Description

The LM317S is an adjustable 3-terminal positive-voltage regulator capable of supplying 1 A over an output-voltage range of 1.2 V to 37 V. It is exceptionally easy to use and requires only two external resistors to set the output voltage. In addition, internal current limiting, thermal shutdown, and safe area compensation, making it essentially blow−out proof.

The LM317S serves a wide variety of applications including local, on card regulation. This device can also be used to make a programmable output regulator, or by connecting a fixed resistor between the adjustment and output, the LM317S can be used as a precision current regulator.

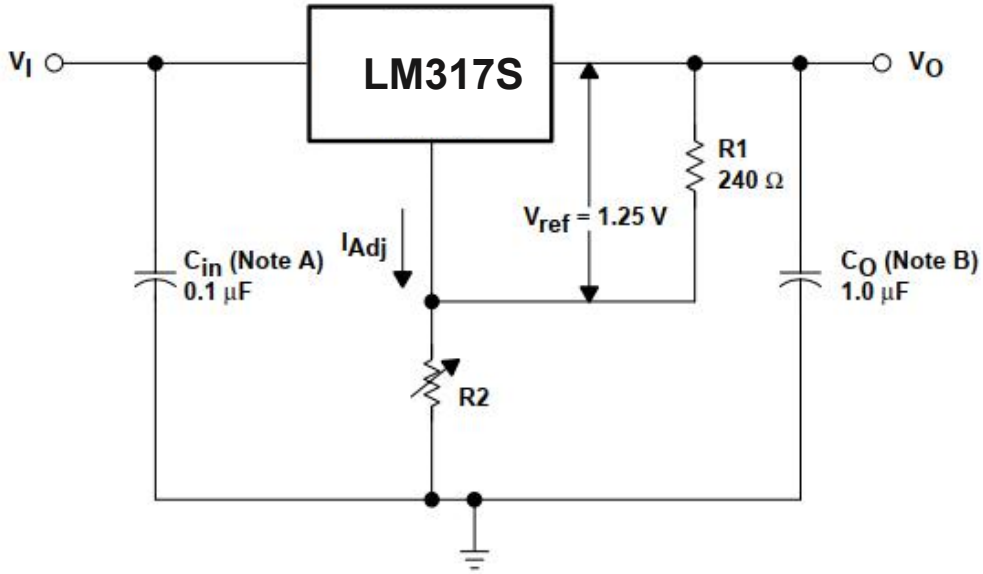
Features

- Output Current in Excess of 1 A
- Output Adjustable Between 1.2 V and 37 V
- Internal Thermal Overload Protection
- Internal Short Circuit Current Limiting Constant with Temperature
- Output Transistor Safe−Area Compensation
- Eliminates Stocking many Fixed Voltages
- Available Packages: SOT-223, TO-252 and SOP-8

Applications

- Electronic Points of Sale
- Medical, Health, and Fitness Applications
- Appliances and White Goods
- TV Set-Top Boxes

Typical Applications



Note:
C_{in} is required if regulator is located an appreciable distance from power supply filter.
C_O is not needed for stability, however, it does improve transient response.

$$V_{OUT}=1.25V(1+R_2/R_1)+I_{Adj}R_2$$

Since I_{Adj} is controlled to less than 50 µA, the error associated with this term is negligible in most applications.

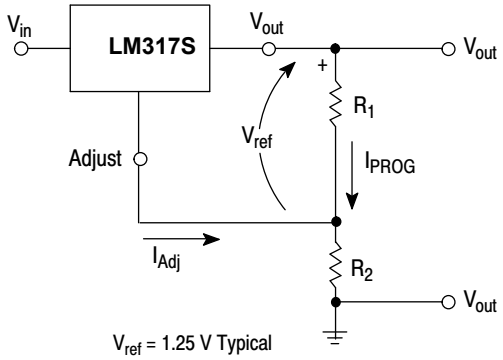
Applications Information

Basic Circuit Operation

The LM317S is a 3−terminal floating regulator. In operation, the LM317S develops and maintains a nominal 1.25V reference (V_{ref}) between its output and adjustment terminals. This reference voltage is converted to a programming current (IPROG) by R1 (see the following figure), and this constant current flows through R2 to ground.
The regulated output voltage is given by:

$$V_{OUT} = 1.25V*(1+R_2/R_1)+I_{Adj}*R_2$$



Basic Circuit Configuration

Since the current from the adjustment terminal (I_{Adj}) represents an error term in the equation, the LM317S was designed to control I_{Adj} to less than 100 μA and keep it constant. To do this, all quiescent operating current is returned to the output terminal. This imposes the requirement for a minimum load current. If the load current is less than this minimum, the output voltage will rise.
Since the LM317S is a floating regulator, it is only the voltage differential across the circuit which is important to performance, and operation at high voltages with respect to ground is possible.

Load Regulation

The LM317S is capable of providing extremely good load regulation, but a few precautions are needed to obtain maximum performance. For best performance, the programming resistor (R1) should be connected as close to the regulator as possible to minimize line drops which effectively appear in series with the reference, there by degrading regulation. The ground end of R2 can be returned near the load ground to provide remote ground sensing and improve load regulation.

External Capacitors

A 0.1 μF disc or 1.0 μF tantalum input bypass capacitor (C_{in}) is recommended to reduce the sensitivity to input line impedance.The adjustment terminal may be bypassed to ground to improve ripple rejection. This capacitor (C_{Adj}) prevents ripple from being amplified as the output voltage is increased. A 10μF capacitor should improve ripple rejection about 15 dB at 120 Hz in a 10V application.
Although the LM317S is stable with no output capacitance, like any feedback circuit, certain values of external capacitance can cause excessive ringing. An output capacitance (C2) in the form of a 1.0μF tantalum or 25μF aluminum electrolytic capacitor on the output swamps this effect and insures stability.

Protection Diodes

When external capacitors are used with any IC regulator it is sometimes necessary to add protection diodes to prevent the capacitors from discharging through low current points into the regulator.The following figure shows the LM317S with the recommended protection diodes for output voltages in excess of 25 V or high capacitance values (C_O > 25μF, C_{Adj} > 10μF). Diode D1 prevents CO from discharging thru the IC during an input short circuit. Diode D2 protects against capacitor C_{Adj} discharging through the IC during an output short circuit.
The combination of diodes D1 and D2 prevents C_{Adj} from discharging through the IC during an input short circuit.
