## DESCRIPTION

PT2272 is a remote control decoder paired with PT2262 utilizing CMOS Technology．It has 12－bit of tri－state address pins providing a maximum of 531，441 （or 312）address codes；thereby，drastically reducing any code collision and unauthorized code scanning possibilities．PT2272 is available in several options to suit every application need：variable number of data output pins，latch or momentary output type．

## APPLICATIONS

－Car Security System
－Garage Door Controller
－Remote Control Fan
－Home Security／Automation System
－Remote Control Toys
－Remote Control for Industrial Use

## FEATURES

－CMOS Technology
－Low Power Consumption
－Very High Noise Immunity
－Up to 12 Tri－State Code Address Pins
－Up to 6 Data Pins
－Wide Range of Operating Voltage：VCC＝4～15V
－Single Resistor Oscillator
－Latch or Momentary Output Type
－Available in DIP and SOP

## FUNCTION DESCRIPTION

PT2272 decodes the waveform received and fed into the DIN pin．The Waveform is decoded into code word that contains the address，data and sync bits．The decoded address bits are compared with the address set at the address input pins．If both addresses match for 2 consecutive code words，PT2272 drives－（1）the data output pin（s）whose corresponding data bit（s）is then decoded to be a＂ 1 ＂bit，and（2）the VT output－－to high voltage（high state）．

## RF OPERATION

## CODE BITS

A Code Bit is the basic component of the encoded waveform，and can be classified as either an AD（Address／Data）Bit or a SYNC（Synchronous）Bit．

## Address／Data（AD）Bit Waveform

An AD Bit can be designated as Bit＂ 0 ＂，＂ 1 ＂or＂ f ＂，if it is in low，high or floating state respectively．One bit waveform consists of 2 pulse cycles．Each pulse cycle has 16 oscillating time periods．For further details，please refer to the diagram below：

where：$\alpha=$ Oscillating Clock Period．Bit 1 is only available for Address Bit．
Synchronous（Sync．）Bit Waveform
The Synchronous Bit Waveform is 4 bits long with $1 / 8$ bit width pulse．Please refer to the diagram below：

Note： 1 bit＝32a

4 bit width＝128a

## CODE WORD

A group of Code Bits is called a Code Word．A Code Word consists of 12 AD bits followed by one Sync Bit．The 12 AD bits are interpreted as either address or data bits depending on the PT2272 version used．Please refer to the diagrams below：

PT2272：

| A0 | A1 | A2 | A3 | A4 | A5 | A6 | A7 | A8 | A9 | A10 | A11 | SYNC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

PT2272A－M2／L2：

| A0 | A1 | A2 | A3 | A4 | A5 | A6 | A7 | A8 | A9 | D1 | D0 | SYNC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

## PT2272－M3／L3：

| A0 | A1 | A2 | A3 | A4 | A5 | A6 | A7 | A8 | D2 | D1 | D0 | SYNC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

PT2272－M4／L4：

| A0 | A1 | A2 | A3 | A4 | A5 | A6 | A7 | D3 | D2 | D1 | D0 | SYNC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

## PT2272－M5／L5：

| A0 | A1 | A2 | A3 | A4 | A5 | A6 | D4 | D3 | D2 | D1 | D0 | SYNC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

PT2272－M6／L6：

| A0 | A1 | A2 | A3 | A4 | A5 | D5 | D4 | D3 | D2 | D1 | D0 | SYNC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

## SINGLE RESISTOR OSCILLATOR

The built－in oscillator circuitry of PT2272 allows a precision oscillator to be constructed with only an external resistor．For the PT2272 to decode correctly the waveform that was received，the oscillator frequency of PT2272 must be $2.5 \sim 8$ times that of the transmitting PT2262．It is a good practice to center the PT2272 oscillator frequency in this window to gain best window margin at both sides．The typical oscillator with various resistor values is shown below for both PT2262 and PT2272．

Suggested oscillator resistor values are shown below．

| PT 2262 | PT 2272 |
| :---: | :---: |
| $4.7 \mathrm{M} \Omega$ | $820 \mathrm{~K} \Omega^{*}$ |
| $3.3 \mathrm{M} \Omega$ | $680 \mathrm{~K} \Omega^{*}$ |
| $1.2 \mathrm{M} \Omega$ | $200 \mathrm{~K} \Omega^{* *}$ |

Note：
＊－－Operates when PT2272＇s VCC＝5V to 15V
＊＊－－Operates when PT2272＇s VCC＝ 4 V to 15 V
This means that if the PT2272 supply voltage is lower than 5 V ，you have to use a lower oscillator resistor value for both PT2262 and PT2272．

普 誠 科 技
Princeton Technology Corp．

## IR OPERATION

In the IR Type of Operation，the functions are similar to the above descriptions；except that the output waveform carried by PT2262－IR has a frequency of 38 KHz ．Details are as follows．

## CODE BITS

The Code Bits are further modulated with a 38 KHz carrier frequency and can be＂ 0 ＂，＂ 1 ＂or＂ f ＂bit．Their waveforms are shown in the diagram below．

Note：$\lambda=2$ clock lengths．

## CODE WORD

A Code Word is made up of code bits and the format is the same as that of the RF Code Frame．

## CODE FRAME

Likewise，a Code Frame is made up of Code Words and the format is the same as that of RF Type of Operation．

## OSCILLATOR

PT2262－IR is specially designed for infrared remote control applications and its output waveform carries 38 KHz frequency． To get the 38 KHz carrier frequency at the data output，the oscillator frequency must be 76 KHz ．A $440 \mathrm{~K} \Omega$ resistor connected between OSC1 and OSC2 pins of PT2262－IR is recommended．Moreover，for a matching decoder frequency， $1 \mathrm{M} \Omega$ resistor connected between the OSC1 and OSC2 pins of PT2272 is also recommended．

## VALID TRANSMISSION

When PT2272 receives a transmission code word，it initially checks whether this is a valid transmission．For a transmission to be valid，（1）it must be a Complete Code Word，and（2）the Address Bits must match the Address Setting at the Address Pins．After two consecutive valid transmissions，PT2272（1）drives the data pins according to the data bits received，and（2） raises VT to high voltage（high state）．

The timings are shown in the following diagram．

## Note：

ta＝8 OSC clock width
tb＝1 OSC clock width tc＝2 code word width

## LATCH OR MOMENTARY DATA OUTPUT TYPE

PT2272 uses either the latch or the momentary data output type depending on the PT2272 version used．The latch type（PT2272－Lx）activates the data out during transmission and this data is sustained in the memory until another data is inputted or entered．A momentary type（PT2272－Mx），on the other hand，activates the data out only during transmission．In the momentary type，the data does not remain in the memory after the transmission is completed．Please refer to the diagram below：

Note：T＝2 code word width

## OPERATION FLOWCHART

## DECODER WITHOUT DATA OUTPUT PIN

1．When Power is turned on，PT2272 activates the Stand－By Mode．
2．It then searches for signals．If there is no signal received，it remains in the Stand－By Mode； otherwise，the address bits received are compared with the address configuration of the pins．
3．The VT goes high signifying the validation of transmission only when there are two（2）continuous frames that contain matched address bits；otherwise，VT will not be activated and the Stand－By Mode remains active．
4．Then，the Address Bits are again checked．Two continuous mismatches of the address bits would disable the VT and make the Stand－By Mode active；otherwise，the address bits are continuously checked．

普 誠 科 技
Princeton Technology Corp．

## DECODER WITH DATA OUTPUT PINS

1．When Power is turned ON，PT2272 activates the Stand－By Mode．
2．It then searches for signals．If there is no signal received，it remains in the Stand－By Mode； otherwise，the address bits are compared with the address configuration of the pins．
3．Whenever the Address Bits in a Frame match with that of the Address Configuration of the Pin，the data bits are stored into the memory．Also，when this IC finds two（2）continuous and identical data having the same address bits，the data output（s）is activated and the VT is enabled．The VT is disabled when there are 2 continuous mismatched addresses．For the momentary type，the data output is reset；while for the latch type，the data output is sustained．
