

### Product Overview

The QPL8831 is an ultra-linear GaAs pHEMT 75-Ohm RF balanced amplifier IC with 5 – 1218 MHz operating bandwidth, featuring high linearity, high gain and low noise for use as a post amplifier in optical receivers or as a low noise balanced preamp. This IC uses a 5V supply for applications requiring lower power dissipation. Due to its wide operational bandwidth the QPL8831 can also be used as a downstream amp in DOCSIS 3.1 as well as an upstream amplifier for DOCSIS 3.1 or DOCSIS 4.0 applications.

### Linearizer Current Settings

The linearizer circuitry is basically a pre-distortion circuit that can correct for 3<sup>rd</sup> order non-linearity. The amount of pre-distortion correction is set by ILIN. The linearizer circuit is coupled to the main amplifiers thru C7 and C8. Disconnecting C7 and C8 will disable the linearizer which causes the gain to increase slightly (~0.5dB) but will also degrade S11 and OIP3.

In the application circuit, R1 and R2 are used to set the linearizer current (ILIN). The ILIN can be calculated using the equation below.

$$ILIN = 2 * (Vdd - 1.6V) / (R1 + 1125)$$

The value of ILIN has been optimized for the QPL8831 at 280mA. In applications where reduced IDD is needed, ILIN should also be reduced to achieve best linearity.

The graph on the right hand side shows the change in ILIN vs. R1, R2.

### ISET Resistor Value

The resistor R7 is used to set the device current. In QPL8831 application circuit, the value of R7 is set to get an IDD of 280mA which is optimal for linearity at 5V. In applications where reduced linearity is acceptable, IDD can be reduced lowering the value of R7 (see graph below).

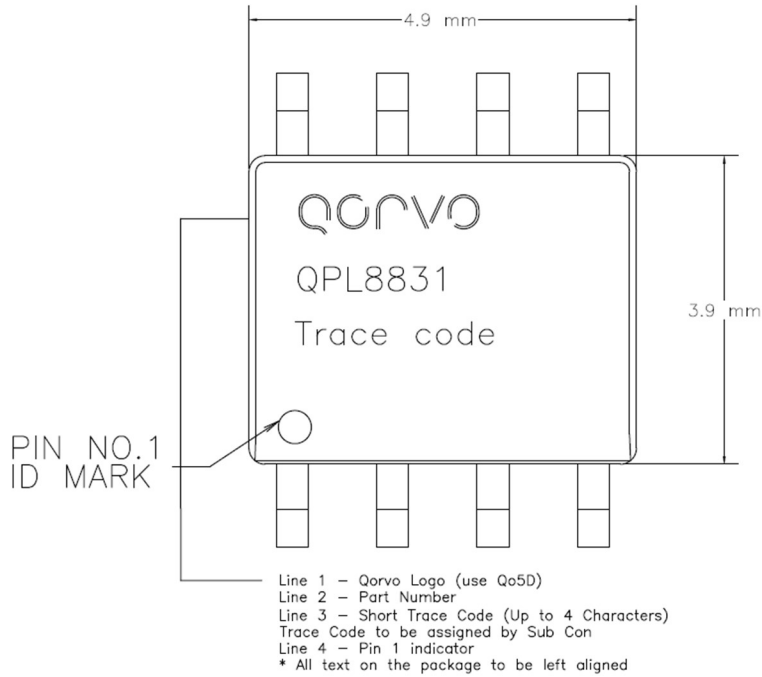

### VG2 Resistor Value Settings

VG2 (pin 6) is connected to the gate of the output device. Resistor R8 is used to fine tune VG2 for best linearity.

Recommended range for R8 is 3k to 7k.
