QMI8658A — 6D Inertial Measurement Unit with Motion Co-Processor

# QMI8658A

## Low Noise, Wide Bandwidth 6D Inertial Measurement Unit with Motion Co-Processor

### Features

- Low 13 mdps/ $\sqrt{\text{Hz}}$  gyroscope noise, low-latency, and wide bandwidth
- Low Noise 150 $\mu\text{g}/\sqrt{\text{Hz}}$  accelerometer noise
- Host (slave) interface supports MIPI™ I3C, I<sup>2</sup>C, and 3-wire or 4-wire SPI
- Accelerometer and gyroscope sensors feature signal processing paths with digitally programmable data rates and filtering
- 3-axis gyroscope and 3-axis accelerometer in a small 2.5 x 3.0 x 0.86 mm 14-pin LGA package
- Large 1536-byte FIFO can be used to buffer sensor data to lower system power dissipation
- Integrated Pedometer, Tap, Any-Motion, No-Motion, Significant-Motion detection
- Large sensor dynamic ranges from  $\pm 16^\circ/\text{s}$  to  $\pm 2048^\circ/\text{s}$  for gyroscope and  $\pm 2 \text{ g}$  to  $\pm 16 \text{ g}$  for accelerometer
- Low power modes for effective power management
- Digitally programmable sampling rate and filters
- Embedded temperature sensor
- Wide extended operating temperature range (-40°C to 85°C)

### Description

The QMI8658A is a complete 6D MEMS inertial measurement unit (IMU). With tight board-level gyroscope sensitivity of  $\pm 3\%$ , gyroscope noise density of 13 mdps/ $\sqrt{\text{Hz}}$ , and low latency, the QMI8658A is ideal for consumer and industrial applications.

The QMI8658A incorporates a 3-axis gyroscope and a 3-axis accelerometer. It provides a host-processor interface supporting I3C, I<sup>2</sup>C and 3-wire or 4-wire SPI.

With its built-in digital functionality, low power, and small size, the QMI8658A is the ideal part for applications requiring motion-based functionality.

### Applications

- Smartphones
- Game controllers, remote controls and pointing devices
- Robotic vacuums
- E-bikes and scooters
- Bluetooth headsets
- Automotive security systems
- Toys
- Portrait-landscape display control

# 1 General Information

## 1.1 Ordering Information

Table 1. Ordering Information

Part Number	Package	Packing Method
QMI8658A	LGA14	Tape & Reel

## 1.2 Marking Information

ROW	EXAMPLE	CODE/EXPLANATION
1	<b>8658</b>	DDDD – Device code
2	<b>2113</b>	YWLL– Y (Year code), W (1-digit, biweekly code), LL (Lot indication)
3	<b>• RB</b>	CR – C (Assembly location), R (Product revision)

Figure 1. Top Mark

### 1.3 Internal Block Diagram

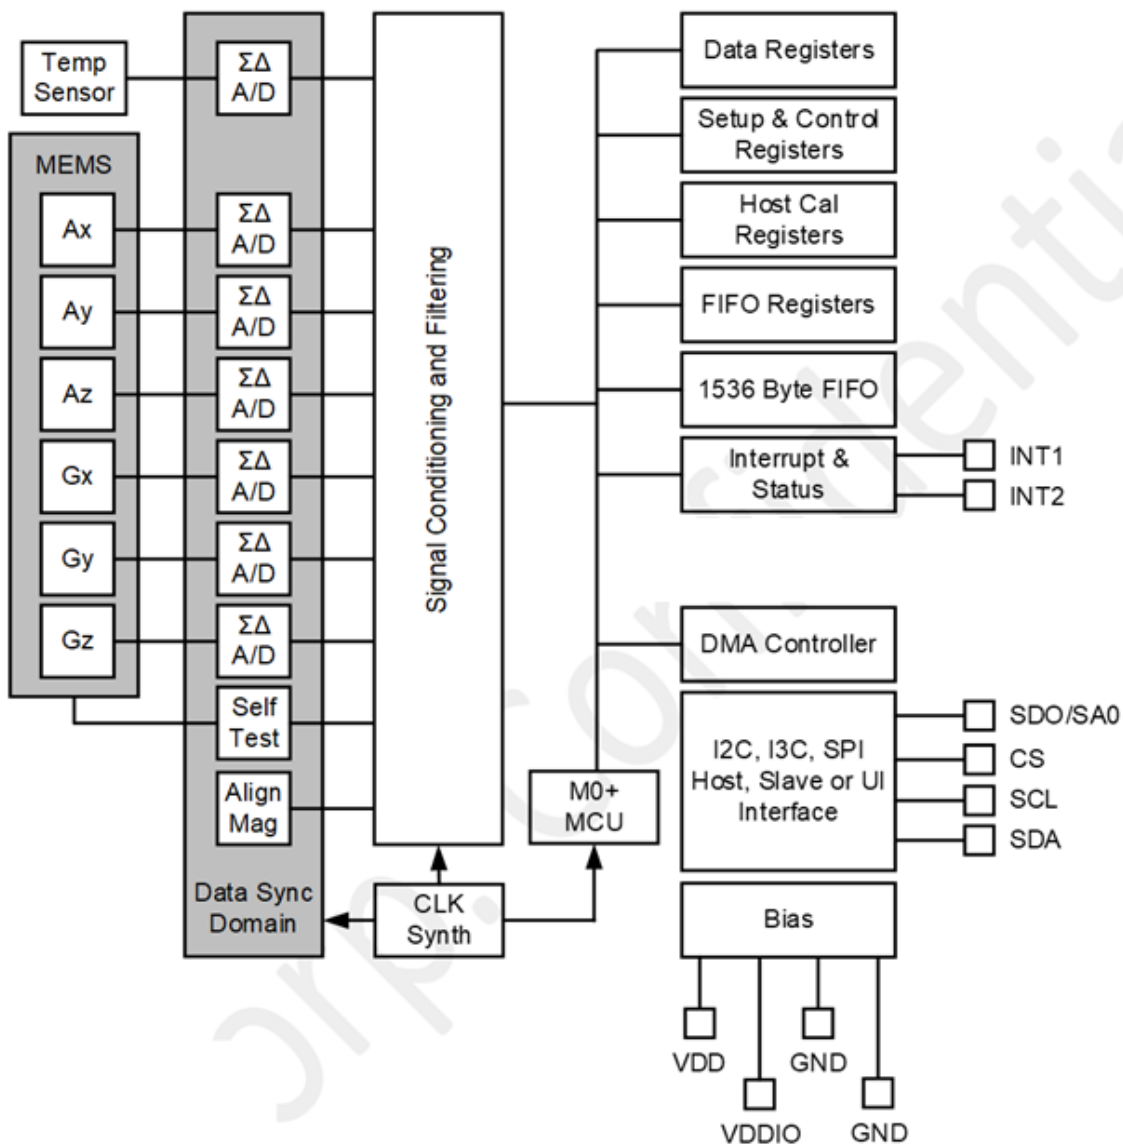

Figure 2. Internal Block Diagram

## 1.4 Interface Operating

The QMI8658A can operate in below mode, as shown in the *Figure 3*.

The QMI8658A is a slave device to a host processor that communicates to it using one of the following interfaces: I<sup>2</sup>C, I<sup>3</sup>C, and SPI (3-wire or 4-wire modes). This slave relationship to the host is the same for all operating modes.

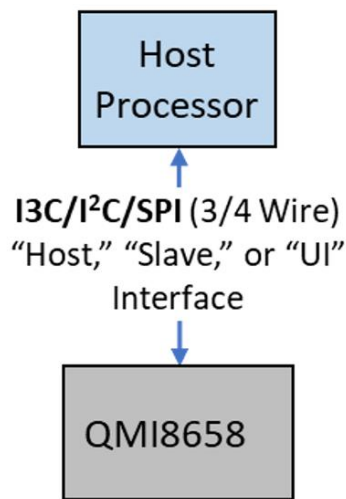

Figure 3. Operating Mode

## 1.5 Application Diagrams

The typical application diagrams are shown in this section.

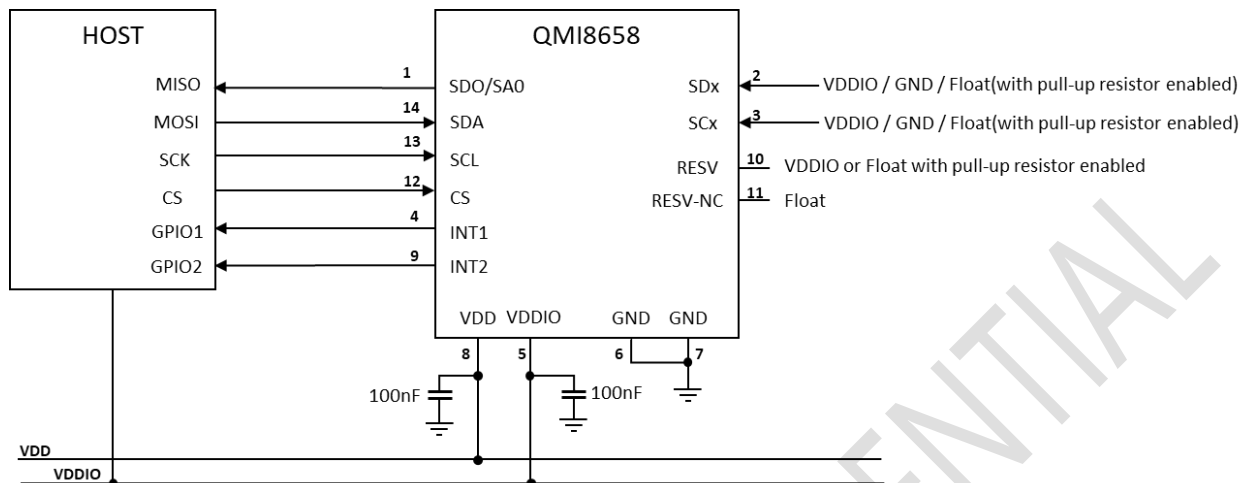

Figure 4. 4-Wire SPI-UI mode

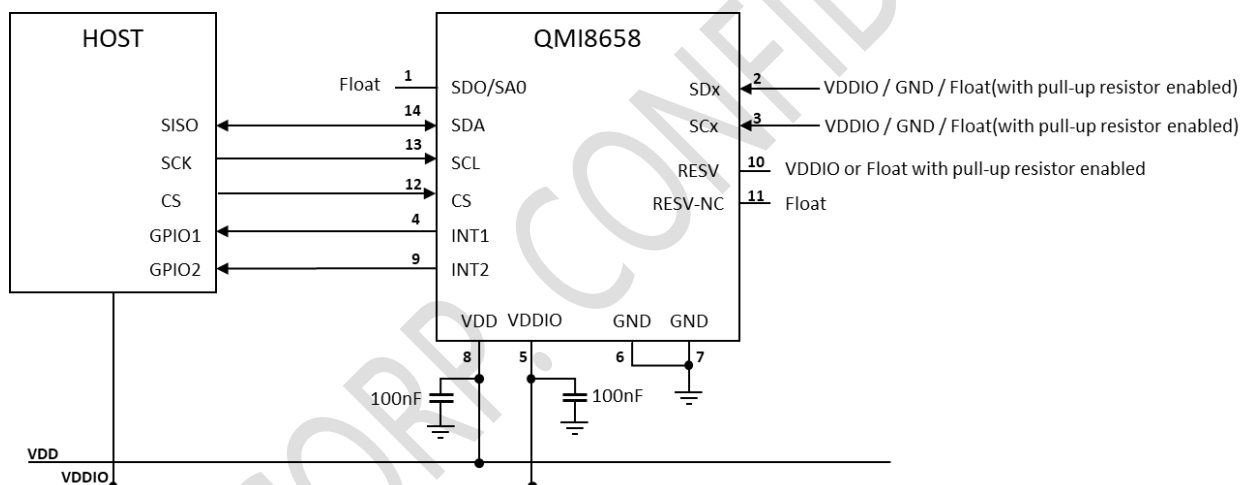

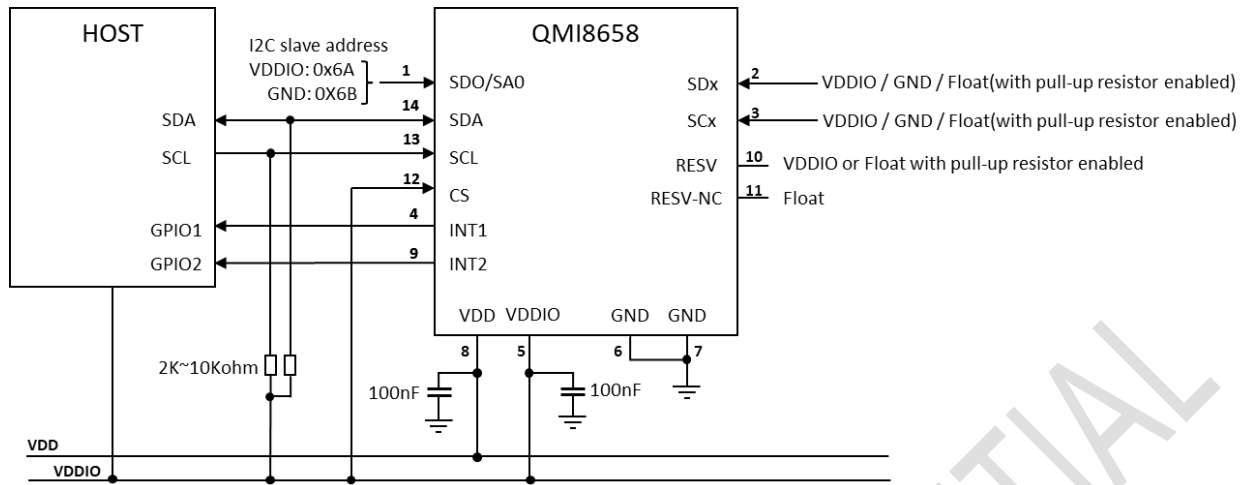

Figure 5. 3-Wire SPI-UI mode

**Figure 6. I3C/I2C-UI mode**

There is internal 200Kohm pull-up resistor on the SCL, SDA, CS, SDx, SCx, RESV (Pin10). By default, all those pull-up resistors are enabled. All the resistors can be disabled by CTRL9 command, refer to 1.6 Package & Pin Information and 5.10.6 CTRL\_CMD\_SET\_RPU for details.

There is internal 200Kohm pull-up resistor on SDO/SA0 pin, and is enabled during Power-On Reset or Soft-Reset, is automatically disabled after detecting the I2C slave address during the Reset Process. Therefore, in I2C/I3C mode leave the SDO/SA0 float or connect it to High level (recommended, to provide a stable level), will set the I2C slave address/I3C static address to 0x6A. And connect it to Low level, will set the I2C slave address/ I3C static address to 0x6B.

In 3-wire SPI mode, leave the SDO/SA0 pin float.

SCx and SDx can be connected to VDDIO or Logic High, GND or Logic Low, or be left float if internal pull-up resistors are enabled.

RESV (Pin 10) should NOT be connected to GND or Logic Low. It can be connected to VDDIO or Logic High, or leave it externally float and enable the internal pull-up resistor(by default the pull-up resistor is enabled). Connecting it to VDDIO is preferred, which can provide a stable High level.

RESV-NC (Pin 11) is by default an output pin, should be float (no connection). In case of the necessity to connect it to High or Low level, the RESV(Pin 10) should be firmly connected to VDDIO, providing a stable High level, to disable the output of Pin 11.

Table 2 describes the names for the pins in different functions. The later descriptions will directly use the function name in different scenarios instead of the pin name.

**Table 2. Pin Name Mapped to Function Name**

Pin Number	Type	Pin Name	Function Name in 4-wire SPI	Function Name in 3-wire SPI	Function Name in Host I2C / I3C
1	O	SDO/SA0	SDO		SA0
12	I	CS	CS	CS	
13	IO	SCL	SPC	SPC	SCL
14	IO	SDA	SDI	SDIO	SDA

## 1.6 Package & Pin Information

The pinout of the QMI8658A is shown in Figure 7 and Figure 8. The pin names and functionality are detailed in Table 3. The pin functionality is dictated by the QMI8658A's operating mode, as described in 1.5 Application Diagrams.

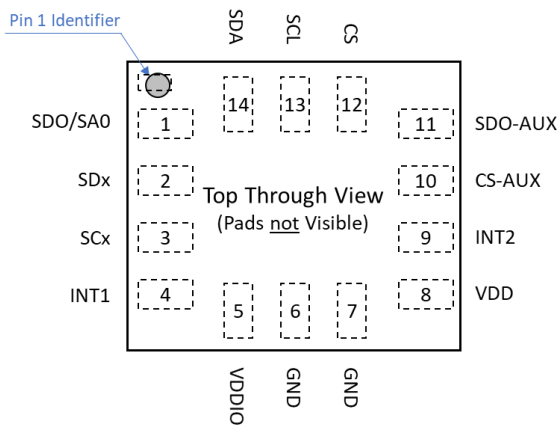

Figure 7. Pins Face Down (Top View)

Figure 8. Pins Face Up (Bottom View)

**Table 3. Pin Definitions**

Pin Number	Type	Pin Name	Function
1	O	SDO/SA0 <sup>(1)(3)</sup>	SPI-UI Data Out (SDO) in SPI-UI 4-Wire Mode SA0, I <sup>2</sup> C Slave address and I <sup>3</sup> C Static address select: If SA0 = 0, I <sup>2</sup> C / I <sup>3</sup> C address = 0x6B If SA0 = 1, I <sup>2</sup> C / I <sup>3</sup> C address = 0x6A
2	IO	SDx <sup>(1)(2)</sup>	Reserved. Connect to VDDIO, GND or No Connection
3	IO	SCx <sup>(1)(2)</sup>	Reserved. Connect to VDDIO, GND or No Connection
4	O	INT1	Programmable Interrupt 1
5	I	VDDIO	Power Supply for IO Pins
6	I	GND	Ground (0 V supply)
7	I	GND	Ground (0 V supply)
8	I	VDD	Power supply
9	O	INT2	Programmable Interrupt 2 (INT2) / Data Ready (DRDY)
10	IO	RESV <sup>(1)(2)</sup>	Reserved. Connect to VDDIO or Logic High, or No Connection and enable (by default) internal pull up resistor. <i>Refer to 1.5 Application Diagrams.</i>
11	I	RESV-NC	Reserved. Connect to VDDIO or Logic High, GND or Logic Low. <i>Refer to 1.5 Application Diagrams.</i>
12	I	CS <sup>(1)(2)</sup>	I <sup>2</sup> C/ I <sup>3</sup> C /SPI-UI selection Pin. (If 1: I <sup>2</sup> C-UI Mode: I <sup>2</sup> C/I <sup>3</sup> C communication enabled, SPI idle mode) (If 0: SPI-UI mode: I <sup>2</sup> C/I <sup>3</sup> C disabled)
13	IO	SCL <sup>(1)(2)</sup>	I <sup>2</sup> C/I <sup>3</sup> C-UI Data (SDA) in I <sup>2</sup> C/ I <sup>3</sup> C mode SPI-UI Serial Clock (SPC) <sup>(3)</sup> in SPI mode
14	IO	SDA <sup>(1)(2)</sup>	I <sup>2</sup> C/I <sup>3</sup> C-UI Data (SDA) SPI-UI Data In (SDI) <sup>(3)</sup> in 4 wire Mode SPI-UI Data IO (SDIO) <sup>(3)</sup> in 3 Wire Mode

**Notes:**

1. This pin has an internal 200K $\Omega$  pull up resistor.
2. The internal pull-up resistor can be disabled by CTRL9 command (CTRL\_CMD\_SET\_RPU). Refer to **5.10.6 CTRL\_CMD\_SET\_RPU** for details.
3. Refer to Section 16 for detailed configuration information.

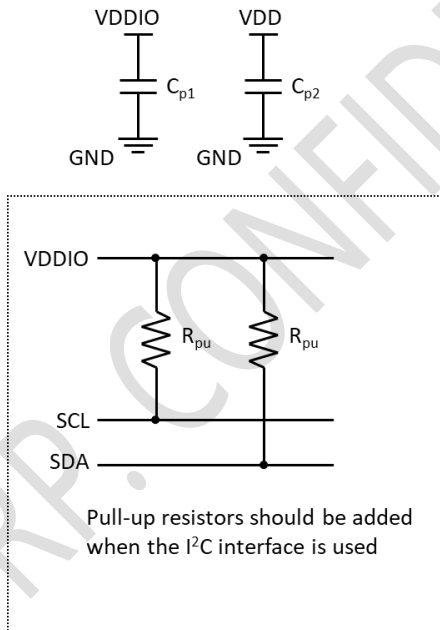

## 1.7 Recommended External Components

**Table 4. Recommended External Components**

Component	Description	Parameter	Typical
C <sub>p1</sub>	Capacitor	Capacitance	100 nF
C <sub>p2</sub>	Capacitor	Capacitance	100 nF
R <sub>pu</sub> <sup>(4)</sup>	Resistor	Resistance	2KΩ ~ 10 kΩ

**Note:**

- R<sub>pu</sub> resistors are only needed when the Host Serial Interface is configured for I<sup>2</sup>C (see I2C Interface section). They are not needed when the Host Serial Interface is configured for SPI or I3C. If pull-up resistors are used on SCL and SDA, then SPI, I3C and I<sup>2</sup>C Modes are all possible. If a pull-down resistor is used on SA0, an alternate slave address is used for I<sup>2</sup>C. SPI and I3C modes will be unaltered with the use of pull-up resistors for I<sup>2</sup>C. Additionally, a suitable pull up resistance (R<sub>pu</sub>) value should be selected, accounting for the tradeoff between current consumption and rise time.

**Figure 9. Typical Electrical Connections**

## 2 QMI8658A Chip Orientation Coordinate System

The QMI8658A uses a right-handed coordinate system as the basis for the sensor frame of reference. Acceleration ( $a_x$ ,  $a_y$ ,  $a_z$ ) are given with respect to the X-Y-Z coordinate system shown above. Increasing accelerations along the positive X-Y-Z axes are considered positive. Angular Rate ( $\omega_x$ ,  $\omega_y$ ,  $\omega_z$ ) in the counterclockwise direction around the respective axis are considered positive.

Figure 10 shows the various frames of reference and conventions for using the QMI8658A.

Figure 10. Chip Orientation Coordinate System

### 3 System, Electrical and Electro-Mechanical Characteristics

#### 3.1 Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions. Stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

**Table 5. Absolute Maximum Ratings**

Symbol	Parameter	Min.	Max.	Unit
T <sub>STG</sub>	Storage Temperature	-40	+125	°C
T <sub>Pmax</sub>	Lead Soldering Temperature, 10 Seconds		+260	°C
VDD	Supply Voltage	-0.3	3.6	V
VDDIO	I/O Pins Supply Voltage	-0.3	3.6	V
S <sub>g</sub> <sup>(5)</sup>	Acceleration g for 0.2 ms (Un-powered)		10,000	g
ESD <sup>(6)</sup>	Electrostatic Discharge Protection Level	Human Body Model per JES001-2014	±2000	V
		Charged Device Model per JESD22-C101	±500	

**Notes:**

- This is a mechanical shock (g) sensitive device. Proper handling is required to prevent damage to the part.
- This is an ESD-sensitive device. Proper handling is required to prevent damage to the part.

#### 3.2 Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for device operation. Recommended operating conditions are specified to ensure optimal performance. It is not forbidden to design beyond to Absolute Maximum Ratings.

**Table 6. Recommended Operating Conditions**

Symbol	Parameter	Min	Typ	Max	Unit
VDD	Supply Voltage	1.71	1.8	3.6	V
VDDIO	I/O Pins Supply Voltage	1.71	1.8	3.6	V
V <sub>IL</sub>	Digital Low Level Input Voltage			0.3 *VDDIO	V
V <sub>IH</sub>	Digital High Level Input Voltage	0.7 *VDDIO		VDDIO + 0.3	V
V <sub>OL</sub>	Digital Low Level Output Voltage			0.1 *VDDIO	V
V <sub>OH</sub>	Digital High Level Output Voltage	0.9 *VDDIO			V
V <sub>POR_RLS</sub>	POR Threshold Voltage		1.1		V

### 3.3 Power On Sequence of VDDIO and VDD

#### 3.3.1 Power-On Reset(POR)

Once the VDD & VDDIO are powered from 0V to a certain level, the internal power voltage detector will trigger the Power-On Reset (POR) automatically, and then exit/release the POR mode as the VDD voltage rises over the POR Threshold (about 1.1V). Refer to *Table 6*.

After POR release, there will be about 200us Startup Delay, followed by the QMI8658A Initialization.

The instability of VDDIO & VDD power lines, especially the power increase/drop with high slew rate, would interfere the QMI8658A Initialization and operation. Therefore, there should be no sudden transients and spikes on power lines after Startup Delay, to make sure the Initialization and later on operations are properly implemented.

Normally it takes within about 15ms (refer to *System Turn On Time* in *Table 7* and *Table 8*) for QMI8658A to finish the Initialization and during which, there should be no write/configuration to QMI8658A, to prevent possible interference and failure.

Note that the Software Reset is triggered by the reset command that host write to QMI8658A, which means POR is not involved, while the following sequence are similar (Startup Delay and Initialization) to POR. Refer to 7.4 for more details.

#### 3.3.2 VDDIO and VDD Are Driven by Single Power

As shown in *Figure 11*, when QMI8658A is driven by single/same power line, the power line should ramp up from POR Threshold (about 1.1V) to Min Operation Voltage(1.71V) with slew rate higher than 40V/s, otherwise the Initialization might fail, and QMI8658A might not work properly.

Figure 11. Power On process When Driven by Single Power Line

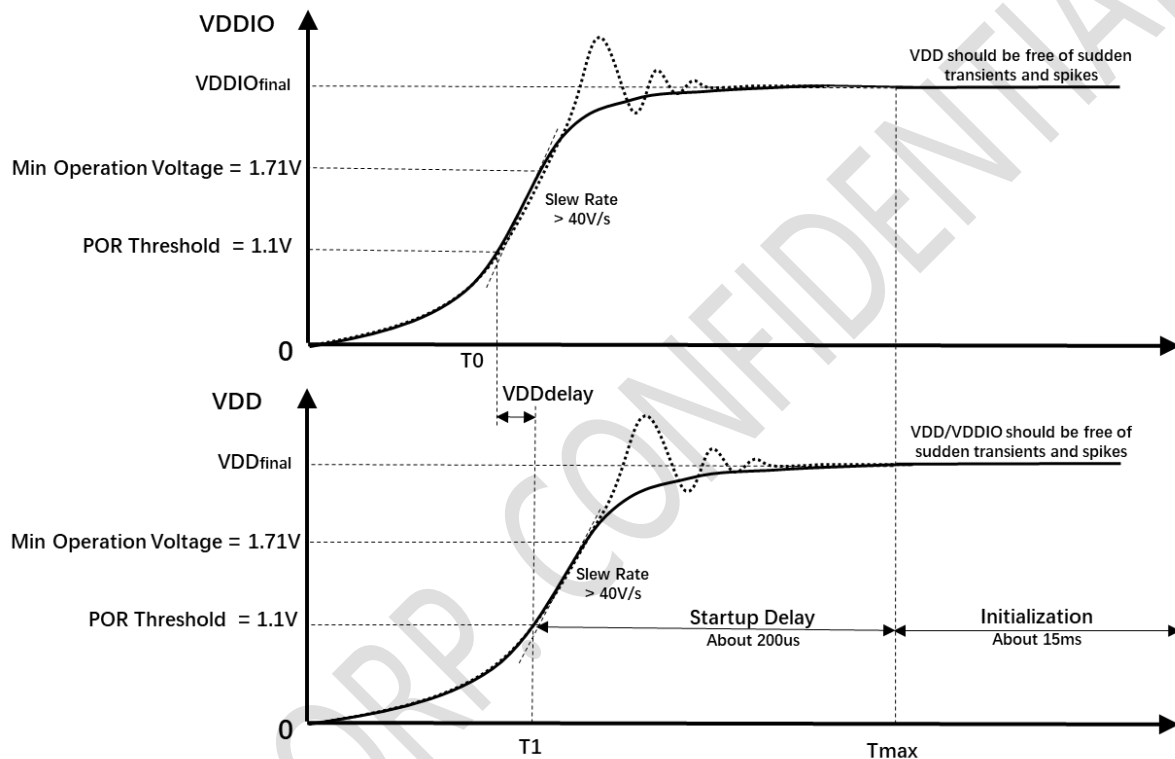

### 3.3.3 VDDIO and VDD Are Driven by Separate Power Lines

As shown in *Figure 12*, when QMI8658A is driven by separate power lines, the VDDIO should be always powered ahead of (no later than) VDD, which means:

$$VDD_{delay} \geq 0, \text{ VDDIO should be driven no later than VDD}$$

Note that the  $VDD_{delay}$  starts from the point when VDDIO rises over the POR Threshold and ended at the VDD rises over the POR Threshold. It should always be non-negative.

The power lines should ramp up from POR Threshold (about 1.1V) to Min Operation Voltage(1.71V) with slew rate higher than 40V/s, otherwise the Initialization might fail, and QMI8658A might not work properly.

**Figure 12. Power On process When Driven by Separate Power Lines**

### 3.4 Electro-Mechanical Specifications

VDD = VDDIO = 1.8 V, T = 25°C unless otherwise noted.

**Table 7. Accelerometer Electro-Mechanical Specifications**

Subsystem	Parameter	Typical		Unit	Comments	
Accelerometer	Noise Density	150		$\mu\text{g}/\sqrt{\text{Hz}}$	High-Resolution Mode	
	Sensitivity Scale Factor	Scale Setting	Sensitivity		LSB/g	16-Bit Output
		$\pm 2$ g	16,384			
		$\pm 4$ g	8,192			
		$\pm 8$ g	4,096			
		$\pm 16$ g	2,048			
	Cross-Axis Sensitivity	$\pm 1$		%		
	Temperature Coefficient of Offset (TCO)	$\pm 1$		$\text{mg}/^\circ\text{C}$	Over-Temperature Range of $-40^\circ\text{C}$ to $85^\circ\text{C}$ , at Board Level	
	Temperature Coefficient of Sensitivity (TCS)	$\pm 0.04$		$\%/^\circ\text{C}$	Over-Temperature Range of $-40^\circ\text{C}$ to $85^\circ\text{C}$ , at Board Level	
	Initial Offset Tolerance	$\pm 100$		mg	Board Level	
Initial Sensitivity Tolerance	$\pm 6$		%	Board Level		
Non-Linearity	$\pm 0.75$		%	Best Fit Line		
	System Turn On Time <sup>(1)</sup>	15		ms	From Software Reset, No Power, or Power Down to Power-on Default state = $t_0$ in Figure 16	
	Accel Turn On Time	3 ms + 3/ODR		ms	Accel Turn on from Power-On Default state or from Low Power state = $t_2 + t_5$ in Figure 16.	

**Note:**

7. System Turn-On Time defines the initialization duration of QMI8658A, it starts from about 200us later than the release of POR(Power On Reset) or the Software Reset. Refer to 3.3 and 7.4 for details.

Table 8. Gyroscope Electro-Mechanical Specifications

Subsystem	Parameter	Typical		Unit	Comments
Gyroscope	Sensitivity	Scale Setting	Sensitivity	LSB/dps	16-Bit Output
		±16 dps	2048		
		±32 dps	1024		
		±64 dps	512		
		±128 dps	256		
		±256 dps	128		
		±512 dps	64		
		±1024 dps	32		
		±2048 dps	16		
	Natural Frequency	22.42		kHz	Precision +/- 2%(typical)
	Noise Density	13		mdps/√ Hz	High-Resolution Mode
	Non-Linearity	±0.2		%	
	Cross-Axis Sensitivity	±2		%	
	g-Sensitivity	±0.1		dps/g	
System Turn On Time <sup>(1)</sup>	15		ms	From Software Reset, No Power, or Power Down to Power-on Default state = t0 in Figure 16	
Gyro Turn On Time	150 ms + 3/ODR		ms	Gyro Turn on from Power-On Default = t1 + t5 in Figure 16	
Temperature Coefficient of Offset (TCO)	X/Y: ±0.1 Z: ±0.05		dps/°C	Over-Temperature Range of -40°C to 85°C, at Board Level	
Temperature Coefficient of Sensitivity (TCS)	X/Y: ±0.05 Z: ±0.01		%/°C	Over-Temperature Range of -40°C to 85°C, at Board Level	
Initial Offset Tolerance	±10		dps	Board Level	
Initial Sensitivity Tolerance	±3		%	Board Level	

**Note:**

8. System Turn-On Time defines the initialization duration of QMI8658A, it starts from about 200us later than the release of POR(Power On Reset) or the Software Reset. Refer to 3.3 and 7.4 for details.

### 3.5 Accelerometer Programmable Characteristics

VDD = VDDIO = 1.8 V, T = 25°C unless otherwise noted. Typical numbers are provided below unless otherwise noted.

If only accelerometer is enabled, the ODR frequency is derived from the internal oscillator. If both accelerometer and gyroscope (6DOF mode) are enabled, the ODR frequency is derived from the natural frequency of gyroscope. *Table 9* shows the two ODR frequencies, which can be referenced for later descriptions in the datasheet. Refer to section 5.3 for detailed ODR configuration.

RMS noise can be calculated based on the noise density and the bandwidth.

**Table 9. Accelerometer Noise Density**

Mode	High-Resolution									Low-Power				Unit
ODR (Accel only)				1000	500	250	125	62.5	31.25	128	21	11	3	Hz
ODR (Accel + Gyro)	7174.4	3587.2	1793.6	896.8	448.4	224.2	112.1	56.05	28.025					Hz
Typical Noise Density	150	150	150	150	150	150	150	150	150	125	180	285	700	μg/√Hz

**Table 10. Accelerometer Filter Characteristics (Accelerometer only)<sup>(9)</sup>**

Mode	High-Resolution									Low-Power				Unit
ODR	8000	4000	2000	1000	500	250	125	62.5	31.25	128	21	11	3	Hz

Bandwidth with Low-Pass Filter Enabled Mode 10 (5.39% of ODR)	386.7	193.4	96.7	48.3	24.2	12.1	6.0	3.0	1.5	NA	NA	NA	NA	
Bandwidth with Low-Pass Filter Enabled Mode 11 (13.37% of ODR)	959.2	479.6	239.8	119.9	60.0	30.0	15.0	7.5	3.7	NA	NA	NA	NA	

**Note:**

10. When both accelerometer and gyroscope are both enabled, all frequencies are synchronized to the nature frequency of gyroscope.

### 3.6 Gyroscope Programmable Characteristics

VDD = VDDIO = 1.8 V, T = 25°C, and represent typical numbers unless otherwise noted. All frequencies are synchronized to the gyroscope nature frequency.

Table 12 shows the noise density of gyroscope output over different ODR configurations.

The typical bandwidths of gyroscope over different ODR settings are listed in Table 13.

RMS noise can be calculated based on the noise density and the bandwidth.

**Table 12. Gyroscope Noise Density**

Mode	High-Resolution									Unit
ODR (Gyro and/or Accel)	7174.4	3587.2	1793.6	896.8	448.4	224.2	112.1	56.05	28.025	Hz
Typical Noise Density	RSV <sup>(11)</sup>	RSV <sup>(11)</sup>	RSV <sup>(11)</sup>	13	13	13	13	13	13	mdps/ $\sqrt{\text{Hz}}$

**Note:**

- The gyroscope noise increases significantly when the ODR is set above 1KHz. It is not recommended to set the ODR beyond 1KHz for the applications that are impacted by gyroscope noise. For more information please contact QST FAE team.

**Table 13. Gyroscope Filter Characteristics**

Mode	High-Resolution									Unit
ODR	7174.4	3587.2	1793.6	896.8	448.4	224.2	112.1	56.05	28.025	Hz
Bandwidth (Default, 27.5% of ODR)	1973.0	986.5	493.2	246.6	123.3	61.7	30.8	15.4	7.7	
Bandwidth with Low-Pass Filter Enabled Mode 00 (2.66% of ODR)	190.8	95.4	47.7	23.9	11.9	6.0	3.0	1.5	0.7	
Bandwidth with Low-Pass Filter Enabled Mode 01 (3.63% of ODR)	260.4	130.2	65.1	32.6	16.3	8.1	4.1	2.0	1.0	
Bandwidth with Low-Pass Filter Enabled Mode 10 (5.39% of ODR)	386.7	193.4	96.7	48.3	24.2	12.1	6.0	3.0	1.5	
Bandwidth with Low-Pass Filter Enabled Mode 11 (13.37% of ODR)	959.2	479.6	239.8	119.9	60.0	30.0	15.0	7.5	3.7	

### 3.7 Electrical Characteristics

VDD = VDDIO = 1.8 V, T = 25°C unless otherwise noted.

**Table 14. Electrical Subsystem Characteristics**

Symbol	Parameter		Min.	Typ.	Max.	Unit
f <sub>SPI</sub>	Host SPI Interface Speed				15	MHz
f <sub>SCL</sub>	Host I <sup>2</sup> C Interface Speed (standard mode and Fast Mode are supported)				400	kHz
f <sub>SCL3</sub>	Host I <sup>3</sup> C Interface Speed	Standard Data Rate (SDR)			12.5	MHz

### 3.8 Current Consumption

VDD = VDDIO = 1.8 V, T = 25°C unless otherwise noted. IDD Current refers to the current flowing into the VDD pin. Typical numbers are provided below.

**Table 15. Current Consumption for Accelerometer Only Sensor Mode (Gyroscope Disabled)**

Mode		High-Resolution						Low-Power				Unit
ODR		1000	500	250	125	62.5	31.25	128	21	11	3	Hz
Typical Overall IDD Current	Filters Disabled (aLPF=0)	182	155	142	134	133	132	55	42	35	30	μA
	Filters Enabled (aLPF=1)	182	155	142	134	133	132	55	42	35	30	

**Table 16. Current Consumption for Gyroscope Only Sensor Mode (Accelerometer Disabled)**

Mode		High-Resolution									Unit

Typical Overall IDD Current	Filters Disabled (gLPF=0)	908	861	748	689	659	656	654	653	651	μA
	Filters Enabled (gLPF=1)	916	863	748	689	659	656	654	653	651	

**Table 17. Current Consumption for 6DOF Sensor Mode (Accelerometer and Gyroscope Enabled)**

Mode		High-Resolution									Unit
ODR		7174.4	3587.2	1793.6	896.8	448.4	224.2	112.1	56.05	28.025	Hz
Typical Overall IDD Current	Filters Disabled (aLPF=0; gLPF=0)	1004	956	843	786	757	754	752	751	750	μA
	Filters Enabled (aLPF=1; gLPF=1)	1031	970	850	789	758	756	753	751	750	

### 3.9 Temperature Sensor

The QMI8658A is equipped with an internal 16-bit embedded temperature sensor that is automatically turned on by default whenever the accelerometer or gyroscope is enabled. The temperature sensor is used internally to correct the temperature dependency of calibration parameters of the accelerometer and gyroscope. The temperature compensation is optimal in the range of -40°C to 85°C with a resolution of 0.0625°C (1/16 °C) or inversely, 16 LSB/°C.

The QMI8658A outputs the internal chip temperature that the HOST can read. The output is 16 bits, with a (1/256)°C per LSB resolution. To read the temperature, the HOST needs to access the TEMP register (see *TEMP\_L* and *TEMP\_H* in *Data Output Registers* in Table 25).

The calculation formular is:

$$T = \text{TEMP\_H} + (\text{TEMP\_L} / 256)$$

To read the temperature sensor data properly, the Host is expected to follow the guidelines in 13 Locking Mechanism.

**Table 18. Temperature Sensor Specifications**

Subsystem	Parameter	Typical	Unit
Digital Temperature Sensor	Range	-40 to +85	°C
	Internal Resolution	16	Bits
	Internal Sensitivity	256	LSB/°C
	Output Register Width	16	Bits
	Output Sensitivity	256	LSB/°C
	Refresh Rate	8	Hz

## 4 Register Map Overview

The QMI8658A UI registers enable programming and control of the inertial measurement unit and associated on-chip signal processing. These registers are accessed through the UI interface – either SPI (4 wires or 3 wires) I3C, or I<sup>2</sup>C.

### 4.1 UI Register Map Overview

UI register map may be classified into the following register categories:

- Chip Information Registers
- Setup and Control Registers: control various aspects of the IMU.
- Host Controlled Calibration Registers: control and configure various aspects of the IMU via the host command interface called CTRL9
- Count Register for time stamping the sensor samples
- Sensor data registers
- FIFO Registers: to set up the FIFO and detect data availability and over-run
- Activity Detection status registers
- General Purpose Registers

**Table 19. UI Register Overview**

Name	Type	Register Address			Default	Comment
		Dec	Hex	Binary	Binary	
<b>General Purpose Registers</b>						
WHO_AM_I	r	0	00	00000000	0000101	Device Identifier

## 5 UI Sensor Configuration Settings and Output Data

### 5.1 Typical Sensor Mode Configuration and Output Data

In Typical sensor mode, QMI8658A outputs raw sensor values. The sensors are configured and read using the registers described below. The accelerometer and gyroscope can be independently configured. *Table 20* summarizes these pertinent registers.

**Table 20. Typical Sensor Mode Configuration and Output Data**

Typical Sensor Configuration and Output Data			
Description	Registers	Unit	Comments
Sensor Enable, SPI 3 or 4 Wire	CTRL1		Control power states, configure SPI communications
Enable Sensor	CTRL7		Individually Enable/Disable the AttitudeEngine, Accelerometer, and Gyroscope Using sEN, aEN, and gEN bits, respectively.
Configure Accelerometer, Enable Self-Test	CTRL2		Configure Full Scale and Output Data Rate; Enable Self-Test
Configure Gyroscope, Enable Self-Test	CTRL3		Configure Full Scale and Output Data Rate; Enable Self-Test
Sensor Filters	CTRL5		Configure and Enable/Disable Low Pass Filters
Status	STATUSINT STATUS0, STATUS1		Data Availability, FIFO Ready to be Read, CTRL9 Protocol Bit
Time Stamp	TIMESTAMP[ H,M,L]		Sample Time Stamp (Circular Register 0 – 0xFFFFFFFF)
Acceleration	A[X,Y,Z]_[H,L]	g	In Sensor Frame of Reference, Right-handed Coordinate System
Angular Rate	G[X,Y,Z]_[H,L]	dps	In Sensor Frame of Reference, Right-handed Coordinate System
Temperature	TEMP_[H,L]	° C	Temperature of the Sensor
FIFO Based Output	FIFO_DATA		1 Byte FIFO Data Outputs

## 5.2 Chip Information Register

Table 21. Chip Information Register Description

Register Name			
<b>WHO_AM_I</b>		<b>Register Address: 0 (0x00)</b>	
Bits	Name	Default	Description
7:0	WHO_AM_I	0x05	Device identifier 0x05 - to identify the device is a QST sensor. Read-only.
<b>REVISION_ID</b>		<b>Register Address: 1 (0x01)</b>	
Bits	Name	Default	Description
7:0	REVISION_ID	0x7C	Device Revision ID. Read-only.

QST CORP. CONFIDENTIAL

### 5.3 Configuration Registers

This section describes the various operating modes and register configurations of the QMI8658A.

**Table 22. Configuration Registers Description**

Register Name																																																																																									
<b>CTRL1</b>		<b>Serial Interface and Sensor Enable. Register Address: 2 (0x02)</b>

**Table 22 Configuration Register Description (Continued)**

Register Name						
CTRL3		Gyroscope Settings: Address 4 (0x04)				
Bits	Name	Default	Description			
7	gST	1'b0	0: Disable Gyro self-Test 1: Enable Gyro Self-Test.			
6:4	gFS<2:0>	3'b0	Set Gyroscope Full-scale: 000 - ±16 dps 001 - ±32 dps 010 - ±64 dps 011 - ±128 dps 100 - ±256 dps 101 - ±512 dps 110 - ±1024dps 111 - ±2048 dps			
3:0	gODR<3:0> <sup>(13)</sup>	4'b0	Set Gyroscope Output Data Rate (ODR):			
			<b>Setting</b>	<b>ODR Rate (Hz)</b>	<b>Mode</b>	<b>Duty Cycle</b>
			0000	7174.4	Normal	100%
			0001	3587.2	Normal	100%
			0010	1793.6	Normal	100%
			0011	896.8	Normal	100%
			0100	448.4	Normal	100%
			0101	224.2	Normal	100%
			0110	112.1	Normal	100%
			0111	56.05	Normal	100%
			1000	28.025	Normal	100%
			1001	N/A		
			1010	N/A		
			1011	N/A		
1100	N/A					
1101	N/A					
1110	N/A					
1111	N/A					

**Note:**

12. The accelerometer low power mode is only available when the gyroscope is disabled
13. In 6DOF mode (accelerometer and gyroscope are both enabled), the ODR is derived from the nature frequency of gyroscope, refer to section 3.5 for more information.

## 5.4 FIFO Registers

Table 23. FIFO Control/Status/Data Registers

Register Name			
<b>FIFO_WTM_TH</b>		<b>FIFO Watermark Register Address: 19 (0x13)</b>	
Bits	Name	Default	Description
7:0	FIFO_WTM	8'h0	Number of ODRs(Samples) needed to trigger FIFO watermark
<b>FIFO_CTRL</b>		<b>FIFO Control Register Address: 20 (0x14)</b>	
Bits	Name	Default	Description
7	FIFO_RD_MODE	1'b0	0: FIFO is in Write mode, sensor data (if enabled) can be filled into FIFO 1: FIFO is in Read mode, FIFO data can be read via FIFO_DATA register This bit is automatically set by using a CTRL9 command. It must be cleared again (by write 1'b0 to this bit) after the data read is complete so that filling data to the FIFO can resume. Refer to 5.10.6.3.
6:4	Reserved	3'b0	
3:2	FIFO_SIZE	2'b0	FIFO_SIZE[1:0]    FIFO Sample Size
			00                    16 samples
			01                    32 samples
			10                    64 samples
1:0	FIFO_MODE	2'b0	FIFO_MODE[1:0]    FIFO Mode
			00                    Bypass (FIFO disable)
			01                    FIFO
			10                    Stream
11                    Reserved			
<b>FIFO_SMPL_CNT</b>		<b>FIFO Sample Count Register Address: 21 (0x15)</b>	
Bits	Name	Default	Description
7:0	FIFO_SMPL_CNT_L SB	8'b0	8 LS bits of FIFO Sample Count, in word (2bytes).
<b>FIFO_STATUS</b>		<b>FIFO Status. Register Address 22 (0x16)</b>	
Bits	Name	Default	Description
7	FIFO_FULL	1'b0	0: FIFO is not Full 1: FIFO is Full
6	FIFO_WTM	1'b0	0: FIFO Water Mark Level not hit. 1: FIFO Water Mark Level Hit
5	FIFO_OVFLOW	1'b0	0: FIFO Overflow has not happened 1: FIFO Overflow condition has happened (data dropping happened)
4	FIFO_NOT_EMPTY	1'b0	0: FIFO is Empty 1: FIFO is not Empty
3:2	Reserved	2'b0	
1:0	FIFO_SMPL_CNT_ MSB	2'b0	2 MS bits of FIFO Sample Count in word (2bytes).
<b>FIFO_DATA</b>		<b>FIFO DATA Output Register Address: 23 (0x17)</b>	
Bits	Name	Default	Description
7:0	FIFO_DATA	8'b0	8 bit FIFO data output.

## 5.5 Status and Time Stamp Registers

Table 24. Status and Time Stamp Registers

Register Name			
<b>STATUSINT</b>		<b>Sensor Data Available and Lock Register Address: 45 (0x2D)</b>	
Bits	Name	Default	Description
7	Ctrl9 CmdDone	1'b0	Indicates CTRL9 Command was done, as part of CTRL9 protocol 0: Not Completed 1: Done
6:2	Reserved	5'b0	
1	Locked	1'b0	If syncSmpl (CTRL7.bit7) = 1: 0: Sensor Data is not locked. 1: Sensor Data is locked. If syncSmpl = 0, this bit shows the same value of INT1 level
0	Avail	1'b0	If syncSmpl (CTRL7.bit7) = 1: 0: Sensor Data is not available 1: Sensor Data is available for reading If syncSmpl = 0, this bit shows the same value of INT2 level
<b>STATUS0</b>		<b>Output Data Status Register Address: 46 (0x2E)</b>	
Bits	Name	Default	Description
7:2	Reserved	6'b0	
1	gDA	1'b0	Gyroscope new data available 0: No updates since last read. 1: New data available.
0	aDA	1'b0	Accelerometer new data available 0: No updates since last read. 1: New data available.
<b>STATUS1</b>		<b>Miscellaneous Status. Register Address 47 (0x2F)</b>	
Bits	Name	Default	Description
7	Significant Motion	1'b0	0: No Significant-Motion was detected 1: Significant-Motion was detected
6	No Motion	1'b0	0: No No-Motion was detected 1: No-Motion was detected
5	Any Motion	1'b0	0: No Any-Motion was detected 1: Any-Motion was detected
4	Pedometer	1'b0	0: No step was detected 1: step was detected
3	Reserved	1'b0	
2	WoM	1'b0	0: No WoM was detected 1: WoM was detected
1	TAP	1'b0	0: No Tap was detected 1: Tap was detected
0	Reserved	1'b0	
<b>TIMESTAMP</b>		<b>3 Bytes Sample Time Stamp – Output Count. Register Address: 48 - 50 (0x30 - 0x32)</b>	
Bits	Name	Default	Description

7:0	TIMESTAMP_L<7:0>	0x00	Sample time stamp. Count incremented by one for each sample (x, y, z data set) from sensor with highest ODR (circular register 0x0-0xFFFFF).
7:0	TIMESTAMP_M<15:8>	0x00	
7:0	TIMESTAMP_H<23:16>	0x00	

QST CORP. CONFIDENTIAL

## 5.6 Sensor Data Output Registers

Table 25. Sensor Data Output Registers Description

Register Name			
<b>TEMP_[H,L]</b>		<b>Temp Sensor Output. Register Address: 0x33 – 0x34</b>	
Bits	Name	Default	Description
7:0	TEMP_L	0x00	Temperature output (°C) in two's complement. $T = TEMP\_H + (TEMP\_L / 256)$
7:0	TEMP_H	0x00	
<b>Register Name</b>			
<b>A[X,Y,Z]_[H,L]</b>		<b>Acceleration Output. Register Address: 0x35 – 0x3A</b>	
Bits	Name	Default	Description
7:0	AX_L<7:0>	0x00	X-axis acceleration in two's complement. AX_L – lower 8 bits. AX_H – upper 8 bits.
7:0	AX_H<15:8>	0x00	
7:0	AY_L<7:0>	0x00	Y-axis acceleration in two's complement. AY_L – lower 8 bits. AY_H – upper 8 bits.
7:0	AY_H<15:8>	0x00	
7:0	AZ_L<7:0>	0x00	Z-axis acceleration in two's complement. AZ_L – lower 8 bits. AZ_H – upper 8 bits.
7:0	AZ_H<15:8>	0x00	
<b>Register Name</b>			
<b>G[X,Y,Z]_[H,L]</b>		<b>Angular Rate Output. Register Address: 0x3B – 0x40</b>	
Bits	Name	Default	Description
7:0	GX_L<7:0>	0x00	X-axis angular rate in two's complement. GX_L – lower 8 bits. GX_H – upper 8 bits.
7:0	GX_H<15:8>	0x00	
7:0	GY_L<7:0>	0x00	Y-axis angular rate in two's complement. GY_L – lower 8 bits. GY_H – upper 8 bits.
7:0	GY_H<15:8>	0x00	
7:0	GZ_L<7:0>	0x00	Z-axis angular rate in two's complement. GZ_L – lower 8 bits. GZ_H – upper 8 bits.
7:0	GZ_H<15:8>	0x00	

## 5.7 Calibration-On-Demand (COD) Status Register

Register Name			
COD_STATUS		Register Address: 70 (0x46)	
Bits	Name	Default	Description
7	X_Limit_L_Fail	1'b0	0: COD passed for checking low sensitivity limit of X axis of gyroscope 1: COD failed for checking low sensitivity limit of X axis of gyroscope
6	X_Limit_H_Fail	1'b0	0: COD passed for checking high sensitivity limit of X axis of gyroscope 1: COD failed for checking high sensitivity limit of X axis of gyroscope
5	Y_Limit_L_Fail	1'b0	0: COD passed for checking low sensitivity limit of Y axis of gyroscope 1: COD failed for checking low sensitivity limit of Y axis of gyroscope
4	Y_Limit_H_Fail	1'b0	0: COD passed for checking high sensitivity limit of Y axis of gyroscope 1: COD failed for checking high sensitivity limit of Y axis of gyroscope
3	Accel_Check	1'b0	0: Accelerometer checked pass (no significant vibration happened during COD) 1: Accelerometer checked failed (significant vibration happened during COD)
2	Startup_Failed	1'b0	0: Gyroscope startup succeeded 1: Gyroscope startup failure happened when COD was called
1	Gyro_Enabled	1'b0	0: COD was called when gyroscope was not enabled 1: COD was called while gyroscope was enabled, COD return failure
0	COD_Failed	1'b0	0: COD succeeded, new gain parameters will be applied to GX & GY data 1: COD failed; no COD correction applied

Note the value of this register is only valid after the COD command. Refer to *14 Calibration-On-Demand (COD)*.

## 5.8 Activity Detection Output Registers

Table 26. Activity Detection Output Registers

Register Name			
<b>TAP_STATUS</b>		<b>Register Address: 89 (0x59)</b>	
Bits	Name	Default	Description
7	TAP_POLARITY	1'b0	0: Tap was detected on the positive direction of the Tap axis 1: Tap was detected on the negative direction of the Tap axis
6	Reserved	1'b0	
5:4	TAP_AXIS	2'b0	0: No Tap was detected 1: Tap was detected on X axis 2: Tap was detected on Y axis 3: Tap was detected on Z axis
3:2	Reserved	2'b0	
1:0	TAP_NUM	2'b0	0: No Tap was detected 1: Single-Tap was detected 2: Double-Tap was detected 3: NA
<b>STEP_COUNT[23:0]</b>			
Bits	Name	Default	Description
23:16	STEP_CNT_HIGH	0x00	24-bit Step Count detected by Pedometer engine
15:8	STEP_CNT_MID	0x00	
7:0	STEP_CNT_LOW	0x00	

## 5.9 Reset Register

Table 27. Reset Register Description

Register Name			
RESET		Register Address: 96 (0x60)	
Bits	Name	Default	Description
7:0	RESET	0x00	Soft Reset Register - Write 0xB0 to this register from any modes, will trigger the sensor reset process immediately. The register 0x4D will equals to 0x80 if there is a successful reset (Power-on Reset or Soft Reset) process. Refer to 7.4 <i>Chip Reset Process</i> .

QST CORP. CONFIDENTIAL

## 5.10 CTRL 9 Functionality (Executing Pre-defined Commands)

### 5.10.1 CTRL9 Protocol Description

The protocol for executing predefined commands from an external host processor on the QMI8658A is facilitated by using the CTRL9 register. The register is available to the host via the UI SPI/I<sup>2</sup>C/I<sup>3</sup>C bus.

It operates by the host writing a pre-defined value (Command, refer to 5.10.2 CTRL9 Command List) to the CTRL9 register. The firmware of the QMI8658A evaluates this command and if a match is found it executes the corresponding pre-defined function.

Once the function has been executed, the QMI8658A signals the completion by setting STATUSINT.bit7 to 1, and raising INT1 interrupt if CTRL1.bit3 = 1 & CTRL8.bit7 == 0. The host must acknowledge this by writing CTRL\_CMD\_ACK (0x00) to CTRL9 register. After receiving the CTRL\_CMD\_ACK command, the QMI8658A clears the STATUSINT.bit7 to 0 and pulls down the INT1 interrupt if CTRL1.bit3 = 1 & CTRL8.bit7 == 0.

This command presentation from the host to the QMI8658A and the subsequent execution and handshake between the host and the QMI8658A will be referred to as the “CTRL9 Protocol”.

There are three types of interactions between the host and QMI8658A that follow the CTRL9 Protocol.

**WCtrl9:** The host needs to supply data to QMI8658A prior to the Ctrl9 protocol. (**Write – Ctrl9 Protocol**)

**Ctrl9R:** The host gets data from QMI8658A following the Ctrl9 protocol. (**Ctrl9 protocol – Read**)

**Ctrl9:** No data transaction is required prior to or following the Ctrl9 protocol. (**Ctrl9**).

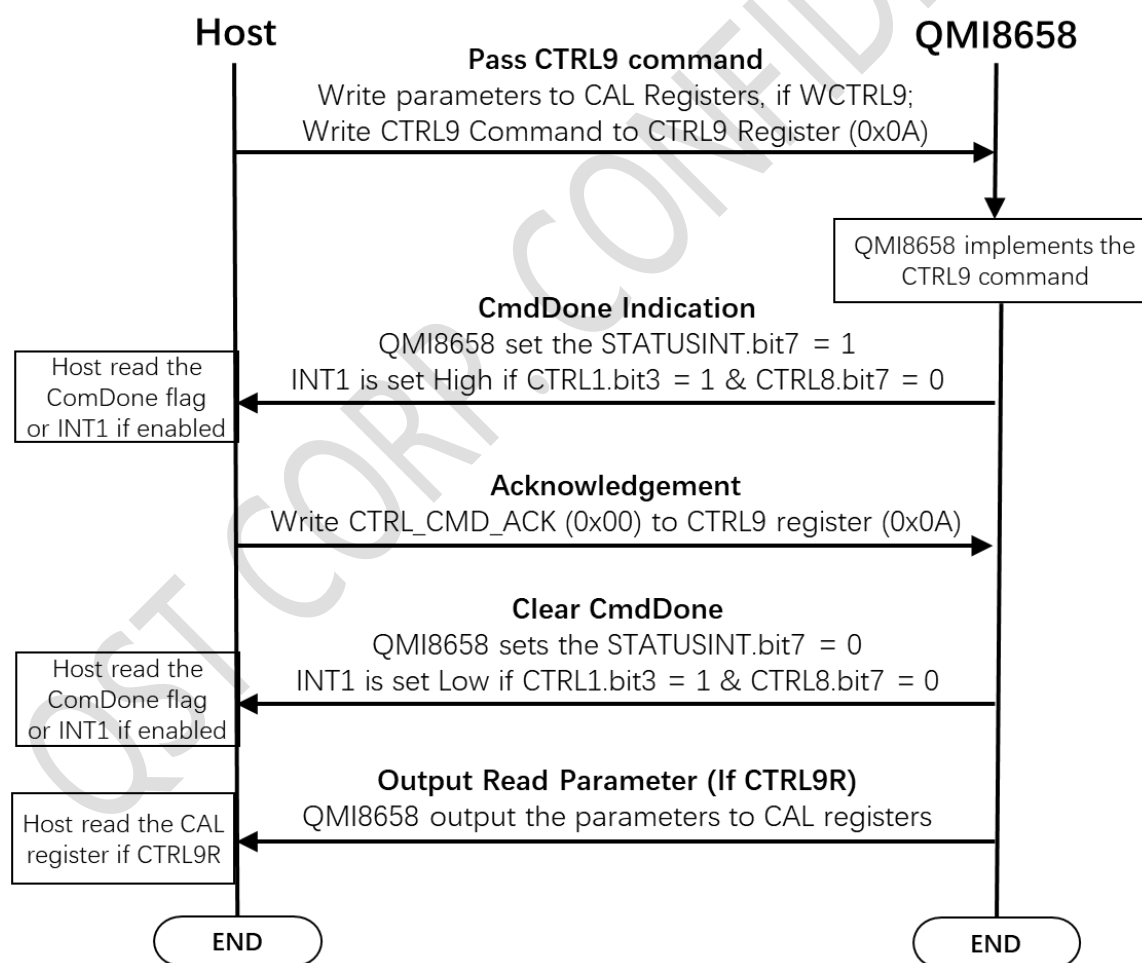

Figure 13. CTRL9 Protocol Flow Chart

### 5.10.2 CTRL9 Command List

The predefined CTRL9 commands are listed in Table 28 List of CTRL9 Command.

**Table 28. List of CTRL9 Commands**

Command Name	CTRL9 Command Value	Protocol Type	Description
CTRL_CMD_ACK	0x00	Ctrl9	Acknowledgement. Host acknowledges to QMI8658, to end the protocol.
CTRL_CMD_RST_FIFO	0x04	Ctrl9	Reset FIFO from Host
CTRL_CMD_REQ_FIFO	0x05	Ctrl9R	Get FIFO data from Device
CTRL_CMD_WRITE_WOM_SETTING	0x08	WCtrl9	Set up and enable Wake on Motion (WoM)
CTRL_CMD_ACCEL_HOST_DELTA_OFFSET	0x09	WCtrl9	Change accelerometer offset
CTRL_CMD_GYRO_HOST_DELTA_OFFSET	0x0A	WCtrl9	Change gyroscope offset
CTRL_CMD_CONFIGURE_TAP	0x0C	WCtrl9	Configure Tap detection
CTRL_CMD_CONFIGURE_PEDOMETER	0x0D	WCtrl9	Configure Pedometer
CTRL_CMD_CONFIGURE_MOTION	0x0E	WCtrl9	Configure Any Motion / No Motion / Significant Motion detection
CTRL_CMD_RESET_PEDOMETER	0x0F	WCtrl9	Reset pedometer count (step count)
CTRL_CMD_COPY_USID	0x10	Ctrl9R	Copy USID and FW Version to UI registers
CTRL_CMD_SET_RPU	0x11	WCtrl9	Configures IO pull-ups
CTRL_CMD_AHB_CLOCK_GATING	0x12	WCtrl9	Internal AHB clock gating switch
CTRL_CMD_ON_DEMAND_CALIBRATION	0xA2	WCtrl9	On-Demand Calibration on gyroscope
CTRL_CMD_APPLY_GYRO_GAINS	0xAA	WCtrl9	Restore the saved Gyroscope gains

### 5.10.3 CAL Registers

The set of CAL registers can be used for the parameter transferring, if WCTL9 or CTRL9R commands are implemented. Refer to Table 28 and 5.10.6 for details.

**Table 29. CAL Register Addresses**

Register Name	Register Address	
	Dec	Hex
CAL1_L	11	0x0B
CAL1_H	12	0x0C
CAL2_L	13	0x0D
CAL2_H	14	0x0E
CAL3_L	15	0x0F
CAL3_H	16	0x10
CAL4_L	17	0x11
CAL4_H	18	0x12

#### 5.10.4 WCtrl9 (Write – CTRL9 Protocol)

1. The host needs to provide the required data for this command to the QMI8658A. The host typically does this by placing the data in a set of registers called the CAL registers. Maximum eight CAL registers are used. Refer to *Table 29*.
2. Write Ctrl9 register 0x0A with the appropriate Command value, refer to *Table 28*.
3. The Device will set STATUSINT.bit7 to 1, and raise INT1 (if CTRL1.bit3 = 1 & CTRL8.bit7 == 0), once it has executed the appropriate function based on the command value.
4. The host must acknowledge this by writing CTRL\_CMD\_ACK (0x00) to CTRL9 register, STATUSINT.bit7 (CmdDone) will be reset to 0 on receiving the CTRL\_CMD\_ACK command. And INT1 is pulled low upon the register read if CTRL1.bit3 = 1 & CTRL8.bit7 == 0.
5. If any data is expected from the device, it will be available at this time. The location of the data is specified separately for each of the Commands.

Refer to 5.10.6 for details.

#### 5.10.5 Ctrl9R (CTRL9 Protocol - Read)

1. Write Ctrl9 register 0x0A with the appropriate Command value.
2. The Device will set STATUSINT.bit7 to 1, and raise INT1 (if CTRL1.bit3 = 1 & CTRL8.bit7 == 0), once it has executed the appropriate function based on the command value.
3. The host must acknowledge this by writing CTRL\_CMD\_ACK (0x00) to CTRL9 register, STATUSINT.bit7 (CmdDone) will be reset to 0 on receiving the CTRL\_CMD\_ACK command. INT1 is pulled low upon the register read if CTRL1.bit3 = 1 & CTRL8.bit7 == 0.
4. Data is available from the device on the CAL registers. The location of the data is specified separately for each of the Commands.

Refer to 5.10.6 for details.

#### 5.10.6 CTRL9 Commands in Details

##### 5.10.6.1 CTRL\_CMD\_ACK

Host acknowledges QMI8658A when received the CmdDone information, to end the CTRL9 protocol.

##### 5.10.6.2 CTRL\_CMD\_RST\_FIFO

This CTRL9 command of writing 0x04 to the Ctrl9 register 0x0a allows the host to instruct the device to reset the FIFO. The FIFO data, sample count and flags will be cleared and reset to default status.

##### 5.10.6.3 CTRL\_CMD\_REQ\_FIFO

This CTRL9 Command is issued when the host wants to get data from the FIFO, by writing 0x05 through the CTRL9 process.

After successfully finish the CTRL9 process, the FIFO read mode will be enabled, the device will direct the FIFO data to the FIFO\_DATA register(0x17) until the FIFO is empty. After reading the FIFO data, host must set FIFO\_CTRL.FIFO\_rd\_mode to 0 by write the FIFO\_CTRL register, which will cause the FIFO\_STATUS.FIFO\_WTM/FIFO\_FULL to be cleared and/or the INT pin (if enabled) be de-asserted. Refer to [错误!未找到引用源。](#) for CTRL9 operation, and refer to 8.8 for details.

##### 5.10.6.4 CTRL\_CMD\_WRITE\_WOM\_SETTING

This CTRL9 Command is issued when the host wants to enable/modify the trigger thresholds or blanking interval of the Wake on Motion Feature of the device. Please refer to *12 Wake on Motion (WoM)* for details of setting up this feature. Once the specified CAL registers are loaded with the appropriate data, the Command is issued by writing 0x08 to CTRL9 register 0x0A.

##### 5.10.6.5 CTRL\_CMD\_ACCEL\_HOST\_DELTA\_OFFSET

This CTRL9 Command is issued when the host wants to manually change the accelerometer offset. Each delta offset value should contain 16 bits and the format is signed 4.12 (12 fraction bits, unit is 1 / 2<sup>12</sup>). The user must write the offset to the following registers:

Accel\_Delta\_X : {CAL1\_H, CAL1\_L}  
Accel\_Delta\_Y : {CAL2\_H, CAL2\_L}  
Accel\_Delta\_Z : {CAL3\_H, CAL3\_L}

Next, the Command is issued by writing 0x09 to CTRL9 register 0x0A. Note, this offset change is lost when the sensor is power cycled, or the system is reset.

#### 5.10.6.6 CTRL\_CMD\_GYRO\_HOST\_DELTA\_OFFSET

This CTRL9 Command is issued when the host wants to manually change the gyroscope offset. Each delta offset value should contain 16 bits and the format is signed 11.5 (5 fraction bits, unit is  $1 / 2^5$ ). The user must write the offset to the following registers:

Gyro\_Delta\_X : {CAL1\_H, CAL1\_L}  
Gyro\_Delta\_Y : {CAL2\_H, CAL2\_L}  
Gyro\_Delta\_Z : {CAL3\_H, CAL3\_L}

Next, the Command is issued by writing 0x0A to CTRL9 register 0x0A. Note, this offset change is lost when the sensor is power cycled, or the system is reset.

#### 5.10.6.7 CTRL\_CMD\_CONFIGURE\_TAP

This CTRL9 command is issued to configure the parameters of Tap detection. Refer to *10.3 Configure Tap for details*.

#### 5.10.6.8 CTRL\_CMD\_CONFIGURE\_PEDOMETER

This CTRL9 command is issued to configure the parameters of Pedometer detection. Refer to *11.2 Configure Pedometer* for details.

#### 5.10.6.9 CTRL\_CMD\_CONFIGURE\_MOTION

This CTRL9 command is issued to configure the parameters of Motion Detection. Refer to *9.4 Config Motion Detection*.

#### 5.10.6.10 CTRL\_CMD\_RESET\_PEDOMETER

This CTRL9 command is issued to clear the step count of Pedometer. Refer to *11.6 Reset Step Count* for details.

#### 5.10.6.11 CTRL\_CMD\_COPY\_USID

The USID is the unique ID of every single QMI8658A part.

This CTRL9 Command copies the following data into UI registers. It is initiated by the host writing 0x10 to CTRL9. After issuing the command, the data will be available for the host to read from the registers shown below:

FW\_Version byte 0 → dQW\_L  
FW\_Version byte 1 → dQW\_H  
FW\_Version byte 2 → dQX\_L  
USID\_Byte\_0 → dVX\_L  
USID\_Byte\_1 → dVX\_H  
USID\_Byte\_2 → dVY\_L  
USID\_Byte\_3 → dVY\_H  
USID\_Byte\_4 → dVZ\_L  
USID\_Byte\_5 → dVZ\_H

Note that after the successful Power-On Reset or Soft-Reset, the FW\_Version and USID will be copied automatically to the according registers once for host to read them. Those registers can be changed after enabling the sensors, so afterwards, the CTRL\_CMD\_COPY\_USID command should be implemented to copy the FW\_Version and USID to the according registers before reading.

#### 5.10.6.12 CTRL\_CMD\_SET\_RPU

This CTRL9 Command is issued when the host configure the IO pull-up resistors. Each bit controls a combination of resistors as shown in *Table 30*:

**Table 30. Pull-Up Resistor Table**

Bit	Signal Name	Pins	Activity
0	aux_rpu_dis	SDx, SCx, RESV(Pin 10)	0: enable pull-up resistors(default) 1: disable pull-up resistors
1	icm_rpu_dis	SDx	0: enable pull-up resistor(default) 1: disable pull-up resistor
2	cs_rpu_dis	CS	0: enable pull-up resistor(default) 1: disable pull-up resistor
3	i2c_rpu_dis	SCL, SDA	0: enable pull-up resistors(default) 1: disable pull-up resistors
4:7	Reserved	NA	

The host writes the appropriate CAL1\_L bit by issuing a WCtrl9 command with 0x11.

By default, all the pull-up resistors are enabled. Write 1 to the bit will disable the pullup resistors accordingly, while write 0 will enable the pull-up resistors.

#### 5.10.6.13 CTRL\_CMD\_AHB\_CLOCK\_GATING

When locking Mechanism is set (CTRL7.bit7 == 1(syncSmpl)), the CTRL\_CMD\_AHB\_CLOCK\_GATING should be disabled to guarantee the locking mechanism of data reading, to prevent the possible misalignment. Refer to 14 *Calibration-On-Demand (COD)* for details.

#### 5.10.6.14 CTRL\_CMD\_ON\_DEMAND\_CALIBRATION

This CTRL9 Command enables host to recalibrate the gyro sensitivity from time to time. Refer to 14 *Calibration-On-Demand (COD)*.

#### 5.10.6.1 CTRL\_CMD\_APPLY\_GYRO\_GAINS

This CTRL9 Command enables host to restore the saved the gyro gains to QMI8658A, to avoid run the COD again. This is not recommended when there are significant environment changes, like significant PCB stress change. Refer to 14.4 *Save and Restore the New Gain Parameters*.

## 6 Interrupts

The QMI8658A has two Interrupt lines, INT1 and INT2.

Both INT1 and INT2 can be configured as High-Z mode or Push-Pull mode by configure the CTRL1.bit3(INT1) or CTRL1.bit4(INT2). If CTRL1.bit3 (CTRL1.bit4) is set to 0, INT1(INT2) will be set in High-Z mode accordingly. While if CTRL1.bit3 (CTRL1.bit4) is set to 1, INT1(INT2) will be set in Push-Pull mode accordingly. By default, INT1 and INT2 are in High-Z mode.

If QMI8658A is configured in Wake on Motion (WoM) mode, there is no sensor data generated. The INT pins behavior follows the configuration of WoM, refer to *12 Wake on Motion (WoM)*.

If QMI8658A is not in Wake on Motion mode, there are two modes of the interrupt map, as described below. Host can config multiple internal signal/interrupt sources to INT pins (INT1 and/or INT2). If driven to one INT pin, the multiple sources act in LOGIC-OR.

### 6.1 SyncSample mode

The SyncSample mode supports locking the values during reading process. Refer to *13 Locking Mechanism*. For details to the sensor data registers.

Set CTRL7.bit7(SyncSample) == 1 will enable the SyncSample mode.

As illustrated in *Figure 14*. In SyncSample mode, the CTRL9 handshake signal will be routed to INT1. Check *5.10* for details.

The motion event interrupts (Any Motion, No Motion, Significant Motion, Pedometer, Tap) will be routed to INT1 if enabled.

FIFO function is not supported in this mode, and DRDY signal will be routed to INT2.

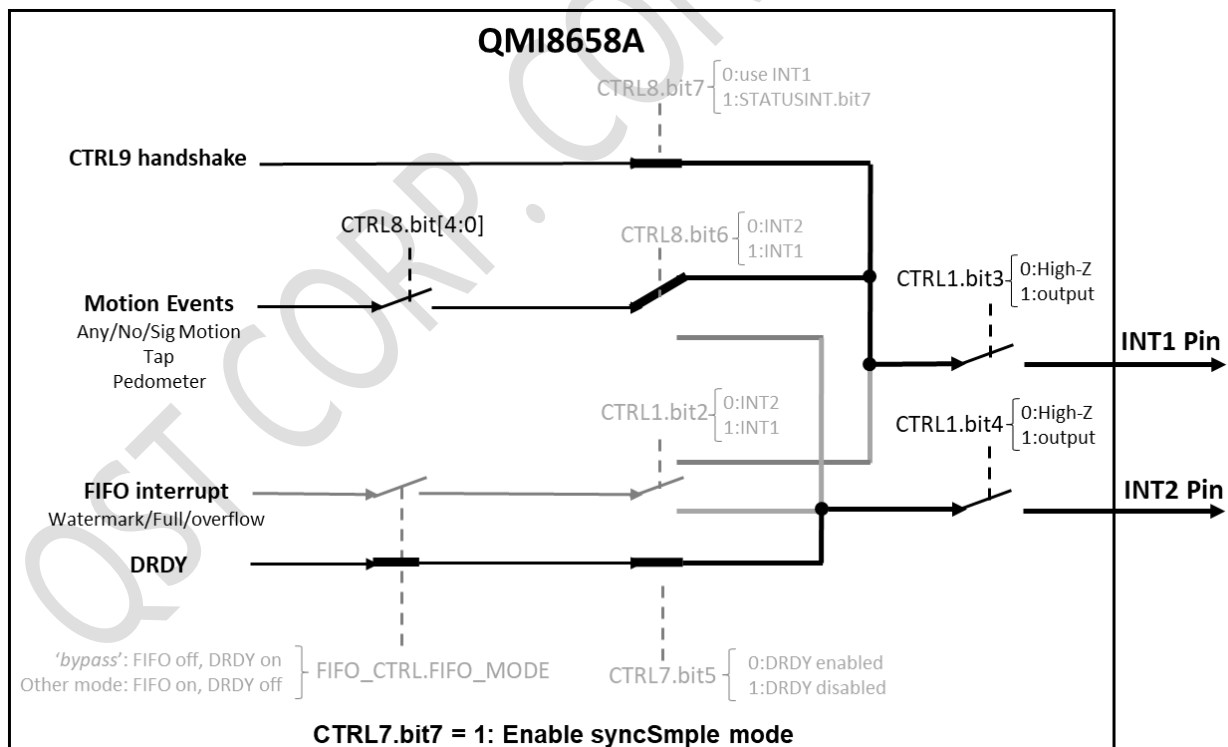

Figure 14. Interrupt Map of SyncSample Mode

## 6.2 Non-SyncSample mode

This mode supports FIFO function and free interrupts configuration, as illustrated in *Figure 15*.

If CTRL7.bit7(SyncSample) == 0, then bit 1 of STATUSINT register will have the same value as INT1 and bit 0 of STATUSINT register will have the same value as INT2.

In Non-SyncSample mode, there are two approaches of CTRL9 handshake. Host can check the INT1 pin high level for the handshark if set CTRL8.bit7 = 0; or poll the STATUSINT.bit7 for handshake if set CTRL8.bit7 = 1.

In Non-SyncSample mode, the motion event interrupt(s) can be configured to INT1 by setting CTRL8.bit6 = 1, or to INT2 by setting CTRL8.bit6 = 0. Note that the motion event engines can be enabled by CTRL8.bit[4:0], refer to *Table 22* for details.

In Non-SyncSample mode, the sensor data can be output through data register or FIFO. Configure the FIFO\_CTRL.FIFO\_MODE = 'bypass' mode, will enable the DRDY function and disable FIFO functionality; configure the FIFO\_CTRL.FIFO\_MODE = other mode, will enable the FIFO functionality and disable the DRDY function.

If FIFO mode is enabled, the FIFO interrupt can be configured to INT1 pin if CTRL1.bit2 is set to 1, or INT2 pin if CTRL1.bit2 is set to 0. Refer to *8 FIFO Description* for more details of FIFO interrupt behavior.

If DRDY mode is enabled, the DRDY signal will be routed to INT2 if the CTRL7.bit5(DRDY\_DIS) is set to 0, or be blocked from INT2 pin if CTRL7.bit5(DRDY\_DIS) is set to 1.

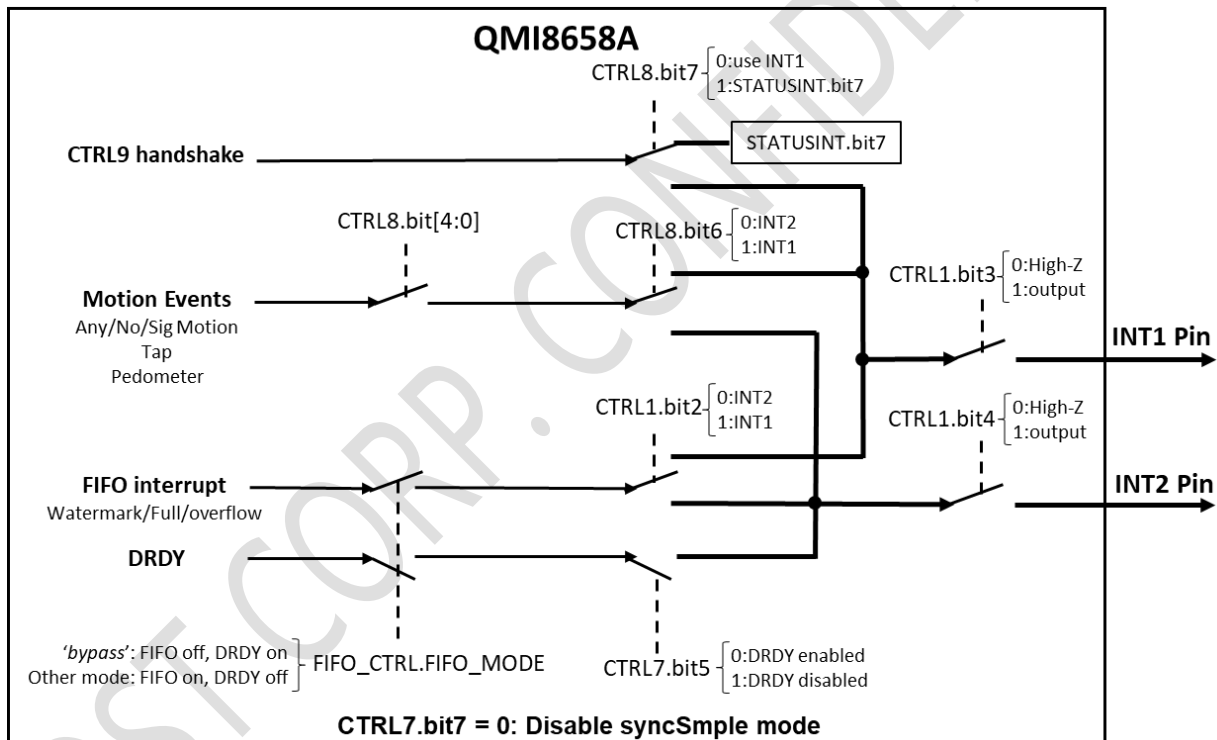

Figure 15. Interrupt Map of Non-SyncSample Mode

## 6.3 DRDY(Data Ready)

If DRDY mode is enabled (accelerometer and/or gyroscope are/is enabled, and FIFO mode is set to bypass) and DRDY\_DIS == 0, DRDY (Data Ready) signal will be driven to the INT2 in edge-trigger mode, means the DRDY signal can be seen on INT2. The Sensor Data Output Registers(refer to 5.6) are updated at the Output Data Rate (ODR), and DRDY signal is pulsed at the ODR frequency. The new data is updated to the data registers during the low level before the rising edge, and a rising edge on DRDY indicates that data is available for host to read. DRDY is cleared automatically after a short duration. The DRDY pulse width is dependent on the sensor ODR set by CTRL2 and/or CTRL3 registers and enabled sensor(s).

In Non-SyncSample mode, it is the responsibility of the host to detect the rising edge and to read the data out during the high level of the INT2 pulse. Otherwise, there is the possibility that the updating of the new data happens during the host reading process and causes data mismatch.

In SyncSample mode, it is possible to lock the data in the data registers and read them in an unlimited delay, by following a process. Refer to *6.1 SyncSample mode*.

QST CORP. CONFIDENTIAL

## 7 Operating Modes

The QMI8658A offers a large number of operating modes that may be used to operate the device in a power efficient manner. These modes are described in *Table 31* and are shown in *Figure 16*; they may be configured using the control (CTRL) registers.

### 7.1 Operating Modes Descriptions

**Table 31. Operating Modes**

Mode	Description	Suggested Configuration
<b>Power-On Default</b>	All sensors off, clock is turned on. The current in this mode is typically 15 $\mu$ A. Note this mode is the default state upon initial power up or after a reset.	CTRL1 sensorDisable = 0 CTRL7 aEN = 0, gEN = 0, CTRL2 aODR = 000
<b>Low Power</b>	Same as Power-On Default mode, except in this mode the 250 kHz clock is turned on instead of the high-speed clock. The current in this mode is typically 8 $\mu$ A. To enter this mode requires host interaction to set CTRL2 aODR=11xx.	CTRL1 sensorDisable = 0 CTRL7 aEN = 0, gEN = 0, CTRL2 aODR = 11xx
<b>Power-Down</b>	All QMI8658A functional blocks are switched off to minimize power consumption. Digital interfaces remain on allowing communication with the device. All configuration register values are preserved, and output data register values are maintained. The current in this mode is typically 6 $\mu$ A. The host must initiate this mode by setting sensorDisable=1.	CTRL1 sensorDisable = 1 CTRL7 aEN = 0, gEN = 0
<b>Normal Accel Only</b>	Device configured as an accelerometer only.	CTRL7 aEN = 1, gEN = 0, CTRL2 aODR != 11xx
<b>Low Power Accel Only</b>	Device configured in low power accelerometer mode.	CTRL7 aEN = 1, gEN = 0, CTRL2 aODR = 11xx
<b>Snooze Gyro</b>	Device configured as gyroscope drive only, the gyroscope MEMS will keep running at resonance frequency. Since the Sensing part is not enabled, there is no data from the gyroscope in this mode. This mode enables relative lower current consumption than Gyro-Only mode and can quickly generate data from clearing of gSN.	CTRL7 gSN=1, aEN = 0, gEN = 1
<b>Gyro Only</b>	Device configured as a gyroscope only.	CTRL7 gSN=0, aEN = 0, gEN = 1
<b>Accel + Gyro (IMU)</b>	Device configured as an Inertial Measurement Unit, i.e. an accelerometer and gyroscope combination sensors.	CTRL7 gSN=0, aEN = 1, gEN = 1 CTRL2 aODR != 11xx
<b>Accel + Snooze Gyro</b>	Accelerometer and gyroscope snooze are enabled. Only accelerometer data is available.	CTRL7 gSN=1, aEN = 1, gEN = 1 CTRL2 aODR != 11xx
<b>Wake on Motion (WoM)</b>	Very low power mode used to wake-up the host by providing an interrupt upon detection of device motion. Refer to 5.10.6.4.	CTRL7 aEN = 1, gEN = 0, CTRL2 aODR = 11xx
<b>Software Reset</b>	Software Reset asserted	
<b>No Power</b>	VDDIO and VDD low	

### 7.2 General Mode Transitioning

Upon exiting the No Power state (i.e. on first applying power to the part) or exiting a Software Reset state, the part will enter the Power-On Default state. From there, the sensor can be configured in the various modes described in Table 31 and as shown in Figure 16. The figure illustrates the timing associated with various mode transitions, and values for these times are given in the section below and in Table 7 and Table 8.

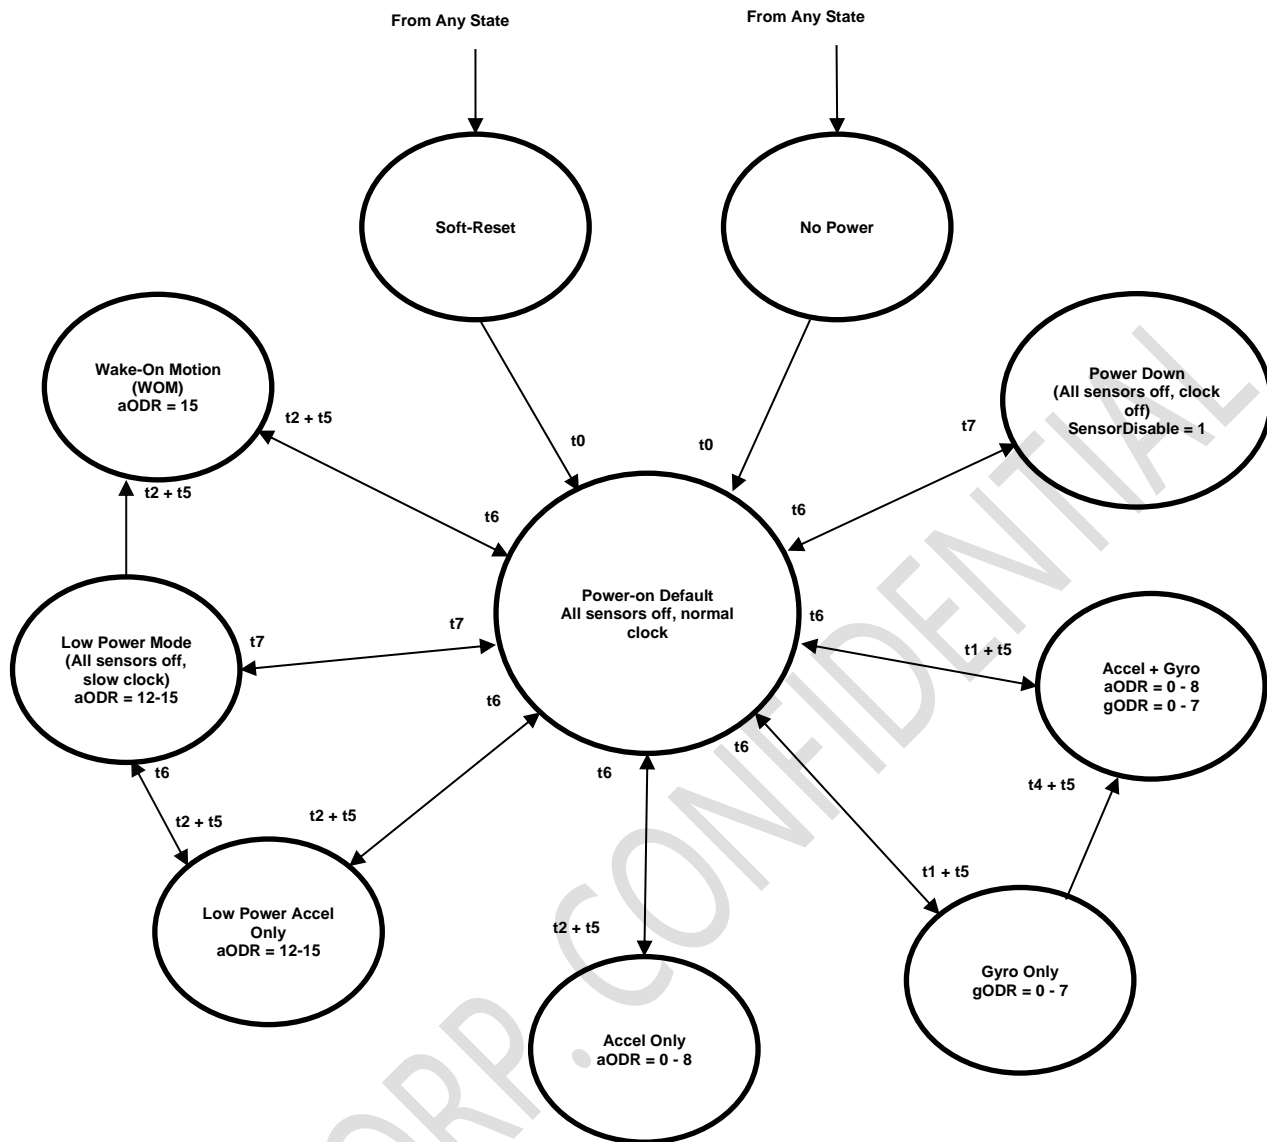

Figure 16. Operating Mode Transition Diagram

### 7.3 Transition Time

$t_0$  is the *System Turn On Time* and is the time to enter the Power-On Default state from Software Reset, No Power, or Power down. Time  $t_0$  is maximum 15ms. This time only needs to be done once, upon transitioning from either a No Power or Power Down state, or whenever a reset is issued, which should not be done unless the intent is to have the device to go through its entire boot sequence (see the specification System Turn On Time in both Table 7 and Table 8).

The times  $t_1$ ,  $t_2$  and  $t_4$ , are defined as the time it takes from issuing the enabling-sensor command (when the corresponding sensor is off) to DRDY(INT2) going high (data being present) or STATUSINT.bit0 is set to 1.

The time  $t_5$  is the time it takes to have the internal filtered data to output the correct representation of the inertial state.  $t_5$  is variable and is associated with the user selected Output Data Rate (ODR). We have defined minimum  $t_5 = (3/ODR)$  to generally represent that time.

$t_6$  is the time it takes to go from a sensor powered state to a state where the sensors are off. This time depends on the Output Data Rate (ODR) and ranges from  $1/ODR$  to  $2/ODR$ .

t7 is the transition time between various states where the sensors are off.

The Gyro Turn on Time (see Table 8) is comprised of t1 (the gyroscope wakeup time) and t5 (the part's filter settling time). t1 is typically 150 ms and t5 is defined as 3/ODR, where ODR is the output data rate in Hertz.

The Accel Turn on Time (see Table 7) is comprised of t2 (the accelerometer wakeup time) and t5 (the part's filter settling time). t2 is typically 3 ms, and t5 is defined as 3/ODR, where ODR is the output data rate in Hertz.

The t7 transition is dependent on data transfer rates and is for I2C at 400 kHz is <100  $\mu$ s for SPI at 11 Mbps is around 40  $\mu$ s.

## 7.4 Chip Reset Process

There are two approaches that can trigger the QMI8658A run the Reset process, Power-On Reset and Software Reset.

Power-On reset is initialized by driving the VDD & VDDIO lines to valid working range from the Power Off status (VDD = 0V, VDDIO = 0V). Refer to 3.2 for details. The Power-On Reset process starts from the release of POR, refer to 3.3 for details.

The Software Reset (Soft Reset) is generated by writing the 0x0B to RESET register (0x60). Refer to 5.9.

After the Reset is triggered (Power-On Reset and Software Reset), the QMI8658 will run the reset process. The UI registers, internal RAM, FIFO will be set to default values, Analog and digital circuitries will be disabled, refer to 3.3 for details.

It takes maximum 15ms for the Reset process to be finished. Refer to *Table 7* and *Table 8* for details. Note that the VDDIO & VDD power lines are expected to be stable(no sharp pulse) once settled to the Final Value(s), before the System Turn On Time. Otherwise, the QMI8658A initialization may be interfered by the unwanted power pulse, and result in failure of accelerometer or gyroscope startup, refer to 3.3 for details.

The register 0x4D will present 0x80 if there is a successful Reset (Power-on Reset or Soft Reset) process. Refer to 5.9. Note that the content of register 0x4D could be overwritten after later operations, like enabling the sensor(s) (in CTRL7.bit[1:0]) or implementing the CTRL9 command, so host is expected to read the register immediately after POR or Software Reset to check the Reset result.

## 8 FIFO Description

### 8.1 FIFO Structure

The QMI8658A contains a programmable 1536-byte FIFO. The FIFO's operating mode and configuration are set via the FIFO\_CTRL register, refer to *Table 23*. FIFO data may consist of gyroscope and accelerometer data and is accessible via the serial interfaces (SPI/I2C/I3C), in burst reads. Depending on how many sensors are enabled, the host is expected to read increments of 6, 12 bytes, corresponding to one and two sensors active at the same time. This feature helps reduce overall system power consumption by enabling the host processor to read and process the sensor data in bursts and then enter a low-power mode. The interrupt function may be used to alert host when FIFO watermark level is reached.

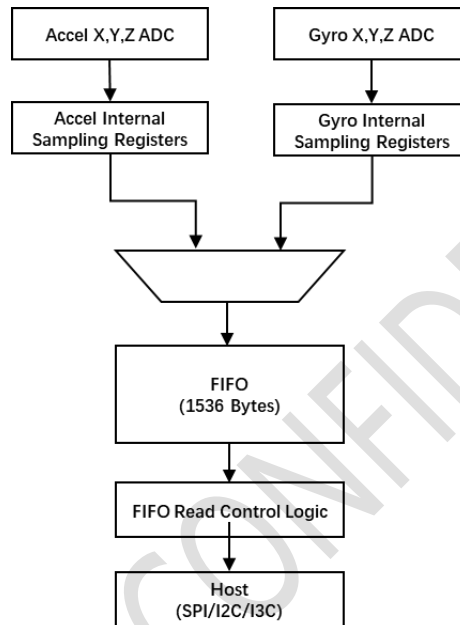

Figure 17. FIFO Data Flow

### 8.2 FIFO Size

There are four levels of FIFO size: 16 samples, 32 samples, 64 samples, 128 samples. The sample stands for 6 bytes of accelerometer data or 6 bytes of gyroscope data if one of them is enabled, or 6 bytes of accelerometer and 6 bytes of gyroscope data (total 12 bytes) if both are enabled.

The FIFO size is configured using the FIFO\_CTRL.FIFO\_SIZE[1:0]: 16 samples(0), 32 samples(1), 64 samples(2), 128 samples(3), refer to *Table 23*.

When the FIFO is enabled for two sensors (Accelerometer and Gyroscope), the sensors must be set at the same Output Data Rate (ODR), refer to *Table 22* for CTRL2 and CTRL3 registers.

### 8.3 Configure FIFO Mode

The FIFO has multiple operating modes: Bypass, FIFO, Stream. The operating modes are set by the FIFO\_CTRL.FIFO\_MDOE[1:0] bits in the register, refer to *Table 23*.

Configure the FIFO\_CTRL.FIFO\_MODE to 'FIFO'(1) or 'Stream'(2) mode will enable the FIFO functionality. Configure the FIFO\_MODE to 'Bypass' (0) mode, will disable the FIFO functionality.

Once FIFO is enabled and the Accelerometer and/or Gyroscope is(are) enabled, the corresponding data will be filled into FIFO.

In 'FIFO' mode, once FIFO is full, the data filling will stop and new data will be discarded until host reads out the FIFO data and release the space for new data to be written to.

In 'Stream' mode, once FIFO is full, the data filling will continue and the oldest data will be discarded, until host reads out the FIFO data and release the space for new data to be written to.

## 8.4 FIFO Sample Count

The FIFO Sample Count indicates the filled content level of FIFO, which means the quantity of sensor data that was written into FIFO, and to be read out.

The FIFO Sample Count is a 10-bit value and stored in FIFO\_SMPL\_CNT and FIFO\_STATUS[1:0], unit is word (two bytes). Host need to read the two registers, to calculate the number of bytes of FIFO content data by below formular:

$$\text{FIFO\_Sample\_Count (in byte)} = 2 * (\text{fifo\_smp\_cnt\_msb}[1:0] * 256 + \text{fifo\_smp\_cnt\_lsb}[7:0])$$

## 8.5 FIFO Watermark Interrupt

The FIFO\_WTM register(0x13) indicates the expected level of FIFO data that host wants to get the FIFO Watermark interrupt. The unit is sample, which means 6 bytes if one of accelerometer and gyroscope is enabled, and 12 bytes if both are enabled.

Note that the configured FIFO watermark should not be higher than the FIFO size configured by FIFO\_CTRL.FIFO\_SIZE.

If the FIFO\_WTM is written with non-zero value, the FIFO watermark function is enabled. The internal FIFO watermark interrupt will be triggered if the FIFO content level reaches or is higher than the configured FIFO watermark level. The FIFO\_STATUS.FIFO\_WTM flag will be set to 1, and will be cleared to 0 if FIFO content drops lower than the FIFO watermark level.

The internal FIFO watermark interrupt signal can drive the INT1 pin if CTRL1.bit2 = 1, or INT2 pin if CTRL1.bit2 = 0. Note that the CTRL1.bit3(INT1) and CTRL1.bit4(INT2) controls the high-Z or push-pull mode of the INT pins, refer to 6 *Interrupts* for details.

Once the corresponds INT pin is configured to the push-pull mode, the FIFO watermark interrupt can be seen on the corresponds INT pin. It will keep high level as long as the FIFO filled level is equal to or higher than the watermark, will drop to low level as long as the FIFO filled level is lower than the configured FIFO watermark after reading out by host and FIFO\_RD\_MODE is cleared.

## 8.6 FIFO Full

The FIFO\_STATUS.FIFO\_FULL flag is set if the FIFO filled level (samples) equals to the FIFO size configured by FIFO\_CTRL.FIFO\_SIZE. And is cleared if FIFO filled level is lower than the FIFO size.

## 8.7 FIFO Read Mode

To read out the FIFO data, host need to set the FIFO into Read Mode, by issuing CTRL\_CMD\_REQ\_FIFO command through CTRL9 process, refer to 5.10 *CTRL 9 Functionality (Executing Pre-defined Commands)*.

Once FIFO Read Mode is enabled, FIFO data will be directed to the FIFO\_DATA register, then host can possibly read data from the FIFO\_DATA register.

Note that once FIFO Read Mode is enabled, the new data won't be filled into FIFO, and will be discarded. Host is expected to read out the FIFO data and disable the FIFO Read Mode before the new data come. Otherwise, data dropping will happen. The time for the new data come is defined by the sensor ODR, which is 1 / ODR.

## 8.8 Read FIFO Data

The FIFO data is read through the I<sup>2</sup>C/I<sup>3</sup>C/SPI interface by reading the FIFO\_DATA register. Any time the FIFO\_DATA register is read, data is erased from the FIFO memory, corresponds to First-In-First-Out concept.

Host is expected to read out the FIFO data, following below sequence:

1. Got FIFO watermark interrupt by INT pin or polling the FIFO\_STATUS register (FIFO\_WTM and/or FIFO\_FULL).
2. Read the FIFO\_SMPL\_CNT and FIFO\_STATUS registers, to calculate the level of FIFO content data, refer to 8.4 FIFO Sample Count.
3. Send CTRL\_CMD\_REQ\_FIFO (0x05) by CTRL9 command, to enable FIFO read mode. Refer to CTRL\_CMD\_REQ\_FIFO for details.
4. Read from the FIFO\_DATA register per FIFO\_Sample\_Count.
5. Disable the FIFO Read Mode by setting FIFO\_CTRL.FIFO\_rd\_mode to 0. New data will be filled into FIFO afterwards.

## 8.9 FIFO Data Pattern

Note that when only the accelerometer or gyroscope is enabled, the sensor data format at the host interface is:

AX\_L[0] →AX\_H[0] →AY\_L[0] →AY\_H[0] →AZ\_L[0] →AZ\_H[0] →AX\_L[1] →...

or

GX\_L[0] →GX\_H[0] →GY\_L[0] →GY\_H[0] →GZ\_L[0] →GZ\_H[0] →GX\_L[1] →...

When both accelerometer and gyroscope are enabled, the sensor data format is:

AX\_L[0] →AX\_H[0] →AY\_L[0] →AY\_H[0] →AZ\_L[0] →AZ\_H[0] →

GX\_L[0] →GX\_H[0] →GY\_L[0] →GY\_H[0] →GZ\_L[0] →GZ\_H[0] →

AX\_L[1] →AX\_H[1] →...

## 8.10 Reset FIFO

The FIFO content can be cleared/emptied by inserting CTRL\_CMD\_RST\_FIFO through CTRL9 process, refer to 5.10 CTRL 9 Functionality (Executing Pre-defined Commands) for details.

QST CORP. CONFIDENTIAL

## 9 Motion Detection

The calculation of the Motion Detection (No-, Any-, or Significant-Motion) is based on the accelerometer ODR defined by *CTRL2.aODR*, refer to *Table 22* for details.

The Motion Detection can only work in Non-SyncSample mode, refer to *6.2 Non-SyncSample mode* for details.

No-, Any-, or Significant-Motion interrupts can be issued to host. No-Motion interrupt indicates that the device is in idle/quiet status, host can run into sleep or low-power mode. Any-Motion interrupt indicates that the device is in movement, host can be awakened from sleep/low-power mode. Significant-Motion indicates host that the device is in significant and continuous movement.

### 9.1 Motion Detection Principle

Any-/No-/Significant-Motion detection is calculating on the slope of the acceleration of enabled axis:

Slope(n) = Acc(n) – Acc(n-1), for enabled axis/axes of accelerometer

#### 9.1.1 Any-Motion Detection Principle

Any-Motion Detection is detecting the absolute of slope that is higher than defined threshold (*AnyMotionXThr*, *AnyMotionYThr*, *AnyMotionZThr*), and last consecutively for *AnyMotionWindow* or more samples. As shown in *Figure 18*. As long as the conditions (threshold and duration) are fulfilled, Any-Motion event flag is set, and can be configured to drive the interrupt pin (INT1 or INT2), synced to the DRDY. When the slope falls within the range of (-Threshold, +Threshold), the Any-Motion conditions are not fulfilled, and the corresponding interrupt is reset.

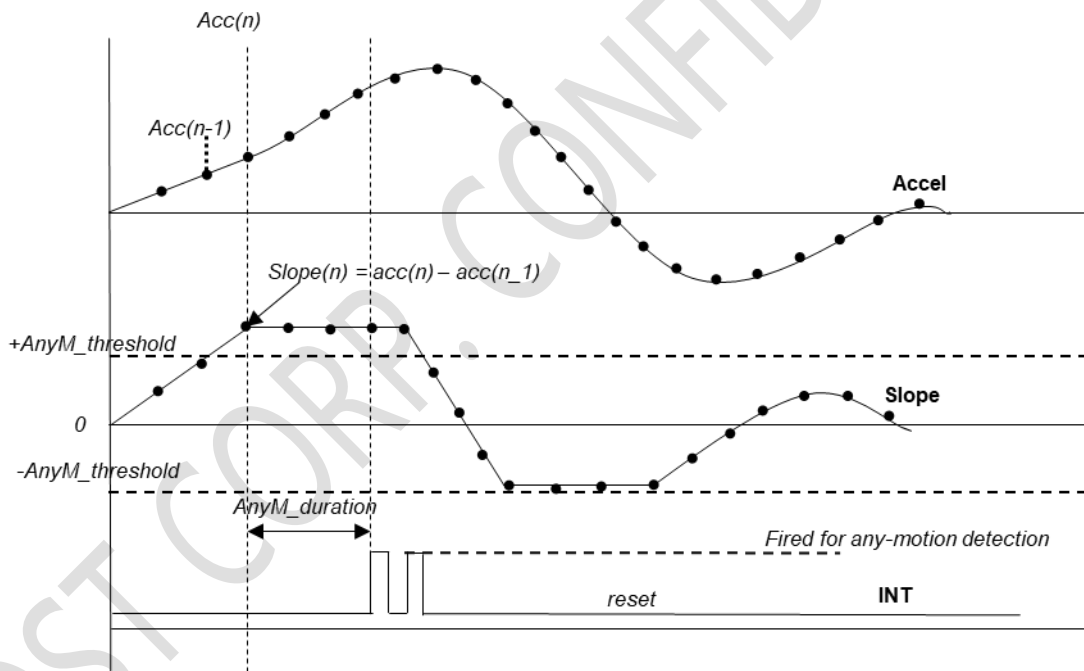

Figure 18. Any-Motion Detection Interrupt

#### 9.1.2 No-Motion Detection Principle

No-Motion Detection is detecting the absolute of slope that is lower than defined threshold (*NoMotionXThr*, *NoMotionYThr*, *NoMotionZThr*), and last consecutively for *NoMotionWindow* or more samples. As shown in *Figure 19*. If the conditions (threshold and duration) are fulfilled, No-Motion event flag is set, and can be configured to drive the interrupt pin (INT1 or INT2), synced to the DRDY. When the slope falls out of the range of (-Threshold, +Threshold), the No-Motion conditions are not fulfilled, and the corresponding interrupt is reset.

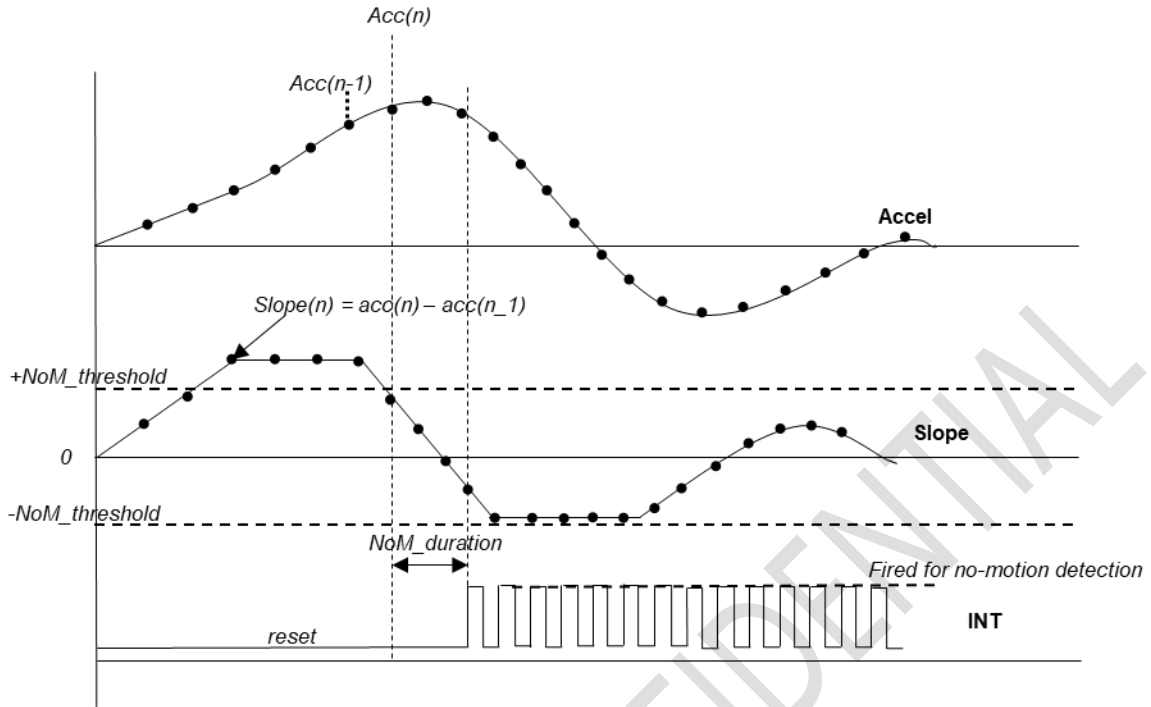

Figure 19. No-Motion interrupt detection

### 9.1.3 Significant-Motion Detection Principle

Significant-Motion Detection works based on Any-Motion and No-Motion events, so both Any-Motion and No-Motion should be configured and enabled to make sure Significant-Motion Detection run properly. As shown in Figure 20.

After valid Any-Motion is detected, if a further Any-Motion is detected after *SigMotionWaitWindow* and before the *SigMotionConfirmWindow* time, the Significant-Motion event flag will be raised to the interrupt path. The Significant-Motion interrupt is cleared when No-Motion is detected.

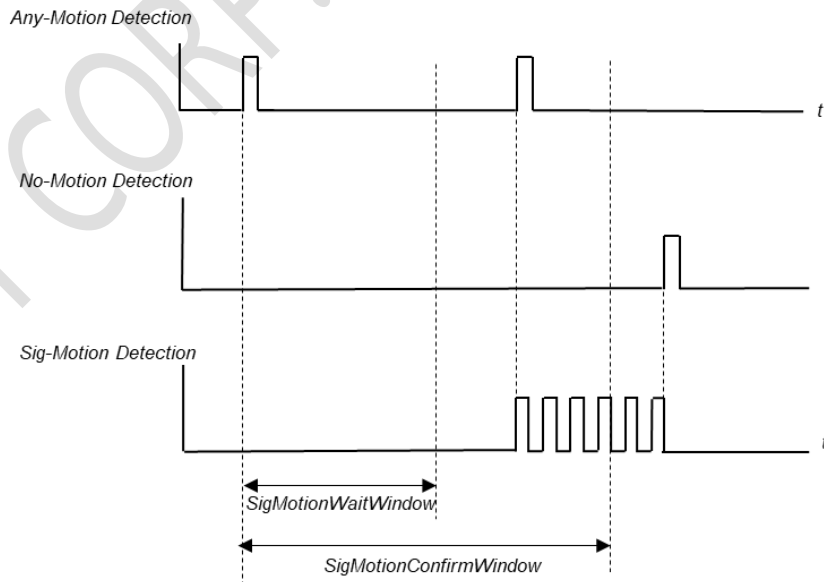

Figure 20. Significant-Motion interrupt detection

## 9.2 Motion Detection Flow

The flow chart of No-Motion Detection is show in Figure 21 No-Motion Detection Flow.

The flow chart of Any-Motion Detection is show in Figure 22 Any-Motion Detection Flow.

The flow chart of Significant-Motion Detection is show in Figure 23 Significant-Motion Detection Flow.

Figure 21. No-Motion Detection Flow

Figure 22. Any-Motion Detection Flow

Figure 23. Significant-Motion Detection Flow

## 9.3 Parameters of Motion Detection

**Table 32. Motion Detection Parameters**

Parameter Name	Format	Resolution	Description
NoMotionAxisLogic	1-bit integer	1	0: Logic-OR between events of enabled axes for No-Motion detection 1: Logic-AND between events of enabled axes for No-Motion detection
NoMotionEnX NoMotionEnY NoMotionEnZ	1-bit integer	1	0: the corresponding axis is not involved for calculation 1: the corresponding axis data is calculated for No-Motion detection
NoMotionXThr NoMotionYThr NoMotionZThr	1-byte format unsigned, 5-bits fraction	0.03125g (1 / 32)	Defines the slope threshold of the corresponding axis for No-Motion detection
NoMotionWindow	1-byte integer	1 sample	Defines the minimum number of consecutive samples (duration) that the absolute of the slope of the enabled axis/axes data should keep lower than the threshold
AnyMotionAxisLogic	1-bit integer	1	0: Logic-OR between events of enabled axes for Any-Motion detection 1: Logic-AND between events of enabled axes for Any-Motion detection
AnyMotionEnX AnyMotionEnY AnyMotionEnZ	1-bit integer	1	0: the corresponding axis is not involved for calculation 1: the corresponding axis data is calculated for Any-Motion detection
AnyMotionXThr AnyMotionYThr AnyMotionZThr	1-byte format unsigned, 5-bits fraction	0.03125g (1 / 32)	Defines the slope threshold of the corresponding axis for Any-Motion detection
AnyMotionWindow	1-byte format unsigned, 5-bits fraction	1 sample	Defines the minimum number of consecutive samples (duration) that the absolute of the slope of the enabled axis/axes data should keep higher than the threshold
SigMotionWaitWindow	2-bytes integer	1 sample	Defines the wait window (idle time) starts from the first Any-Motion event until starting to detecting another Any-Motion event for confirmation
SigMotionConfirmWindow	2-bytes integer	1 sample	Defines the maximum duration for detecting the other Any-Motion event to confirm Significant-Motion, starts from the first Any-Motion event

**Note:** Once the Logic-OR is selected, the calculation on any enabled axis and reported one valid event, will trigger the corresponding Motion Detection(Any-Motion or No-Motion). Once the Logic-AND is selected, the calculation on all enabled axes should report valid event, to trigger the corresponding Motion Detection(Any-Motion or No-Motion).

The MOTION\_MODE\_CTRL byte consists of the parameters shown in *Table 33*.

**Table 33. MOTION\_MODE\_CTRL Content**

7	6	5	4	3	2	1	0
NoMotionAxisLogic	NoMotionEnZ	NoMotionEnY	NoMotionEnX	AnyMotionAxisLogic	AnyMotionEnZ	AnyMotionEnY	AnyMotionEnX

## 9.4 Config Motion Detection

The Motion Detection parameters are divided into two sets and can be passed to the QMI8658A internal algorithm through two callings of CTRL9 command. As shown in *Table 34*.

Host should write the parameters to the corresponding registers, according to *Table 34*. Especially, write 0x01 to CAL4\_H register for the first set of parameters, while write 0x02 to CAL4\_H for the second set of parameters. Refer to *Table 29* for address of CAL registers.

Then trigger the CTRL9 command with 0x0E(CTRL\_CMD\_CONFIGURE\_MOTION). Refer to *Table 28* for details.

**Table 34. Write Motion Detection Parameters to QMI8658A**

Register (bits)	First CTRL9 Command	Second CTRL9 Command
CAL1_L (7:0)	AnyMotionXThr.	AnyMotionWindow.
CAL1_H (7:0)	AnyMotionYThr.	NoMotionWindow
CAL2_L (7:0)	AnyMotionZThr.	SigMotionWaitWindow[7:0]
CAL2_H (7:0)	NoMotionXThr.	SigMotionWaitWindow [15:8]
CAL3_L (7:0)	NoMotionYThr.	SigMotionConfirmWindow[7:0]
CAL3_H (7:0)	NoMotionZThr.	SigMotionConfirmWindow[15:8]
CAL4_L (7:0)	MOTION_MODE_CTRL	NA
CAL4_H (7:4)	0x01(means 1st command)	0x02(means 2nd command)
CTRL9 code	0x0E(CTRL_CMD_CONFIGURE_MOTION)	0x0E(CTRL_CMD_CONFIGURE_MOTION)

**Note:** Configuration should be done when accelerometer and gyroscope are disabled(CTRL7.aEN = CTRL7.gEN =0).

## 9.5 Enabling Motion Detection

After successfully passing the parameters to QMI8658A Motion Detection engine, host need to enable the Any-Motion Detection engine by setting CTRL8.bit1 to 1, enable the No-Motion Detection engine by setting CTRL8.bit2 to 1, enable the Significant-Motion Detection engine by setting CTRL8.bit3 to 1. If the accelerometer is configured and enabled too, the enabled engines will be started to detect the corresponding events.

On contrary, set the bit(s) in CTRL8.bit[3:1] to 0, will disable the corresponding engine. This can be done when accelerometer and/or gyroscope are(is) enabled or disabled. Refer to *5.3 Configuration Registers* for the details of CTRL8.

## 9.6 Motion Interrupt

Once the Any-Motion, No-Motion and/or Significant-Motion event(s) is/are reported, the corresponding Motion Detection Event will be generated.

The Motion Event (internal signal) can be selected to drive INT1(CTRL8.bit6 = 1) or INT2(CTRL8.bit6 = 0). And once the corresponding INT pin is enabled (by CTRL1.bit3 for INT1, or CTRL1.bit4 for INT2), the Motion interrupt can be seen on the INT pin (syncd with DRDY). Refer to *5.3 Configuration Registers* for details.

At the meantime, the STATUS1.bit[7:5] is updated and host can read these bits to confirm the Motion interrupt status. Note that the STATUS1.bit[5] = 1 represents the Any-Motion was detected, STATUS1.bit[6] = 1 represents the No-Motion was detected, STATUS1.bit[7] = 1 represents the Significant-Motion was detected. Refer to *5.3 Configuration Registers* for details.

# 10 Tap

The Tap engine detects the Single-Tap or Double-Tap, if enabled.

The calculation of the Tap Detection is based on the accelerometer ODR defined by *CTRL2.aODR*, refer to *Table 22* for details.

The Tap detection can only work in Non-SyncSample mode, refer to for details 6.2 Non-SyncSample mode.

## 10.1 Tap Detection Principle

Figure 24 shows the principle of Tap detecting, includes Single Tap and Double Tap.

The acceleration data of the three axes (x, y, z) is dynamically averaged to get the Average of Acceleration. Alpha parameter defines the ratio/weight of the averaging calculation.

The Linear Acceleration is calculated:  $\text{Linear Acceleration} = \text{Acceleration} - \text{Average of Acceleration}$ .

The Average Movement Magnitude indicates the movement energy level, is used to detect the Quiet status. It is calculated with *Gamma*.

If the square sum of the Linear Acceleration of three axes is higher than the *PeakMagThr*, the peak detecting is started. If later at the end of *PeakWindow*, the Average of the Movement Magnitude is lower than the *UDMThr* (*Undefined Motion Threshold*), it means the vibration is low and return to Quiet status, it is considered a valid Peak is detected.

If a valid Peak is detected, and no further significant vibration within the *TapWindow* (be quiet after the Peak, no further Tap), a valid Tap is detected.

Once a valid Tap (first Tap) is detected, the second Tap of the Double-Tap should be detected after the *TapWindow* (Quiet time after first Tap) and before the *DTapWindow* (timeout of the Double Tap detection), and the Double-Tap event will be reported.

If the second Tap is detected within the *TapWindow*, it is considered as the Undefined Motion, and will reset the full Tap process, no Tap event will be reported.

If no further Tap is detected within the *DTapWindow*, Single-Tap event will be reported. The Tap detected after *DTapWindow*, is considered as the First Tap of the new round of detecting.

Figure 24. Tap Detect Principle

## 10.2 Tap Detection Parameters

The parameters listed in *Table 35* are used to configure the Tap Engine.

**Table 35. Tap Parameters**

Parameter Name	Format	Resolution	Description
Priority	1-byte integer	NA	Priority definition between the x, y, z axes of acceleration. Only Priority[2:0] bits are used.  The axis that output the first peak of Linear Acceleration in a valid Tap detection, will be consider as the Tap axis. However, there is possibility that two or three of the axes shows same Linear Acceleration at exactly same time when reach (or be higher than) the PeakMagThr. In this case, the defined priority is used to judge and select the axis as Tap axis.
PeakWindow	1-byte integer	1 sample	Defines the maximum duration (in sample) for a valid peak. In a valid peak, the linear acceleration should reach or be higher than the <i>PeakMagThr</i> and should return to quiet (no significant movement) within <i>UDMThr</i> , at the end of <i>PeakWindow</i> .  E.g., 20 @500Hz ODR
TapWindow	2-bytes integer	1 sample	Defines the minimum quiet time before the second Tap happen. After the first Tap is detected, there should be no significant movement (defined by <i>UDMThr</i> ) during the <i>TapWindow</i> . The valid second tap should be detected after <i>TapWindow</i> and before <i>DTapWindow</i> .  E.g., 50 @500Hz ODR
DTapWindow	2-bytes integer	1 sample	Defines the maximum time for a valid second Tap for Double Tap, count start from the first peak of the valid first Tap.  E.g., 250 @500Hz ODR
Alpha	1-byte unsigned, 7-bits fraction	0.0078 (1/128)	Defines the ratio for calculation the average of the acceleration. The bigger of <i>Alpha</i> , the bigger weight of the latest data.  E.g., 0.0625
Gamma	1-byte unsigned, 7-bits fraction	0.0078 (1/128)	Defines the ratio for calculating the average of the movement magnitude. The bigger of <i>Gamma</i> , the bigger weight of the latest data.  E.g., 0.25
PeakMagThr	2-bytes unsigned, 10-bits fraction	0.001g <sup>2</sup> (1/ 1024)	Threshold for peak detection.  E.g, 0.8g <sup>2</sup> (0x0320)
UDMThr	2-bytes unsigned, 10-bits fraction	0.001g (1/ 1024)	Undefined Motion threshold. This defines the threshold of the Linear Acceleration for quiet status.  E.g., 0.4g <sup>2</sup> (0x0190)

The *Priority[2:0]* is defined as below:

- 0: (X > Y > Z)
- 1: (X > Z > Y)
- 2: (Y > X > Z)
- 3: (Y > Z > X)
- 4: (Z > X > Y)
- 5: (Z > Y > X)
- 6, 7: (Same as 0)

## 10.3 Configure Tap

The Tap parameters are divided into two sets and can be passed to the QMI8658A internal algorithm through two callings of CTRL9 command. As shown in *Table 36*.

Host should write the parameters to the corresponding registers, according to *Table 36*. Especially, write 0x01 to CAL4\_H register for the first set of parameters, while write 0x02 to CAL4\_H for the second set of parameters. Refer to *Table 29* for address of CAL registers.

Then trigger the CTRL9 command with 0x0C(CTRL\_CMD\_CONFIGURE\_TAP). Refer to 5.10 for details.

**Table 36. Write Tap Parameters to QMI8658A**

Register (bits)	First Command Set	Second Command Set
CAL1_L (7:0)	PeakWindow[7:0]	Alpha[7:0]
CAL1_H (7:0)	Priority[7:0] (actually only [2:0] is used)	Gamma[7:0]
CAL2_L (7:0)	TapWindow[7:0]	PeakMagThr[7:0]
CAL2_H (7:0)	TapWindow[15:8]	PeakMagThr[15:8]
CAL3_L (7:0)	DTapWindow[7:0]	UDMThr[7:0]
CAL3_H (7:0)	DTapWindow[15:8]	UDMThr[15:8]
CAL4_L (7:0)	NA	NA
CAL4_H (7:4)	0x01 (means 1st command)	0x02 (means 2nd command)
CTRL9 code	0x0C(CTRL_CMD_CONFIGURE_TAP)	0x0C(CTRL_CMD_CONFIGURE_TAP)

**Note:** Configuration should be done when accelerometer and gyroscope are disabled(CTRL7.aEN = CTRL7.gEN = 0).

## 10.4 Enable Tap Detection

After successfully passing the parameters to QMI8658A Tap engine, host need to enable the Tap engine by setting CTRL8.bit0 to 1. If the accelerometer is properly configured and enabled (CTRL7.aEN = 1), Tap engine will be started to detect the taps. To detecting the Tap activity, it is recommended to set accelerometer ODR to higher than 200Hz (defined by CTRL2.aODR).

If CTRL8.bit0 is set to 0, or CTRL7.aEN = 0, Tap engine will be stopped to detect the taps.

## 10.5 Tap Interrupt

Once the Tap event is reported (Single- or Double-Tap), it can generate the Tap interrupt.

The Tap event (internal signal) can be selected to drive INT1(CTRL8.bit6 = 1) or INT2(CTRL8.bit6 = 0). And once the corresponding INT pin is enabled (by CTRL1.bit3 for INT1, or CTRL1.bit4 for INT2), the Tap interrupt will be seen on the INT pin (syncd with DRDY). Refer to 5.3 *Configuration Registers* for details.

At the meantime, the STATUS1.bit1 is set and host can read this bit to confirm the Tap (Single- or Double-Tap) interrupt is generated.

## 10.6 Tap Detection Output

When the Tap (Single- or Double-Tap) is detected, the information of the Tap is presented in TAP\_STATUS (register 0x59). The TAP\_STATUS is updated and valid after the Tap event is detected (STATUSINT.bit1 = 1).

The TAP\_NUM indicate the Single-Tap (TAP\_STATUS.TAP\_NUM = 1) or Double-Tap (TAP\_STATUS.TAP\_NUM = 2) was detected.

The TAP\_STATUS.TAP\_AXIS indicates the first valid peak of the Tap happens on X axis (TAP\_STATUS.TAP\_AXIS = 1), or Y axis (TAP\_STATUS.TAP\_AXIS = 2), or Z axis (TAP\_STATUS.TAP\_AXIS = 3). Note the TAP\_AXIS judgement follows the definition of the Tap Priority. Refer to *Table 35* for details.

The TAP\_STATUS.TAP\_POLARITY indicates the direction from which the Tap moves towards the 8658A. Note that, this direction is derived from the value of the linear acceleration of first valid Peak.

QST CORP. CONFIDENTIAL

# 11 Pedometer

The Pedometer Engine detects the steps and output the step count to the UI registers for host to read, as well as generate the Pedometer interrupt.

The calculation of the Pedometer Detection is based on the accelerometer ODR defined by *CTRL2.aODR*, refer to *Table 22* for details.

The Pedometer can only work in Non-SyncSample mode, refer to 6.2 Non-SyncSample mode for details.

## 11.1 Pedometer Parameters

The parameters listed in *Table 37* are used to configure the Pedometer Engine.

**Table 37. Pedometer Parameters**

Parameter Name	Format	Resolution	Description
ped_sample_cnt	2-bytes integer	1 sample	Indicates the count of sample batch/window for calculation
ped_fix_peak2peak	2-bytes format unsigned, 10-bits fraction	$(1 / 2^{10})$ g = 1 mg	Indicates the threshold of the valid peak-to-peak detection E.g., 0x00CC means 200mg
ped_fix_peak	2-bytes format unsigned, 10-bits fraction	1 mg	Indicates the threshold of the peak detection comparing to average E.g., 0x0066 means 100mg
ped_time_up	2-bytes integer	1 sample	Indicates the maximum duration (timeout window) for a step. Reset counting calculation if no peaks detected within this duration. E.g., 80 means 1.6s @ ODR = 50Hz
ped_time_low	1-byte integer	1 sample	Indicates the minimum duration for a step. The peaks detected within this duration (quiet time) is ignored. E.g., 12 means 0.25s @ ODR = 50Hz
ped_time_cnt_entry	1-byte integer	1 step	Indicates the minimum continuous steps to start the valid step counting. If the continuously detected steps is lower than this count and timeout, the steps will not be take into account; if yes, the detected steps will all be taken into account and counting is started to count every following step before timeout. This is useful to screen out the fake steps detected by non-step vibrations. The timeout duration is defined by <i>ped_time_up</i> . E.g., 10 means 10 steps entry count
ped_fix_precision	1-byte integer	1 sample	0 is recommended
ped_sig_count	1-byte integer	1 sample	The amount of steps when to update the pedometer output registers. E.g., <i>ped_sig_count</i> = 4, every 4 valid steps is detected, update the registers once (added by 4).

In the example of parameters listed below, the calculation window is 50 samples (1s duration);

The slowest step that can be detected is 4s (0.25 step per 1 second); the fastest step that can be detected is 0.4s (2.5 steps per 1 second).

The steps detected lower than 10 and timeout (defined by *ped\_time\_up*), will be ignored. The step counting starts if 10 continues steps detected (internal steps: 10, 11, 12, ...), while the step count registers is updated with 10, 14, 18... (update once after every 4 steps detected).

It is recommended to select the proper *ped\_fix\_peak2peak* and *ped\_fix\_peak* values depend on the movement amplitude and movement pattern, for example, if places QMI8658A in a watch or bend, running normally shows more significant *peaks than walking*.

ODR = 50Hz  
 ped\_sample\_cnt: 50 samples (0x0032)  
 ped\_fix\_peak2peak: 200mg (0x00CC in u6.10 format)  
 ped\_fix\_peak: 100mg (0x0066 in u6.10 format)  
 ped\_time\_up: 200 samples (0x00C8, 4s)  
 ped\_time\_low: 20 samples (0x14, 0.4)  
 ped\_time\_cnt\_entry: 10 samples (0x0A)  
 ped\_fix\_precision: 0 (0x00)  
 ped\_sig\_count: 4 samples (0x04)

## 11.2 Configure Pedometer

The Pedometer parameters are divided into two sets and can be passed to the QMI8658A internal algorithm through two callings of CTRL9 command. As shown in *Table 38*.

Host should write the parameters to the corresponding registers, according to *Table 38*. Especially, write 0x01 to CAL4\_H register for the first CTRL9 command of parameters, while write 0x02 to CAL4\_H for the second CTRL9 command of parameters. Then trigger the CTRL9 command with 0x0D(CTRL\_CMD\_CONFIGURE\_PEDOMETER). Refer to *Table 28* for details.

**Table 38. Write Pedometer Parameters to QMI8658A**

Register (bits)	First CTRL9 Command	Second CTRL9 Command
CAL1_L (7:0)	ped_sample_cnt[7:0]	ped_time_up[7:0]
CAL1_H (7:0)	ped_sample_cnt[15:8]	ped_time_up [15:8]
CAL2_L (7:0)	ped_fix_peak2peak [7:0]	ped_time_low
CAL2_H (7:0)	ped_fix_peak2peak[15:8]	ped_cnt_entry
CAL3_L (7:0)	ped_fix_peak [7:0]	ped_fix_precision
CAL3_H (7:0)	ped_fix_peak[15:8]	ped_sig_count
CAL4_L (7:0)	NA	NA
CAL4_H (7:4)	0x01(means 1st command)	0x02(means 2nd command)
CTRL9 code	0x0D (CTRL_CMD_CONFIGURE_PEDOMETER)	0x0D (CTRL_CMD_CONFIGURE_PEDOMETER)

**Note:** Configuration should be done when accelerometer and gyroscope are disabled(CTRL7.aEN = CTRL7.gEN =0).

## 11.3 Enable Pedometer

After successfully passed the parameters to QMI8658 Pedometer engine, host need to enable the Pedometer engine by setting CTRL8.bit4 to 1. If the accelerometer is enabled (CTRL7.aEN = 1), the Pedometer engine will start to detect the steps.

If CTRL8.bit4 is set to 0, or CTRL7.aEN = 0, Pedometer engine will stop to detect the steps.

## 11.4 Pedometer Interrupt

Once the detected steps (count from last pedometer event) reach the *ped\_sig\_count* defined by host, it will generate the Pedometer interrupt once. For example, if *ped\_sig\_count* = 4, then every 4 valid steps detected, there is one Pedometer interrupt (internal signal).

At the meantime, the STATUS1.bit4 is set and host can read this bit to confirm Pedometer event is detected.

The Pedometer interrupt(internal signal) can be selected to drive INT1(CTRL8.bit6 = 1) or INT2(CTRL8.bit6 = 0). And once the corresponding INT pin is enabled(by CTRL1.bit3 for INT1, or CTRL1.bit4 for INT2), the Pedometer interrupt will be seen on the INT pin(synced with DRDY). Refer to 5.3 Configuration Registers for details.

## 11.5 Read Step Count

When the Pedometer is enabled, and the Pedometer event is detected (STATUS1.bit4 = 1), the step count is updated to the Step Count registers of STEP\_CNT\_LOW, STEP\_CNT\_MIDL, STEP\_CNT\_HIGH, in 24-bits value. Note that the step count is updated per the *ped\_sig\_count* definition. For example, if *ped\_sig\_count* = 4, the step count is be updated every 4 steps. The 24-bits step count is cycling counted, will return to 0 after 0xFFFFFFFF.

Host can read from the three registers, to get the latest step count.

## 11.6 Reset Step Count

The Step Count can be reset by issuing Power-On Reset, Soft Reset, setting CTRL8.bit4 to 1 from 0, and CTRL9 command (CTRL\_CMD\_RESET\_PEDOMETER).

After reset the Step Count registers (STEP\_CNT\_LOW, STEP\_CNT\_MIDL, STEP\_CNT\_HIGH) are cleared to 0.

When CTRL8.bit4 (Pedo\_EN) = 0, set CTRL8.bit4 to 1 will reset the Setp Count registers. Host can simply clear the CTRL8.bit4 and then set it to restart the Pedometer engine and reset the Step Count registers. Refer to Table 22 for CTRL8 register.

Send 0x0F (CTRL\_CMD\_RESET\_PEDOMETER) by CTRL9 command protocol will reset the Step Count without reset the QMI8658A. Refer to Table 28 for CTRL9 operation.

Note that enable and/or disable the accelerometer by configure CTRL7.bit1 (aEN), will not influence the content of the Step Counter registers.

## 12 Wake on Motion (WoM)

### 12.1 Wake on Motion Principle

The purpose of the Wake on Motion (WoM) functionality is to allow a system to enter a low power sleep state while the system is static and then to automatically awaken when moved. In this mode the system should use very little power, yet still respond quickly to motion.

It is assumed that the system host processor is responsible for configuring the QMI8658A correctly to place it into Wake on Motion mode, and then reconfigure the QMI8658A as necessary following a WoM interrupt.

Note that, Wake on Motion function works similar to Any-Motion detection but without sensor data output and can be configured more flexibly on interrupt behavior. Besides, once QMI8658A is configured into Wake on Motion mode, there is WoM interrupt to awaken the host if movement is detected.

### 12.2 Wake on Motion Parameters

Wake on Motion is configured through the CTRL9 command interface (refer to *Table 28* for details for CTRL\_CMD\_WRITE\_WOM\_SETTING).

**Table 39. Registers used for WoM**

Register (bits)	Format	Resolution	Function
CAL1_L[7:0]	1-byte unsigned integer	1mg	WoM Threshold: Indicate the threshold of absolute of slope of a valid movement 0x00 must be used to indicate that WoM mode is disabled
CAL1_H[7:6]	2-bits unsigned integer	1	WoM Interrupt Initial Value select: 01 – INT2 (with initial value 0) 11 – INT2 (with initial value 1) 00 – INT1 (with initial value 0) 10 – INT1 (with initial value 1)
CAL1_H[5:0]	6-bits unsigned integer	1	Interrupt Blanking Time (in number of accelerometer samples), the number of consecutive samples that will be ignored after enabling the WoM, to screen out unwanted fake detection
CTRL9[7:0]	1-byte unsigned integer	1	CTRL_CMD_WRITE_WOM_SETTING (0x08): to send this pre-defined command to QMI8658A to enable the WoM mode

The WoM Threshold value is configurable to make the amount of motion required to wake QMI8658A and the host. The special threshold value of 0x00 can be used to disable the WoM mode, returning the interrupt pins to their normal functionality. Refer to *6 Interrupts*.

The Interrupt Initial Value (1 or 0) and the interrupt pin used for signaling (INT1 or INT2) are selectable to make it easy for system integrators to use the WoM motion mode to wake the host processor from its deepest sleep level. The selected INT pin can be configured as High-active or Low-active, if enabled by CTRL1.bit3 for INT1, or CTRL1.bit4 for INT2, the WoM interrupt can be seen on the INT pin and interrupt host.

The Interrupt Blanking Time is a programmable number of accelerometer samples to ignore when starting WoM mode so that no spurious wake-up events are generated by startup transients.

### 12.3 Accelerometer Configuration

Host is expected to configure the proper ODR and full-scale range of accelerometer by configure CTRL2 register. Refer to *Table 22*.

### 12.4 Wake on Motion Event

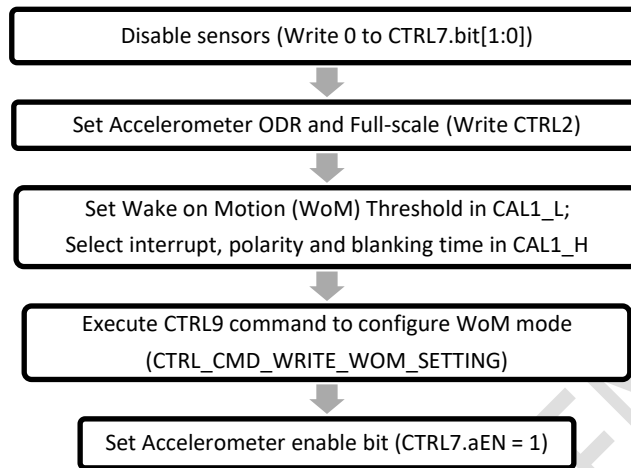

When a Wake on Motion event is detected the QMI8658A will set STATUS1.WoM = 1 (bit2). Reading STATUS1 by the host will clear the WoM bit and will reset the chosen interrupt line (INT1 or INT2) to the value given by the WoM Interrupt initial value (refer to *12.2*).

For each WoM event, the state of the selected interrupt line is toggled. This ensures that while the system is moved, the host processor will receive wakeup interrupts regardless of whether it uses high, low, positive- or negative-edge interrupts.

The QMI8658A stays in WoM mode until commanded to enter a new mode by the host processor.

## 12.5 Configuration Procedure

To configure QMI8658A into WoM mode, the sequence illustrated in *Figure 25* should be followed and implemented.

**Figure 25. WoM Configuration Commands and Sequence**

The STATUS1.WoM bit is cleared upon setting the WoM threshold to a non-zero value, and the selected interrupt pin is configured according to the settings. The interrupt blanking time is included that prevents spurious interrupts to propagate after the enabling of WoM.

## 12.6 Exit Wake on Motion Mode

To exit WoM mode the host must first clear CTRL7[1:0] to disable all sensors, and then write a threshold value of 0x0 for the WoM Threshold (see *Table 39*, Registers used for WoM) and execute the WoM configuration CTRL9 command (refer to *Table 28* for details for CTRL\_CMD\_WRITE\_WOM\_SETTING). On doing this the interrupt pins will return to their normal function. After zeroing the WoM Threshold the host processor can proceed to reconfigure the QMI8658A as normal.

**Figure 26. WoM Example Diagram**

# 13 Locking Mechanism

## 13.1 Locking Mechanism Principle

Locking Mechanism function is enabled in SyncSample mode, can lock the sensor data and keep the values in data registers after a proper locking process.

As the concept of “shadow register”, which enables host to read the locked data in unlimited delay without the risk of mixing the two consecutive data if the new data comes and updates to the sensor data registers during the host read the sensor data registers. Refer to 6.1 SyncSample mode.

## 13.2 Locking Mechanism Data Reading Process

Figure 27 shows the process of reading data in Locking Mechanism.

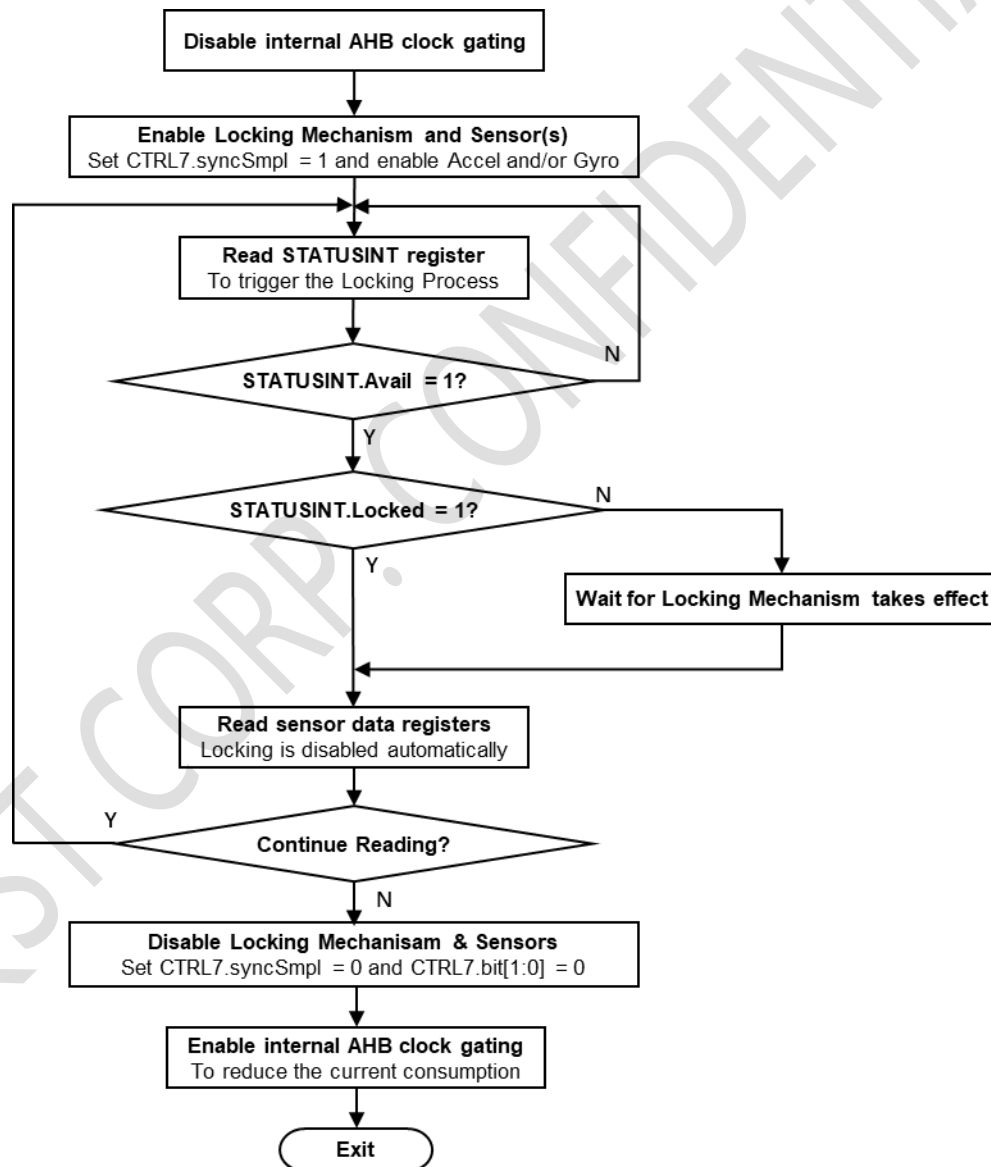

Figure 27. Data Reading Process in Locking Mechanism

### 13.2.1 Disable/Enable AHB Clock Gating

First host need to disable the internal AHB clock gating, this will fully screen out the possibility of misalignment of the two consecutive data samples. Note this is ONLY needed when using SPI (accel only mode with ODR less than 500Hz), I2C or I3C interfaces (in all ODRs).

Host can disable the internal AHB clock gating by applying:

- 1- write 0x01 to CAL1\_L register.
- 2- write 0x12 (CTRL\_CMD\_AHB\_CLOCK\_GATING) in CTRL9 protocol, refer to 5.9 and 5.10.6.13.

After disabling the sensor, enable back the clock gating by:

- 1- write 0x00 to CAL1\_L register.
- 2- write 0x12 (CTRL\_CMD\_AHB\_CLOCK\_GATING) in CTRL9 protocol, refer to 5.9 and 5.10.6.13.

### 13.2.2 Enable Locking Mechanism

The locking Mechanism is enabled when setting CTRL7.bit7 to "1" (*syncSmpI*) and enable accelerometer and/or gyroscope.

- 1- Enable 6DOF in this mode, write 0x83 to CTRL7.
- 2- Enable only Accel in this mode, write 0x81 to CTRL7.
- 3- Enable only Gyro in this mode, write 0x82 to CTRL7.

### 13.2.3 Reading Sensor Data

When the Locking Mechanism is enabled, the reading to the STATUSINT register when new sensor data is available (STATUSINT.Avail = 1) will trigger the locking of the current sensor data sample. Once the data sample is locked, new data will be dropped, until the release of the locking. The Locking Mechanism is automatically released after host reads GZ\_H if gyroscope is enabled or AZ\_H if accelerometer only is enabled.

Process of data reading in Locking Mechanism mode:

Read STATUSINT register, if STATUSINT.Avail = 1, the locking mechanism is started to take effect, go to step 2. If STATUSINT.Avail = 0, repeat step 1.

If STATUSINT.Avail = 1 and STATUSINT.Locked = 0, means data looking is in progress, and will be locked within Data\_Lock\_Delay. If STATUSINT.Locked = 1, go to step 4.

- 1- Wait for Data\_Lock\_Delay duration (refer to 13.3), go to step 4.

Burst read the sensor data until the last byte of enabled sensor(s) (to release the locking), Refer to Table 25.

- 2- Repeat step 1 – 4, until Exit

## 13.3 Data\_Lock\_Delay

When the gyroscope is enabled the duration of Data\_Lock\_Delay is shown in Table 40.

**Table 40. Data\_Lock\_Delay When Gyroscope Is Enabled**

ODR setting	ODR(Hz)	Data_Lock_Delay (usec)
0	7174.4	2
1	3587.2	2
2	1793.6	4
3	896.8	6
4	448.4	12
5	224.2	12
6	112.1	12
7	56.05	12
8	28.025	12

When the gyro is not enabled (accel only mode) the value of *Data\_Lock\_Delay* is shown in *Table 41*.

**Table 41. Data\_Lock\_Delay When Gyroscope Is Disabled**

ODR setting	ODR(Hz)	Data_Lock_Delay (usec)
3	1000	6
4	500	12
5	250	24
6	125	48
7	62.5	48
8	31.25	48
12	128	40
13	21	100
14	11	200
15	3	270

### 13.4 Exit Locking Mechanism

Once pulling sensor data from QMI8658 is finished, it can be configured to exit the Locking Mechanism mode, by disabling the sensors by setting CTRL7.bit[1:0] to 0, and enabling the AHB Clock Gating (refer to 13.2.1).

### 13.5 On-The-Fly ODR Change in Locking Mechanism

The on-the-fly ODR changing is supported, so host can change the ODR of sensor without disable the sensor.

An example sequence of changing ODR without disabling the sensor in locking mechanism is shown below:

- 1- Write CTRL2/CTRL3 to set the ODR's of accelerometer and gyroscope and full scales.
- 2- Write 0x81 / 0x82 / 0x83 to CTRL7.
- 3- Read Sensor Data according 13.2.3.
- 4- Changing ODR on-the-fly:
  - a- Write 0x01/0x02/0x03 to CTRL7(clear the syncSmpl bit).
  - b- Wait 1ms.
  - c- Clear the Locking Mechanism in case if the data is still locked from previous ODR by reading GZ\_H if gyroscope is enabled or AZ\_H if accelerometer only is enabled.
  - d- Write CTRL2 / CTRL3 with the new ODR's.
  - e- Write 0x81/0x82/0x83 to CTRL7.
- 5- Start poll and read Sensor Data using the new ODRs based on 13.2.3.

Note that, the new data will be stable in at least 3 samples for filter to settle down, therefore, it is recommended to discard the first several samples at host side.

## 14 Calibration-On-Demand (COD)

### 14.1 COD Principle

The Calibration-On-Demand supports the on-demand calibration of Gyro X and Y axes. Based the internal integrated functionality, the QMI8658A can calibrate the internal gain of X & Y axes of gyroscope, result in a more precise sensitivity, and a tighter distribution of the X & Y axes sensitivity over QMI8658A chips.

Note that the Z axis of gyroscope is not influenced by COD.

### 14.2 Run COD

To run the COD, host need to

1. Set CTRL7.aEN = 0 and CTRL7.gEN = 0, to disable the accelerometer and gyroscope.
2. Issue the CTRL\_CMD\_ON\_DEMAND\_CALIBRATION (0xA2) by CTRL9 command.
3. And wait about 1.5 seconds for QMI8658A to finish the CTRL9 command.
4. Read the COD\_STATUS register (0x46) to check the result/status of the COD implementation.

During the process, it is recommended to place the device in quiet, otherwise, the COD might fail and report error.

If succeeds, the recalibrated gain parameters will be applied to the sensor data afterwards. The updated gains are output to the UI registers and can be read by host, refer to 14.3. The recalibrated gain parameters will be lost if a power on reset or soft reset is implemented, QMI8658A will then use the on-chip default gain parameters.

If failed, there is no influence on the operation of gyroscope, QMI8658A will keep using the previous workable parameters (last successful COD parameters or the on-chip default parameters).

### 14.3 COD Status

If the COD command is successfully implemented, the COD\_STATUS register will output 0x00 for the indication.

The non-zero value of COD\_STATUS indicates different modes of failure. Refer to 5.7 Calibration-On-Demand (COD) Status Register for details.

### 14.4 Save and Restore the New Gain Parameters

After a successful COD, the new gains with COD correction will be applied to the future data of X and Y axes of Gyroscope. At the meantime, the new parameters are updated to the registers below, for host to read and save.

1. Gyro-X gain (16 bits) will be in dVX\_L and dVX\_H registers (0x51, 0x52)
2. Gyro-Y gain (16 bits) will be in dVY\_L and dVY\_H registers (0x53, 0x54)
3. Gyro-Z gain (16 bits) will be in dVZ\_L and dVZ\_H registers (0x55, 0x56)

If the host saved those gain parameters, it is possible to pass them back to the QMI8658A (without invoking again the COD routine), using the CTRL9 command CTRL\_CMD\_APPLY\_GYRO\_GAINS (0xAA) as follow:

1. Disable Accelerometer and Gyroscope by setting CTRL7.aEN = 0 and CTRL7.gEN = 0
2. write Gyro-X gain (16 bits) to registers CAL1\_L and CAL1\_H registers (0x0B, 0x0C)
3. write Gyro-Y gain (16 bits) to registers CAL2\_L and CAL2\_H registers (0x0D, 0x0E)
4. write Gyro-Z gain (16 bits) to registers CAL3\_L and CAL3\_H registers (0x0F, 0x10)
5. Write 0xAA to CTRL9 and follow CTRL9 protocol

Once the CTRL9 command is successfully finished, the restored gains will take effects for future data of Gyroscope.

Note that it is always recommended to run the COD from time to time to apply the precise and up-to-date correction of the Gyro-X and Gyro-Y sensitivity. Designer should be careful to restore the out-of-date gain parameters, especially when there is significant change of PCB stress.

## 15 Self-Test (Check-Alive)

### 15.1 Accelerometer Self-Test

The accelerometer Self-Test (Check-Alive) is used to determine if the accelerometer is functional and working within acceptable parameters.

It is implemented by applying an electrostatic force to actuate each of the three X, Y, and Z axis of the accelerometer. If the accelerometer mechanical structure responds to this input stimulus by sensing at least 200 mg, then the accelerometer can be considered functional.

The accelerometer Self-Test data is available to be read at registers dVX\_L, dVX\_H, dVY\_L, dVY\_H, dVZ\_L and dVZ\_H. The Host can initiate the Self-Test at any time with the following procedure.

Procedure for accelerometer Self-Test:

- 1- Disable the sensors (CTRL7 = 0x00).
- 2- Set proper accelerometer ODR (CTRL2.aODR) and bit CTRL2.aST (bit7) to 1 to trigger the Self-Test.
- 3- Wait for QMI8658A to drive INT2 to High, if INT2 is enabled (CTRL1.bit4 = 1), or STATUSINT.bit0 is set to 1.
- 4- Set CTRL2.aST(bit7) to 0, to clear STATUSINT1.bit0 and/or INT2.
- 5- Check for QMI8658A drives INT2 back to Low, and sets STATUSINT1.bit0 to 0.
- 6- Read the Accel Self-Test result:

X channel: dVX\_L and dVX\_H (registers 0x51 and 0x52)

Y channel: dVY\_L and dVY\_H (registers 0x53 and 0x54)

Z channel: dVZ\_L and dVZ\_H (registers 0x55 and 0x56)

The results are 16-bits in format signed U5.11, resolution 0.5mg ( $1 / 2^{11}$  g).

If the absolute results of all three axes are higher than 200mg, the accelerometer can be considered functional. Otherwise, the accelerometer cannot be considered functional.

Note that, the Self-Test function will automatically set the full-scale to 16g and use the aODR set by user (CTRL2.aODR). At the end of Self-Test, QMI8658A will update CTRL2 with the original value user set before starting the Check-Alive routine.

The typical time for Self-Test (from setting aST to 1, until the rising edge of INT2 if enabled, or STATUSINT.bit0 is set to 1) costs about 25 ODRs:

25ms @ 1KHz ODR

800ms @ 32Hz ODR

2.2s @ 11Hz ODR

### 15.2 Gyroscope Self-Test

The gyroscope Self-Test (Check-Alive) is used to determine if the gyroscope is functional.

It is implemented by applying an electrostatic force to actuate each of the three X, Y, and Z axis of the gyroscope and measures the mechanical response on the corresponding X, Y, and Z axis. If the equivalent magnitude of the gyroscope output is greater than 300dps for each axis, the gyroscope can be considered as functional.

The gyroscope Self-Test data is available to be read at output registers dVX\_L, dVX\_H, dVY\_L, dVY\_H, dVZ\_L & dVZ\_H. The Host can initiate the Self-Test anytime with the following procedure.

Procedure for gyroscope Self-Test:

- 1- Disable the sensors (CTRL7 = 0x00).
- 2- Set the bit gST to 1. (CTRL3.bit7 = 1'b1).
- 3- Wait for QMI8658A to drive INT2 to High, if INT2 is enabled, or STATUSINT.bit0 is set to 1.
- 4- Set CTRL3.aST(bit7) to 0, to clear STATUSINT1.bit0 and/or INT2.
- 5- Check for QMI8658A drives INT2 back to Low, or sets STATUSINT1.bit0 to 0.
- 6- Read the Gyro Self-Test result:

X channel: dVX\_L and dVX\_H (registers 0x51 and 0x52)

Y channel: dVY\_L and dVY\_H (registers 0x53 and 0x54)

Z channel: dVZ\_L and dVZ\_H (registers 0x55 and 0x56)

Read the 16 bits result in format signed U12.4, resolution is 62.5mdps ( $1 / 2^4$  dps).

If the absolute results of all three axes are higher than 300dps, the gyroscope can be considered functional. Otherwise, the gyroscope cannot be considered functional.

Note that, the Self-Test function will automatically set the full-scale (gFS) and ODR (gODR) of CTRL3. At the end of Self-Test, QMI8658A will update CTRL3 with the original value user set before starting the Self-Test routine.

The typical time (from writing gST to 1, until the rising edge of INT2 if enabled, or STATUSINT.bit0 set to 1) cost for the Self-Test process is about 400ms.

QST CORP. CONFIDENTIAL

## 16 Host Serial Interface

QMI8658A Host Serial Interface supports slave interfaces of I<sup>2</sup>C, MIPI I<sup>3</sup>C and SPI. For SPI, it supports both 3-wire and 4-wire modes. The basic timing characteristics for the interface are described below. Through the QMI8658A Host Serial Interface, the host can access, setup and control the QMI8658A UI Registers.

### 16.1 Address Auto Increment

During burst reads and writes, the target address can be configured in Auto-Increment or Non-Increment, by CTRL1.ADDR\_AI(bit 6), refer to 5.3.

For example, during burst read(burst write is similar) started from register 0x0B(CAL1\_L):

If ADDR\_AI = 0, the register address will not increase, and QMI8658A will output the content of CAL1\_L, CAL1\_L, CAL1\_L ..., as long as host continues the burst read clock;

If ADDR\_AI = 1, the register address will automatically increase, and QMI8658A will output the content of CAL1\_L, CAL1\_H, CAL2\_L ..., as long as host continues the burst read clock.

Note that the default value of ADDR\_AI is 0, so it is recommended to set it to 1 from beginning, in case of burst read/write is required.

Note that, burst writes to Configuration Registers(refer to Table 22) are NOT supported. These registers should be written in single cycle mode only.

### 16.2 Serial Peripheral Interface (SPI)

#### 16.2.1 SPI Features

QMI8658A supports both 3-wire and 4-wire modes in the SPI slave interface. The SPI 4-wire mode uses two control lines (CS, SPC) and two data lines (SDI, SDO). The SPI 3-wire mode uses the same control lines and one bi-directional data line (SDIO). The SDI /SDIO pin is used for both 3- and 4-wire modes and is configured based on the mode selected.

SPI transactions can be done in either Mode 0 (CPOL=0, CPHA=0) or Mode 3 (CPOL=1, CPHA=1). The QMI8658A interface automatically detects which mode is in use and configures clocking accordingly.

SPI 3- or 4-wire modes are configured by setting CTRL1.bit7. SPI 3-wire mode is selected when CTRL1.bit7 = 1. The default configuration is SPI 4-wire mode, that CTRL1.bit7 is 0.

Figure 28 shows the SPI address and data formats.

#### SPI Features

- Data is latched on the rising edge of the clock
- Data should change on falling edge of clock
- Maximum frequency is 15 MHz
- Data is delivered MSB first
- Support single read/writes and multi cycle (Burst) read/writes.
- **NOTE:** burst writes to Configuration Registers(refer to Table 22) are NOT supported. These registers should be written in single cycle mode only.
- Supports 7-bit Address format and 8-bit data format

### Address Format

<b>MSB</b>							<b>LSB</b>
Read	A6	A5	A4	A3	A2	A1	A0

Read – indicates read (1) or write (0) transaction relative to the SPI master

### Data Format

<b>MSB</b>							<b>LSB</b>
D7	D6	D5	D4	D3	D2	D1	D0

Figure 28. SPI Address and Data Format

## 16.2.2 SPI Interface Connection

In a typical SPI Master and Multi-Slave configuration, the SPI master shares the SPI clock (SPC), the serial data input (SDI), and the Serial Data Output (SDO) with all the connected SPI slave devices. Unique Chip Select (CS) lines connect each SPI slave to the master.

Figure 29. Typical SPI 4-Wire Connection

Figure 29 and Figure 30 show typical multi-slave 4- and 3-wire configurations. The primary difference between the two configurations is that the SDI and SDO lines are replaced by the bi-directional SDIO line. The SDIO line is driven by the master with both address and data when it is configured for write mode. During read mode, the SDIO line is driven by the master with the address, and subsequently driven by the “addressed” slave with data.

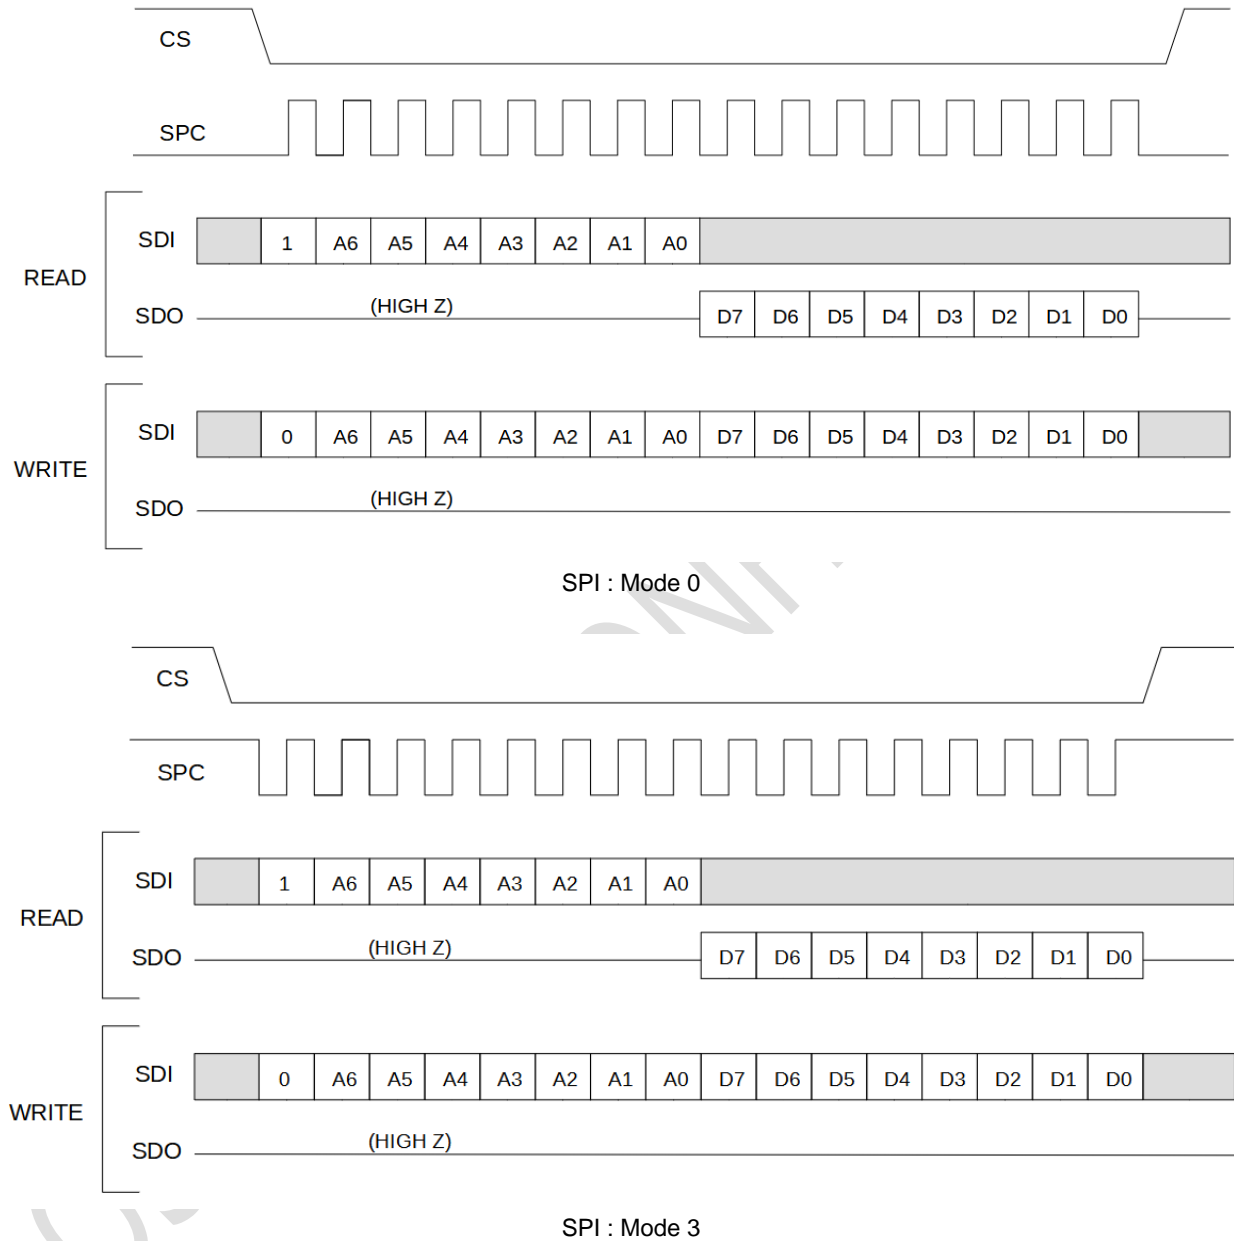

Figure 30. Typical SPI 3-Wire Connection

### 16.2.3 SPI Transaction Protocol

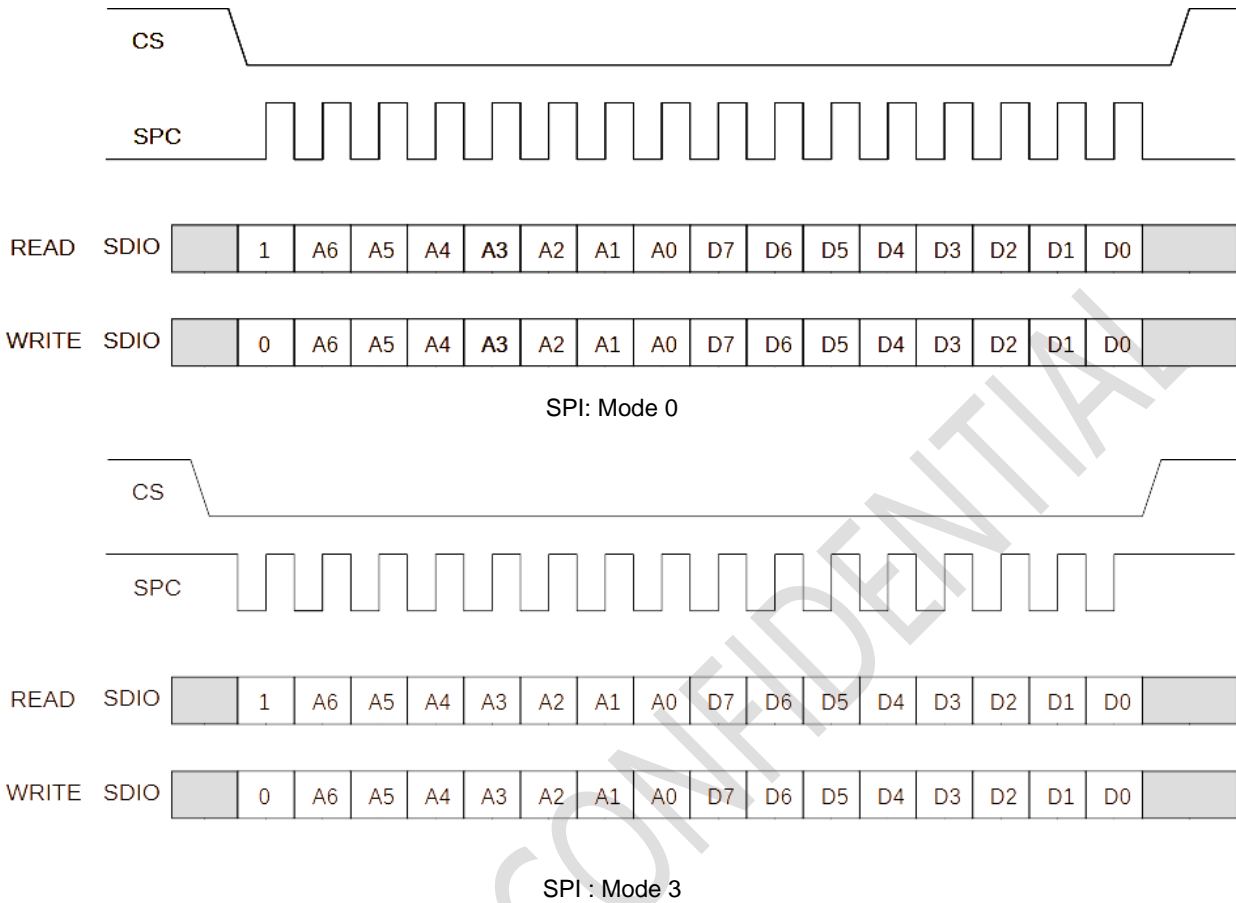

Figure 31 and Figure 32 illustrate the waveforms for both 4-wire and 3-wire SPI read and write transactions. Note that CS is active during the entire transaction.

**Figure 31. SPI 4-Wire Single Byte Read and Write (Mode 0 and Mode 3)**

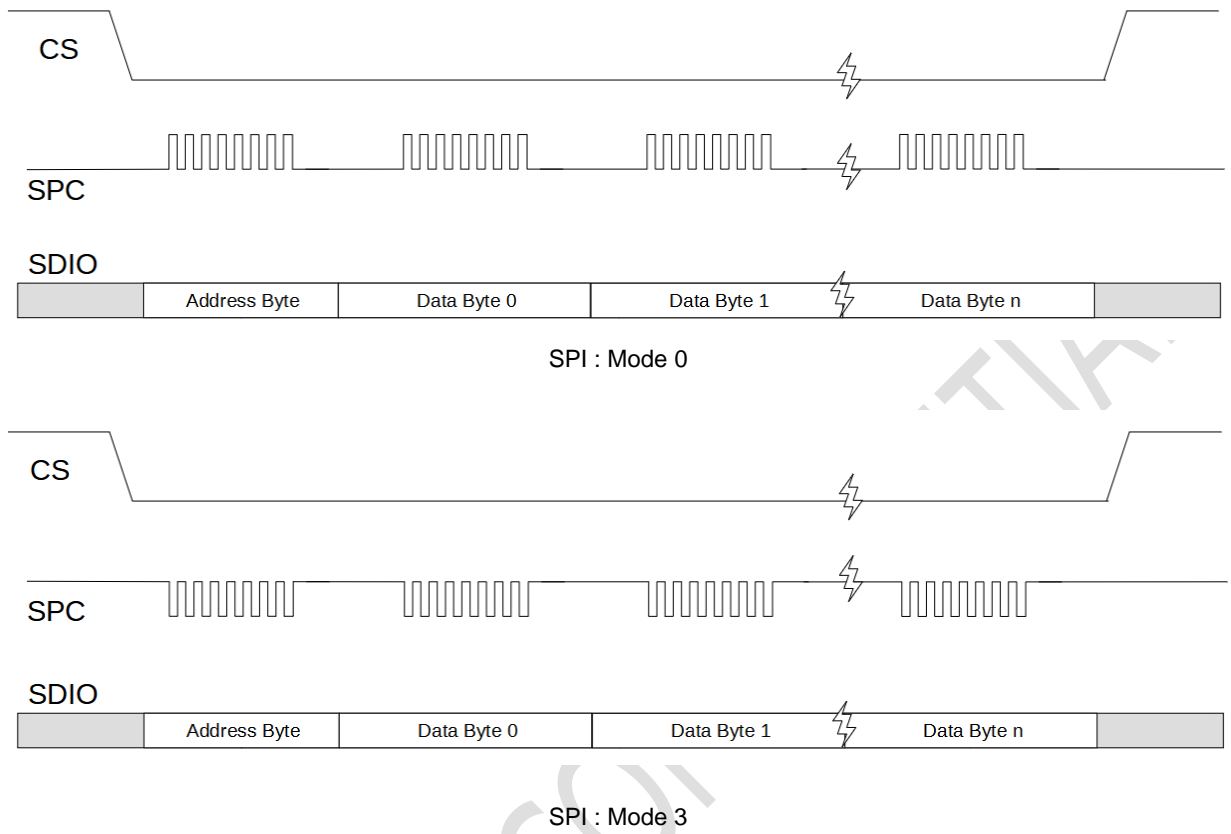

**Figure 32. SPI 4-Wire Multi-Byte Read and Write Transactions**

**Figure 33. SPI 3-Wire Single Byte Read and Write Transactions**

**Figure 34. SPI 3-Wire Multi-Byte Read and Write Transactions**

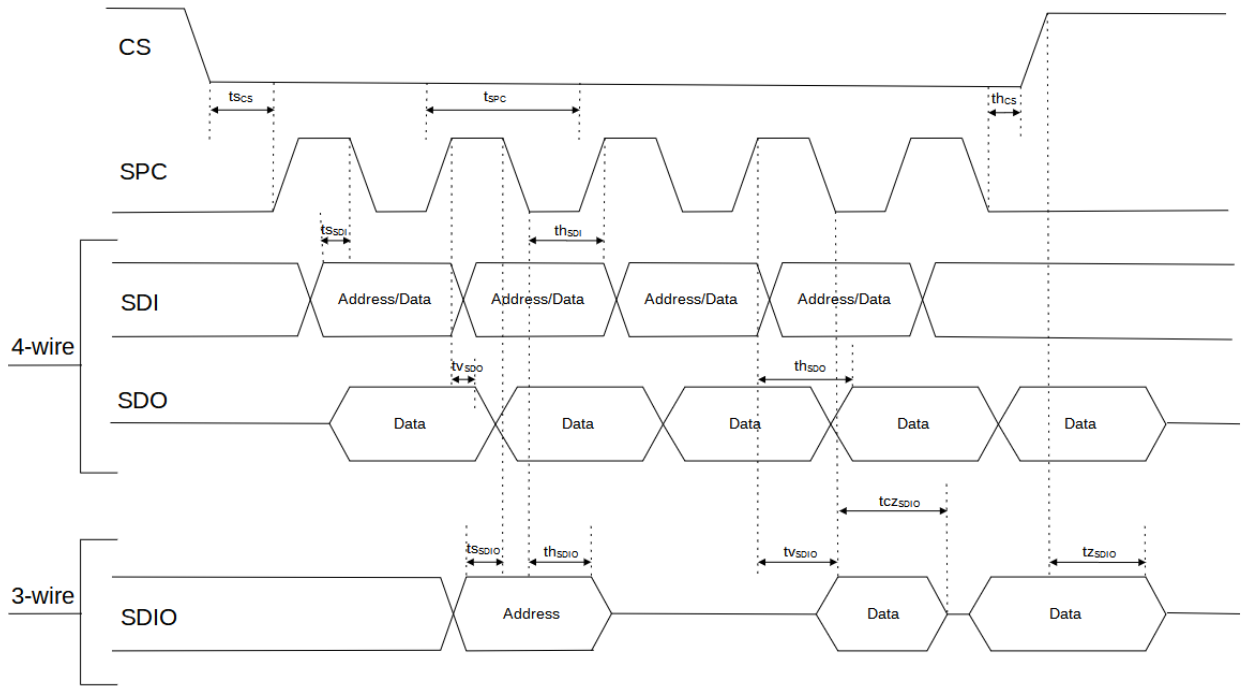

### 16.2.4 SPI Timing Characteristics

The typical operating conditions for the SPI interface are provided in Table 42. Please refer to Table 6 for the  $V_{IL}$ ,  $V_{IH}$ ,  $V_{OL}$ ,  $V_{OH}$  definition to define the rising and falling edge condition of the timing symbols.

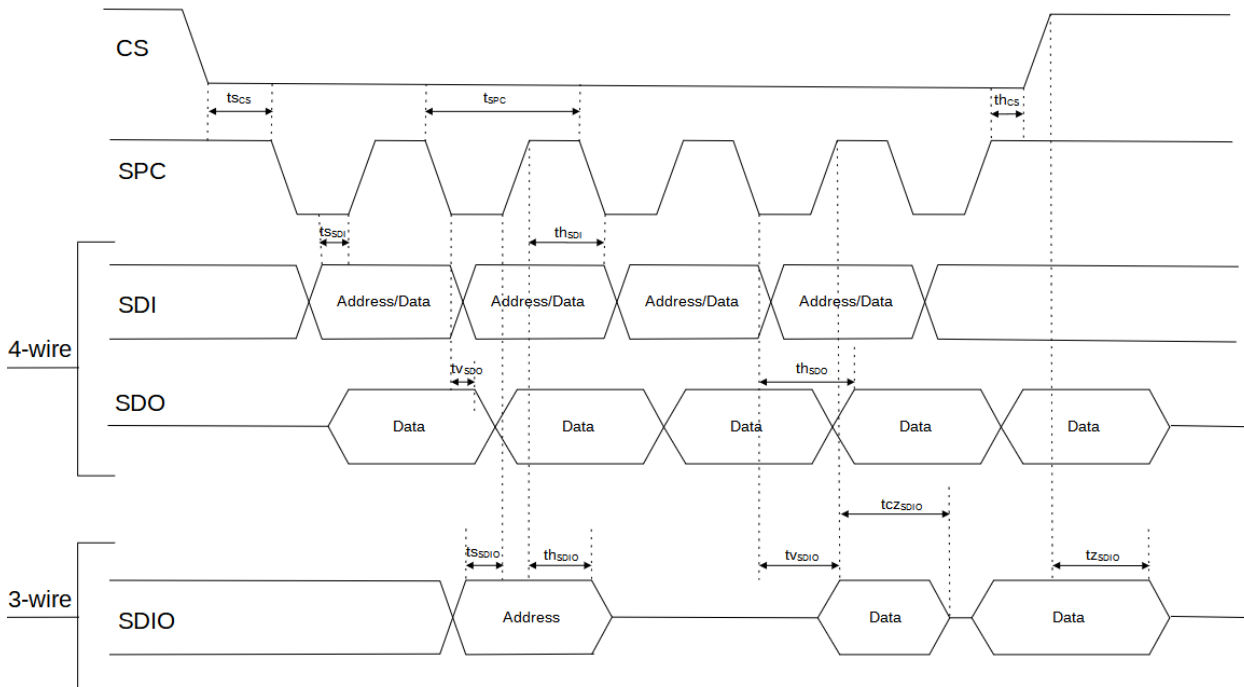

VDDIO = 1.8 V, T = 25°C unless otherwise noted.

**Table 42. SPI Interface Timing Characteristics**

Symbol	Parameter	Min.	Max.	Unit
$t_{SPC}$	SPI Clock Cycle	66.6		ns
$f_{SPC}$	SPI Clock Frequency		15	MHz
$t_{SCS}$	CS Setup Time	6		ns
$t_{HCS}$	CS Hold Time	8		ns
$t_{SSDI}$	SDI Input Setup Time	5		ns
$t_{HSDI}$	SDI Input Hold Time	15		ns
$t_{VSDO}$	SDO Time for Valid Output		50	ns
$t_{HSDO}$	SDO Hold Time for Output	9		ns
$t_{DSDO}$	SDO Disable Time for Output		50	ns
$t_{SSDIO}$	SDIO Address Setup Time	5		ns
$t_{HSDIO}$	SDIO Address Hold Time	15		ns
$t_{VSDIO}$	SDIO Time for Valid Data		50	ns
$t_{CZSDIO}$	SDIO Time from SPC to High Z		50	ns
$t_{ZSDIO}$	SDIO Time from CS to High Z		50	ns

## 16.3 I<sup>2</sup>C Interface

### 16.3.1 I<sup>2</sup>C Slave Address Selection

During the slave device selection phase, the I<sup>2</sup>C master supplies the 7-bit I<sup>2</sup>C slave device address to enable the QMI8658A. When SA0 is pulled down externally, the 7-bit device address becomes 0x6B (0b1101011). The 7-bit device address for the QMI8658A is 0x6A (0b1101010) if SA0 is pulled up or left unconnected. Note that internally there is a weak pull-up of 200K $\Omega$ , and this pull-up resistor will be automatically disabled after the detection of I<sup>2</sup>C slave address during the Reset Process, refer to 7.4.

### 16.3.2 I<sup>2</sup>C Interface Characteristics

Table 43 provides the I<sup>2</sup>C interface timing characteristics while Figure 36 and Figure 37 illustrate the I<sup>2</sup>C timing for both fast and standard modes, respectively. Please refer to Table 6 for the V<sub>IL</sub>, V<sub>IH</sub>, V<sub>OL</sub>, V<sub>OH</sub> definition to define the rising and falling edge condition of the timing symbols.

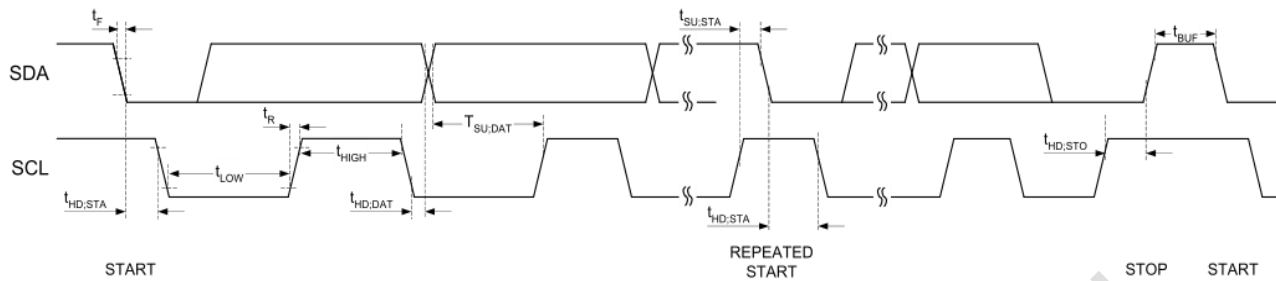

For additional technical details about the I<sup>2</sup>C standard, such as pull-up resistor sizing the user is referred to “UM10204 I<sup>2</sup>C-bus specification and user manual,” published by NXP B.V.

**Table 43. I<sup>2</sup>C Timing Characteristics**

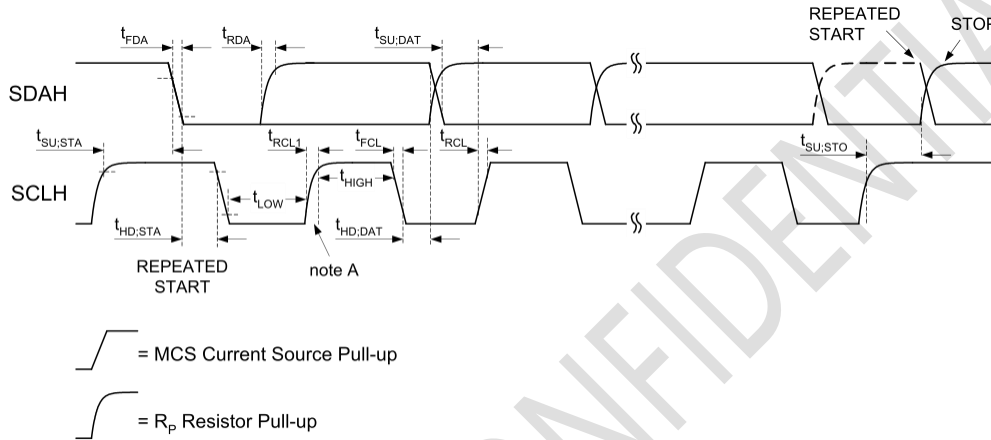

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
f <sub>SCL</sub>	SCL Clock Frequency		0		400	KHz
t <sub>BUF</sub>	Bus-Free Time between STOP and START Conditions		1300			ns
t <sub>HD,STA</sub>	START or Repeated START Hold Time		600			ns
t <sub>LOW</sub>	SCL LOW Period		1300			ns
t <sub>HIGH</sub>	SCL HIGH Period		600			ns
t <sub>SU,STA</sub>	Repeated START Setup Time		600			ns
t <sub>SU,DAT</sub>	Data Setup Time		100			ns
t <sub>HD,DAT</sub>	Data Hold Time	Standard Mode	0		3450	ns
		Fast Mode	0		900	
t <sub>RCL, t<sub>R</sub></sub>	SCL Rise Time	Standard Mode			1000	ns
		Fast Mode	20 + 0.1 * C <sub>B</sub> <sup>(14)</sup>		300	
t <sub>FCL</sub>	SCL Fall Time	Standard Mode			300	ns
		Fast Mode	20 + 0.1 * C <sub>B</sub> <sup>(14)</sup>		300	
t <sub>RDA, t<sub>RCL1</sub></sub>	SDA Rise Time. Rise Time of SCL after a Repeated START Condition and after ACK Bit	Standard Mode			1000	ns
		Fast Mode	20 + 0.1 * C <sub>B</sub> <sup>(14)</sup>		300	
t <sub>FDA</sub>	SDA Fall Time	Standard Mode			300	ns
		Fast Mode	20 + 0.1 * C <sub>B</sub> <sup>(14)</sup>		300	
t <sub>SU,STO</sub>	Stop Condition Setup Time		600			ns

**Note:**

14. C<sub>B</sub> is the bus capacitance.

**Figure 36. I2C Standard Mode Interface Timing**

Note A: First rising edge of SCLH after Repeated Start and after each ACK bit.

**Figure 37. I2C Fast Mode Interface Timing**

## 16.4 I<sup>3</sup>C Interface

The QMI8658A is compliant with the MIPI Alliance Basic Specification for I<sup>3</sup>C, version 1.0.

Note that HDR, IBI are not supported by QMI8658A.

The PID of 8658A is 0x086E00051000.

MIPI Manufacturer ID(VID) for QST Corp. is 0x0437.

The static address of I<sup>3</sup>C follows the descriptions in I<sup>2</sup>C, refer to 16.3.1.

# 17 Package and Handling

## 17.1 Package Drawing

Figure 38. 14 Pin LGA 2.5 x 3.0 x 0.86 mm Package

## 17.2 Reflow Specification

**Note:**

15. Figure from JEDEC J-STD-020

Profile Feature	Pb-Free Assembly Profile
Temperature Min. ( $T_{smin}$ )	150°C
Temperature Max. ( $T_{smax}$ )	200°C
Time ( $t_s$ ) from ( $T_{smin}$ to $T_{smax}$ )	60-120 seconds
Ramp-up Rate ( $T_L$ to $T_P$ )	3°C/second max.
Liquidous Temperature ( $T_L$ )	217°C
Time ( $t_L$ ) Maintained above ( $T_L$ )	60-150 seconds
Peak Body Package Temperature ( $T_P$ )	260°C +0°C / -5°C
Time ( $t_p$ ) within 5°C of 260°C	30 seconds
Ramp-down Rate ( $T_P$ to $T_L$ )	6°C/second max.
Time 25°C to Peak Temperature	8 minutes max.

**Figure 39. Reflow Profile**

## 17.3 Storage Specifications

QMI8658A storage specification conforms to IPC/JEDEC J-STD-020D.01 Moisture Sensitivity Level (MSL) 3. Floor life after opening the moisture-sealed bag is 168 hours with storage conditions: Temperature: ambient to  $\leq 30^\circ\text{C}$  and Relative Humidity: 60%RH.

# 18 Document Information

## 18.1 Revision History

Revision	Revision Date	Description
0.4	April 22, 2020	Initial release of Advance Information datasheet
0.5	July 7, 2020	Updated CAL Register Addresses, CTRL9 Commands and Descriptions, Current Consumption, Accelerometer and Gyroscope Filter Characteristics, Low Power Mode ODR, Wake on Motion, Magnetometer Sensors supported
0.6	Jan 13, 2021	Updated SPI description and diagrams, SPI modes, product performance specifications, and register map and descriptions
0.7	17 May, 2021	Updated the pin name and function name map, typical SPI connections, soft reset, Self-Test, On-Demand Calibration, I2C timing parameter table, ADDR_AI, BE, VDDIO rising limitation, recommended I2C pull-up resistance
0.8	10 Sep, 2021	Added the maximum limitation of VIH, updated FIFO read command and sequence, updated ODR & filter bandwidth configurations, updated CTRL2, CTRL3, CTRL4, CTRL5 descriptions, deleted descriptions of magnetometer, updated Electro-Mechanical Specifications, updated the internal block diagram & interface operating modes, deleted the specifications, registers, and application diagrams that relative to I2CM interface, updated the Features, Descriptions & Applications, updated the marking information, updated the disabling of the internal pull-up resistors in Ios.
0.9	10 Jan, 2022	updated the INT1/INT2 enable bit in CTRL1, updated Wake on Motion, added locking mechanism.
0.94	29 Apr, 2022	Updated the parameters of Acceleration and Gyroscope, remove sys_hs, removed AltitudeEngine relative information, updated FIFO relative descriptions, updated Interrupt relative descriptions, updated operating mode and transition diagram, updated CTRL1, CTRL7, CTRL8 register map, added Motion Detection, Tap, Pedometer descriptions.
0.95	6 May, 2022	Added the Reset process, updated the time cost for Self-Test process and correct the description of aODR used for Self-Test, added the COD chapter, removed the CTRL_CMD_GYRO_BIAS CTRL9 command, updated the Locking Mechanism, WoM, COD, Self-Test, SPI, I2C, I3C interface descriptions, adjusted the format, remove CTRL4 & CTRL6, remove tr requirement, added power on sequence of VDDIO and VDD, added noise density of gyroscope over ODR.
1.0	20 June, 2022	Updated the gyro noise density, changed the name of RESV-NC(pin 10) to RESV, updated the power on sequence.
