#### Notes:

- All specifications are based on the TriQuint schematic for the main reference design.
- Production test is performed at room temp. to a guard-banded specification to ensure electrical compliance over temperature.
- Electrical margin has been built into the design to account for variation due to temperature drift and manufacturing tolerances.
- Typical values are based on average measurements at room temperature of 25°C.
- This is defined as the difference between the maximum and minimum insertion loss within the specified band.
- This is defined as the worst case difference between a peak and adjacent valley within defined frequency points.
- This is the optimum impedance in order to achieve the performance shown.
