<b>Title</b>	<b><i>Reference Design Report for a 7 W Non-Dimmable, Non-Isolated Buck LED Driver Using LYTSwitch™-0 LYT0006D</i></b>
<b>Specification</b>	190 VAC – 265 VAC Input; 85 V, 82 mA Output
<b>Application</b>	A17 / A19 LED Driver Lamp Replacement
<b>Author</b>	Applications Engineering Department
<b>Document Number</b>	RDR-378
<b>Date</b>	October 4, 2013
<b>Revision</b>	1.0

**Summary and Features**

- Single-stage power factor corrected ( $>0.5$  at 230 V) and accurate constant current (CC) output
- Low cost, low component count and small PCB footprint solution
- Highly energy efficient, 91% across VAC input range
- Fast start-up time ( $<100$  ms) – no perceptible delay
- Integrated protection and reliability features
  - Single-shot no-load protection
  - Output short-circuit protected with auto-recovery
  - Auto-recovering thermal shutdown with large hysteresis protects both components and PCB
  - No damage during brown-out conditions
- Meets IEC ring wave, differential line surge and EN55015 conducted EMI

**PATENT INFORMATION**

The products and applications illustrated herein (including transformer construction and circuits external to the products) may be covered by one or more U.S. and foreign patents, or potentially by pending U.S. and foreign patent applications assigned to Power Integrations. A complete list of Power Integrations' patents may be found at [www.powerint.com](http://www.powerint.com). Power Integrations grants its customers a license under certain patent rights as set forth at <http://www.powerint.com/ip.htm>.

### Important Note:

Although this board is designed to satisfy safety isolation requirements, the engineering prototype has not been agency approved. Therefore, all testing should be performed using an isolation transformer to provide the AC input to the prototype board.

## 1 Introduction

This document describes a cost-effective power supply utilizing the LYTSwitch™-0 family (LYT0006D) in a highly compact buck topology.

**Figure 1** – Populated Circuit Board

This power supply operates over an input voltage range of 190 VAC to 265 VAC. The DC bus voltage is high enough to support an 85 V output when using a buck topology - in a buck converter the output voltage must always be lower than the input voltage. The output voltage is also limited by the maximum duty cycle of the LYTSwitch-0 (which also requires the input voltage to be larger than the output voltage).

The reference design is not limited for retrofit lamp application; the design layout can be easily modified to fit in LED tube or ballast applications.

Figure 2 – Populated Circuit Board, Top View.

Figure 3 – Populated Circuit Board, Bottom View.

## 2 Power Supply Specification

The table below represents the minimum acceptable performance for the design. Actual performance is listed in the results section.

Description	Symbol	Min	Typ	Max	Units	Comment
<b>Input</b>						
Voltage Operation	$V_{IN}$	190		265	VAC	2 Wire – no P.E. Operating frequency is not limited. Adjust sense resistor if application is for 400 Hz line.
Frequency	$f_{LINE}$	47	50/60		Hz	
<b>Output</b>						
Output Voltage	$V_{OUT}$	83	85	88	V	±4% at 200 VAC - 240 VAC
Output Current	$I_{OUT}$		82		mA	
<b>Total Output Power</b>						
Continuous Output Power	$P_{OUT}$		7		W	
<b>Efficiency</b>						
240 VAC; 85 V LED	$\eta$	91			%	Measured at $P_{OUT}$ , 25 °C
<b>Power Factor</b>						
240 VAC; 85 V LED	PF	0.5				Measured at $P_{OUT}$ , 25 °C
<b>Environmental</b>						
Conducted EMI		Meets CISPR22B / EN55015B				
Line Surge Differential Mode (L1-L2)			0.5		kV	1.2/50 $\mu$ s surge, IEC 1000-4-5, Series Impedance: Differential Mode: 2 $\Omega$
Ring Wave (100 kHz) Differential Mode (L1-L2)			2.5		kV	500 A short circuit Series Impedance: Differential Mode: 2 $\Omega$
Ambient Temperature	$T_{AMB}$	-10	25		°C	Free convection, sea level

### 3 Schematic

**Figure 4 – Schematic.** Zener Diode VR1 is Optional, Providing One-time No-load Protection. Refer to AN-60 for Additional OVP Options.

## 4 Circuit Description

The power supply shown in Figure 3 uses the LYT0006D (U1) in a high-side buck configuration to deliver a constant 82 mA current at an output voltage of 85 VDC. The power supply is designed for driving LEDs, which should always be driven with a constant current (CC).

### 4.1 Input EMI Filtering

Fuse RF1 provides short circuit protection. Bridge BR1 provides full wave rectification for good power factor. Capacitor C1, C2 and common-mode choke L1 form a  $\pi$  filter in order meet conducted EMI standards. Capacitor C1 and C2 are also used for energy storage reducing line noise and protecting against line surge.

### 4.2 LYTSwitch-0

The LYTSwitch-0 family is fully optimized to enable the design of a simple, cost-effective LED driver with good line and temperature regulation from 0 to 100 °C (LYTSwitch-0 case temperature). The PIXIs spreadsheet was used to achieve the best possible line regulation by optimizing the choices of power inductor and sense resistor. Optimize the total input capacitance to design for the highest possible power factor and line load regulation.

The LYTSwitch-0 family has a built-in thermal limit to protect the power supply in the event that temperature rises beyond the suitable level of operation.

The buck converter stage consists of the integrated power MOSFET switch within LYT0006D (U1), a freewheeling diode (D1), sense resistors (R2, R3), power inductor L2 and output capacitor (C5). The converter is operating mostly in discontinuous mode (DCM) in order to limit the cycles of reverse current. A fast freewheeling diode was selected to minimize switching losses.

A standard off-the-shelf inductor was used in the power converter to reduce cost.

### 4.3 Output Rectification

Fast output diode (D1) was used to achieve good efficiency and for thermal management. Normally for LED applications, the ambient temperature is above 70 °C. A device with low  $t_{RR}$  (<35 ns) is recommended.

### 4.4 Output Feedback

Regulation is maintained by skipping switching cycles. As the output current rises, the voltage into the FEEDBACK (FB) pin also rises. If this voltage exceeds  $V_{FB}$  then subsequent switching cycles will be skipped until the voltage drops below  $V_{FB}$ . Current is sensed via R2, R3 and filtered by C4, then fed to the FB pin for accurate regulation. The key to achieving good line regulation is in balancing the power inductor and sense resistor values after the minimum inductance has been calculated.

The bypass capacitor (C4) is connected between the FB pin and the SOURCE (S) pin and helps reduce power loss during output current sensing. The capacitor acts to sample-and-hold the feedback current information for the FB pin. No limiting resistor is required between the FB pin and C4, because the peak voltage will not exceed the maximum rating of the device.

#### **4.5 No-Load Protection**

An optional, one-shot, no-load protection circuit is incorporated into the design. In case of accidental no-load operation, the output capacitor is protected by VR1. Zener diode VR1 would need to be replaced after a failure. Refer to AN-60 for other OVP design options.

In operation (LED retrofit lamp), the load is always connected, so VR1 could be removed to save cost. If this option is utilized, to protect during board level testing (in manufacturing) 70 VAC can be applied to the input; if no output current is measured then the load is not connected. This test will allow safe, non-destructive initial power up of the board, without the need of an OV protection circuit.

### 5 PCB Layout

## 10 Waveforms

### 10.1 Drain Voltage, Current Normal Operation

Missing pulses are normal and are used to regulate the output current. These missing pulses are present every time the sense resistors (R2, R3) voltage-drop reaches 1.65 V. The unit will enter into auto-restart if there is not at least one missing pulse within a 50 ms period. For some designs where the power inductance is high and the circuit is operating (mostly) in CCM, a period of reverse current may be present. This can be avoided by increasing the device size or increase input capacitance or adding a drain blocking diode. See AN-60 for additional information.

### 10.5 Input-Output Profile

There is no limitation to the amount of output capacitance that can be added. If the application requires less output current ripple then increasing the output capacitance is straightforward. Note that the output current waveform below will change depending on LED load impedance which varies according to LED type.

**Figure 26** – 190 VAC / 50 Hz, Nominal  $V_{LED}$  Load.  
 Ch1 (Yellow):  $V_{IN}$ , 100 V / div.  
 Ch2 (Red):  $V_{OUT}$ , 20 V.  
 Ch3 (Blue):  $I_{IN}$ , 50 mA / div.  
 Ch4 (Green):  $I_{OUT}$ , 20 mA / div, 10 ms / div.

### 10.6 Line Sag and Surge

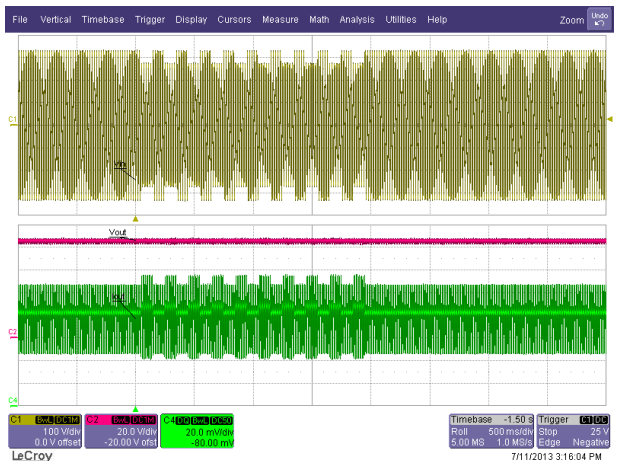

An inherent advantage of the buck converter implemented with the LYTSwitch-0 family is the imperceptible start-up delay, the driver will turn-on within 100 ms as shown below. No failure of any component occurred during line fluctuation tests.

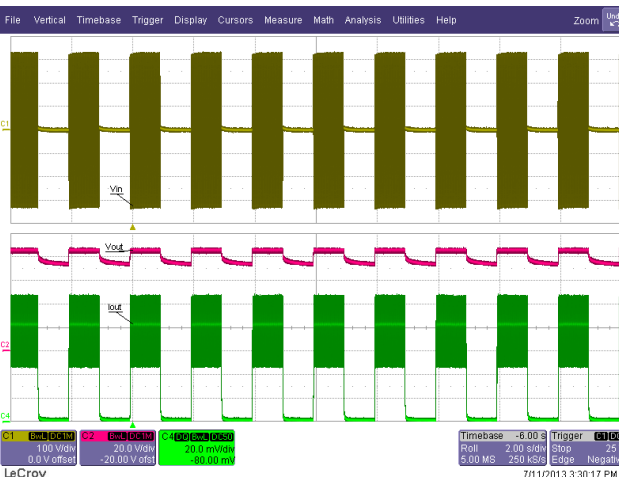

**Figure 30 – Line Sag Test at 230 - 0 V at 0.1 Second Interval.**  
 Ch1:  $V_{IN}$ , 100 V / div.  
 Ch2:  $V_{OUT}$ , 20 V / div.  
 Ch4:  $I_{OUT}$ , 50 mA / div.  
 Time Scale: 500 ms / div.

 Ch4:  $I_{OUT}$ , 50 mA / div.  
 Time Scale: 2 s / div.

### 10.7 One Shot No-Load Protection

The reference design is protected with one shot no-load protection. Zener diode VR1 will need to be replaced after the fault.

**Figure 34** – No-Load Protection When Load is Disconnected. 265 V / 50 Hz.  
 Ch2:  $V_{OUT}$ , 20 V / div.  
 Ch3:  $I_{DRAIN}$ , 100 mA / div.  
 Ch3:  $I_{OUT}$ , 50 mA / div.  
 Time Scale: 200 ms / div.

**Figure 35** – No-Load Start-Up. 265 V / 50 Hz.

 Ch3:  $I_{DRAIN}$ , 100 mA / div.  
 Ch3:  $I_{OUT}$ , 50 mA / div.  
 Time Scale: 200 ms / div.

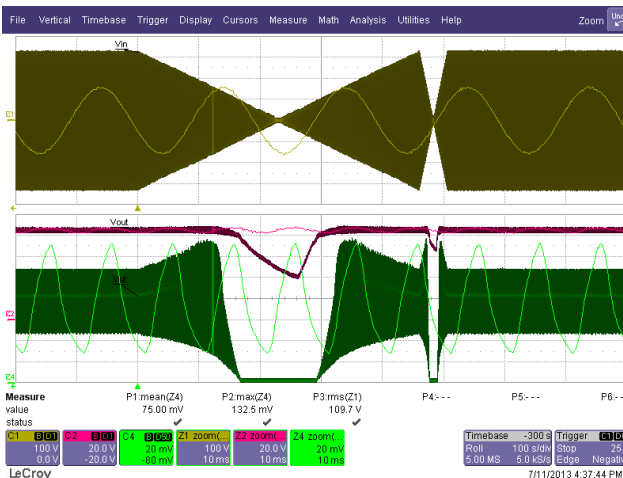

### 10.8 Brown-out / Brown-in

No failure of any component during brownout test of 1 V / sec and 10 V / sec AC cut-in and cut-off. Consider the peak current at 132 mApk with an average of 75 mA<sub>AVG</sub> during brown-out for LED absolute maximum rating.

**Figure 36** – Brown-out Test at 1 V / s and 10 V / s.  
 The Unit is Able to Operate Normally  
 Without Any Failure and Without Flicker.

 Ch1: V<sub>OUT</sub>, 20 V / div.  
 Ch3: I<sub>OUT</sub>, 20 mA / div.  
 Time Scale: 100 s / div.

## 11 Line Surge

Differential input line 500V / 50  $\mu$ s surge testing was completed on a single test unit following the test method described in IEC61000-4-5. Input voltage was set at 230 VAC / 60 Hz. Full output load applied and operation was verified following each surge event.

Surge Level (V)	Input Voltage (VAC)	Injection Location	Injection Phase (°)	Test Result (Pass/Fail)
+500	230	L to N	90	Pass
-500	230	L to N	90	Pass
+500	230	L to N	270	Pass
-500	230	L to N	270	Pass
+500	230	L to N	0	Pass
-500	230	L to N	0	Pass

Unit passed testing under all conditions.

Differential ring input line surge testing was completed on a single test unit following the test method described in IEC61000-4-5. Input voltage was set at 230 VAC / 60 Hz. Full output load was applied and operation was verified following each surge event.

Surge Level (V)	Input Voltage (VAC)	Injection Location	Injection Phase (°)	Test Result (Pass/Fail)
+2500	230	L to N	90	Pass
-2500	230	L to N	90	Pass
+2500	230	L to N	270	Pass
-2500	230	L to N	270	Pass
+2500	230	L to N	0	Pass
-2500	230	L to N	0	Pass

Unit passed testing under all conditions.
