## Product Description

The PE42724 is a HaRP ${ }^{\text {TM }}$ technology-enhanced reflective SPDT RF switch designed for use in cable applications including DOCSIS 3.0/1 cable modem, set-top box and residential gateway. It delivers high linearity, excellent harmonics performance and high surge immunity in the $5-1794 \mathrm{MHz}$ band. It also features low insertion loss and high isolation performance making the PE42724 ideal for DOCSIS 3.1 applications.

The PE42724 is manufactured on pSemi's UltraCMOS ${ }^{\circledR}$ process, a patented variation of silicon-on-insulator (SOI) technology on a sapphire substrate, offering the performance of GaAs with the economy and integration of conventional CMOS.

## Absolute Maximum Ratings

Exceeding absolute maximum ratings listed in Table 1 may cause permanent damage. Operation should be restricted to the limits in Table 2. Operation between operating range maximum and absolute maximum for extended periods may reduce reliability.

## ESD Precautions

When handling this UltraCMOS device, observe the same precautions as with any other ESD-sensitive devices. Although this device contains circuitry to protect it from damage due to ESD, precautions should be taken to avoid exceeding the rating specified in Table 1.

## Latch-up Immunity

Unlike conventional CMOS devices, UltraCMOS devices are immune to latch-up.

## Switching Frequency

The PE42724 has a maximum 10 kHz switching frequency. Switching frequency describes the time duration between switching events. Switching time is the time duration between the point the control signal reached $50 \%$ of the final value and the point the output signal reaches within $10 \%$ or $90 \%$ of its target value.

## Spurious Performance

The PE42724 spur fundamental occurs around 10 MHz . Its typical performance is $-154 \mathrm{dBm} / \mathrm{Hz}(\mathrm{V} 1$ $=\mathrm{H})$ and $-165 \mathrm{dBm} / \mathrm{Hz}(\mathrm{V} 1=\mathrm{L})$, with 100 kHz bandwidth.

## Thermal Data

Psi-JT ( $\Psi_{J T}$ ), junction top-of-package, is a thermal metric to estimate junction temperature of a device on the customer application PCB (JEDEC JESD51-2).
$\Psi_{J T}=\left(T_{J}-T_{T}\right) / P$
where
$\Psi_{\mathrm{JT}}=$ junction-to-top of package characterization parameter, ${ }^{\circ} \mathrm{C} / \mathrm{W}$
$\mathrm{T}_{\mathrm{J}}=$ die junction temperature, ${ }^{\circ} \mathrm{C}$
$\mathrm{T}_{\mathrm{T}}=$ package temperature (top surface, in the center), ${ }^{\circ} \mathrm{C}$
P = power dissipated by device, Watts

## Evaluation Kit

The PE42724 evaluation board was designed to ease customer evaluation of the PE42724 RF switch. The RF common port is connected through a $75 \Omega$ transmission line via the F-Type connector, J3. RF1 and RF2 ports are connected through $75 \Omega$ transmission lines via F-Type connectors J1 and J2, respectively. A $75 \Omega$ through transmission line is available via F-Type connectors J4 (THRU left) and J5 (THRU right), which can be used to deembed the loss of the PCB. J6 provides DC and digital inputs to the device.
