error.
0x64	0x00	RF communication mode error	Conflict with host communication occurs. Cannot access to non-volatile memory.
0x67	0x00	Lc/Le specification error (*1)	・ Lc and Le were out of the specification. ・ Lc were not 0x10 on VERIFY command
0x69	0x83	Verify maximum error	・ Password number of comparisons exceeds the upper limit
0x69	0x84	Verify error	・ Password mismatch
0x6A	0x86	P1-P2 specification error	・ Bit 7 of P1 was not 0. (*2) ・ Illegal mode setting (RFU setting) ・ Specified outside non-volatile memory. ・ Both of P1 and P2 were not 0x00 on VERIFY command
0x6D	0x00	INS specification error	Illegal INS setting (Specified an unimplemented command)
0x6E	0x00	CLA specification error	Illegal CLA setting (except 0x00)
0x6F	0x00	Self-diagnosis error (*1)	・ Write access to non-volatile memory-Read-Only area (RORF setting) ・

(*1) For more information about these errors, see the Administrator's Manual.

(*2) In the case of SELECT command, it may become "Lc, Le error 0x6700" depending on the combination of values of P1,P2.

4.3.9 Command

The commands based on ISO/IEC14443 TypeA supported by this RFID fall into two types:

Commands defined in ISO/IEC14443-3 and ISO/IEC14443-4, and APDU commands defined in ISO/IEC7816-4 to be sent in the ISO/IEC14443-4 format.

These commands are shown in Table 4-22 and Table 4-23.

For information about the command format, see Section 4.3.2 Frame Format and Section 4.3.5 Upper Command Format.

Additionally, protocol control such as chaining, ACK/NAK response (R-Block), DESELECT, and WTX (S-Block) are also supported. For its detail, see Section 4.3.3　Protocol Control.

Subsequent sections describe each command in detail.

Table 4-22 ISO/IEC14443-3/4 TypeA Command List

Name	Code	Description
REQA	0x26	Catches the RFID. Used by reader/writer.
WUPA	0x52	Catches the RFID. Used by reader/writer.
ANTICOLLISION/ SELECT	0x93	Identifies the RFID. Used by reader/writer.
HLTA	0x50	Transitions the RFID to a HALT state. Used by reader/writer.
RATS	0xE0	Requires protocol signal information to the RFID. Used by reader/writer.

Table 4-23 APDU Command List

Name	INS	Description
SELECT	0xA4	Selects the file.
VERIFY	0x20	Perform a password authentication.
READ	0xB0	Reads the data of RFID from reader/writer. While in tunnel mode, reads the data of the host from reader/writer.
WRITE	0xD6	Writes a data to RFID from reader/writer. While in tunnel mode, writes a data to the host.

4.3.9.1 REQA/WUPA (ISO/IEC14443-3 TypeA command)

■   Purpose

Catches the RFID. Used by reader/writer

・REQA is used when the RFID is in IDLE state.

・WUPA is used when the RFID is in HALT state. (It can be also used in IDLE state.)

・Short Frame Format

- Data field

Field	Output value	Remarks
Length byte TL	0x05 Specify the length of ATS, including TL itself. The CRC byte is not included in TL. 0xxb: UID completed, and PICC not adapted to ISO/IEC14443-3	For details, refer to ISO/IEC14443-3
Constitution byte TO	0x78 Bit7: Fixed to 0 Bit6-4: Y(1) (Coded) 　　Bit6=1: TA(1) is included 　　Bit5=1: TB(1) is included 　　Bit4=1: TC(1) is included Bit3-0: FSCI, FSC (Coded) 　　Encoding is the same as FSD	(Note) 　FSD: The maximum frame size that PCD can receive
Connection Information byte TA(1)	0x80 Bit7: Fixed to 1 (The same data rate in both communication direction) Bit6-4: DS Bit3: Fixed to 0 Bit2-0: DR	This RFID supports 106kbps symmetric communication. (Note) DS: PCD to PICC data rate 　　　　DR: PCD to PICC data rate
Connection Information byte TB(1)	0xX0 Bit7-4: FWI 　　Use FWI parameter (1 to 14 available) Bit3-0: SFGI 　　Fixed to 0000b (1 to 14 available) 　　SFGT = (256 x 16 /fc)^SFGI	(Note) FWI: Waiting time for frame 　　　　SFGT: Waiting time for start frame (Waiting time for frame after ATS)
Connection Information byte TC(1)	0x00 Bit1: When 1 is set, CID is supported Bit0: When 1 is set, NAD is supported	
Control information byte T1 to Tk	On ISO/IEC7816-4 rule	Control information bytes are not added.
CRC_A	See CRC_A　ISO/IEC14443-3	

4.3.9.6 SELECT (APDU command)

■   Purpose

Selects the file.

This RFID conforms to the NDEF Ver. 2.0 of NFC forum Type 4 tag and therefore is capable of performing the following selections: EF file, NDEF application, CC file, or NDEF file.

For operations at CC file or NDEF file selections, see 4.3.10.3 CC File and 4.3.10.4 NDEF file.

・NDEF tag application selection

CLA	INS	P1	P2	Lc	Data	Le
0x00	0xA4	0x04	0x00	0x07	0xD2760000850101	0x00

In case of the NDEF tag application choice, only the value mentioned above is settable.

・CC file selection

CLA	INS	P1	P2	Lc	Data
0x00	0xA4	0x00	0x0C	0x02	0xE103

In case of the CC file application choice, only the value mentioned above is settable.

・NDEF file selection

CLA	INS	P1	P2	Lc	Data
0x00	0xA4	0x00	0x0C	0x02	0x0103

In case of the NDEF file application choice, only the value mentioned above is settable.

ID(File ID) of the NDEF file in this RFID is 0x0103 fixations.

■   Response message

● Format

SW1	SW2
1 byte	1 byte

● Data field

Field	Output value	Remarks
SW1	See 4.3.8.7 Status Word.	
SW2	See 4.3.8.7 Status Word.	

4.3.9.7 READ (APDU command)

■   Purpose

Reads the data. In RF mode, readout the data of RFID from reader/writer, and in tunnel mode, reads the data of the host from reader/writer.

■   Command message

● Format

CLA	INS	P1	P2	Le
1 byte	1 byte	1 byte	1 byte	1 byte

● Data field

Field	Setting	Remarks
CLA	0x00	Responds with an error, except 0x00.
INS	0xB0	
P1	Sets the start address to be read. ・ See 4.3.8.5 Address.	
P2	Sets the start address to be read. ・ See 4.3.8.5 Address	
Le	Sets the byte length of data to be read. ・ Setting range: 0x01(1) to 0xFB(251) ・ Sets to 16×n (n: integer) for encrypted communication.	Maximum value of n is 15 for encrypted communication.

■   Response message

● Format

Data	SW1	SW2
1 to 251 bytes	1 byte	1 byte

● Data field

Field	Output value	Remarks
Data	Sets the data to be read. ・ See 4.3.8.6 Data.	Omitted except when status word ends normally.
SW1	See 4.3.8.7 Status Word.	
SW2	See 4.3.8.7 Status Word.	

4.3.9.8 WRITE (APDU command)

■   Purpose

Writes a data. In RF mode, write a data to RFID from reader/writer, and in tunnel mode, writes a data to the host.

■   Command message

● Format

CLA	INS	P1	P2	Lc	Data
1 byte	1 byte	1 byte	1 byte	1 byte	1 to 248 bytes

● Data field

Field	Setting	Remarks
CLA	0x00	Responds with an error, except 0x00.
INS	0xD6	
P1	Sets the start address of data to be written. ・ See 4.3.8.5 Address	
P2	Sets the start address of data to be written. ・ See 4.3.8.5 Address	
Lc	Sets the byte length of the Data block. ・ Setting range: 0x01(1) to 0xF8(248) ・ Sets to 16×n (n: integer) for encrypted communication.	Maximum value of n is 15 for encrypted communication.
Data	Sets the data to be written. ・ See 4.3.8.6 Data.	

■   Response message

● Format

SW1	SW2
1 byte	1 byte

● Data field

Field	Output value	Remarks
SW1	See 4.3.8.7 Status Word.	
SW2	See 4.3.8.7 Status Word.	

4.3.9.9 VERIFY (APDU command)

■　Purpose

Perform the password authentication.

■　Command message

● Format

CLA	INS	P1	P2	Lc	Data
1 byte	1 byte	1 byte	1 byte	1 byte	16 bytes

● Data field

Field	Setting	Remarks
CLA	0x00	Responds with an error, except 0x00.
INS	0x20	Responds with an error, except 0x20.
P1	0x00	Responds with an error, except 0x00.
P2	0x00	Responds with an error, except 0x00.
Lc	0x10.　byte length of the Data block	Responds with an error, except 0x10.
Data	Password data	

■　Response message

● Format

SW1	SW2
1 byte	1 byte

● Data field

Field	Output value	Remarks
SW1	See 4.3.8.7　Status Word.	
SW2	See 4.3.8.7　Status Word.	

4.3.10 NDEF

This RFID is based on Type3 Tag and Type4 Tag of NFC Forum and supports data exchange of a NDEF format.

This section explains Type4 Tag. In addition, 4.2.7 NDEF explains Type3 Tag of NFC Forum.

This RFID supports the NDEF format of Type4 Tag of Version 2.0.

Data exchange of NDEF can be performed by performing a predetermined setup to the user area of non-volatile memory.

Please refer to the applicable written standards of NFC Forum for the details of NDEF.

4.3.10.1 Memory Map

Fig 4-27 shows the memory map in NDEF format.

CC file is assigned to Block 59. NDEF file is assigned to part of Block 0, and Blocks 1 to58.

Block	Address	0x0	0x1	0x2	0x3	0x4	0x5	0x6	0x7	0x8	0x9	0xA	0xB	0xC	0xD	0xE	0xF
0	0x0000																
1	0x0010																
2	0x0020																
3	0x0030																
4	0x0040																
5	0x0050																
6	0x0060																
7	0x0070																
8	0x0080																
9	0x0090																
10	0x00A0																
11	0x00B0																
12	0x00C0																
13	0x00D0																
14	0x00E0				NDEF Data Area (Message)												
15	0x00F0																
16	0x0100																
17	0x0110																
18	0x0120																
19	0x0130																
20	0x0140																
21	0x0150																
22	0x0160																
23	0x0170																
24	0x0180																
:	:																
58	0x03A0																
59	0x03B0					CC File Area											
60	0x03C0																
61	0x03D0					System Area											
62	0x03E0																
63	0x03F0																

Figure 4-27 Memory map when NDEF is used

4.3.10.2 NDEF Tag Application Selection

This selection requires a SELECT command.

4.3.10.3 CC File

This selection requires a SELECT command.

While in CC file selection, CC file starts from the beginning of Block 59 (physical address 0x03B0).

See Table 4-24 shows a setting example of the CC file.

Table 4-24 Example of the CC file

Select address	Physical address	Size	Value	Contents	Remarks
0x0000 ～0x0001	0x03B0 ～0x03B1	2Byte	0x000F	CCLEN (Length of CC file)	
0x0002	0x03B2	1Byte	0x20	Mapping Version	Please set 0x20 in this RFID.
0x0003 ～0x0004	0x03B3 ～0x03B4	2Byte	0x003B	MLe (The biggest response length of the Read command)	
0x0005 ～0x0006	0x03B5 ～0x03B6	2Byte	0x0034	Mlc (The biggest response length of the Write command)	
0x0007	0x03B7	1Byte	0x04	T field of the NDEF File Control TLV	
0x0008	0x03B8	1Byte	0x06	L field of the NDEF File Control TLV	
0x0009 ～0x000A	0x03B9 ～0x03BA	6Byte	0x0103	V field of the NDEF File Control TLV	File ID Please set 0x 0103 in this RFID.
0x000B ～0x000C	0x03BB ～0x03BC		0x0032		The biggest NDEF size
0x000D	0x03BD		0x00		Read access condition
0x000E	0x03BE		0x00		Write access condition

4.3.10.4 NDEF File

This selection requires a SELECT command.

Table 4-25 shows empty NDEF file as a setting example of the NDEF file.

Table 4-25 setting example of the NDEF file(when NDEF file is empty)

Select address	Physical address	Size	Value	Contents	Remarks
0x0000 ～0x0001	0x000C ～0x000D	2Byte	0x0003	NLEN (NDEF message length)	The size of NLEN is 2 Byte fixations.
0x0002 ～0x0004	0x0010 ～0x0012	3Byte	0xD00000	NDEF message	The value shows an empty message

The access to the NDEF file in the NDEF file choice state, I link NLEN and NDEF message and, only other than only NLEN or NDEF message, can access it by 1 command.

In the NDEF file choice state, physical address 0x000C of Block0 the NDEF file top, the top (physical address 0x0010) becomes address 0x0002 of the NDEF file) of Block1. In other words, the NLEN field of the NDEF file is placed in 0x000C - 0x000D of the physical address, and the NDEF message field is placed by 0x0010 of the physical address.

4.4 ISO/IEC14443 TypeB Specification

This section describes the ISO/IEC14443 TypeB specification.

4.4.1 Communication Specification

Table 4-26 provides the communication specifications of this RFID based on ISO/IEC14443 TypeB.

Table 4-26 ISO/IEC14443 TypeB Communication Specification

Carrier frequency		13.56 MHz
Modulation mode, Bit coding	R/W→RFID	ASK10%, NRZ coding
	RFID→R/W	Load modulation, BPSK coding (848 kHz subcarrier)
Data rate		106 kbps / 212 kbps / 424kbps
Character transmission		･LSB-first ･Data (8 bits) ･Start bit (1 bit) ･Stop bit (1 bit)

4.4.2 Frame Format

Figure 4-28 illustrates the ISO/IEC14443 TypeB frame format. SOF(Start Of Frame) and EOF(End Of Frame) are added to a data field. The maximum size of data field is 256 bytes in this RFID.

SOF	Data field (maximum 256 bytes)	EOF
Figure 4-28 ISO/IEC14443 TypeB Frame Format

Additionally, the ISO/IEC14443-4 block format shown in Figure 4-29 is applied to the data field shown in Figure 4-28. This RFID does not support CID and NAD of the first field, so adding them is prohibited.

First field			Information field	Last field
PCB	[CID]*	[NAD]*	INF	ECD
1 byte	1 byte	1 byte	0 to 253 bytes (when CID and NAD are omitted)	2 bytes（CRC）

•CID and NAD: Not supported by this RFID
(Adding CID and NAD is prohibited.)

Error-detecting signal

Frame size
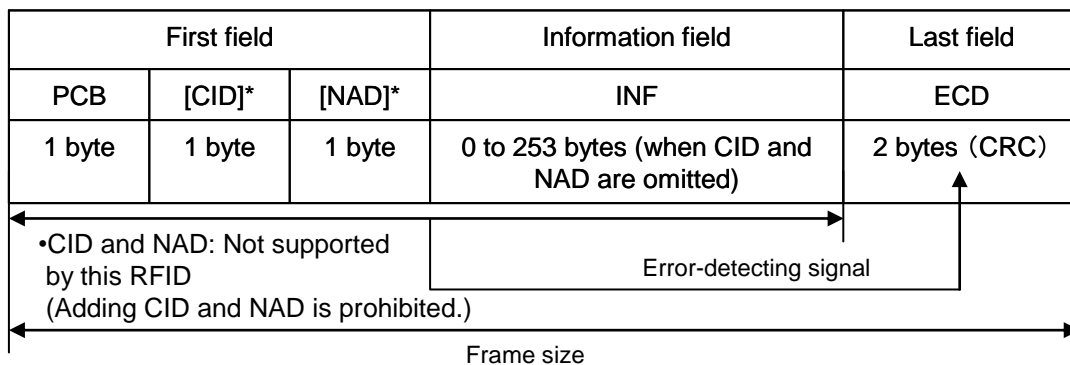

Figure 4-29 ISO/IEC14443-4 Block Format

Table 4-27 ISO/IEC14443-4 Field Definition

Field name	Byte length	Definition
PCB	1	Protocol Control Byte. See 4.3.3　Protocol Control
CID	1	Card Identifier (optional) Used to identify RFID. (Not supported by this RFID; not added.)
NAD	1	Node Address (optional). Used to establish a logical channel. (Not supported by this RFID; not added.)
INF	n	Command message or response message
ECD	2	See CRC_B ISO/IEC14443-3.

4.4.3 Protocol Control

For about Protocol Control, it's the same as ISO/IEC14443 TypeA specifications.

Refer to 4.3.3　Protocol Control.

4.4.4 Block Control

For about Block Control, it's the same as ISO/IEC14443 TypeA specifications.

Refer to 4.3.4　Block Control.

4.4.5 Upper Command Format

For about Upper Command Format, it's the same as ISO/IEC14443 TypeA specifications.

Refer to 4.3.5　Upper Command Format.

4.4.6 State Transition Diagram

Figure 4-30 provides the state transition diagram for this RFID's operation based on ISO/IEC14443 TypeB.
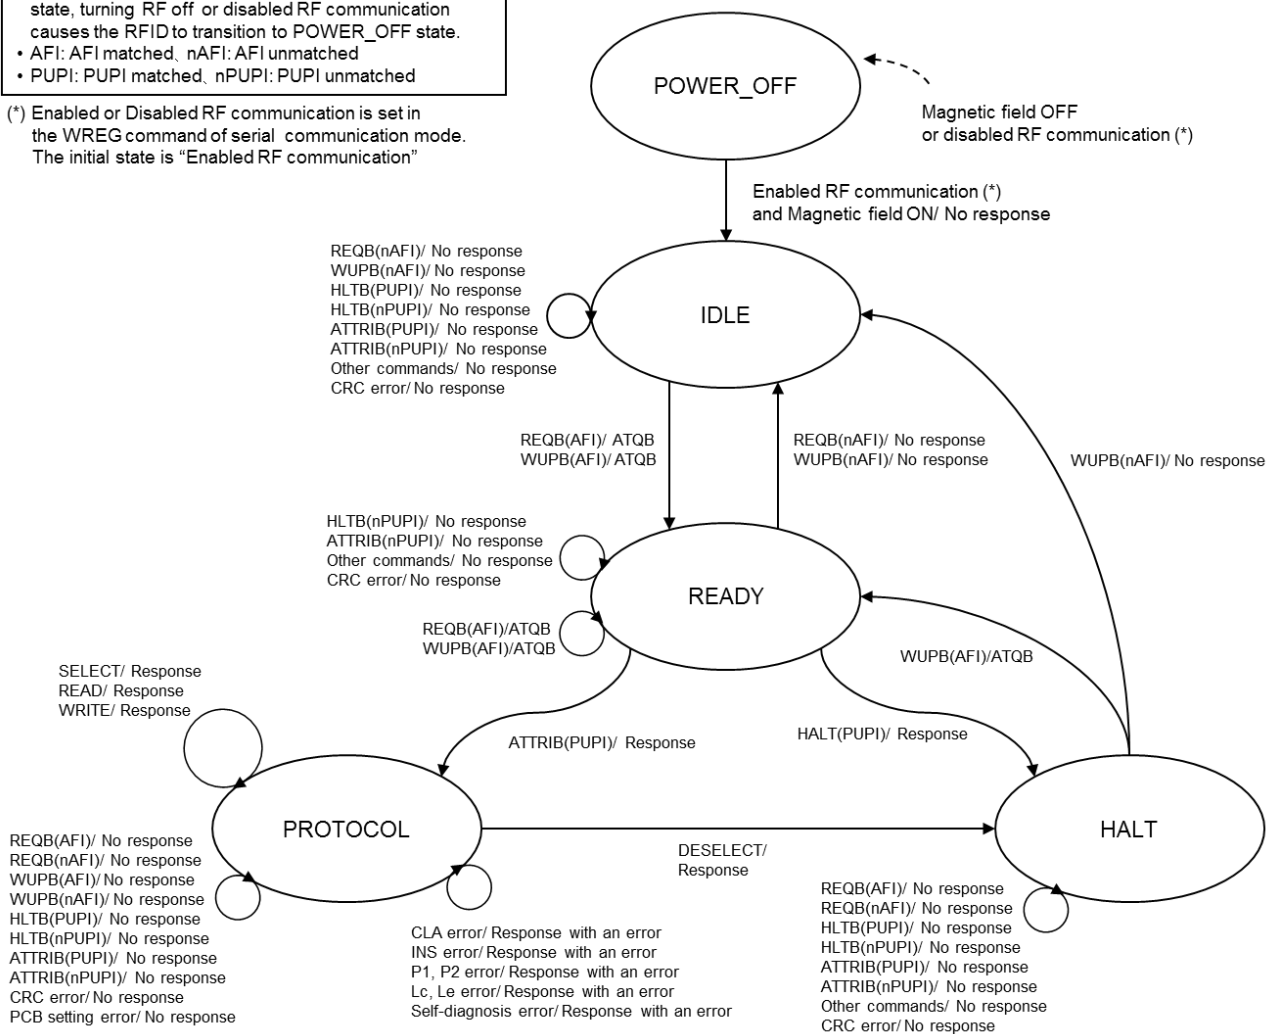

Figure 4-30 State Transition Diagram for Operation Based on ISO/IEC14443 TypeB

4.4.7　Flow Chart

Figure 4-31 illustrates the flow chart for this RFID's command processing based on ISO/IEC14443 TypeB.

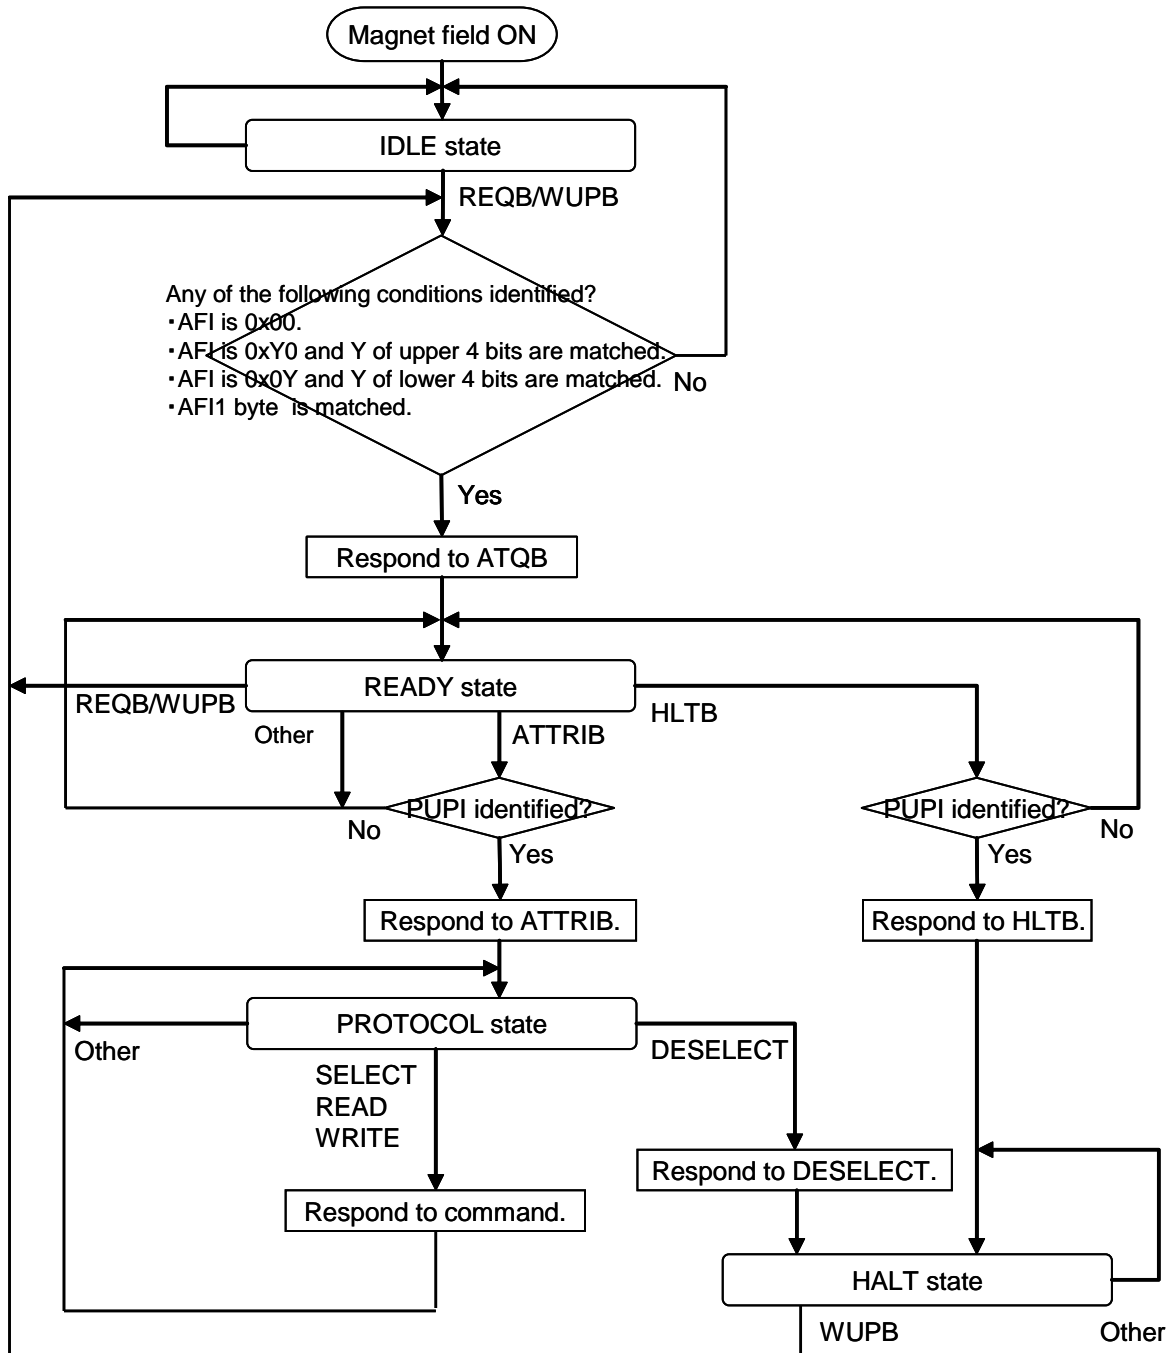

```

Figure 4-31 Flow Chart of Command Processing Based on ISO/IEC14443 TypeB

4.4.8 Various Settings

This section describes the parameter settings and operation specifications based on ISO/IEC14443 TypeB for this RFID.

4.4.8.1 AFI (Application Family Identifier)

Figure 4-32 shows the format of AFI (Application Family Identifier). The value of AFI is set in the system area AFI.

AFI is a parameter specified by the REQB command. The response operation to REQB command in this RFID is shown in Table 4-28. For information about the setting values for AFI, see ISO/IEC14443-3.

AFI

D0
AFI

Figure 4-32 AFI Format

Table 4-28 REQB Command Response Operation

REQB command AFI setting value	RFID's response to REQB command
0x00	Responds regardless of the system area AFI setting.
0xY0	Responds when the value Y of the upper 4 bits of the REQB command's AFI is matched.
0x0Y	Responds when the value Y of the lower 4 bits of the REQB command's AFI is matched.
Other	Responds only when the setting value of the REQB command's AFI matches the value specified in the system area AFI.

4.4.8.2 PUPI (Pseudo-Unique PICC Identifier)

For about PUPI, it's the same as ISO/IEC14443 TypeA specifications.

Refer to 4.3.8.1 PUPI (Pseudo-Unique PICC Identifier).

4.4.8.3 FWI (Frame Waiting Time Integer)

For about FWI, it's the same as ISO/IEC14443 TypeA specifications.

Refer to 4.3.8.2 FWI (Frame Waiting Time Integer).

4.4.8.4 WTXM (waiting time extension multiplier)

For about WTXM, it's the same as ISO/IEC14443 TypeA specifications.
Refer to 4.3.8.3   WTXM (waiting time extension multiplier).

4.4.8.5 File System

For about File System, it's the same as ISO/IEC14443 TypeA specifications.
Refer to 4.3.8.4   File System.

4.4.8.6 Address

For about Addressing, it's the same as ISO/IEC14443 TypeA specifications.
Refer to 4.3.8.5   Address.

4.4.8.7 Data

For about the data structure, it's the same as ISO/IEC14443 TypeA specifications.
Refer to 4.3.8.6   Data.

4.4.8.8 Status Word

For about the Status Word, it's the same as ISO/IEC14443 TypeA specifications.
Refer to 4.3.8.7   Status Word

4.4.9 Command

The commands based on ISO/IEC14443 TypeB supported by this RFID fall into two types:

Commands defined in ISO/IEC14443-3, and APDU commands defined in ISO/IEC7816-4 to be sent in the ISO/IEC14443-4 format.

These commands are shown in Table 4-29 and Table 4-30.

APDU command is the same as ISO/IEC14443 TypeA specifications. Refer to the corresponding section of 4.3.9   Command.

For information about the command format, see Section 4.4.2   Frame Format and Section 4.4.5   Upper Command Format.

Additionally, protocol control such as chaining, ACK/NAK response (R-Block), DESELECT (S-Block) ,and WTX are also supported. For its detail, see Section 4.4.3   Protocol Control.

Subsequent sections describe each command in detail.

Table 4-29 ISO/IEC14443-3 TypeB Command List

Name	Code	Description
REQB/WUPB	0x05	Identifies the RFID. Used by reader/writer.
ATTRIB	0x1D	Exchanges protocol signal information between reader/writer and RFID, and causes the RFID to transition to the state in which command processing is enabled.
HLTB	0x50	Transitions the RFID to a HALT state. Used by reader/writer.

Table 4-30 APDU Command List

Name	INS	Description
SELECT	0xA4	Selects the file. (No processing is performed in this RFID.)
VERIFY	0x20	Perform a password authentication
READ	0xB0	Reads the data of RFID from reader/writer. While in tunnel mode, reads the data of the host from reader/writer.
WRITE	0xD6	Writes a data to RFID from reader/writer. While in tunnel mode, writes a data to the host.

4.4.9.1 REQB/WUPB (ISO/IEC14443-3 TypeB command)

■ Purpose

Catches and identifies the RFID. Used by reader/writer

· REQB is used when the RFID is in IDLE state.

· WUPB is used when the RFID is in HALT state. (It can be also used in IDLE state.)

■ Command message

● Format

Command code	AFI	PARAM	CRC_B
1 byte	1 byte	1 byte	2 bytes

● Data field

Field	Setting		Remarks
Command code	0x05		
AFI	0x00: Identifies all RFIDs. 0xY0: RFID whose upper 4 bits are identified responds. 0x0Y: RFID whose lower 4 bits are identified responds. Other than 0x00: RFID corresponding to the specified system code responds.		See 4.4.8.1 AFI (Application Family Identifier).
PARAM	0x00: REQB 0x08: WUPB		This RFID always operates as follows: · Ignores the setting of bits 7-5. · Recognizes the number N of Slots is 1 (always responds with ATQB) even when bits 2-0 are set to any of the values (including PFU).
	Bits 7-5	RFU (Set to 000b.)	
	Bit 4	0: Extension ATQB not supported 1: Extension ATQB supported	
	Bit 3	0: REQB 1: WUPB	
	Bits 2-0	000b: Slot count N = 1 001b: Slot count N = 2 010b: Slot count N = 4 011b: Slot count N = 8 100b: Slot count N = 16 101b: RFU 110b: RFU	
CRC_B	See CRC_B ISO/IEC14443-3.		

■　Response message

● Format

Response code	PUPI	Application data	Protocol info	CRC_B
1 byte	4 bytes	4 bytes	3 bytes	2 bytes

● Data field

Field	Output value		Remarks
response code	0x50 (ATQB)		
PUPI	See 4.2.5.2　PICC (Proximity IC Card) Identifier.		
Application Data	0x00000000		Reserved (treated as proprietary data.)
Protocol Info	1st byte: 0xB3		For more information about parameters, see ISO/IEC14443-3. (*1) A response in the case that RFSPD is set 0 and TYPBSPD is set 1. When the RFSPD is set 1, 0x80 would be responded regardless the TYPBSPD setting. (R/W→RFID: 106 [k bps] , RFID→R/W: 106 [k bps], The speeds from R/W to RFID, from RFID to R/W are same.)
	Bits 7-0	Data rate setting: 0xB3 (*1) · R/W→RFID: 106K, 212K ,424Kbps · RFID→R/W: 106K, 212K ,424Kbps · R/W→RFID, RFID→R/W (same data rate)	
	2nd byte: 0x81		
	Bits 7-4	Maximum frame size of RFID 1000b: 256 bytes	
	Bits 3-0	Protocol type: 0001b · RFID is ISO/IEC14443-4 compliant · Minimum reader/writer command wait time (TR2) after RFID responds: 10etu + 32/fs (fs = 848 kHz)	
	3rd byte: 0xX0 (X is a value of FWI.)		
	Bits 7-4	FWI (Frame waiting time Integer) See 4.3.8.2　FWI (Frame Waiting Time Integer).	
	Bits 3-2	ADC (Application Data Coding) 00b: Proprietary Application Data	
	Bits 1-0	FO (Frame Option) 00b: NAD, CID not supported	
CRC_B	See CRC_B ISO/IEC14443-3.		

4.4.9.2 ATTRIB (ISO/IEC14443-3 TypeB command)

■   Purpose

Exchanges protocol signal information between reader/writer and RFID, and causes the RFID to transition to the state in which command processing is enabled.

■   Command message

● Format

Command code	Identifier	Param1	Param2	Param3	Param4	CRC_B
1 byte	4 bytes	1 byte	1 byte	1 byte	1 byte	2 bytes

● Data field

Field	Setting		Remarks
Command code	0x1D		
Identifier	Sets PUPI for ATQB response.		
Param1	0x00		This RFID operates with: · bits 1-0 ignored · bits 7-6 set to 00b (when these bits are set to 11b) · bits 5-4 set to 00b (when these bits are set to 11b) This RFID operates with: · Minimum TR0: 64/fs · Minimum TR1: 80/fs · EOF not omitted · SOF not omitted
	Bits 7-6	Minimum value of RFID response time to reader/writer command (TR0): (fs = 848 kHz) 00b: 64/fs (106 Kbps), 64/fs (212 Kbps), 64/fs(424Kbps) 01b: 48/fs (106 Kbps), 32/fs (212 Kbps), 16/fs(424Kbps) 10b: 16/fs (106 Kbps), 8/fs (212 Kbps), 4/fs(424Kbps) 11b: RFU	
	Bits 5-4	Minimum value of the time (TR1) until RFID starts data transmission after subcarrier is generated: (fs = 848 kHz) 00b: 80/fs (106 Kbps), 80/fs (212 Kbps), 80/fs(424Kbps) 01b: 64/fs (106 Kbps), 32/fs (212 Kbps), 32/fs (424K bps) 10b: 16/fs (106 Kbps), 8/fs (212K bps), 8/fs (424K bps) 11b: RFU	
	Bit 3	0: Do not omit EOF. 1: Omit EOF.	
	Bit 2	0: Do not omit SOF. 1: Omit SOF.	
	Bits 1-0	RFU (Set to 00b.)	

Param2	0xXX (For XX, see the settings below.)		· If parameters other than those on the left (communication settings or reader/writer frame size which the RFID does not support) are set, the RFID will generate no response. · If the data rate setting differs between RFID→PCD and PCD→RFID, the RFID will generate no response.

Chapter 5 Serial Communication Mode

5

5.1 Serial Communication Mode Sequence

This RFID provides a serial communication function via I2C interface.

The host is the master and the RFID operates as the slave.

Figure 5-1 illustrates the sequence in serial communication mode. Each sequence is described below.

SNo.1 (slave reception): The host sends a serial communication mode command to the RFID.

SNo.2 (slave transmission): Once the RFID receives the serial communication mode command described in SNo.1, it processes the command and then sends the result to the host as the response to the command.

It is also possible to read the status of the RFID by omitting SNo.1 and performing only SNo.2.
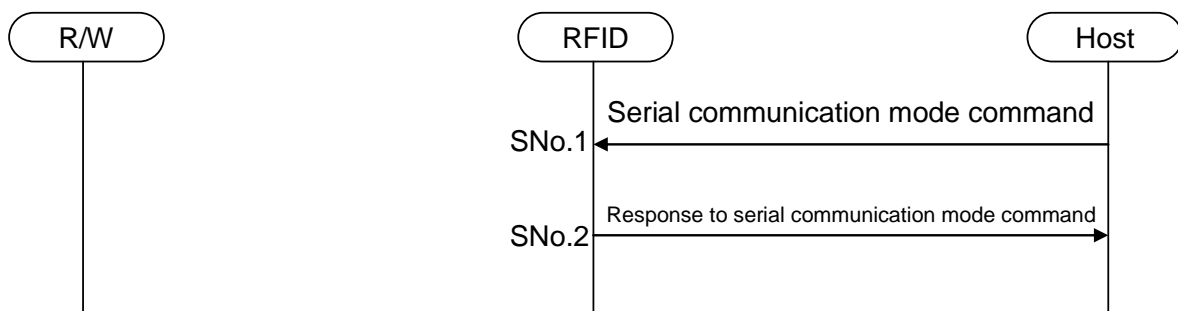

Figure 5-1　Serial Communication Mode Sequence

The commands and responses can be input or output divided at any byte position.

Command is possible to divide in 1-byte units, but the maximum number of divisions is 2 in the data field of non-response status. (It can not be divided into three or more.)

In this user's manual, that communication with divided command and response is described "Divided Access", and the communication with normal command and response is described "Normal Access".

5.2 I2C

This section describes the I2C specification.

5.2.1 Communication Specifications

Table 5-1 shows the I2C specification of this RFID.

Table 5-1 I2C Communication Specification

Data transfer method	I2C-format, Slave communication
Data rate	1kHz to 400kHz
Character transmission	· Slave address (7 bits) · Data (8 bits)
Frame transmission and reception	· For command frame and response frame, frame dividing is available (frame division access)

5.2.2 Frame Format

Figure 5-2 illustrates the I2C frame format, Table 5-2 defines the field.

Address field	Data field
1 byte	0 to 255 bytes

Figure 5-2 Frame Format

Table 5-2 Field Definition

Field name	Byte length	Definition
Address field	1	Slave address (7 bits) and data direction bit (R/W)
Data field	n	Command message or Response message

When the slave address is identified and the data direction bit is 0, a command is input from the host as slave reception.

When the slave address is identified and the data direction bit is 1, a response is sent to the host as slave transmission.

Both of the command and response frame, frame can be divided by a byte unit.

Refer to 5.2.6   Time Chart for detail.

5.2.3 Specifying Slave Address

The slave address of I2C is specified by I2C_SLV in the system area HW1 of non-volatile memory.

For more information, see Section 3.3   HW1 (2 bytes)   in Section System Area.

5.2.4 Status

Table 5-3 and Table 5-4 show the field format and the meaning of the RFID's response status, respectively.

Table 5-3 Field Format of RFID Response Status

Field name	Bit position	Description
RFWRITE_IRQ	Bit 7	Indicates whether an RF reading interrupt is generated. 0: Not generated 1: Generated
RFREAD_IRQ	Bit 6	Indicates whether an RF writing interrupt is generated. 0: Not generated 1: Generated
RFTX_IRQ	Bit 5	Indicates whether an RF transmission interrupt is generated. 0: Not generated 1: Generated
RFDET_IRQ	Bit 4	Indicates whether a magnetic-field detect interrupt is generated. 0: Not generated 1: Generated
CMD_RES	Bits 3-0	Indicates the results of command processing. (See Table 5-4 RFID Response Status (CMD_RES Field).)

Table 5-4 RFID Response Status (CMD_RES Field)

Value	Meaning	Description
0x0	No information	Response has been sent, indicating no information
0x1	Tunnel Read Request (*1)	The tunneling mode Read detection by the RF communication
0x3	Tunnel Write Request (*1)	The tunneling mode Write detection by the RF communication
0x5	Normal end	Terminated normally
0x8	Unimplemented command error	The command was an unimplemented one.
0xA	Command parameter error (*2)	・ Address was specified outside non-volatile memory. ・ Data length was out of the specification.
0x9	Tunnel mode error	QUERY and ANSWER commands were issued in IDLE state and RFID command processing in progress.
0xB	Self-diagnosis error	Write access to non-volatile memory-Read-Only area (ROSI setting)
0x7	BUSY	RFID command processing in progress (read, write, status command only)
0xF	HOST_BUSY	Host command processing in progress

(*1) For tunnel mode, see the Chapter 7 Tunnel mode.

(*2) For more information about these errors, see the Administrator's Manual.

Table 5-5 Command response of RFID command processing in progress

Command	Response status (CMD_RES Field)	Meaning	Description
READ WRITE STATUS	0x7	BUSY	RFID command processing in progress
RREG WREG	0x5	Normal end	Normal end
	0xA	Command parameter error	Data length was out of the specification.
QUERY ANSWER	0x9	Tunnel mode error	QUERY and ANSWER commands were issued in IDLE state and RFID command processing in progress

5.2.5 Command

Table 5-6 lists the serial communication mode commands supported by this RFID.

Subsequent sections describe each command in detail.

Table 5-6 Command List in Serial Communication Mode

Name	Code	Description
READ	0x08	Reads an RFID data from the host.
WRITE	0x18	Writes a data to RFID from the host.
RREG	0x68	Reads an RFID control data from the host.
WREG	0x78	Writes a control data to RFID from the host.
STATUS	-	Reads RFID status information from the host.

5.2.5.1 READ

■   Purpose

Reads an RFID data from the host.

■   Command message

● Format

Command code	Start address	Data length n
1 byte	2 bytes	1 byte

● Data field

Field	Setting	Remarks
Command code	0x08	
Start address	Address at which to start reads	· Byte units · Big endian format
Data length n	Size of data to be read · Setting range: 0x01(1) to 0xFE(254)	Byte units

■   Response message

● Format

Status	Data
1 byte	1 to 254 bytes

● Data field

Field	Output value	Remarks
Status	See 5.2.4 Status.	
Data	Data to be read	See Note below.

Note: If the status of a response message from RFID is not normal (error or busy), data will be omitted.

5.2.5.2 WRITE

■   Purpose

Writes a data to RFID from the host.

■   Command message

● Format

Command code	Start address	Data length n	Data
1 byte	2 bytes	1 byte	1 to 251 bytes

● Data field

Field	Setting	Remarks
Command code	0x18	
Start address	Address at which to start writes	・Byte units ・Big endian format
Data length n	Size of data to be written ・ Setting range: 0x01(1) to 0xFB(251)	Byte units
Data	Data to be written	

■   Response message

● Format

Status
1 byte

● Data field

Field	Output value	Remarks
Status	See 5.2.4 Status.	

5.2.5.3 RREG

■　Purpose

Reads an RFID control data and interrupt source from the host.

■　Command message

●　Format

Command code
1 byte

●　Data field

Field	Setting	Remarks
Command code	0x68	

■　Response message

●　Format

Status	Data
1 byte	1 byte

●　Data field

Field	Output value		Remarks
Status	See 5.2.4　Status.		
Data	Bit 7	Masks RF writing interrupt	Set by the WREG command
	Bit 6	Masks RF reading interrupt	Set by the WREG command.
	Bit 5	Masks RF transmission interrupt.	Set by the WREG command.
	Bit 4	Masks magnetic-field detect interrupt	Set by the WREG command.
	Bit 3	Stops RF communication.	Set by the WREG command.
	Bit 2	Reserved (Fixed at 0)	
	Bit 1	CFEN error 0: None 1:CFEN error	Reads the CFEN check results for values of the system area. For CFEN check, see the Administrator's Manual.
	Bit 0	BCC error 0: None 1: BCC error	Reads the BCC check results for values of the system area. For BCC check, see the Administrator's Manual.

5.2.5.4 WREG

■   Purpose

Writes a control data to RFID from the host.

■   Command message

● Format

Command code	Data
1 byte	1 byte

● Data field

Field	Setting		Remarks
Command code	0x78		
Data	Bit 7	Masks RF writing interrupt. 0: Disable (default) 1: Enable	Setting to 1 masks non-volatile memory writing interrupt, regardless of the system area HW2 parameter's IRQSEL setting.
	Bit 6	Masks RF reading interrupt. 0: Disable (default) 1: Enable	Setting to 1 masks non-volatile memory reading interrupt, regardless of the system area HW2 parameter's IRQSEL setting.
	Bit 5	Masks RF transmission completion interrupt. 0: Disable (default) 1: Enable	Setting to 1 masks RF transmission interrupt, regardless of the system area HW2 parameter's IRQSEL setting.
	Bit 4	Masks magnetic-field detect interrupt. 0: Disable (default) 1: Enable	Setting to 1 masks magnetic-field detect interrupt, regardless of the system area HW2 parameter's IRQSEL setting.
	Bit 3	Stops RF communication. 0: Disable (default) 1: Enable	Setting to 1 disables RF communication temporarily. When it is reset to 0, set to1 the Requests a reset (Bit0) at the same time.
	Bit 2-1	Reserved (Set to 0.)	
	Bit 0	Requests a reset. 0: Normal operation (default) 1: Enable	Self-reset the LSI after sending a response to WREG command. During the self-reset period, to initialize the LSI by non-volatile memory settings. For this reason, it is necessary to 3ms(min) latency before performing the host access. By the host access during self-reset period, it becomes busy response.

■   Response message

● Format

Status
1 byte

● Data field

Field	Output value	Remarks
Status	See 5.2.4 Status.	

5.2.5.5 STATUS

■   Purpose

Reads RFID status information from the host.

■   Command message

The STATUS command has no command message.

A slave transmission request serves as a STATUS command.

■   Response message

● Format

Status
1 byte

● Data field

Field	Output value	Remarks
Status	See 5.2.4 Status.	

5.2.6 Time Chart

In a serial communication by I2C interface, the commands and responses can be divided by a byte unit.

The case of commands and responses no divided is referred Normal Access, and the case of divided is referred Divided Access.

Subsequent sections describe the time chart of Normal Access and Divided Access

5.2.6.1 Time Chart of Normal Access

  Figure 5-3 shows the time chart of Normal Access by I2C interface.

t0: The host inputs a request of slave reception.

It means inputting start condition and then inputs a slave address and R/W bit (L). The RFID returns an ACK if the slave address is identified. Subsequently, if the host inputs a command data, the RFID returns an ACK in byte units. The host inputs a stop condition last. Pull up the NIRQ pin to high.

t1: The host stops the clock input to the SCK pin after inputting command data.

The RFID executes command processing internally.

t2: Once the internal command processing is completed, the RFID outputs low to the NIRQ pin to send a response.

t3: The host detects the low output of the NIRQ pin and inputs a request of slave transmission.

The request of slave transmission means inputting start condition, and then inputs a slave address and R/W bit (H).

The RFID returns an ACK and stops the low output of the NIRQ pin if the slave address is identified. Subsequently, if the host inputs a clock to the SCK pin, the RFID returns an ACK in byte units. The top of data is status showing the result of operation. The host inputs an ACK in byte units, and inputs an NACK and stop condition last.
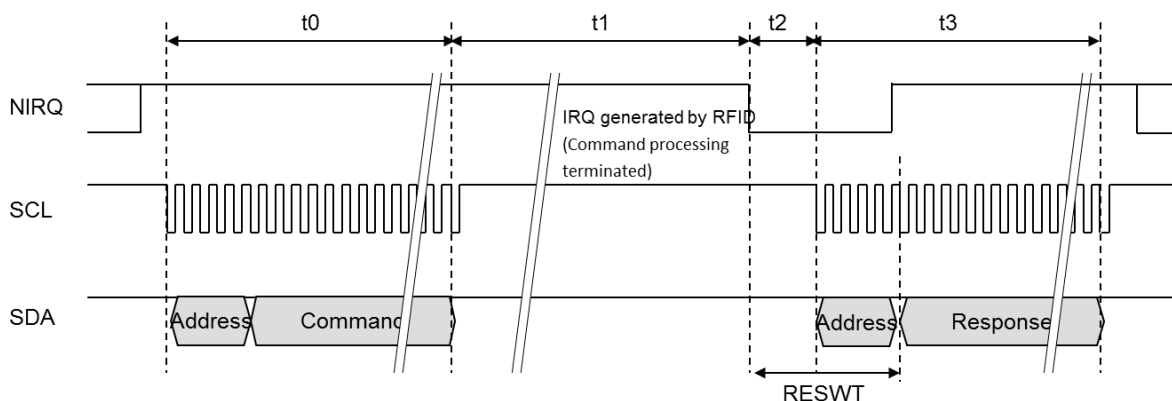

Figure 5-3 Time Chart of Normal Access

5.2.6.2   Time Chart of Divided Command Access

Figure 5-4 shows the time chart of Divided Access of command.

It shows an example of the case that command data is divided into 2.

t0: The host inputs a request of slave reception.

The RFID returns an ACK if the slave address is identified. Subsequently, the host inputs a command data, the RFID returns an ACK in byte units. The host inputs a stop condition to the last of divided byte.

t1: Waiting time for the host start inputting the remaining command data.

t2: The host inputs a request of slave reception again.

The input of a slave reception request must be completed in the time set by RESWT in system area.

The RFID returns an ACK if the slave address is identified. Subsequently, the host inputs a command data, the RFID returns an ACK in byte units. The host inputs a stop condition to the last of command data.

t3 to t5: The same as t1 to t3 of the Normal Access.
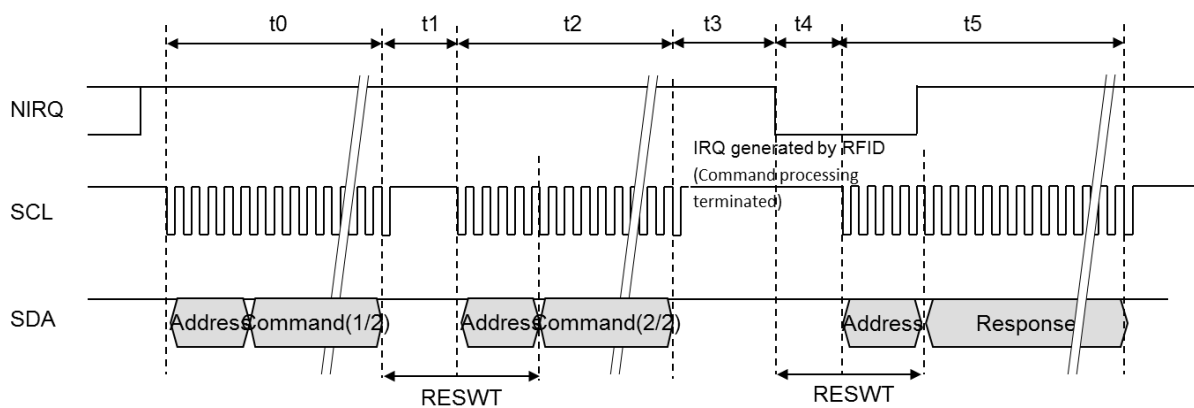

Figure 5-4   Time Chart of Divided Command Access

5.2.6.3   Time Chart of Divided Response Access

Figure 5-5 shows the time chart of Divided Access of response.

It shows an example of the case that response data to read command is divided into 2.

t0 to t2: The same as t0 to t2 of the Normal Access.

t3: The host detects the low output of the NIRQ pin and inputs a request of slave transmission.

The input of a slave transmission request must be completed in the time set by RESWT in system area.

The RFID returns an ACK and stops the low output of the NIRQ pin if the slave address is identified. Subsequently, if the host inputs a clock to the SCK pin, the RFID returns an ACK in byte units. The host inputs an ACK in byte units, and inputs an NACK and stop condition last. The top of data is status showing the result of operation. Following to status, the read data would be read out

t4: Waiting time for the host start reading the remaining response data.

The host stops a clock to the SCK pin

t5: The host inputs a request of slave transmission again.

The input of a slave transmission request must be completed in the time set by RESWT in system area.

The RFID returns an ACK if the slave address is identified.

Subsequently, if the host inputs a clock to the SCK pin, the RFID returns data in byte units. The host inputs an ACK in byte units, and inputs an NACK and stop condition last.

The top of divided response data is status, "0xXB"(self-diagnosis error) would be returned. Following to status, the remaining read data would be read out
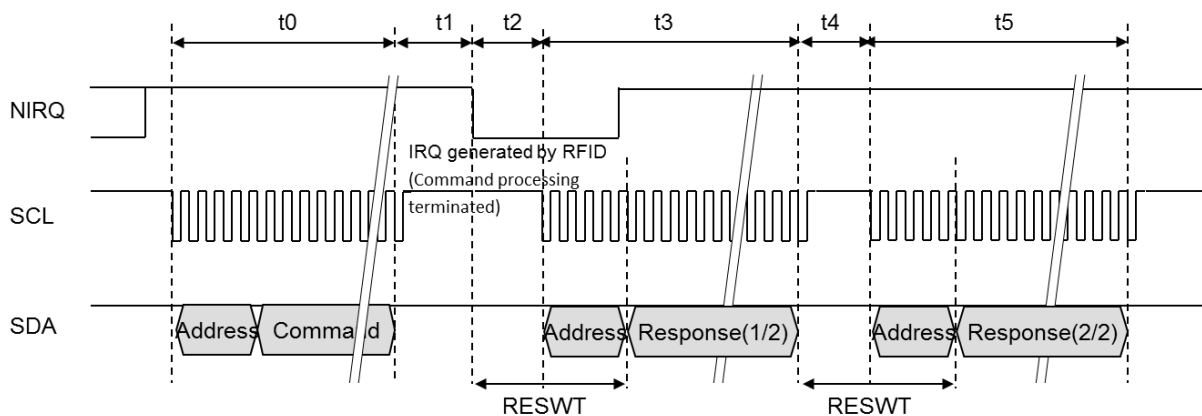

Figure 5-5   Time Chart of Divided Response Access

Note: The maximum number of divisions is 2 in the data field of the status of non-response message.

In the example, the case of a read response, the status is 1 byte, the read data is max 254 bytes, but it is up to 2 divided.

5.2.6.4   The time constraint by INTWT setting

Figure 5-6 shows the time constraints by INTWT setting by the I2C communication.

INTWT settings are applied to the SCL negative edge interval of slave address after recognition.
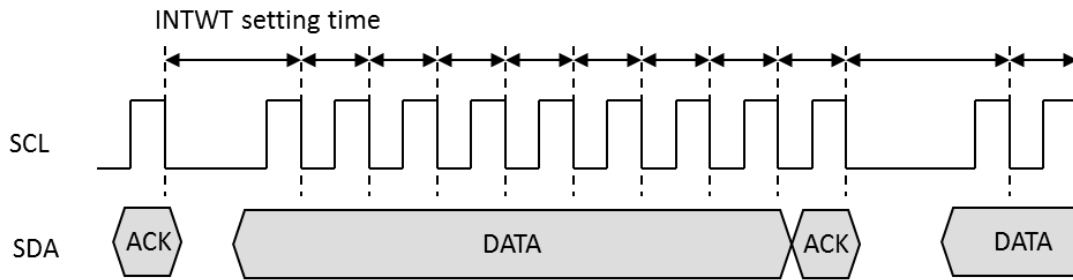

Figure 5-6   Time constraints by INTWT setting

Panasonic

Chapter 6 Interrupt Generation Function

6

6.1 Interrupt Source

This RFID provides an NIRQ pin for interrupt output. A low output to the pin enables IRQ notification to notify the host of generation of an interrupt.

Table 6-1   shows interrupt sources

Table 6-1   Interrupt source list

Interrupt source	Source selection	Mask advisability
Serial mode communication	-	disable
Tunnel mode detection	- (depends on RF command)	disable
RF writing	Enable (IRQSEL parameter)	Enable (WREG command)
RF reading	Enable (IRQSEL parameter)	Enable (WREG command)
RF transmission complete	Enable (IRQSEL parameter)	Enable (WREG command)
Magnetic-field detection	Enable (IRQSEL parameter)	Enable (WREG command)

Interrupt sources are described below.

・Serial communication interrupt

　An IRQ that is caused by serial communication.

　IRQ would be　issued when processing of the command input from the host is completed.

　Serial communication interrupt cannot be masked.

・Tunnel mode detect interrupt

　An IRQ that is caused by tunnel mode command from the reader/writer.

　Refer to Chapter 7　Tunnel Mode for tunnel mode commands.

　Tunnel mode detect interrupt cannot be masked.

・RF writing interrupt

　An IRQ that is caused by RF communication and issued either when starts the non-volatile memory writing by RF command.

　The system area HW2 parameter's IRQSEL selects whether interrupt is generated and the interrupt source. Bit 3 selects the interrupt source.

　In addition, even when interrupt generation is enabled, the WREG command for serial command can mask the IRQ.
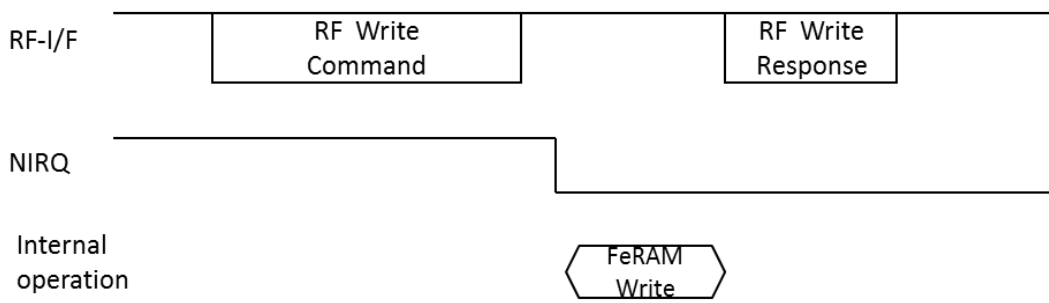

Figure 6-1　RF writing interrupt

Note:　This interrupt is not intended to notify the completion of the write to the non-volatile memory.

Correct data or written, to be confirmed such as by setting a flag data.

・RF reading interrupt

An IRQ that is caused by RF communication and issued either when RF response transmission is completed after a reading out to non-volatile memory area set by system parameter IRQBS and IRQBE.

The system area HW2 parameter's IRQSEL selects whether interrupt is generated and the interrupt source. Bit 2 selects the interrupt source.

In addition, even when interrupt generation is enabled, the WREG command for serial command can mask the IRQ.
Figure 6-2　RF reading interrupt

・RF transmission complete interrupt

An IRQ that is caused by RF communication and issued either when RF response transmission is completed.

The system area HW2 parameter's IRQSEL selects whether interrupt is generated and the interrupt source. Bit 1 selects the interrupt source.

In addition, even when interrupt generation is enabled, the WREG command for serial command can mask the IRQ.

Figure 6-3   RF transmission complete interrupt

・Magnetic-field detect interrupt

An IRQ that is caused by RF magnetic-field detection and issued when an RF magnetic field by reader/writer is detected.

Bit 0 of the system area HW2 parameter's IRQSEL selects whether interrupt is generated.

In addition, even when interrupt generation is enabled, the WREG command for serial command can mask the IRQ.

While the contact power supply VDDEX is applied, even if RF magnetic field disappears, the Low output of the NIRQ pin by the IRQ notification is continued.

While the contact power supply VDDEX is not applied, an IRQ is issued by starting a power supply due to RF magnetic field. However, when RF magnetic field disappears, power supply will be stopped and low output of the NIRQ pin will be stopped.

In the any IRQ notification, it is released when the slave address is matched by the slave transmission request from the Host, and low output of NIRQ pin is negated.

Panasonic

Chapter 7 Tunnel Mode

7

7.1 Tunnel Mode Sequence

This section describes the sequence of tunnel mode, which is shown in Figure 7-1.

SNo.1: Reader/writer sends a tunnel mode command to RFID.

SNo.2: RFID receives the tunnel mode command and issues an interrupt request (IRQ) to the host.

SNo.3: If VDDEX is not applied, the host applies VDDEX.

SNo.4: The host sends a QUERY command (inquiry) to RFID.

SNo.5: RFID sends a response to the QUERY command to the host. The response includes data of the tunnel mode command in step SNo.1.

SNo.6: The host sends an ANSWER command (notification of the result) to RFID. The command includes data to be sent to reader/writer.

SNo.7: RFID receives the ANSWER command and sends a response (processing result; Normal end or Error) to the command to the host.

SNo.8: After sending the response to the ANSWER command in step SNo.7, RFID sends the data of the ANSWER command to reader/writer as a response to the tunnel mode command.

For more information about tunnel mode operation, see Section 8.2　State Transition Diagram in Operation Mode, Section 8.3　Flow Chart in Tunnel Mode, or other related sections.
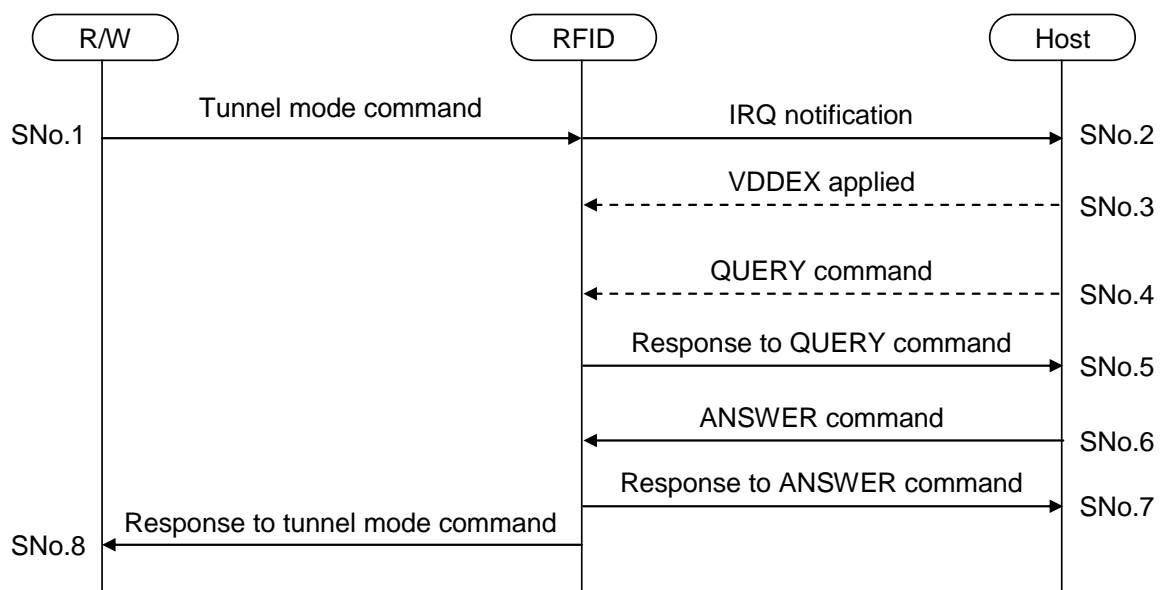

Figure 7-1　Tunnel Mode Sequence

7.2 Communication between Reader/Writer and RFID

This section describes the communication between Reader/Writer and RFID in tunnel mode, based on JISX6319-4 and ISO/IEC14443.

7.2.1 Using JISX6319-4

READ and WRITE commands, same as those of RF communication mode, are used.

Use the given bits of block number to set the tunnel mode commands. For more information, see Section 4.2.5.6   Section Block.

For information on how to set block list and block data, see Section 4.2.5.7   Block List.

7.2.2 Using ISO/IEC14443

READ and WRITE commands, same as those of RF communication mode, are used.

Use the given bits of address (P1, P2) to set the tunnel mode commands. For more information, see Section 4.3.8.5   Address.

For information on how to set data, see Section 4.3.8.6   Data.

7.3 Communication between Host and RFID

This section describes the I2C communication between the host and RFID in tunnel mode.

7.3.1 Communication Specification

The specification for I2C communication is the same as that for serial communication mode. There are restrictions in the I2C divided access. See Section 5.2   I2C.

QUERY and ANSWER commands are provided only for tunnel mode. For more information about commands, see Section 7.4   Command.

7.3.2 IRQ Notification

Once this RFID receives a tunnel mode command from reader/writer, it sends an IRQ to the host.

IRQ is output from the NIRQ pin. The NIRQ pin also outputs IRQs in other modes than tunnel mode by setting the system area HW2 parameter's IRQSEL. For more information about IRQSEL, see Section 3.3   HW1 (2 bytes)   in Section System Area.

When the host receives an IRQ and detects that the supply voltage VDDEX is not applied, it applies VDDEX and sends a QUERY command to the RFID. The RFID can receive I2C commands at the falling edge of NIRQ.

In addition, if the RFID does not receive a QUERY command from the host even when the maximum wait time for QUERY command specified in the system area QWT elapses after the NIRQ pin outputs low, it detects a timeout. For more information, see Section   8.3   Flow Chart in Tunnel Mode.

For more information, see 7.3.4 Timeout.

7.3.3 Response to QUERY Command

When a response to QUERY command in tunnel mode is sent, the RFID reports the content of the command from reader/writer to the host.

The address setting for response to QUERY is shown in Figure 7-2.

Bit 7 of upper byte is fixed to 0 and bit 6 is fixed to 1. Setting bit 6 to 1 indicates the RFID is in tunnel mode. Bits 5 and 4 indicate mode.

Table 7-1 shows the meaning of mode of upper byte bits 5 and 4.

Start address (2 bytes)

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Output	0	1	Mode		Start address designation											
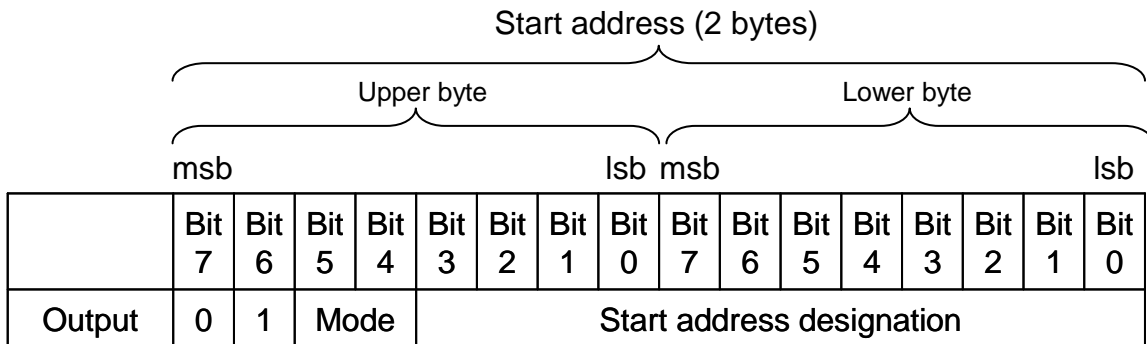

Figure 7-2 Address Setting for Response to QUERY Command

Table 7-1 QUERY Response Mode

Upper byte		Meaning
bit 5	bit 4	
0	0	The read value is "00"
1	0	Reserved
1	1	
0	1	

7.3.4 Timeout

In tunnel mode command processing for communication between host and RFID, a timeout processing is applied if the host sends no response to QUERY and ANSWER commands.

Figure 7-3 shows the wait time for commands in tunnel mode.

Subsequent section describes the wait time for QUERY and ANSWER commands.
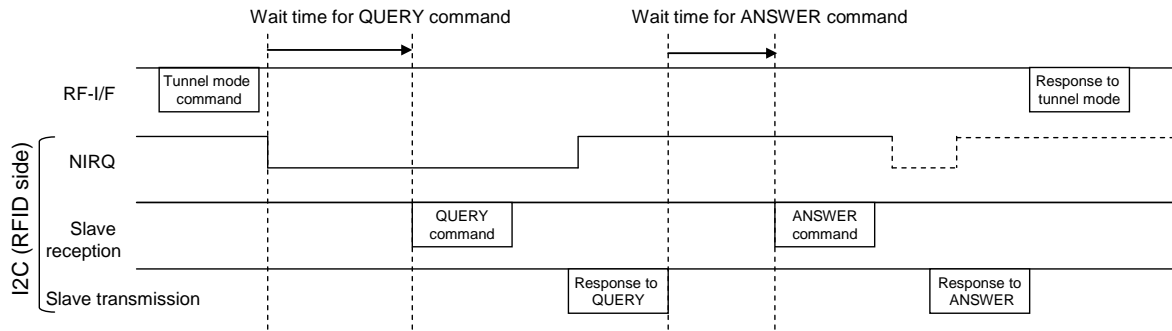

Figure 7-3 Wait Time for Commands

Note: In timeout measurement processing for I2C, the start of command is detected at the start of ACK transmission to a slave address input, not start condition.

7.3.4.1　Wait Time for QUERY Command

The time sequence for timeout of waiting for QUERY command (no response from the host) is shown in Figure 7-4 . The measurement of timeout starts when the IRQ state of NIRQ pin changes to low from high.

A timeout time is QWT setting time.

■ No response from the host
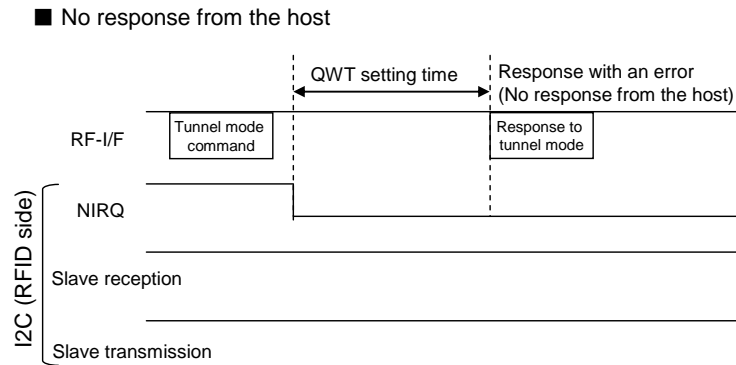

Figure 7-4 Timeout of Waiting for QUERY Command (No Response from the Host)

Next, the time sequence when the RFID receives a command other than QUERY from the host while it waits for a QUERY command is shown in Figure 7-5 .Note that the timeout measurement time does not include the time from serial communication command issue to the response to the command.

For more information, see Section 8.3　Flow Chart in Tunnel Mode.

■ Command other than QUERY
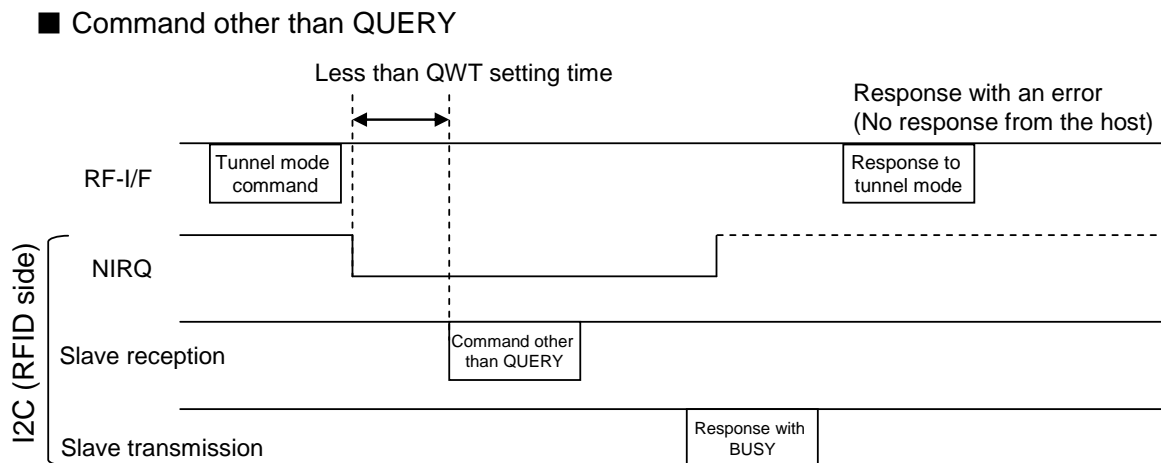

Figure 7-5 Timeout of Waiting for QUERY Command (Command Other Than QUERY)

7.3.4.2 Wait Time for ANSWER Command

The time sequence when the RFID receives no response from the host while it waits for an ANSWER command is shown in Figure 7-6 . The measurement of timeout starts immediately after the first response (to normal QUERY command) is sent.
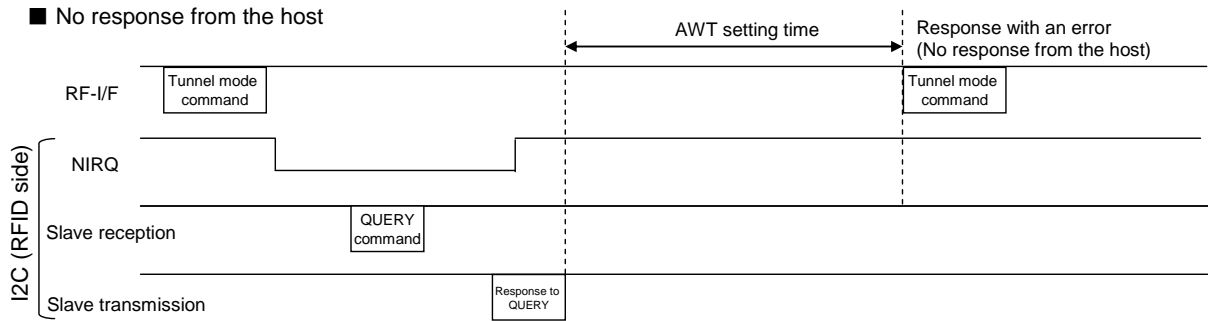

Figure 7-6 Timeout of Waiting for ANSWER Command (No Response from the Host)

Next, the time sequence when the RFID receives a command other than ANSWER from the host while it waits for an ANSWER command is shown in Figure 7-7 . Note that the timeout measurement time does not include the time from serial communication command issue to the response to the command.
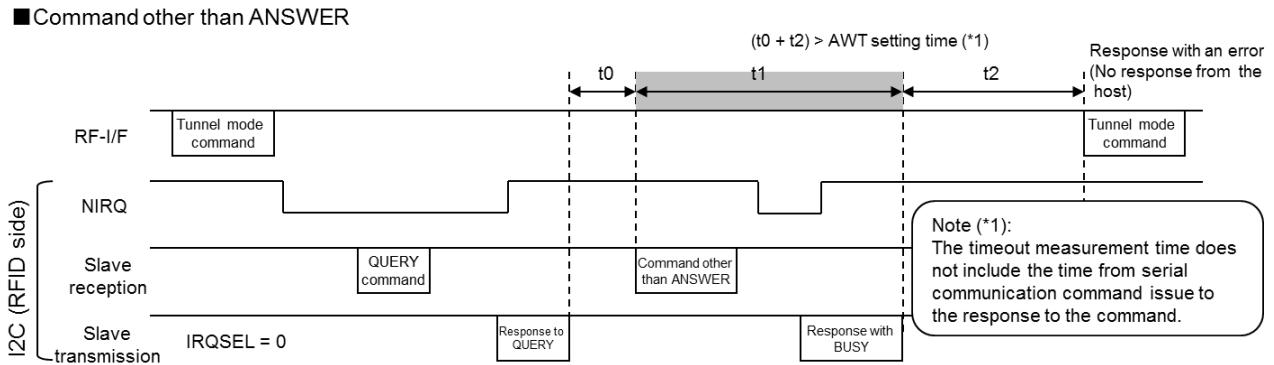

Figure 7-7 Timeout of Waiting for ANSWER Command (Command Other Than ANSWER)

Panasonic

7.4 Command

The tunnel mode commands supported by this RFID fall into two types:

RF-interface-side commands between reader/writer and RFID and serial-interface-side commands between the host and RFID.

These commands are shown in Table 7-2 and Table 7-3.

Subsequent sections describe each command in detail.

Table 7-2 RF Interface Command List in Tunnel Mode

Name	Code		Description
	JISX6319-4	ISO/IEC 14443	
READ	0x06	0xB0	Reads data of the host from reader/writer. (Command code is the same as that for RF communication mode)
WRITE	0x08	0xD6	Writes data to the host from reader/writer. (Command code is the same as that for RF communication mode)

Table 7-3 Serial-Communication-Side Commands List in Tunnel Mode

Name	Code	Description
QUERY	0x28	The host inquires about the content of tunnel mode command to RFID.
ANSWER (normal end)	0xF8	The host reports the processing result (normal end) of tunnel mode command to RFID.
ANSWER (error)	0xE8	The host reports the processing result (error) of tunnel mode command to RFID.

7.4.1 Read in Tunnel Mode

■　Purpose

Reads data of the host from reader/writer via RFID.

7.4.1.1 Read Command in Tunnel Mode (Reader/Writer to RFID)

■　JIX6319-4

●　Format

Command code	PICC identifier	No. of service file identifiers (k)	List of service file identifiers	No. of blocks (m)	Block list
1 byte	8 bytes	1 byte	2×k byte	1 byte	2×m or 3×m bytes

●　Data field

Field	Setting	Remarks
Command code	0x06	
PICC identifier	PICC identifier acquired by REQ command described in Section 4.2.6.1　REQ.	
No. of service file identifiers (k)	Number of service files Setting range: 0x01(1) to 0x0F(15)	When the range other than the range on the left column is set, the RFID responds with an error.
List of service file identifiers	Don't care (Setting example: 0x0900)	When specifying multiple services, the RFID responds with an error if all service files are not set to the same value.
No. of blocks (m)	Number of blocks specified in block list Setting range: ・ Plaintext communication in RF communication mode: 0x01(1) to 0x0F(15) ・ Other communication: 0x01(1) to 0x0F(15)	When the range other than the range on the left column is set, the RFID responds with an error.
Block list	Block list of data to be read For information about how to set, see the following: ・ See 4.2.5.6　Block. ・ See 4.2.5.7　Block List.	

■　ISO/IEC14443 TypeA/TypeB

●　Format

CLA	INS	P1	P2	Le
1 byte	1 byte	1 byte	1 byte	1 byte

● Data field

Field	Setting	Remarks
CLA	0x00	Responds with an error, except 0x00.
INS	0xB0	
P1	Start address of data to be read ・ See 4.3.8.5 Address.	
P2	Start address of data to be read ・ See 4.3.8.5 Address.	
Le	Byte length of data to be read ・ Setting range: 0x01(1) to 0xFB(251)	

7.4.1.2 QUERY Command (Host to RFID)

● Format

Command code
1 byte

● Data field

Field	Setting	Remarks
Command code	0x28	

7.4.1.3 QUERY Response (RFID to Host)

● Format

Response code	Start address	Data length n
1 byte	2 bytes	1 byte

● Data field

Field	Setting	Remarks
Response code	See 5.2.4 Status.	
Start address	Address at which to start reads	・Byte units ・Big endian format
Data length n	Size of data to be read	Byte units

7.4.1.4 ANSWER Command (Host to RFID)

● Format

Command code	Data
1 byte	n bytes

● Data field

Field	Output value	Remarks
Command code	0xF8: Normal end 0xE8: Error	
Data	Data of the range specified by the response to the QUERY command	See Note below.

Note: If the status of the ANSWER command is "error," omit the data.

7.4.1.5 ANSWER Response (RFID to Host)

● Format

Status
1 byte

● Data field

Field	Output value	Remarks
Status	See 5.2.4 Status.	

7.4.1.6 Read Response in Tunnel Mode (RFID to Reader/Writer)

1.

■   JIX6319-4

● Format

Response code	PICC identifier	Status flag 1	Status flag 2	No. of blocks (m)	Block data
1 byte	8 bytes	1 byte	1 byte	1 byte	16×m bytes

● Data field

Field	Output value	Remarks
Response code	0x07	
PICC identifier	See 4.2.5.2　PICC (Proximity IC Card) Identifier.	
Status flag 1	See 4.2.5.8　Status Flag.	
Status flag 2	See 4.2.5.8　Status Flag.	
No. of blocks (m)	Number of blocks specified by the tunnel mode read command	Omitted when the status is not "Normal end"
Block data	Data specified by the ANSWER command ・ See 4.2.5.7　Block List.	Omitted when the status is not "Normal end"

■　ISO/IEC14443 TypeA/TypeB

■　Format

Data	SW1	SW2
1 to 251 bytes	1 byte	1 byte

■　Data field

Field	Output value	Remarks
Data	Read data See 4.3.8.6　Data.	Omitted when the status word is not "Normal end"

1 byte	1 byte

● Data field

Field	Output value	Remarks
SW1	See 4.3.8.7　Status Word.	
SW2	See 4.3.8.7　Status Word.	

Panasonic

Chapter 8   Annex

8

8.1 Exclusive Control

While in operation mode, this RFID performs an exclusive control not to receive other commands.

Figure 8-1 shows the exclusive control period. The period is from the start of an operation mode command to the end of the response to the command. In tunnel mode, the period is from the start of the tunnel mode command from reader/writer (see SNo.1 in Figure 7-1 Tunnel Mode Sequence) to the end of the response to the command from RFID to reader/writer (see SNo.8 in Figure 7-1 Tunnel Mode Sequence).
Figure 8-1　Exclusive Control Period

Table 8-1 to Table 8-4 shows the operations in exclusive control period for each operation mode.

The RFID responds to a command from the host if the slave address is identified. It also responds with unimplemented command error for unimplemented command.

In tunnel mode, the RFID operation differs between before and after IRQ output following the reception of a tunnel mode command from reader/writer.

Table 8-1 Operation during Exclusive Control (Response at HOST command recieved)

Current operation mode	Receive command	Operation to a receive command
During transmission or reception by the RF	READ WRITE STATUS	Responds with BUSY.
	WREG RREG	Normal end or Self-diagnosis error
	QUERY (*2) ANSWER (*2)	Tunnel mode error
During transmission or reception by the serial communication	READ (*2) WRITE (*2) STATUS WREG (*2) RREG (*2) QUERY (*2) ANSWER (*2)	Responds with HOST-BUSY. (*3)
Tunnel mode Waiting for QUERY command	READ (*2) WRITE (*2)	Unimplemented command error
	STATUS	Tunnel Read detect or Tunnel Write detect
	WREG (Except RF Stop request) RREG	Tunnel Read detect or Tunnel Write detect (Normal end), or Self-diagnosis error
	WREG (RF Stop request)	Normal end or Self-diagnosis error
	QUERY	See 7.1 Tunnel Mode Sequence.
	ANSWER (*2)	Unimplemented command error
Tunnel mode Waiting for Answer command	READ (*2) WRITE (*2)	Unimplemented command error
	STATUS	Tunnel Read detect or Tunnel Write detect
	WREG RREG	Normal end or Self-diagnosis error
	QUERY (*2)	Unimplemented command error
	ANSWER	See 7.1 Tunnel Mode Sequence.

(*1) During the processing of the Host command, more and Host command is input, the interrupt for after the command does not occur.

(*2) The irregular case is not assumed as the normal operation.

(*3) HOST-BUSY response is a response in the case where the slave transmission request before the interrupt occurred.

Table 8-2 Operation during Exclusive Control (JISX6319-4 command recieved)

Current operation mode	Receive command	Operation to a receive command
During transmission or reception by the RF	All Commands (*1)	No response
During transmission or reception by the serial communication	All Commands	No response
Tunnel mode Waiting for QUERY command	All Commands (*1)	No response
Tunnel mode Waiting for Answer command	All Commands (*1)	No response

(*1) The irregular case is not assumed as the normal operation.

Table 8-3 Operation during Exclusive Control (ISO14443 TypeA/B command received (SWTX="0"))

Current operation mode	Receive command	Operation to a receive command
During transmission or reception by the RF	All Commands (*1)	No response
During transmission or reception by the serial communication	All Commands	No response
Tunnel mode Waiting for QUERY command	All Commands (*1)	No response
Tunnel mode Waiting for Answer command	All Commands (*1)	No response

(*1) The irregular case is not assumed as the normal operation.

Table 8-4 Operation during Exclusive Control (ISO14443 TypeA/B command received (SWTX="1"))

Current operation mode	Receive command	Operation to a receive command
During transmission or reception by the RF	All Commands (*1)	No response
During transmission or reception by the serial communication	SELECT READ WRITE VERIFY	S(WTX) response
	Other	Response
Tunnel mode Waiting for QUERY command	All Commands (*1)	No response
Tunnel mode Waiting for Answer command	All Commands (*1)	No response

(*1) The irregular case is not assumed as the normal operation.

Figure 8-2 shows the detail of exclusive control in tunnel mode.

When the RFID receives a command from the host during tunnel mode command reception and before IRQ output, it sends a response to the Host command and then outputs Tunnel mode detect IRQ.

See "During transmission or reception by the RF " Table 8-2 for "Response *1" in Fig 8-2

After tunnel mode detect IRQ output, if a command is received from the Host, and the response to the command.

See "Tunnel mode Waiting for QUERY command " Table 8-3 for "Response *2" in Fig 8-2

● Issuing a serial interface command before generating Tunnnel mode detect IRQ

● Issuing a serial interface command after generating Tunnel mode detect IRQ
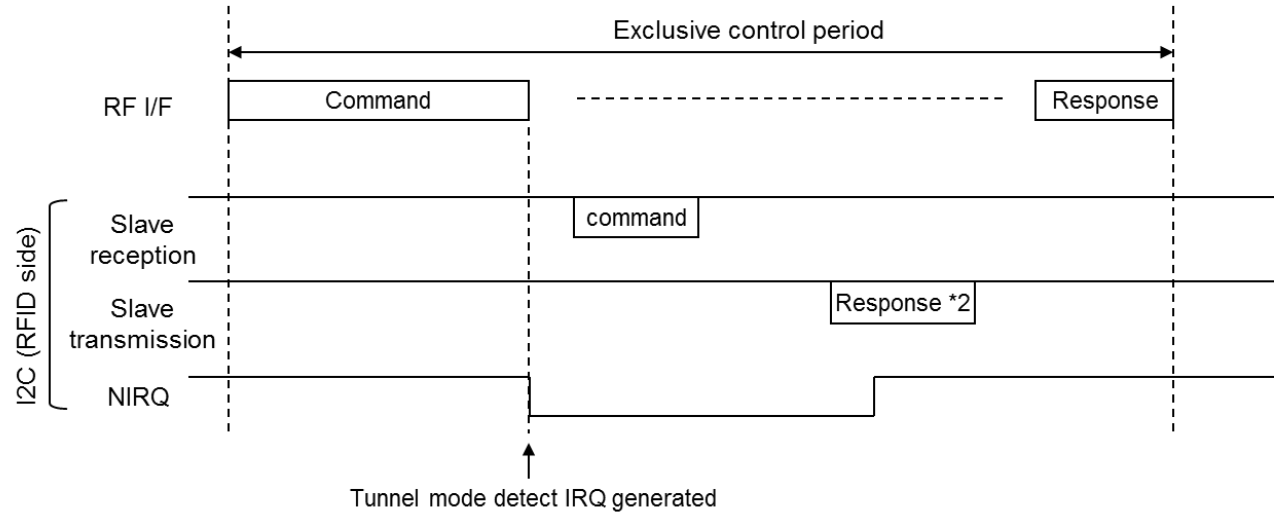

Figure 8-2   Exclusive Control in Tunnel Mode

8.2 State Transition Diagram in Operation Mode

Figure 8-3 shows the state transition diagram of this RFID in operation mode.
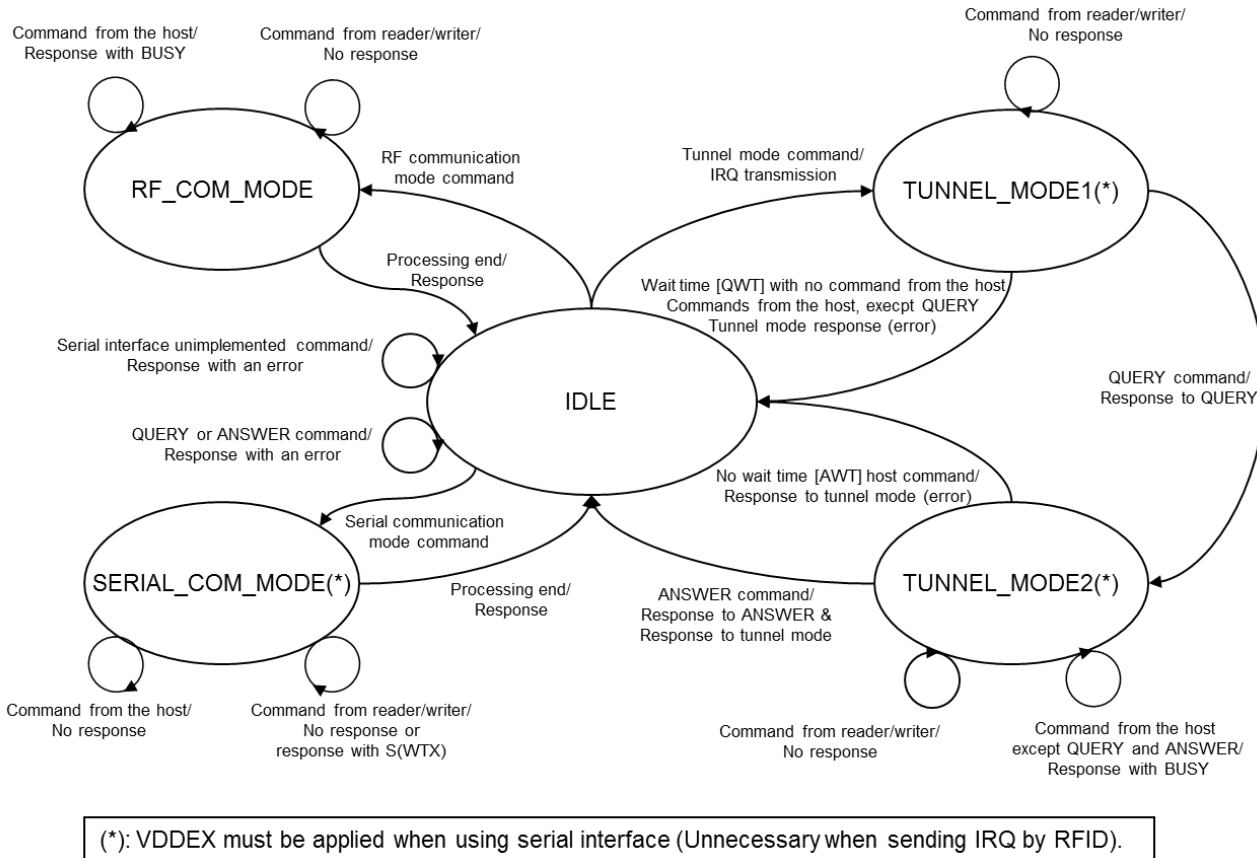

Figure 8-3   State Transition Diagram in Operation Mode

8.3 Flow Chart in Tunnel Mode

Figure 8-4 illustrates a flow chart for tunnel mode.
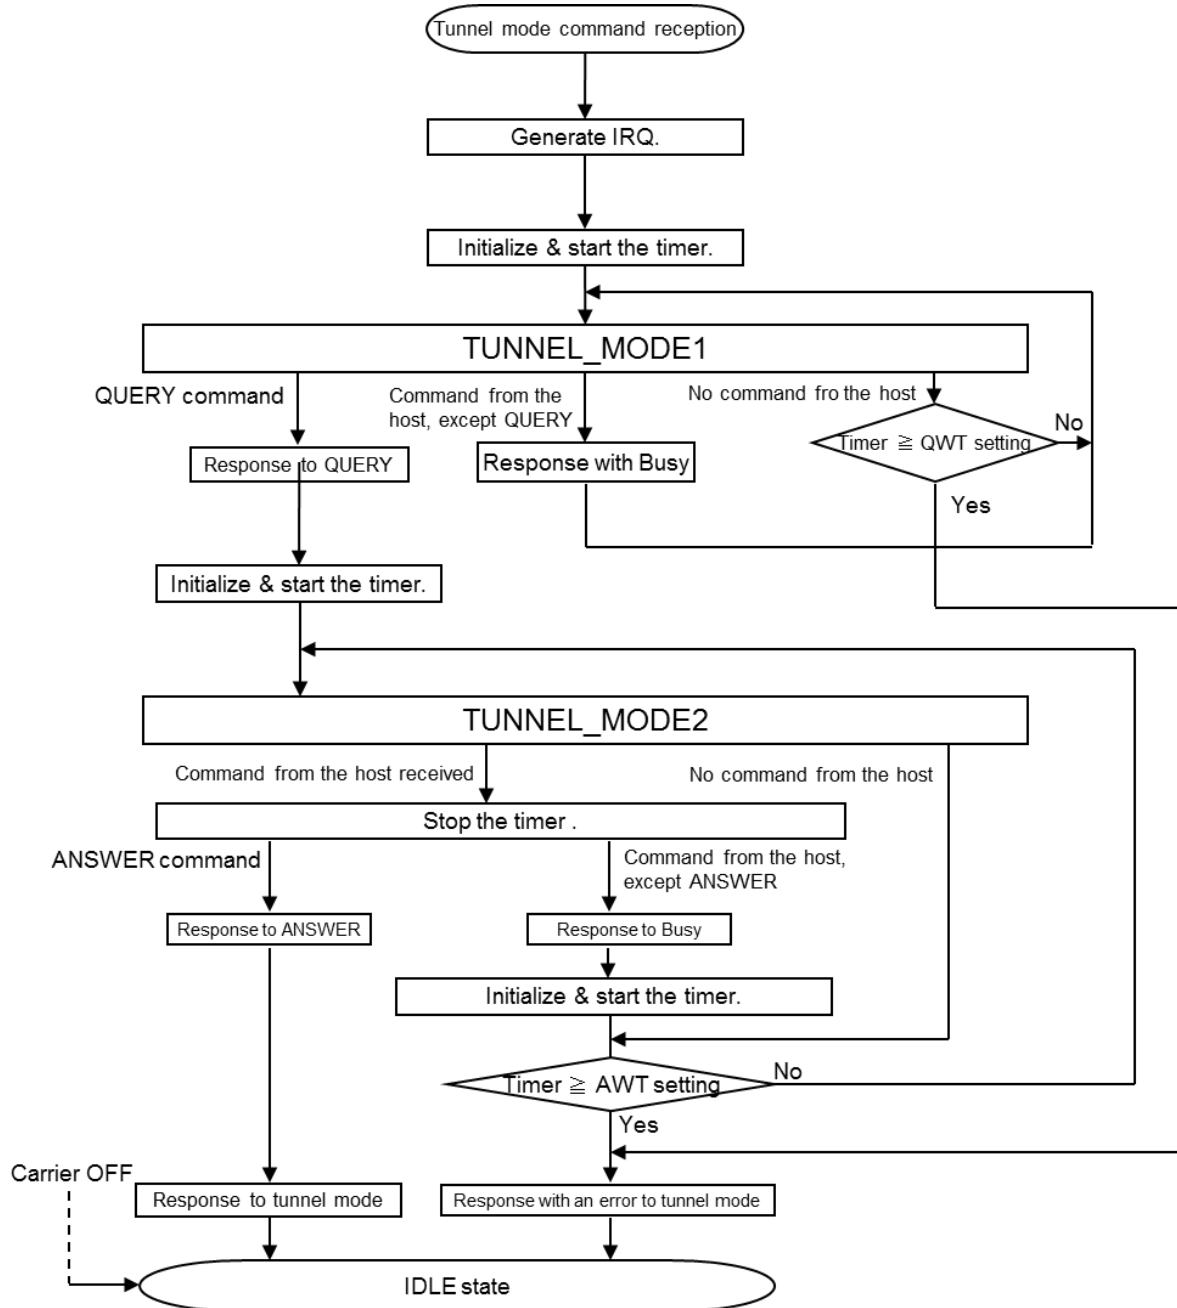

Figure 8-4   Flow Chart in Tunnel Mode

In TUNNEL_MODE2, Timer will initialize when Busy response by commands from the Host of non-ANSWER. No time-out is generated when repeating a Busy response more frequently than AWT settings, it is not a transition to the IDLE state. Transitions to the IDLE state by receiving the ANSWER command.

PART No. : MN63Y3214N1

PACKAGE CODE No. | Board mount type contact/contactless tag module

v0. 1

		Electrical characteristics		

Attention

The technical information described in this document is intended only to show the main characteristics and application circuit examples of the product. No license is granted in and to any intellectual property right or other right owned by Panasonic Corporation or any other company. Therefore, no responsibility is assumed by our company as to the infringement upon any such right owned by any other company which may arise as a result of the use of technical information described in this document.

  Use caution regarding the orientation of the LSI during use. Mounting of the LSI in an incorrect orientation may cause smoke or fire.

	Electrical characteristics		

Structure	CMOS Type LSI with 8Kbit Non-volatile Memory
Application	Digital AV devices, Home Appliances, Portable devices, etc.
Function	Dual interface RFID
Connection	Fig.2-1,Fig.2-2 and Fig.2-3

A. Absolute Maximum Ratings Note 1)

$V_{SS} = 0$ V

	Item		Symbol	Rating	Unit
A1	Power supply Note 2)		V_{DDEX}	- 0.3 ～ + 4.6	V
A2			V_{DDA}	- 0.3 ～ + 4.6	V
A3	Voltage antenna terminals swing (VB Peak to peak) Note3)		V_{AB}	26	V
A4	Input pin voltage (SDA,SCL,NIRQ)		V_I	- 0.3 ～ + 4.6	V
A5	Output current		I_O	12	mA
A6	Storage temperature Note 4)		T_{stg}	-40 ～ 85	°C
A7	Operating ambient temperature		T_{opr}	-20 ～ 85	°C

Note 1)   Absolute Maximum Ratings are limit values not to destroy LSI mounted on the tag
               module and are not to guarantee operation.

Note 2)   VDDA is generated internally and are not supplied externally. This is the power supply
               voltage generated in the LSI by RF communication.

Note 3)   Definition of Voltage antenna terminals swing (V_{AB})
Fig.1

Note 4)   It is recommended that a data write to Non-volatile memory be performed after
               reflow soldering (Otherwise, due to very high temperature in reflow soldering,
               Non-volatile memory data retention is not guaranteed.)

	Electrical characteristics		

B. Operating Conditions

1) Communication method :　Dielectric wireless communication method

2) RF Interface :

　　　　　　　・Compliant with　JIS X6319-4 (212kbps/424kbps)

　　　　　　　・Compliant with　ISO/IEC 14443 TypeB (106kbps/212kbps)

3) Operating frequency :　13.56MHz

4) Storage temperature :　-40 ～ 85 ℃

5) Operating ambient temperature :　-20 ～ 75 ℃

6) VDDEX condition　　:

Ta = -20 °C ～ 75 °C, V_{SS} = 0 V

Item		Symbol	Conditions	Limits			Unit
				Min	Typ	Max	
B1	Supply voltage VDDEX	V_{DDEX}		1.7	1.8	3.6	V

	Electrical characteristics		

C. Electric Characteristics

DC Characteristics   Ta = -20 °C $\sim$ 75 °C, V_{SS} = 0 V

Item		Symbol	Conditions	Limits			Unit
				Min	Typ	Max	
C1	Operating current on VDDEX	I_{DDEX}	V_{DDEX} =1.8V	-	250	500	μA

	Electrical characteristics		

I/O terminal characteristics   Ta = -20 °C～75 °C, V_{DDEX}=1.7V～3.6V, V_{SS} = 0 V

Item		Symbol	Condition	Limits			Unit
				Min	Typ	Max	
Input/Output pin : SDA、SCL							
C2	Input voltage high level	V_{IH1}		$0.7 \times V_{DDEX}$	-	V_{DDEX}	V
C3	Input voltage low level	V_{IL1}		0	-	$0.3 \times V_{DDEX}$	V
C4	Input leakage current	I_{LK1}		−10	0.02	10	μA
C5	Output voltage low level (SDA)	I_{LK1}	I_{OL}=2.0 mA	-	-	0.4	V
Output pin : NIRQ							
C6	Output leakage current	I_{LK2}		−10	0.02	10	μA
C7	Output voltage low level	V_{OL2}	I_{OL}=2.0 mA	-	-	0.4	V

Reference information

As a reference of pull-up resistor connected to the open-drain type terminals,
SDA, SCL and NIRQ, 3.3kΩ resistors are used in our evaluation. Please adjust the
resistance value considering the communication speed, capacitive loads and other factors.

Panasonic

	Electrical characteristics		

D. AC characteristics

I2C interface   Ta = -20 °C $\sim$ 75 °C, V_{DDEX}=1.7V$\sim$3.6V,V_{SS} = 0 V

	Item	Symbol	Limits			Unit
			Min	Typ	Max	
D1	SCL clock frequency	F_{SCL}	1		400	kHz
D2	Hold time of Repeated-START condition	$T_{HD;STA}$	0.6			µs
D3	SCL clock low period	T_{LOW}	1.3			µs
D4	SCL clock high period	T_{HIGH}	0.6			µs
D5	Setup time of Repeated-START condition	$T_{SU;STA}$	0.6			µs
D6	SDA hold time	$T_{HD;DAT}$	0.0		0.9	µs
D7	SDA setup time	$T_{SU;DAT}$	100			ns
D8	Setup time of STOP condition	$T_{SU;STO}$	0.6			µs
D9	Period between STOP condition and START condition	T_{BUF}	1.3			µs
Fig.2

	Electrical characteristics		

RF interface   Ta = -20 °C $\sim$ 75 °C, V_{SS} = 0 V

	Item	Symbol	Condition	Limits			Unit
				Min	Typ	Max	
D10	VB voltage (peak to peak) at "RF High" period	V_{RFH1}	RF 13.56 MHz	-	-	18	V
D11	Modulation index of command	m	JISX6319-4 RF interface specification Communication rate of 212kbps	4.0	-	-	%

Note 5)   This specification is applied both when receiving command and when transmitting response.
Modulation Factor $m = \dfrac{a-b}{a+b}$ The RF waveform is measured with a calibration coil specified in ISO/IEC 10373-6.

Fig.3

	Electrical characteristics		

E. Boot of power supply

Ta = -20 °C ～ 75 °C, V_{DDEX}=1.7V～3.6V, V_{SS} = 0 V

	Item	Symbol	Condition	Limits			Unit
				Min	Typ	Max	
E1	VDDEX rise time	t_{UP}	Note 6)	0.0025	-	1.0	V/µs
E2	VDDEX boot time to be ready to receive command	t_{BOOT}	Note 6)	-	-	3	ms
E3	VDDEX low pulse period	t_{PLW}	Note 6)	3	-	-	ms

Note 6) Make it into a monotone increase or monotone decreasing at the time of ON/OFF of a VDDEX power supply.
When it turn OFF a VDD power supply, make VDDEX less than 0.3V.

Note 7) Host access enable after T_{BOOT} time passed on Power up. Host access is finished before Power down.

Note 8) If VDDEX rise time is below the limit value, to the reset request by WREG command after T_{BOOT} time passed on Power up.
