4.9GHz to 5.85GHz 802.11a/n/ac WiFi  
Front End Module

The RFFM8505 provides a complete integrated solution in a single front end module (FEM) for WiFi 802.11a/n/ac systems. The ultra-small factor and integrated matching minimizes layout area in the customer's application and greatly reduces the number of external components. This simplifies the total front end solution by reducing the bill of materials, system footprint, and manufacturing cost. The RFFM8505 integrates a 5 GHz power amplifier (PA), single pole double throw switch (SP2T), LNA with bypass, and a power detector coupler for improved accuracy. The device is provided in a 2.5mm x 2.5mm x 0.40mm, 16-pin QFN package. This module meets or exceeds the RF front end needs of IEEE 802.11a/n/ac WiFi RF systems.

Notes:  
 1. Thermal vias for center slug "C" should be incorporated into the PCB design. The number and size of thermal vias will depend on the application, power, dissipation and electrical requirements. Example of the number and size of vias can be found on the RFMD evaluation board layout (gerber files are available upon request)

## Pin Names and Descriptions

Pin	Name	Description
1	GND	Ground connection. This pin is not connected internally and can be left floating or connected to ground.
2	RX	RF output port for the 802.11a/n/ac LNA. This port is matched to 50Ω and DC blocked internally.
3	GND	This pin is not connected internally and can be left floating or connected to ground.
4	VCC	Supply voltage for the LNA and PA Regulator. See applications schematic for biasing and bypassing components.
5	PDET	Power detector voltage for the TX path. May need external series R/shunt C to adjust voltage level and to filter RF noise.
6	PA_EN	Control voltage for the PA and TX switch. See truth table for proper settings.
7	GND	This pin is not connected internally and can be left floating or connected to ground.
8	TX	RF input port for the 802.11a/n/ac PA. Input is matched to 50Ω and DC blocked internally
9	VMODE	High/Low power mode control signal. $V_{MODE}$ can be low or floating for nominal conditions (high power mode). Applying 2.8V or greater to this pin enables low power mode.
10	VCC	Supply voltage for the first and second stage of the PA. See applications schematic for biasing and bypassing components.
11	VCC	Supply voltage for the final stage of the PA. See applications schematic for biasing and bypassing components.
12	GND	This pin is not connected internally and can be left floating or connected to ground.
13	ANT	RF bidirectional antenna port matched to 50Ω. An External DC block is required
14	GND	This pin is not connected internally and can be left floating or connected to ground.
15	C_RX	Receive switch control pin. See switch truth table for proper level.
16	LNA_EN	Control voltage for the LNA. When this pin is set to a LOW logic state, the bypass mode is enabled.
Pkg Base	GND	Ground connection. The backside of the package should be connected to the ground plane through a short path, i.e., PCB vias under the device are recommended.
