

# Intel<sup>®</sup> Quark<sup>™</sup> SoC X1000

Datasheet

---

*August 2015*

You may not use or facilitate the use of this document in connection with any infringement or other legal analysis concerning Intel products described herein. You agree to grant Intel a non-exclusive, royalty-free license to any patent claim thereafter drafted which includes subject matter disclosed herein.

No license (express or implied, by estoppel or otherwise) to any intellectual property rights is granted by this document.

All information provided here is subject to change without notice. Contact your Intel representative to obtain the latest Intel product specifications and roadmaps.

The products described may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Copies of documents which have an order number and are referenced in this document may be obtained by calling 1-800-548-4725 or by visiting: <http://www.intel.com/design/literature.htm>

Intel technologies' features and benefits depend on system configuration and may require enabled hardware, software or service activation. Learn more at <http://www.intel.com/> or from the OEM or retailer.

No computer system can be absolutely secure.

<b>1.0</b>	<b>Introduction</b>	37
1.1	About This Manual	37
1.2	Component Overview	37
1.2.1	SoC CPU Core Features	38
1.2.2	System Memory Controller Features	39
1.2.3	Embedded SRAM Features	39
1.2.4	Power Management Features	39
1.2.5	Security Features	39
1.2.6	PCI Express* Features	39
1.2.7	Ethernet Features	40
1.2.8	USB2 Host Controller Features	40
1.2.9	USB2 Device Controller Features	40
1.2.10	SD/SDIO/eMMC Controller Features	40
1.2.11	I <sup>2</sup> C* Master Controller	40
1.2.12	GPIO Features	41
1.2.13	SPI Master Controller	41
1.2.14	High Speed UART Controller with DMA	41
1.2.15	Legacy Bridge	41
1.2.16	Package	41
1.3	Component Identification	41
<b>2.0</b>	<b>Physical Interfaces</b>	45
2.1	Pin States Through Reset	47
2.2	System Memory Signals	47
2.3	PCI Express* 2.0 Signals	48
2.4	Ethernet Interface Signals	49
2.5	USB 2.0 Interface Signals	49
2.6	Integrated Clock Interface Signals	50
2.7	SDIO/SD/MMC Signals	50
2.8	High Speed UART Interface Signals	51
2.9	I <sup>2</sup> C* Interface Signals	51
2.10	Legacy Serial Peripheral Interface (SPI) Signals	52
2.11	Serial Peripheral Interface (SPI)	52
2.12	Real Time Clock (RTC) Interface Signals	53
2.13	Power Management Signals	53
2.14	JTAG and Debug Interface Signals	53
2.15	Legacy Interface Signals	54
2.16	General Purpose I/O Interface Signals	54
2.17	Power And Ground Pins	55
2.18	Hardware Straps	56
<b>3.0</b>	<b>Ballout and Package Information</b>	59
3.1	Package Diagram	59
3.2	Ball Listings	60
<b>4.0</b>	<b>Electrical Characteristics</b>	69
4.1	Absolute Maximum Ratings	69
4.2	Recommended Power Supply Ranges	70
4.3	Maximum Supply Current	71
4.4	Configurable IO Characteristics	72
4.5	RTC DC Characteristics	74
4.6	PCI Express* 2.0 DC/AC Characteristics	74
4.7	USB 2.0 DC/AC Characteristics	77

- 4.8 General Interface Timing .....79
  - 4.8.1 Legacy SPI Interface Timing .....79
  - 4.8.2 SPI0/1 Interface Timing .....80
  - 4.8.3 SDIO Interface Timing .....81
- 4.9 Clock AC Timing .....82
  - 4.9.1 Reference Clock AC Characteristics .....82
- 5.0 Register Access Methods .....85**
  - 5.1 Fixed I/O Register Access .....85
  - 5.2 Fixed Memory Mapped Register Access .....85
  - 5.3 I/O Referenced Register Access .....85
  - 5.4 Memory Referenced Register Access .....86
  - 5.5 PCI Configuration Register Access .....86
    - 5.5.1 PCI Configuration Access - CAM: I/O Indexed Scheme .....86
    - 5.5.2 PCI Configuration Access - ECAM: Memory Mapped Scheme .....87
  - 5.6 Message Bus Register Access .....88
  - 5.7 Register Field Access Types .....89
- 6.0 Mapping Address Spaces .....91**
  - 6.1 Physical Address Space Mappings .....91
    - 6.1.1 Bridge Memory Map .....91
      - 6.1.1.1 MMIO .....93
      - 6.1.1.2 DOS DRAM .....94
      - 6.1.1.3 Additional Mappings .....94
    - 6.1.2 MMIO Map .....95
  - 6.2 I/O Address Space .....95
    - 6.2.1 Host Bridge I/O Map .....96
    - 6.2.2 I/O Fabric I/O Map .....96
      - 6.2.2.1 Legacy Bridge Fixed I/O Address Ranges .....96
      - 6.2.2.2 Variable I/O Address Ranges .....96
  - 6.3 PCI Configuration Space .....97
  - 6.4 Message Bus Space .....99
- 7.0 Clocking ..... 101**
  - 7.1 Clocking Features ..... 101
  - 7.2 Platform/System Clock Domains ..... 102
- 8.0 Power Management ..... 105**
  - 8.1 Power Management Features ..... 105
  - 8.2 Signal Descriptions ..... 105
  - 8.3 ACPI Supported States ..... 106
    - 8.3.1 S-State Definition ..... 106
      - 8.3.1.1 S0 - Full On ..... 106
      - 8.3.1.2 S3 - Suspend to RAM (Standby) ..... 106
      - 8.3.1.3 S4 - Suspend to Disk (Hibernate) ..... 106
      - 8.3.1.4 S5 - Soft Off ..... 107
    - 8.3.2 System States ..... 107
    - 8.3.3 Processor Idle States ..... 108
    - 8.3.4 Integrated Memory Controller States ..... 108
    - 8.3.5 PCIe\* States ..... 108
    - 8.3.6 Interface State Combinations ..... 109
  - 8.4 Processor Core Power Management ..... 109
    - 8.4.1 Low-Power Idle States ..... 109
      - 8.4.1.1 Clock Control and Low-Power States ..... 109
    - 8.4.2 Processor Core C-States Description ..... 109
      - 8.4.2.1 Core C0 State ..... 109
      - 8.4.2.2 Core C1 State ..... 110

- 8.4.2.3 Core C2 State..... 110
- 8.5 Memory Controller Power Management..... 110
  - 8.5.1 Disabling Unused System Memory Outputs ..... 110
  - 8.5.2 DRAM Power Management and Initialization ..... 110
    - 8.5.2.1 Initialization Role of CKE..... 110
    - 8.5.2.2 Dynamic Self-Refresh ..... 110
    - 8.5.2.3 Dynamic Power Down Operation ..... 111
    - 8.5.2.4 Functional Clock Gating ..... 111
- 9.0 Power Up and Reset Sequence..... 113**
  - 9.1 Intel® Quark™ SoC X1000 System States ..... 113
    - 9.1.1 System Sleep States Control (S-States) ..... 113
  - 9.2 Power Up and Down Sequences..... 113
    - 9.2.1 Power Up, Wake and Reset Overview ..... 113
    - 9.2.2 RTC Power Well Transition: G5 to G3 State Transition ..... 114
    - 9.2.3 AC Power Applied: G3 to S4/S5 State Transition ..... 115
    - 9.2.4 Using PWR\_BTN\_B: Transition from S4/S5 to S0 ..... 116
    - 9.2.5 Power-Up Sequence without G2/G3: No Coin-Cell Battery ..... 118
    - 9.2.6 Going to Sleep: Transitions from S0 to S3 or S4/S5 ..... 120
    - 9.2.7 Wake Events: Transition from S3 to S0 ..... 120
    - 9.2.8 System Reset Sequences..... 121
      - 9.2.8.1 Cold Boot Sequence ..... 121
      - 9.2.8.2 Cold Reset Sequence..... 121
      - 9.2.8.3 Warm Reset Sequence (Internal) ..... 122
      - 9.2.8.4 Externally Initiated Warm Reset Sequence ..... 122
    - 9.2.9 Handling Power Failures ..... 122
- 10.0 Thermal Management ..... 123**
  - 10.1 Overview ..... 123
  - 10.2 Thermal Sensor..... 123
- 11.0 Processor Core ..... 125**
- 12.0 Host Bridge ..... 127**
  - 12.1 Embedded SRAM (eSRAM)..... 127
    - 12.1.1 Initialization ..... 127
    - 12.1.2 Configuration ..... 127
      - 12.1.2.1 4KB Page Mode ..... 127
      - 12.1.2.2 512KB Block Page Mode..... 128
    - 12.1.3 Configuration Locking ..... 129
    - 12.1.4 ECC Protection ..... 130
    - 12.1.5 Flush to DRAM ..... 130
  - 12.2 Isolated Memory Regions (IMR)..... 130
    - 12.2.1 IMR Violation ..... 131
    - 12.2.2 IMR Locking..... 131
  - 12.3 Remote Management Unit DMA ..... 131
  - 12.4 Register Map ..... 132
  - 12.5 PCI Configuration Registers ..... 132
    - 12.5.1 PCI Device ID and Vendor ID Fields (PCI\_DEVICE\_VENDOR)—Offset 0h..... 133
    - 12.5.2 PCI Status and Command Fields (PCI\_STATUS\_COMMAND)—Offset 4h..... 133
    - 12.5.3 PCI Class Code and Revision ID Fields (PCI\_CLASS\_REVISION)—Offset 8h... 134
    - 12.5.4 PCI Miscellaneous Fields (PCI\_MISC)—Offset Ch ..... 134
    - 12.5.5 PCI Subsystem ID and Subsystem Vendor ID Fields (PCI\_SUBSYSTEM)—Offset 2Ch ..... 135
    - 12.5.6 Message Bus Control Register (MCR) (SB\_PACKET\_REG)—Offset D0h..... 135
    - 12.5.7 Message Data Register (MDR) (SB\_DATA\_REG)—Offset D4h ..... 136

- 12.5.8 Message Control Register eXtension (MCRX) (SB\_ADDR\_EXTN\_REG)—Offset D8h ..... 136
- 12.5.9 Manufacturer ID (PCI\_MANUFACTURER)—Offset F8h ..... 137
- 12.6 IO Mapped Register ..... 138
  - 12.6.1 ACPI Processor Block..... 138
    - 12.6.1.1 Processor Control (P\_CNT)—Offset 0h ..... 138
    - 12.6.1.2 Level 2 Register (P\_LVL2)—Offset 4h ..... 138
    - 12.6.1.3 C6 Control Register (P\_C6C)—Offset Ch ..... 139
  - 12.6.2 SPI DMA Block ..... 140
    - 12.6.2.1 Option Register 1(P\_CFG\_72) —Offset 72h ..... 140
- 12.7 Message Bus Register..... 140
  - 12.7.1 Host Bridge Arbiter (Port 0x00) ..... 140
    - 12.7.1.1 Enhanced Configuration Space (AEC\_CTRL)—Offset 0h ..... 141
    - 12.7.1.2 STATUS—Offset 21h ..... 141
    - 12.7.1.3 Requester ID Match Control (ASUBCHAN\_CTRL)—Offset 50h ..... 142
    - 12.7.1.4 Requester ID Match Sub-Channel 1 (ASUBCHAN1\_MATCH)—Offset 51h ..... 143
    - 12.7.1.5 Requester ID Match Sub-Channel 2 (ASUBCHAN2\_MATCH)—Offset 52h ..... 143
    - 12.7.1.6 Requester ID Match Sub-Channel 3 (ASUBCHAN3\_MATCH)—Offset 53h ..... 144
  - 12.7.2 Host Bridge (Port 0x03)..... 145
    - 12.7.2.1 Host Miscellaneous Controls 2 (HMISC2)—Offset 3h ..... 146
    - 12.7.2.2 Host System Management Mode Controls (HSMMCTL)—Offset 4h.. 147
    - 12.7.2.3 Host Memory I/O Boundary (HMBOUND)—Offset 8h ..... 148
    - 12.7.2.4 Extended Configuration Space (HECREG)—Offset 9h ..... 148
    - 12.7.2.5 Miscellaneous Legacy Signal Enables (HLEGACY)—Offset Ah ..... 149
    - 12.7.2.6 Host Bridge Write Flush Control (HWFLUSH)—Offset Ch ..... 149
    - 12.7.2.7 MTRR Capabilities (MTRR\_CAP)—Offset 40h ..... 150
    - 12.7.2.8 MTRR Default Type (MTRR\_DEF\_TYPE)—Offset 41h..... 151
    - 12.7.2.9 MTRR Fixed 64KB Range 0x00000 (MTRR\_FIX64K\_00000)—Offset 42h ..... 151
    - 12.7.2.10 MTRR Fixed 64KB Range 0x40000 (MTRR\_FIX64K\_40000)—Offset 43h ..... 152
    - 12.7.2.11 MTRR Fixed 16KB Range 0x80000 (MTRR\_FIX16K\_80000)—Offset 44h ..... 152
    - 12.7.2.12 MTRR Fixed 16KB Range 0x90000 (MTRR\_FIX16K\_90000)—Offset 45h ..... 153
    - 12.7.2.13 MTRR Fixed 16KB Range 0xA0000 (MTRR\_FIX16K\_A0000)—Offset 46h ..... 154
    - 12.7.2.14 MTRR Fixed 16KB Range 0xB0000 (MTRR\_FIX16K\_B0000)—Offset 47h ..... 154
    - 12.7.2.15 MTRR Fixed 4KB Range 0xC0000 (MTRR\_FIX4K\_C0000)—Offset 48h ..... 155
    - 12.7.2.16 MTRR Fixed 4KB Range 0xC4000 (MTRR\_FIX4K\_C4000)—Offset 49h ..... 155
    - 12.7.2.17 MTRR Fixed 4KB Range 0xC8000 (MTRR\_FIX4K\_C8000)—Offset 4Ah ..... 156
    - 12.7.2.18 MTRR Fixed 4KB Range 0xCC000 (MTRR\_FIX4K\_CC000)—Offset 4Bh ..... 156
    - 12.7.2.19 MTRR Fixed 4KB Range 0xD0000 (MTRR\_FIX4K\_D0000)—Offset 4Ch ..... 157
    - 12.7.2.20 MTRR Fixed 4KB Range 0xD40000 (MTRR\_FIX4K\_D4000)—Offset 4Dh..... 158
    - 12.7.2.21 MTRR Fixed 4KB Range 0xD8000 (MTRR\_FIX4K\_D8000)—Offset 4Eh ..... 158
    - 12.7.2.22 MTRR Fixed 4KB Range 0xDC000 (MTRR\_FIX4K\_DC000)—Offset 4Fh ..... 159

12.7.2.23	MTRR Fixed 4KB Range 0xE0000 (MTRR_FIX4K_E0000)—Offset 50h.....	159
12.7.2.24	MTRR Fixed 4KB Range 0xE4000 (MTRR_FIX4K_E4000)—Offset 51h.....	160
12.7.2.25	MTRR Fixed 4KB Range 0xE8000 (MTRR_FIX4K_E8000)—Offset 52h.....	160
12.7.2.26	MTRR Fixed 4KB Range 0xEC000 (MTRR_FIX4K_EC000)—Offset 53h.....	161
12.7.2.27	MTRR Fixed 4KB Range 0xF0000 (MTRR_FIX4K_F0000)—Offset 54h.....	161
12.7.2.28	MTRR Fixed 4KB Range 0xF4000 (MTRR_FIX4K_F4000)—Offset 55h.....	162
12.7.2.29	MTRR Fixed 4KB Range 0xF8000 (MTRR_FIX4K_F8000)—Offset 56h.....	163
12.7.2.30	MTRR Fixed 4KB Range 0xFC000 (MTRR_FIX4K_FC000)—Offset 57h.....	163
12.7.2.31	System Management Range Physical Base (MTRR_SMRR_PHYSBASE)—Offset 58h .....	164
12.7.2.32	System Management Range Physical Mask (MTRR_SMRR_PHYSMASK)—Offset 59h.....	164
12.7.2.33	MTRR Variable Range Physical Base 0 (MTRR_VAR_PHYSBASE0)—Offset 5Ah.....	165
12.7.2.34	MTRR Variable Range Physical Mask 0 (MTRR_VAR_PHYSMASK0)—Offset 5Bh .....	165
12.7.2.35	MTRR Variable Range Physical Base 1 (MTRR_VAR_PHYSBASE1)—Offset 5Ch.....	166
12.7.2.36	MTRR Variable Range Physical Mask 1 (MTRR_VAR_PHYSMASK1)—Offset 5Dh .....	167
12.7.2.37	MTRR Variable Range Physical Base 2 (MTRR_VAR_PHYSBASE2)—Offset 5Eh.....	167
12.7.2.38	MTRR Variable Range Physical Mask 2 (MTRR_VAR_PHYSMASK2)—Offset 5Fh.....	168
12.7.2.39	MTRR Variable Range Physical Base 3 (MTRR_VAR_PHYSBASE3)—Offset 60h.....	168
12.7.2.40	MTRR Variable Range Physical Mask 3 (MTRR_VAR_PHYSMASK3)—Offset 61h .....	169
12.7.2.41	MTRR Variable Range Physical Base 4 (MTRR_VAR_PHYSBASE4)—Offset 62h.....	169
12.7.2.42	MTRR Variable Range Physical Mask 4 (MTRR_VAR_PHYSMASK4)—Offset 63h .....	170
12.7.2.43	MTRR Variable Range Physical Base 5 (MTRR_VAR_PHYSBASE5)—Offset 64h.....	171
12.7.2.44	MTRR Variable Range Physical Mask 5 (MTRR_VAR_PHYSMASK5)—Offset 65h .....	171
12.7.2.45	MTRR Variable Range Physical Base 6 (MTRR_VAR_PHYSBASE6)—Offset 66h.....	172
12.7.2.46	MTRR Variable Range Physical Mask 6 (MTRR_VAR_PHYSMASK6)—Offset 67h .....	172
12.7.2.47	MTRR Variable Range Physical Base 7 (MTRR_VAR_PHYSBASE7)—Offset 68h.....	173
12.7.2.48	MTRR Variable Range Physical Mask 7 (MTRR_VAR_PHYSMASK7)—Offset 69h .....	173
12.7.3	Remote Management Unit (Port 0x04) .....	174
12.7.3.1	SPI DMA Count Register (P_CFG_60)—Offset 60h.....	174
12.7.3.2	SPI DMA Destination Register (P_CFG_61)—Offset 61h .....	175
12.7.3.3	SPI DMA Source Register (P_CFG_62)—Offset 62h .....	175
12.7.3.4	Processor Register Block (P_BLK) Base Address (P_CFG_70)—Offset 70h .....	176
12.7.3.5	Control Register (P_CFG_71)—Offset 71h.....	176
12.7.3.6	Watchdog Control Register (P_CFG_74)—Offset 74h .....	177

- 12.7.3.7 Thermal Sensor Mode Register (P\_CFG\_B0)—Offset B0h..... 178
- 12.7.3.8 Thermal Sensor Temperature Register (P\_CFG\_B1)—Offset B1h .... 178
- 12.7.3.9 Thermal Sensor Programmable Trip Point Register (P\_CFG\_B2)—Offset B2h ..... 179
- 12.7.4 Memory Manager (Port 0x05) ..... 180
  - 12.7.4.1 Control (BCTRL)—Offset 1h ..... 181
  - 12.7.4.2 Write Flush Policy (BWFLUSH)—Offset 2h ..... 182
  - 12.7.4.3 Isolated Memory Region Violation Control (BIMRVCTL)—Offset 19h 183
  - 12.7.4.4 Debug 1 (DEBUG1)—Offset 31h ..... 184
  - 12.7.4.5 Isolated Memory Region 0 Low Address (IMR0L)—Offset 40h ..... 186
  - 12.7.4.6 Isolated Memory Region 0 High Address (IMR0H)—Offset 41h ..... 186
  - 12.7.4.7 Isolated Memory Region 0 Read Mask (IMR0RM)—Offset 42h ..... 187
  - 12.7.4.8 Isolated Memory Region 0 Write Mask (IMR0WM)—Offset 43h ..... 189
  - 12.7.4.9 Isolated Memory Region 1 Low Address (IMR1L)—Offset 44h ..... 190
  - 12.7.4.10 Isolated Memory Region 1 High Address (IMR1H)—Offset 45h.... 191
  - 12.7.4.11 Isolated Memory Region 1 Read Mask (IMR1RM)—Offset 46h.... 191
  - 12.7.4.12 Isolated Memory Region 1 Write Mask (IMR1WM)—Offset 47h ... 193
  - 12.7.4.13 Isolated Memory Region 2 Low Address (IMR2L)—Offset 48h ..... 195
  - 12.7.4.14 Isolated Memory Region 2 High Address (IMR2H)—Offset 49h.... 196
  - 12.7.4.15 Isolated Memory Region 2 Read Mask (IMR2RM)—Offset 4Ah.... 196
  - 12.7.4.16 Isolated Memory Region 2 Write Mask (IMR2WM)—Offset 4Bh ... 198
  - 12.7.4.17 Isolated Memory Region 3 Low Address (IMR3L)—Offset 4Ch.... 200
  - 12.7.4.18 Isolated Memory Region 3 High Address (IMR3H)—Offset 4Dh ... 200
  - 12.7.4.19 Isolated Memory Region 3 Read Mask (IMR3RM)—Offset 4Eh.... 201
  - 12.7.4.20 Isolated Memory Region 3 Write Mask (IMR3WM)—Offset 4Fh.... 203
  - 12.7.4.21 Isolated Memory Region 4 Low Address (IMR4L)—Offset 50h ..... 204
  - 12.7.4.22 Isolated Memory Region 4 High Address (IMR4H)—Offset 51h.... 205
  - 12.7.4.23 Isolated Memory Region 4 Read Mask (IMR4RM)—Offset 52h.... 205
  - 12.7.4.24 Isolated Memory Region 4 Write Mask (IMR4WM)—Offset 53h ... 207
  - 12.7.4.25 Isolated Memory Region 5 Low Address (IMR5L)—Offset 54h ..... 209
  - 12.7.4.26 Isolated Memory Region 5 High Address (IMR5H)—Offset 55h.... 210
  - 12.7.4.27 Isolated Memory Region 5 Read Mask (IMR5RM)—Offset 56h.... 210
  - 12.7.4.28 Isolated Memory Region 5 Write Mask (IMR5WM)—Offset 57h ... 212
  - 12.7.4.29 Isolated Memory Region 6 Low Address (IMR6L)—Offset 58h ..... 214
  - 12.7.4.30 Isolated Memory Region 6 High Address (IMR6H)—Offset 59h.... 214
  - 12.7.4.31 Isolated Memory Region 6 Read Mask (IMR6RM)—Offset 5Ah.... 215
  - 12.7.4.32 Isolated Memory Region 6 Write Mask (IMR6WM)—Offset 5Bh ... 217
  - 12.7.4.33 Isolated Memory Region 7 Low Address (IMR7L)—Offset 5Ch.... 218
  - 12.7.4.34 Isolated Memory Region 7 High Address (IMR7H)—Offset 5Dh ... 219
  - 12.7.4.35 Isolated Memory Region 7 Read Mask (IMR7RM)—Offset 5Eh.... 219
  - 12.7.4.36 Isolated Memory Region 7 Write Mask (IMR7WM)—Offset 5Fh.... 221
  - 12.7.4.37 eSRAM Control (ESRAMCTRL)—Offset 81h ..... 223
  - 12.7.4.38 eSRAM Block Page Control (ESRAMPGCTRL\_BLOCK)—Offset 82h 224
  - 12.7.4.39 eSRAM Correctable Error (ESRAMCERR)—Offset 83h..... 226
  - 12.7.4.40 eSRAM Uncorrectable Error (ESRAMUERR)—Offset 84h ..... 226
  - 12.7.4.41 eSRAM ECC Error Syndrome (ESRAMSDROME)—Offset 88h ..... 227
- 12.7.5 Memory Manager eSRAM (Port 0x05) ..... 228
  - 12.7.5.1 eSRAM Page Control Register[0-127] (ESRAMPGCTRL[0-127])—Offset 0h, Count 128, Stride 4h ..... 228
- 12.7.6 SoC Unit (Port 0x31) ..... 229
  - 12.7.6.1 Thermal Sensor Configuration 4 (SCU\_TSCFG4\_Config)—Offset 34h ..... 229

19.1.2.3	Functional Description .....	732
19.1.3	Use .....	737
19.1.3.1	Master Mode Operation.....	737
19.1.3.2	Disabling I <sup>2</sup> C* Controller.....	737
19.1.4	References .....	738
19.2	GPIO Controller.....	738
19.2.1	Signal Descriptions .....	738
19.2.2	Features .....	738
19.3	Register Map .....	738
19.4	PCI Configuration Registers .....	739
19.4.1	Vendor ID (VENDOR_ID)—Offset 0h .....	740
19.4.2	Device ID (DEVICE_ID)—Offset 2h .....	741
19.4.3	Command Register (COMMAND_REGISTER)—Offset 4h .....	741
19.4.4	Status Register (STATUS)—Offset 6h .....	742
19.4.5	Revision ID and Class Code (REV_ID_CLASS_CODE)—Offset 8h .....	742
19.4.6	Cache Line Size (CACHE_LINE_SIZE)—Offset Ch .....	743
19.4.7	Latency Timer (LATENCY_TIMER)—Offset Dh .....	743
19.4.8	Header Type (HEADER_TYPE)—Offset Eh .....	744
19.4.9	BIST (BIST)—Offset Fh .....	744
19.4.10	Base Address Register (BAR0)—Offset 10h.....	745
19.4.11	Base Address Register (BAR1)—Offset 14h.....	745
19.4.12	Cardbus CIS Pointer (CARDBUS_CIS_POINTER)—Offset 28h .....	746
19.4.13	Subsystem Vendor ID (SUB_SYS_VENDOR_ID)—Offset 2Ch.....	746
19.4.14	Subsystem ID (SUB_SYS_ID)—Offset 2Eh .....	747
19.4.15	Expansion ROM Base Address (EXP_ROM_BASE_ADR)—Offset 30h.....	747
19.4.16	Capabilities Pointer (CAP_POINTER)—Offset 34h.....	747
19.4.17	Interrupt Line Register (INTR_LINE)—Offset 3Ch .....	748
19.4.18	Interrupt Pin Register (INTR_PIN)—Offset 3Dh .....	748
19.4.19	MIN_GNT (MIN_GNT)—Offset 3Eh.....	749
19.4.20	MAX_LAT (MAX_LAT)—Offset 3Fh .....	749
19.4.21	Capability ID (PM_CAP_ID)—Offset 80h.....	749
19.4.22	Next Capability Pointer (PM_NXT_CAP_PTR)—Offset 81h.....	750
19.4.23	Power Management Capabilities (PMC)—Offset 82h .....	750
19.4.24	Power Management Control/Status Register (PMCSR)—Offset 84h.....	751
19.4.25	PM CSR PCI-to-PCI Bridge Support Extension (PMCSR_BSE)—Offset 86h ...	752
19.4.26	Power Management Data Register (DATA_REGISTER)—Offset 87h .....	752
19.4.27	Capability ID (MSI_CAP_ID)—Offset A0h .....	752
19.4.28	Next Capability Pointer (MSI_NXT_CAP_PTR)—Offset A1h .....	753
19.4.29	Message Control (MESSAGE_CTRL)—Offset A2h.....	753
19.4.30	Message Address (MESSAGE_ADDR)—Offset A4h.....	754
19.4.31	Message Data (MESSAGE_DATA)—Offset A8h.....	754
19.4.32	Mask Bits for MSI (PER_VEC_MASK)—Offset ACh .....	754
19.4.33	Pending Bits for MSI (PER_VEC_PEND)—Offset B0h.....	755
19.5	Memory Mapped Registers.....	755
19.5.1	I <sup>2</sup> C* Controller Memory Mapped Registers.....	755
19.5.1.1	Control Register (IC_CON)—Offset 0h.....	756
19.5.1.2	Master Target Address (IC_TAR)—Offset 4h.....	757
19.5.1.3	Data Buffer and Command (IC_DATA_CMD)—Offset 10h.....	758
19.5.1.4	Standard Speed Clock SCL High Count (IC_SS_SCL_HCNT)—Offset 14h.....	759

- 19.5.1.5 Standard Speed Clock SCL Low Count (IC\_SS\_SCL\_LCNT)—Offset 18h ..... 760
- 19.5.1.6 Fast Speed Clock SCL High Count (IC\_FS\_SCL\_HCNT)—Offset 1Ch 760
- 19.5.1.7 Fast Speed Clock SCL Low Count (IC\_FS\_SCL\_LCNT)—Offset 20h .. 761
- 19.5.1.8 Interrupt Status (IC\_INTR\_STAT)—Offset 2Ch..... 761
- 19.5.1.9 Interrupt Mask (IC\_INTR\_MASK)—Offset 30h..... 763
- 19.5.1.10 Raw Interrupt Status (IC\_RAW\_INTR\_STAT)—Offset 34h ..... 764
- 19.5.1.11 Receive FIFO Threshold Level (IC\_RX\_TL)—Offset 38h ..... 766
- 19.5.1.12 Transmit FIFO Threshold Level (IC\_TX\_TL)—Offset 3Ch..... 766
- 19.5.1.13 Clear Combined and Individual Interrupt (IC\_CLR\_INTR)—Offset 40h ..... 767
- 19.5.1.14 Clear RX\_UNDER Interrupt (IC\_CLR\_RX\_UNDER)—Offset 44h ..... 767
- 19.5.1.15 Clear RX\_OVER Interrupt (IC\_CLR\_RX\_OVER)—Offset 48h ..... 768
- 19.5.1.16 Clear TX\_OVER Interrupt (IC\_CLR\_TX\_OVER)—Offset 4Ch..... 768
- 19.5.1.17 Clear RD\_REQ Interrupt (IC\_CLR\_RD\_REQ)—Offset 50h..... 769
- 19.5.1.18 Clear TX\_ABRT Interrupt (IC\_CLR\_TX\_ABRT)—Offset 54h..... 769
- 19.5.1.19 Clear ACTIVITY Interrupt (IC\_CLR\_ACTIVITY)—Offset 5Ch..... 770
- 19.5.1.20 Clear STOP\_DET Interrupt (IC\_CLR\_STOP\_DET)—Offset 60h..... 770
- 19.5.1.21 Clear START\_DET Interrupt (IC\_CLR\_START\_DET)—Offset 64h ... 771
- 19.5.1.22 Enable (IC\_ENABLE)—Offset 6Ch ..... 771
- 19.5.1.23 Status (IC\_STATUS)—Offset 70h..... 772
- 19.5.1.24 Transmit FIFO Level (IC\_TXFLR)—Offset 74h ..... 773
- 19.5.1.25 Receive FIFO Level (IC\_RXFLR)—Offset 78h..... 774
- 19.5.1.26 SDA Hold (IC\_SDA\_HOLD)—Offset 7Ch..... 774
- 19.5.1.27 Transmit Abort Source (IC\_TX\_ABRT\_SOURCE)—Offset 80h ..... 775
- 19.5.1.28 Enable Status (IC\_ENABLE\_STATUS)—Offset 9Ch..... 776
- 19.5.1.29 SS and FS Spike Suppression Limit (IC\_FS\_SPKLEN)—Offset A0h 777
- 19.5.2 GPIO Controller Memory Mapped Registers..... 777
  - 19.5.2.1 Port A Data (GPIO\_SWPORTA\_DR)—Offset 0h ..... 778
  - 19.5.2.2 Port A Data Direction (GPIO\_SWPORTA\_DDR)—Offset 4h..... 778
  - 19.5.2.3 Interrupt Enable (GPIO\_INTEN)—Offset 30h ..... 779
  - 19.5.2.4 Interrupt Mask (GPIO\_INTMASK)—Offset 34h ..... 779
  - 19.5.2.5 Interrupt Type (GPIO\_INTTYPE\_LEVEL)—Offset 38h..... 780
  - 19.5.2.6 Interrupt Polarity (GPIO\_INT\_POLARITY)—Offset 3Ch ..... 781
  - 19.5.2.7 Interrupt Status (GPIO\_INTSTATUS)—Offset 40h..... 781
  - 19.5.2.8 Raw Interrupt Status (GPIO\_RAW\_INTSTATUS)—Offset 44h..... 782
  - 19.5.2.9 Debounce Enable (GPIO\_DEBOUNCE)—Offset 48h ..... 782
  - 19.5.2.10 Clear Interrupt (GPIO\_PORTA\_EOI)—Offset 4Ch ..... 783
  - 19.5.2.11 Port A External Port (GPIO\_EXT\_PORTA)—Offset 50h..... 784
  - 19.5.2.12 Synchronization Level (GPIO\_LS\_SYNC)—Offset 60h ..... 784
- 20.0 SPI Interface ..... 787**
  - 20.1 Signal Descriptions ..... 787
  - 20.2 Features ..... 787
    - 20.2.1 SPI Controller..... 787
      - 20.2.1.1 Processor-Initiated Data Transfer ..... 788
      - 20.2.1.2 Data Format ..... 788
      - 20.2.1.3 FIFO Operation ..... 789
      - 20.2.1.4 Baud Rate Generation ..... 789
  - 20.3 Register Map ..... 791
  - 20.4 PCI Configuration Registers..... 792
    - 20.4.1 Vendor ID (VENDOR\_ID)—Offset 0h ..... 792
    - 20.4.2 Device ID (DEVICE\_ID)—Offset 2h..... 793
    - 20.4.3 Command Register (COMMAND\_REGISTER)—Offset 4h ..... 793
    - 20.4.4 Status Register (STATUS)—Offset 6h..... 794
    - 20.4.5 Revision ID and Class Code (REV\_ID\_CLASS\_CODE)—Offset 8h ..... 795
    - 20.4.6 Cache Line Size (CACHE\_LINE\_SIZE)—Offset Ch ..... 795
    - 20.4.7 Latency Timer (LATENCY\_TIMER)—Offset Dh..... 796
    - 20.4.8 Header Type (HEADER\_TYPE)—Offset Eh ..... 796

20.4.9	BIST (BIST)—Offset Fh .....	796
20.4.10	Base Address Register (BAR0)—Offset 10h .....	797
20.4.11	Cardbus CIS Pointer (CARDBUS_CIS_POINTER)—Offset 28h .....	798
20.4.12	Subsystem Vendor ID (SUB_SYS_VENDOR_ID)—Offset 2Ch .....	798
20.4.13	Subsystem ID (SUB_SYS_ID)—Offset 2Eh .....	798
20.4.14	Expansion ROM Base Address (EXP_ROM_BASE_ADR)—Offset 30h .....	799
20.4.15	Capabilities Pointer (CAP_POINTER)—Offset 34h .....	799
20.4.16	Interrupt Line Register (INTR_LINE)—Offset 3Ch .....	799
20.4.17	Interrupt Pin Register (INTR_PIN)—Offset 3Dh .....	800
20.4.18	MIN_GNT (MIN_GNT)—Offset 3Eh .....	800
20.4.19	MAX_LAT (MAX_LAT)—Offset 3Fh .....	801
20.4.20	Capability ID (PM_CAP_ID)—Offset 80h .....	801
20.4.21	Next Capability Pointer (PM_NXT_CAP_PTR)—Offset 81h .....	801
20.4.22	Power Management Capabilities (PMC)—Offset 82h .....	802
20.4.23	Power Management Control/Status Register (PMCSR)—Offset 84h .....	802
20.4.24	PM CSR PCI-to-PCI Bridge Support Extension (PMCSR_BSE)—Offset 86h....	803
20.4.25	Power Management Data Register (DATA_REGISTER)—Offset 87h .....	803
20.4.26	Capability ID (MSI_CAP_ID)—Offset A0h .....	804
20.4.27	Next Capability Pointer (MSI_NXT_CAP_PTR)—Offset A1h .....	804
20.4.28	Message Control (MESSAGE_CTRL)—Offset A2h .....	804
20.4.29	Message Address (MESSAGE_ADDR)—Offset A4h .....	805
20.4.30	Message Data (MESSAGE_DATA)—Offset A8h .....	805
20.4.31	Mask Bits for MSI (PER_VEC_MASK)—Offset ACh .....	806
20.4.32	Pending Bits for MSI (PER_VEC_PEND)—Offset B0h .....	806
20.5	Memory Mapped Registers .....	807
20.5.1	SPI Control Register 0 (SSCR0)—Offset 0h .....	807
20.5.2	SPI Control Register 1 (SSCR1)—Offset 4h .....	808
20.5.3	SPI Status Register (SSSR)—Offset 8h .....	810
20.5.4	SPI Data Register (SSDR)—Offset 10h .....	811
20.5.5	DDS Clock Rate Register (DDS_RATE)—Offset 28h .....	812
<b>21.0</b>	<b>Legacy Bridge .....</b>	<b>815</b>
21.1	Features .....	815
21.2	Register Map .....	816
21.3	PCI Configuration Registers .....	817
21.3.1	PCI Device ID and Vendor ID Fields (PCI_DEVICE_VENDOR)—Offset 0h .....	818
21.3.2	PCI Status and Command Fields (PCI_STATUS_COMMAND)—Offset 4h .....	818
21.3.3	PCI Class Code and Revision ID Fields (PCI_CLASS_REVISION)—Offset 8h...	819
21.3.4	PCI Miscellaneous Fields (PCI_MISC)—Offset Ch .....	819
21.3.5	PCI Subsystem ID and Subsystem Vendor ID Fields (PCI_SUBSYSTEM)—Offset 2Ch .....	820
21.3.6	GPIO Base Address (GBA)—Offset 44h .....	821
21.3.7	PM1_BLK Base Address (PM1BLK)—Offset 48h .....	821
21.3.8	GPE0_BLK Base Address (GPE0BLK)—Offset 4Ch .....	821
21.3.9	ACPI Control (ACTL)—Offset 58h .....	822
21.3.10	PIRQA, PIRQB, PIRQC and PIRQD Routing Control (PABCDRC)—Offset 60h.	822
21.3.11	PIRQE, PIRQF, PIRQG and PIRQH Routing Control (PEFGHRC)—Offset 64h .	824
21.3.12	Watch Dog Timer Base Address (WDTBA)—Offset 84h .....	824
21.3.13	BIOS Decode Enable (BCE)—Offset D4h .....	825
21.3.14	BIOS Control (BC)—Offset D8h .....	826
21.3.15	Root Complex Base Address (RCBA)—Offset F0h .....	827
21.4	Memory Mapped Registers .....	827
21.4.1	Root Complex Register Block .....	827
21.4.1.1	Root Complex Topology Capabilities List (RCTCL)—Offset 0h .....	828
21.4.1.2	Element Self Description (ESD)—Offset 4h .....	828

- 21.4.1.3 Interrupt Queue Agent 0 (IRQAGENT0)—Offset 3140h..... 829
- 21.4.1.4 Interrupt Queue Agent 1 (IRQAGENT1)—Offset 3142h..... 829
- 21.4.1.5 Interrupt Queue Agent 2 (IRQAGENT2)—Offset 3144h..... 830
- 21.4.1.6 Interrupt Queue Agent 3 (IRQAGENT3)—Offset 3146h..... 830
- 21.4.1.7 RTC Configuration (RC)—Offset 3400h ..... 831
- 21.5 IO Registers..... 832
  - 21.5.1 Fixed IO Registers ..... 832
    - 21.5.1.1 NMI Status and Control Register (NSC)—Offset 61h ..... 832
    - 21.5.1.2 NMI Enable and RTC Index Register (NMIE)—Offset 70h ..... 833
    - 21.5.1.3 Software SMI Control Port (SWSMICTL)—Offset B2h ..... 833
    - 21.5.1.4 Software SMI Status Port (SWSMISTS)—Offset B3h ..... 834
    - 21.5.1.5 Reset Control Register (RSTC)—Offset CF9h..... 834
  - 21.5.2 ACPI GPE0 Block..... 835
    - 21.5.2.1 GPE0 Status Register (GPE0STS)—Offset 0h ..... 835
    - 21.5.2.2 GPE0 Enable Register (GPE0EN)—Offset 4h..... 836
    - 21.5.2.3 SMI Enable Register (SMIEN)—Offset 10h..... 837
    - 21.5.2.4 SMI Status Register (SMISTS)—Offset 14h ..... 838
    - 21.5.2.5 General Purpose Event Control Register (GPEC)—Offset 18h ..... 839
    - 21.5.2.6 Power Management Configuration Core Well Register (PMCW)—Offset 28h ..... 839
    - 21.5.2.7 Power Management Configuration Suspend Well Register (PMSW)—Offset 2Ch..... 840
    - 21.5.2.8 Power Management Configuration RTC Well Register (PMRW)—Offset 30h ..... 841
  - 21.5.3 ACPI PM1 Block ..... 841
    - 21.5.3.1 PM1 Status Register (PM1S)—Offset 0h ..... 841
    - 21.5.3.2 PM1 Enable Register (PM1E)—Offset 2h..... 842
    - 21.5.3.3 PM1 Control Register (PM1C)—Offset 4h..... 843
    - 21.5.3.4 Power Management 1 Timer Register (PM1T)—Offset 8h..... 844
- 21.6 Legacy GPIO ..... 845
  - 21.6.1 Signal Descriptions ..... 845
  - 21.6.2 Features..... 845
  - 21.6.3 Use..... 845
  - 21.6.4 Register Map..... 846
  - 21.6.5 IO Mapped Registers ..... 846
    - 21.6.5.1 Core Well GPIO Enable (CGEN)—Offset 0h ..... 847
    - 21.6.5.2 Core Well GPIO Input/Output Select (CGIO)—Offset 4h ..... 847
    - 21.6.5.3 Core Well GPIO Level for Input or Output (CGLVL)—Offset 8h..... 848
    - 21.6.5.4 Core Well GPIO Trigger Positive Edge Enable (CGTPE)—Offset Ch .. 848
    - 21.6.5.5 Core Well GPIO Trigger Negative Edge Enable (CGTNE)—Offset 10h ..... 849
    - 21.6.5.6 Core Well GPIO GPE Enable (CGGPE)—Offset 14h ..... 849
    - 21.6.5.7 Core Well GPIO SMI Enable (CGSMI)—Offset 18h ..... 850
    - 21.6.5.8 Core Well GPIO Trigger Status (CGTS)—Offset 1Ch..... 850
    - 21.6.5.9 Resume Well GPIO Enable (RGEN)—Offset 20h..... 851
    - 21.6.5.10 Resume Well GPIO Input/Output Select (RGIO)—Offset 24h ..... 851
    - 21.6.5.11 Resume Well GPIO Level for Input or Output (RGLVL)—Offset 28h 852
    - 21.6.5.12 Resume Well GPIO Trigger Positive Edge Enable (RGTPE)—Offset 2Ch..... 852
    - 21.6.5.13 Resume Well GPIO Trigger Negative Edge Enable (RGTNE)—Offset 30h ..... 852
    - 21.6.5.14 Resume Well GPIO GPE Enable (RGGPE)—Offset 34h ..... 853
    - 21.6.5.15 Resume Well GPIO SMI Enable (RGSMI)—Offset 38h ..... 854
    - 21.6.5.16 Resume Well GPIO Trigger Status (RGTS)—Offset 3Ch..... 854
    - 21.6.5.17 Core Well GPIO NMI Enable (CGNMIEN)—Offset 40h..... 855
    - 21.6.5.18 Resume Well GPIO NMI Enable (RGNMIEN)—Offset 44h ..... 855
- 21.7 Legacy SPI Controller ..... 856
  - 21.7.1 Signal Descriptions ..... 856

21.7.2	Features .....	856
21.7.3	Register Map .....	856
21.7.4	Legacy SPI Host Interface Registers.....	857
21.7.4.1	SPI Status (SPISTS)—Offset 3020h .....	859
21.7.4.2	SPI Control (SPICTL)—Offset 3022h .....	859
21.7.4.3	SPI Address (SPIADDR)—Offset 3024h .....	860
21.7.4.4	SPI Data 0 - Lower 32 Bits (SPID0_1)—Offset 3028h.....	861
21.7.4.5	SPI Data 0 - Upper 32 Bits (SPID0_2)—Offset 302Ch.....	861
21.7.4.6	SPI Data 1 - Lower 32 Bits (SPID1_1)—Offset 3030h.....	862
21.7.4.7	SPI Data 1 - Upper 32 Bits (SPID1_2)—Offset 3034h.....	862
21.7.4.8	SPI Data 2 - Lower 32 Bits (SPID2_1)—Offset 3038h.....	862
21.7.4.9	SPI Data 2 - Upper 32 Bits (SPID2_2)—Offset 303Ch.....	863
21.7.4.10	SPI Data 3 - Lower 32 Bits (SPID3_1)—Offset 3040h .....	863
21.7.4.11	SPI Data 3 - Upper 32 Bits (SPID3_2)—Offset 3044h .....	863
21.7.4.12	SPI Data 4 - Lower 32 Bits (SPID4_1)—Offset 3048h .....	864
21.7.4.13	SPI Data 4 - Upper 32 Bits (SPID4_2)—Offset 304Ch .....	864
21.7.4.14	SPI Data 5 - Lower 32 Bits (SPID5_1)—Offset 3050h .....	865
21.7.4.15	SPI Data 5 - Upper 32 Bits (SPID5_2)—Offset 3054h .....	865
21.7.4.16	SPI Data 6 - Lower 32 Bits (SPID6_1)—Offset 3058h .....	865
21.7.4.17	SPI Data 6 - Upper 32 Bits (SPID6_2)—Offset 305Ch .....	866
21.7.4.18	SPI Data 7 - Lower 32 Bits (SPID7_1)—Offset 3060h .....	866
21.7.4.19	SPI Data 7 - Upper 32 Bits (SPID7_2)—Offset 3064h .....	866
21.7.4.20	BIOS Base Address (BBAR)—Offset 3070h .....	867
21.7.4.21	Prefix Opcode Configuration (PREOP)—Offset 3074h .....	867
21.7.4.22	Opcode Type Configuration (OPTYPE)—Offset 3076h .....	868
21.7.4.23	Opcode Menu Configuration - Lower 32 Bits (OPMENU_1)—Offset 3078h .....	869
21.7.4.24	Opcode Menu Configuration - Upper 32 Bits (OPMENU_2)—Offset 307Ch .....	869
21.7.4.25	Protected BIOS Range 0 (PBR0)—Offset 3080h .....	870
21.7.4.26	Protected BIOS Range 1 (PBR1)—Offset 3084h .....	871
21.7.4.27	Protected BIOS Range 2 (PBR2)—Offset 3088h .....	871
21.8	8254 Programmable Interval Timer.....	873
21.8.1	Features .....	873
21.8.1.1	Counter 0, System Timer .....	873
21.8.1.2	Counter 1, Refresh Request Signal .....	873
21.8.1.3	Counter 2, Speaker Tone .....	873
21.8.2	Use .....	873
21.8.2.1	Timer Programming .....	873
21.8.2.2	Reading from the Interval Timer .....	874
21.8.3	Register Map .....	875
21.8.4	Timer I/O Registers .....	876
21.8.4.1	Counter 0 Interval Time Status Byte Format (C0TS)—Offset 40h ...	877
21.8.4.2	Counter 1 Interval Time Status Byte Format (C1TS)—Offset 41h ...	877
21.8.4.3	Counter 2 Interval Time Status Byte Format (C2TS)—Offset 42h ...	878
21.8.4.4	Timer Control Word Register (TCW)—Offset 43h .....	879
21.8.4.5	Counter 0 Counter Access Port Register (C0AP)—Offset 50h .....	879
21.8.4.6	Counter 1 Counter Access Port Register (C1AP)—Offset 51h .....	880
21.8.4.7	Counter 2 Counter Access Port Register (C2AP)—Offset 52h .....	880
21.9	High Precision Event Timer (HPET).....	880
21.9.1	Features .....	881
21.9.1.1	Non-Periodic Mode - All Timers .....	881
21.9.1.2	Periodic Mode - Timer 0 Only.....	881
21.9.1.3	Interrupts.....	882
21.9.2	Register Map .....	882
21.9.3	Memory Mapped Registers.....	883
21.9.3.1	General Capabilities and ID Register - Lower 32 Bits (GCID_1)—Offset 0h .....	884

- 21.9.3.2 General Capabilities and ID Register - Upper 32 Bits (GCID\_2)—Offset 4h ..... 885
- 21.9.3.3 General Configuration (GC)—Offset 10h ..... 885
- 21.9.3.4 General Interrupt Status Register (GIS)—Offset 20h ..... 885
- 21.9.3.5 Main Counter Value Register - Lower 32 Bits (MCV\_1)—Offset F0h ..... 886
- 21.9.3.6 Main Counter Value Register - Upper 32 Bits (MCV\_2)—Offset F4h ..... 886
- 21.9.3.7 Timer 0 Config and Capabilities Register - Lower 32 Bits (TOC\_1)—Offset 100h ..... 887
- 21.9.3.8 Timer 0 Config and Capabilities Register - Upper 32 Bits (TOC\_2)—Offset 104h ..... 888
- 21.9.3.9 Timer 0 Comparator Value Register - Lower 32 Bits (TOCV\_1)—Offset 108h ..... 888
- 21.9.3.10 Timer 0 Comparator Value Register - Upper 32 Bits (TOCV\_2)—Offset 10Ch ..... 888

## 1.0 Introduction

### 1.1 About This Manual

This document is intended for Original Equipment Manufacturers and BIOS vendors creating products based on the Intel® Quark™ SoC X1000 application processor.

*Note:* Throughout this document, SoC is used as a general term and refers to all Intel® Quark™ SoC X1000 SKUs, unless specifically noted otherwise.

This manual assumes a working knowledge of the vocabulary and principles of interfaces and architectures such as PCI Express\*, USB, SDIO/MMC, and ACPI. Although some details of these features are described within this manual, refer to the individual industry specifications listed in [Table 1](#) for the complete details.

All PCI buses, devices and functions in this manual are abbreviated using the following nomenclature; Bus:Device:Function. This manual abbreviates buses as *B<sub>n</sub>*, devices as *D<sub>n</sub>* and functions as *F<sub>n</sub>*. For example, Device 31 Function 0 is abbreviated as D31:F0, Bus 1 Device 8 Function 0 is abbreviated as B1:D8:F0. Generally, the bus number is not used, and can be considered to be Bus 0.

### 1.2 Component Overview

The Intel® Quark™ SoC X1000 processor is the next generation secure, low-power Intel® Architecture (IA) SoC for deeply embedded applications. The SoC integrates the Intel® Quark™ SoC X1000 Core plus all the required hardware components to run off-the-shelf operating systems and to leverage the vast x86 software ecosystem.

To enable secure applications, the SoC secure SKUs feature an on-die Boot ROM that is used to establish a hardware Root of Trust (RoT). The immutable code located within the Boot ROM is used to initiate an iterative firmware authentication process ensuring only trusted code is executed when taking the platform out of reset.

To facilitate low-cost platforms with sensitive Bill of Material (BOM) requirements, all SoC clocks can be generated from a single crystal oscillator while all the required SoC voltage levels can be derived from a single commercial off-the-shelf (COTS) voltage regulator. In addition, the SoC provides an ECC-protected DRAM solution using only standard x8 DDR3 devices.

The SoC also features a 512 Kbyte on-die embedded SRAM (eSRAM) that can be configured to overlay regions of DRAM to provide low latency access to critical portions of system memory. For robustness, the contents of this on-die eSRAM are also ECC protected.

**Figure 1. Block Diagram**

### 1.2.1 SoC CPU Core Features

- 400 MHz maximum operating frequency
- Low power options to run at half or at quarter of maximum CPU frequency

- 32-bit address bus, 32-bit data bus
- 16 Kbyte shared instruction and data L1 cache.

### 1.2.2 System Memory Controller Features

- Single channel DDR3 memory controller with ECC support
- 16-bit data bus
- Supports up to two ranks total
- Supports DDR3 with 800 MT/s data rates
- x8 DRAM device data width
- 1 Gbit, 2 Gbit, and 4 Gbit DRAM device densities
- Total memory size from 128 Mbyte to 2 Gbyte
- Supports different physical mappings of bank addresses to optimize performance
- Out-of-order request processing to increase performance
- Aggressive power management to reduce power consumption
- Proactive page closing policies to close unused pages
- Supports soldered down DRAM devices

### 1.2.3 Embedded SRAM Features

- Low Latency 512 Kbyte on-die embedded SRAM
- Configurable to either overlay a 512 Kbyte block or overlay individual 4 Kbyte pages of system memory
- ECC protected

### 1.2.4 Power Management Features

- Supports ACPI 3.0 specification
- Supports C0, C1, and C2 processor power states
- Supports S0, S3, and S4/S5 system power states

### 1.2.5 Security Features

- On-die Boot ROM provides Hardware Root of Trust (RoT) for firmware authentication

### 1.2.6 PCI Express\* Features

The SoC has two PCI Express\* root ports, each supporting the PCI Express Base specification Rev 2.0 at a maximum of 2.5 GT/s data transfer rates. Each root port is configured as a x1 link.

- 128 Byte max payload size with the capability of splitting the request at 64 Byte granularity
- Software-Initiated Link Power Management (D1, D2, D3Hot, and L1 States)
- PME event generation

### 1.2.7 Ethernet Features

- 10 and 100 Mbps data transfer rates with RMI interface to communicate with an external Fast Ethernet PHY
- Full-duplex operation:
  - IEEE 802.3x flow control support
  - Optional forwarding of received pause control frames to the user application
- Half-duplex operation:
  - CSMA/CD Protocol support
- Flexible address filtering modes:
  - 64-bit Hash filter for multicast and unicast (DA) addresses
  - Option to pass all multicast addressed frames
  - Promiscuous mode to pass all frames without any filtering for network monitoring
  - Pass all incoming packets (as per filter) with a status report
- Programmable frame length to support Standard Ethernet frames with size up to 1522 bytes
- Enhanced Receive module for checking IPv4 header checksum and TCP, UDP, or ICMP checksum encapsulated in IPv4 or IPv6 datagrams (Type 2)
- Support Ethernet frame time stamping as described in IEEE 1588-2002 and IEEE 1588-2008. The 64-bit timestamps are given in the transmit or receive status of each frame.

### 1.2.8 USB2 Host Controller Features

- 2 host ports that support high-speed (480 Mbps), full-speed (12 Mbps), and low-speed (1.5 Mbps) operation
- EHCI and OHCI host controllers

### 1.2.9 USB2 Device Controller Features

- Single device port that supports high-speed (480 Mbps) and full-speed (12 Mbps) operation

### 1.2.10 SD/SDIO/eMMC Controller Features

- Host Controller provides a single port configurable as an SD, SDIO, or eMMC interface
- SD Clock Frequency up to 50 MHz
- Supports SD Host Controller Standard Specification 3.0
- Supports SDIO card specification 3.0
- Supports SD Memory Card Specification 3.0
- Supports SD Memory Card Security Specification 1.01
- Supports eMMC Specification 4.41

### 1.2.11 I<sup>2</sup>C\* Master Controller

- Two-wire I<sup>2</sup>C serial bus interface

- Two I<sup>2</sup>C speeds supported: Standard (100 Kbit/s) and Fast (400 Kbit/s) data rates
- Fully asynchronous I<sup>2</sup>C clock signal
- Master I<sup>2</sup>C operation

### 1.2.12 GPIO Features

- 16 GPIO pins provided
- 6 GPIO pins remain active during S3 and can be used to wake the system from the Suspend state.
- Remaining 10 GPIO pins are powered during S0 state only and are not available in S3

### 1.2.13 SPI Master Controller

- Two SPI Master controllers
- One Chip Select per master controller
- Configurable SCLK frequency from 1 kHz up to 25 MHz

### 1.2.14 High Speed UART Controller with DMA

- Two 16550 compliant UART controllers
- Supported Baud rates from 300 to 2764800
- Integrated DMA capability with hardware flow control

### 1.2.15 Legacy Bridge

The Legacy Bridge is a collection of hardware blocks critical to implement an Intel Architecture compatible platform. Some of its key features are:

- A 20 MHz Serial Peripheral Interface (SPI) for Flash only - stores boot FW and system configuration data
- A Power Management Controller (PMC) that controls many of the power management features present in the SoC
- Legacy Bridge Components - Provides hardware blocks required to support legacy PC platform features. The legacy bridge components include the RTC, Interrupt Controllers, Timers and General Purpose I/Os (GPIO).

### 1.2.16 Package

The SoC is packaged in a Flip-Chip Ball Grid Array (FCBGA) package with 393 solder balls with 0.593 mm ball pitch. The package dimensions are 15mm x 15mm.

## 1.3 Component Identification

The Intel® Quark™ SoC X1000 stepping is identified by both:

- Processor Family/Model/Stepping returned by the CPUID instruction. This always returns 0x590 for SoC.
- Revision ID register of the Host Bridge, located at D0:F0. Reads of the register reflect the stepping.

**Table 2. Component Identification**

Vendor ID <sup>1</sup>	Device ID <sup>2</sup>	Revision ID <sup>3</sup>	Stepping
8086h	0958h	00h	A0h

**Notes:**

1. The Vendor ID corresponds to bits 15-0 of the Vendor ID Register located at offset 00-01h in the PCI configuration space of the device.
2. The Device ID corresponds to bits 15-0 of the Device ID Register located at offset 02-03h in the PCI configuration space of the device.
3. The Revision ID corresponds to bits 7-0 of the Revision ID Register located at offset 08h in the PCI configuration space of the device.

The SoC incorporates a variety of PCI functions as listed in [Table 3](#). All devices reside on PCI Bus 0 as shown in [Figure 2](#).

Figure 2. Intel® Quark™ SoC X1000 PCI View

Table 3. Intel® Quark™ SoC X1000 Device ID

Device Function	Description	Device ID	A0 SRID
D0:F0	Host Bridge	0958h	00h
D31:F0	Legacy Bridge	095Eh	00h
D23:F0	PCIe* Root Port 0	11C3h	00h
D23:F1	PCIe* Root Port 1	11C4h	00h
D20:F0	SDIO / eMMC Controller	08A7h	10h
D20:F1	HS-UART 0	0936h	10h
D20:F2	USB 2.0 Device	0939h	10h
D20:F3	USB EHCI Host Controller	0939h	10h
D20:F4	USB OHCI Host Controller	093Ah	10h
D20:F5	HS-UART 1	0936h	10h
D20:F6	10/100 Ethernet MAC 0	0937h	10h
D20:F7	10/100 Ethernet MAC 1	0937h	10h
D21:F0	SPI Controller 0	0935h	10h
D21:F1	SPI Controller 1	0935h	10h
D21:F2	I <sup>2</sup> C* Controller and GPIO Controller	0934h	10h

§ §

## 2.0 Physical Interfaces

---

Many interfaces contain physical pins. These groups of pins make up the physical interfaces. This chapter summarizes the physical interfaces.

Figure 3. Signals In Default System Pin List

## 2.1 Pin States Through Reset

This chapter describes the each signal state before, during, and directly after reset. Additionally, some signals have internal pull-up/pull-down termination resistors, and their values are also provided.

**Table 4. I/O Power Well Definitions**

Power Type	Power Well Description
CORE	Core I/O, and everything else uses the CORE power well.
SUS	Devices outside of memory that must remain on in the S3 state use the SUS power well.
RTC	Devices that must be on in the S4/S5 state use the RTC power well.

**Table 5. Buffer Type Definitions**

Buffer Type	Buffer Description
PCIe*	PCIe*, differential buffer type
SSTL-15	DDR3, 1.5V tolerant SSTL buffer type
DDI	DDR (TMDS, DP) 1.0V tolerant differential buffer type
CMOS[ <i>Voltage</i> ]	CMOS buffer type. [ <i>Voltage</i> ] can be of the following types: 1.05, 1.5, 1.8, and 3.3.
CMOS[ <i>Voltage</i> ] <sub>OD</sub>	Open drain CMOS buffer type [ <i>Voltage</i> ] can be of the following types: 1.05, 1.5, 1.8 and 3.3.
Analog	Analog pins that do not have specific digital requirements. Often used for circuit calibration or monitoring.

**Table 6. Default Buffer State Definitions**

Buffer State	Description
High-Z	The SoC places this output in a high-impedance state. For inputs, external drivers are not expected.
Do Not Care	The state of the input (driven or tristated) does not affect the SoC. For outputs, it is assumed that the output buffer is in a high-impedance state.
V <sub>OH</sub>	The SoC drives this signal high.
V <sub>OL</sub>	The SoC drives this signal low.
Unknown	The SoC drives or expects an indeterminate value.
V <sub>IH</sub>	The SoC expects/requires the signal to be driven high.
V <sub>IL</sub>	The SoC expects/requires the signal to be driven low.
Pull-up	This signal is pulled high by a pull-up resistor (internal or external — internal value specified in "Term" column).
Pull-down	This signal is pulled low by a pull-down resistor (internal or external — internal value specified in "Term" column).
Running	The clock is toggling, or the signal is transitioning.
Off	The power plane for this signal is powered down. The SoC does not drive outputs, and inputs should not be driven to the SoC. (VSS on output)

## 2.2 System Memory Signals

See [Section 6.0](#) for more details of the DDR3 interface signals. Termination not listed.

**Table 7. System Memory Signals**

Signal Name	Dir	Term	Power	Type	Default Buffer State			
					S4/S5	S3	Reset	Enter S0
DDR3_BS[2:0]	O	-	1.5V	SSTL-15	Off	High-Z	High-Z	High-Z
DDR3_CASB	O	-	1.5V	SSTL-15	Off	High-Z	High-Z	High-Z
DDR3_RASB	O	-	1.5V	SSTL-15	Off	High-Z	High-Z	High-Z
DDR3_WEB	O	-	1.5V	SSTL-15	Off	High-Z	High-Z	High-Z
DDR3_MA[15:0]	I/O	-	1.5V	SSTL-15	Off	High-Z	High-Z	High-Z
DDR3_CK[1:0]	I/O	-	1.5V	SSTL-15	Off	High-Z	High-Z	High-Z
DDR3_CKB[1:0]	I/O	-	1.5V	SSTL-15	Off	High-Z	High-Z	High-Z
DDR3_CKE[1:0]	I/O	-	1.5V	SSTL-15	Off	V <sub>OL</sub>	V <sub>OL</sub>	V <sub>OL</sub>
DDR3_CSB[1:0]	I/O	-	1.5V	SSTL-15	Off	High-Z	High-Z	V <sub>OH</sub>
DDR3_ODT[1:0]	I/O	-	1.5V	SSTL-15	Off	High-Z	High-Z	V <sub>OL</sub>
DDR3_DQ[15:0]	I/O	-	1.5V	SSTL-15	Off	High-Z	High-Z	High-Z
DDR3_DM[1:0]	I/O	-	1.5V	SSTL-15	Off	High-Z	High-Z	High-Z
DDR3_DQS[1:0]	I/O	-	1.5V	SSTL-15	Off	High-Z	High-Z	High-Z
DDR3_DQSB[1:0]	I/O	-	1.5V	SSTL-15	Off	High-Z	High-Z	High-Z
DDR3_IDRAM_PWROK	I	Ext	1.5V	CMOS-15	V <sub>IL</sub>	V <sub>IH</sub>	Pull-up	V <sub>IH</sub>
DDR3_ISYSPWRGOOD	I	Ext	1.5V	CMOS-15	V <sub>IL</sub>	V <sub>IL</sub>	Pull-up	V <sub>IH</sub>
DDR3_DRAMRSTB	O	-	1.5V	CMOS-15	Off	V <sub>OH</sub>	V <sub>OL</sub>	V <sub>OL</sub> /V <sub>OH</sub> (S3 Exit)
DDR3_VREF	I/O	-	1.5V	Reference	Off	Reference	Reference	Reference

DDR3_DQPU	I/O	-	1.5V	Analog	Off	Analog	Analog	Analog
DDR3_CMDPU	I/O	-	1.5V	Analog	Off	Analog	Analog	Analog

### 2.3 PCI Express\* 2.0 Signals

See “PCI Express\* 2.0” on page 261 for more details of the interface signals.

**Table 8. PCI Express\* 2.0 Signals**

Signal Name	Dir	Term	Power	Type	Default Buffer State			
					S4/S5	S3	Reset	Enter S0
PCIE_REFCLKP	I	-	1.05V	PCIe	Off	Off	Running/Unknown	Running/Unknown
PCIE_REFCLKN	I	-	1.05V	PCIe	Off	Off	Running/Unknown	Running/Unknown
PCIE_PETP[1:0]	O	-	1.05V	PCIe	Off	Off	V <sub>OL</sub>	V <sub>OL</sub>
PCIE_PETN[1:0]	O	-	1.05V	PCIe	Off	Off	V <sub>OL</sub>	V <sub>OL</sub>
PCIE_PERP[1:0]	I	-	1.05V	PCIe	Off	Off	High-Z	High-Z
PCIE_PERN[1:0]	I	-	1.05V	PCIe	Off	Off	High-Z	High-Z
PCIE_IRCOMP	I/O	-	1.5V	Analog	Off	Off	Analog	Analog
PCIE_RBIAS	I	-	1.5V	Analog	Off	Off	Analog	Analog

## 2.4 Ethernet Interface Signals

See Chapter 15.0, “10/100 Mbps Ethernet” for more details of the Ethernet interface signals.

**Table 9. Ethernet Interface Signals**

Signal Name	Dir	Term	Power	Type	Default Buffer State			
					S4/S5	S3	Reset	Enter S0
RMII_REF_CLK	I	-	3.3V	CMOS3.3	Off	Off	Running/ Unknown	Running
MAC0_TXEN	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OL</sub>	V <sub>OL</sub>
MAC0_TXDATA[1:0]	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OL</sub>	V <sub>OL</sub>
MAC0_RXDV	I	20k(L)	3.3V	CMOS3.3	Off	Off	Pull-down	Pull-down
MAC0_RXDATA[1:0]	I	-	3.3V	CMOS3.3	Off	Off	Unknown	Unknown
MAC0_MDC	O	Ext	3.3V	CMOS3.3	Off	Off	Pull-up	Pull-up
MAC0_MDIO	I/O	Ext	3.3V	CMOS3.3_OD	Off	Off	Pull-up	Pull-up
MAC1_TXEN	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OL</sub>	V <sub>OL</sub>
MAC1_TXDATA[1:0]	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OL</sub>	V <sub>OL</sub>
MAC1_RXDV	I	20k(L)	3.3V	CMOS3.3	Off	Off	Pull-down	Pull-down
MAC1_RXDATA[1:0]	I	-	3.3V	CMOS3.3	Off	Off	Unknown	Unknown
MAC1_MDC	O	Ext	3.3V	CMOS3.3	Off	Off	Pull-up	Pull-up
MAC1_MDIO	I/O	Ext	3.3V	CMOS3.3_OD	Off	Off	Pull-up	Pull-up

## 2.5 USB 2.0 Interface Signals

See Chapter 16.0, “USB 2.0” for more details of the USB 2.0 interface signals.

**Table 10. USB 2.0 Interface Signals (Sheet 1 of 2)**

Signal Name	Dir	Term	Power	Type	Default Buffer State			
					S4/S5	S3	Reset	Enter S0
USBH0_OC_B	I	20k(H)	3.3V	CMOS3.3	Off	Off	Pull-up	Pull-up
USBH1_OC_B	I	20k(H)	3.3V	CMOS3.3	Off	Off	Pull-up	Pull-up
USBH0_PWR_EN	O	Ext	3.3V	CMOS3.3	Off	Off	Pull-down	Pull-down
USBH1_PWR_EN	O	Ext	3.3V	CMOS3.3	Off	Off	Pull-down	Pull-down
USBH0_DP	I/O	-	3.3V	USB	Off	Off	High-Z	High-Z
USBH0_DN	I/O	-	3.3V	USB	Off	Off	High-Z	High-Z
USBH1_DP	I/O	-	3.3V	USB	Off	Off	High-Z	High-Z
USBH1_DN	I/O	-	3.3V	USB	Off	Off	High-Z	High-Z
USBD_DP	I/O	-	3.3V	USB	Off	Off	High-Z	High-Z
USBD_DN	I/O	-	3.3V	USB	Off	Off	High-Z	High-Z
USB_CLK96P	I	-	1.05V	USB	Off	Off	Running/ Unknown	Running/ Unknown

**Table 10. USB 2.0 Interface Signals (Sheet 2 of 2)**

Signal Name	Dir	Term	Power	Type	Default Buffer State			
					S4/S5	S3	Reset	Enter S0
USB_CLK96N	I	-	1.05V	USB	Off	Off	Running/ Unknown	Running/ Unknown
OUSBCOMP_P18	O	-	1.8V	Analog	Off	Off	Analog	Analog
IUSBCOMP_N18	I	-	1.8V	Analog	Off	Off	Analog	Analog

## 2.6 Integrated Clock Interface Signals

See Chapter 7.0, “Clocking” for more details of the Integrated Clock interface signals.

**Table 11. Integrated Clock Interface Signals**

Signal Name	Dir	Term	Power	Type	Default Buffer State			
					S4/S5	S3	Reset	Enter S0
XTAL_IN	I	-	1.05V	Analog	Running	Running	Running	Running
XTAL_OUT	O	-	1.05V	Analog	Running	Running	Running	Running
CKSYS25OUT	O	-	3.3V	CMOS3.3	Running	Running	Running	Running
REF0_OUTCLK_P	O	-	1.05V	CMOS1.05	V <sub>OL</sub>	V <sub>OL</sub>	V <sub>OL</sub>	Running
REF0_OUTCLK_N	O	-	1.05V	CMOS1.05	V <sub>OL</sub>	V <sub>OL</sub>	V <sub>OL</sub>	Running
REF1_OUTCLK_P	O	-	1.05V	CMOS1.05	V <sub>OL</sub>	V <sub>OL</sub>	V <sub>OL</sub>	Running
REF1_OUTCLK_N	O	-	1.05V	CMOS1.05	V <sub>OL</sub>	V <sub>OL</sub>	V <sub>OL</sub>	Running
FLEX0_CLK	O	-	3.3V	CMOS3.3	V <sub>OL</sub>	V <sub>OL</sub>	V <sub>OL</sub>	Running
FLEX1_CLK	O	-	3.3V	CMOS3.3	V <sub>OL</sub>	V <sub>OL</sub>	V <sub>OL</sub>	Running
FLEX2_CLK	O	-	3.3V	CMOS3.3	V <sub>OL</sub>	V <sub>OL</sub>	V <sub>OL</sub>	Running
RMII_REF_CLK_OUT	O	-	3.3V	CMOS3.3	V <sub>OL</sub>	V <sub>OL</sub>	V <sub>OL</sub>	Running
OSC_COMP	I	-	1.5V	Analog	Analog	Analog	Analog	Analog
HPLL_REFCLK_P	I	-	1.05V	CMOS1.05	Off	Off	Running/ Unknown	Running/ Unknown
HPLL_REFCLK_N	I	-	1.05V	CMOS1.05	Off	Off	Running/ Unknown	Running/ Unknown
PAD_BYPASS_CLK	I	-	1.05V	CMOS1.05	Off	Off	Running/ Unknown	Running/ Unknown

## 2.7 SDIO/SD/MMC Signals

See Chapter 17.0, “SDIO/SD/eMMC” for more details of the interface signals, including different options based on port configuration.

**Table 12. SD/SDIO/MMC Signals (Sheet 1 of 2)**

Signal Name	Dir	Term	Power	Type	Default Buffer State			
					S4/S5	S3	Reset	Enter S0
SD_DATA[7:0]	I/O	20k(H)	3.3V	CMOS3.3	Off	Off	Pull-up	Pull-up
SD_CMD	I/O	20k(H)	3.3V	CMOS3.3	Off	Off	Pull-up	Pull-up
SD_CLK	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OL</sub>	V <sub>OL</sub>

Table 12. SD/SDIO/MMC Signals (Sheet 2 of 2)

Signal Name	Dir	Term	Power	Type	Default Buffer State			
					S4/S5	S3	Reset	Enter S0
SD_WP	I	20k(L)	3.3V	CMOS3.3	Off	Off	Pull-down	Pull-down
SD_CD_B	I	20k(H)	3.3V	CMOS3.3	Off	Off	Pull-up	Pull-up
SD_LED	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OL</sub>	V <sub>OL</sub>
SD_PWR	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OL</sub>	V <sub>OL</sub>

## 2.8 High Speed UART Interface Signals

The SoC features two separate High Speed UARTs. However, only UART0 provides the Modem Control pins DCD, DSR, DTR and RI.

See Chapter 18.0, "High Speed UART" for more details of the HSUART interface signals.

Table 13. High Speed UART Signals

Signal Name	Dir	Term	Power	Type	Default Buffer State			
					S4/S5	S3	Reset	Enter S0
SIU0_CTS_B	I	20k(H)	3.3V	CMOS3.3	Off	Off	Pull-up	Pull-up
SIU0_DCD_B	I	20k(H)	3.3V	CMOS3.3	Off	Off	Pull-up	Pull-up
SIU0_DSR_B	I	20k(H)	3.3V	CMOS3.3	Off	Off	Pull-up	Pull-up
SIU0_DTR_B	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OH</sub>	V <sub>OH</sub>
SIU0_RI_B	I	20k(H)	3.3V	CMOS3.3	Off	Off	Pull-up	Pull-up
SIU0_RTS_B	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OH</sub>	V <sub>OH</sub>
SIU0_RXD	I	20k(H)	3.3V	CMOS3.3	Off	Off	Pull-up	Pull-up
SIU0_TXD	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OH</sub>	V <sub>OH</sub>
SIU1_CTS_B	I	20k(H)	3.3V	CMOS3.3	Off	Off	Pull-up	Pull-up
SIU1_RTS_B	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OH</sub>	V <sub>OH</sub>
SIU1_RXD	I	20k(H)	3.3V	CMOS3.3	Off	Off	Pull-up	Pull-up
SIU1_TXD	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OH</sub>	V <sub>OH</sub>

## 2.9 I<sup>2</sup>C\* Interface Signals

See Chapter 19.0, "I<sup>2</sup>C\* Controller/GPIO Controller" for more details of the I<sup>2</sup>C Interface signals.

Table 14. I<sup>2</sup>C\* Signals

Signal Name	Dir	Term	Power	Type	Default Buffer State			
					S4/S5	S3	Reset	Enter S0
I2C_DATA	I/O	Ext	3.3V	CMOS3.3_OD	Off	Off	Pull-up	Pull-up
I2C_CLK	I/O	Ext	3.3V	CMOS3.3_OD	Off	Off	Pull-up	Pull-up

## 2.10 Legacy Serial Peripheral Interface (SPI) Signals

See Section 21.7 for more details of the SPI signals.

**Table 15. Legacy SPI Signals**

Signal Name	Dir	Term	Power	Type	Default Buffer State			
					S4/S5	S3	Reset	Enter S0
LSPI_MOSI	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OH</sub>	V <sub>OH</sub>
LSPI_MISO	I	20k(H)	3.3V	CMOS3.3	Off	Off	Pull-up	Pull-up
LSPI_SS_B	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OH</sub>	V <sub>OH</sub>
LSPI_SCK	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OL</sub>	V <sub>OL</sub>

## 2.11 Serial Peripheral Interface (SPI)

See Chapter 20.0, “SPI Interface” for more details of the SPI signals.

**Table 16. SPI Signals**

Signal Name	Dir	Term	Power	Type	Default Buffer State			
					S4/S5	S3	Reset	Enter S0
SPIO_MOSI	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OL</sub>	V <sub>OL</sub>
SPIO_MISO	I	20k(H)	3.3V	CMOS3.3	Off	Off	Pull-up	Pull-up
SPIO_SS_B	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OH</sub>	V <sub>OH</sub>
SPIO_SCK	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OL</sub>	V <sub>OL</sub>
SPI1_MOSI	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OL</sub>	V <sub>OL</sub>
SPI1_MISO	I	20k(H)	3.3V	CMOS3.3	Off	Off	Pull-up	Pull-up
SPI1_SS_B	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OH</sub>	V <sub>OH</sub>
SPI1_SCK	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OL</sub>	V <sub>OL</sub>

## 2.12 Real Time Clock (RTC) Interface Signals

See Section 21.10 for more details of the RTC interface signals.

**Table 17. Real Time Clock (RTC) Interface Signals**

Signal Name	Dir	Term	Power	Type	Default Buffer State			
					S4/S5	S3	Reset	Enter S0
RTCX1	I/O	-	<1V	Analog	Running	Running	Running	Running
RTCX2	I/O	-	<1V	Analog	Running	Running	Running	Running
IVCCRTCEXT	I/O	-	1.5V	Analog	Analog	Analog	Analog	Analog
RTC_RST_B	I	-	3.3V	CMOS3.3	V <sub>IH</sub>	V <sub>IH</sub>	V <sub>IH</sub>	V <sub>IH</sub>
RTC_EXT_CLK_EN_B	I	-	3.3V	CMOS3.3	V <sub>IH</sub> /V <sub>IL</sub>	V <sub>IH</sub> /V <sub>IL</sub>	V <sub>IH</sub> /V <sub>IL</sub>	V <sub>IH</sub> /V <sub>IL</sub>

## 2.13 Power Management Signals

See Chapter 8.0, “Power Management” for more details of the Power Management interface signals.

**Table 18. Power Management Interface Signals**

Signal Name	Dir	Term	Power	Type	Default Buffer State			
					S4/S5	S3	Reset	Enter S0

## 2.14 JTAG and Debug Interface Signals

See Chapter 1.0, “Debug Port and JTAG/TAP” for more details of the JTAG interface signals.

**Table 19. JTAG and Debug Interface Signals**

Signal Name	Dir	Term	Power	Type	Default Buffer State			
					S4/S5	S3	Reset	Enter S0
TCK	I	20k(L)	3.3V	CMOS3.3	Pull-down	Pull-down	Pull-down	Pull-down
TDI	I	20k(H)	3.3V	CMOS3.3	Pull-up	Pull-up	Pull-up	Pull-up
TDO	O	Ext	3.3V	CMOS3.3	Pull-up	Pull-up	Pull-up	Pull-up
TMS	I	20k(H)	3.3V	CMOS3.3	Pull-up	Pull-up	Pull-up	Pull-up
TRST_B	I	20k(H)	3.3V	CMOS3.3	Pull-up	Pull-up	Pull-up	Pull-up
PRDY_B	O	-	3.3V	CMOS3.3	Off	Off	V <sub>OH</sub>	V <sub>OH</sub>
PREQ_B	I	20k(H)	3.3V	CMOS3.3	Pull-up	Pull-up	Pull-up	Pull-up

## 2.15 Legacy Interface Signals

See Chapter 19.0, “I<sup>2</sup>C\* Controller/GPIO Controller” and Chapter 21.0, “Legacy Bridge” for more details of the legacy interface signals.

**Table 20. Legacy Interface Signals**

Signal Name	Dir	Term	Power	Type	Default Buffer State			
					S4/S5	S3	Reset	Enter S0
CLK14	I	-	3.3V	CMOS3.3	Off	Off	Unknown/Running	Unknown/Running
WAKE_B	I	20k(H)	3.3V	CMOS3.3_OD	Off	Pull-up	Pull-up	Pull-up
GPE_B	I	20k(H)	3.3V	CMOS3.3_OD	Off	Pull-up	Pull-up	Pull-up
THRM_B	I	20k(H)	3.3V	CMOS3.3	Off	Off	Pull-up	Pull-up
SMI_B	I	20k(H)	3.3V	CMOS3.3	Off	Off	Pull-up	Pull-up

## 2.16 General Purpose I/O Interface Signals

All GPIOs default to inputs. GPIO\_SUS[5:0] are suspend well GPIOs and remain available in S3. The default buffer state of these GPIOs while in S3 and when entering S0 from S3 is configuration dependent.

**Table 21. General Purpose I/O Signals**

Signal Name	Dir	Term	Power	Type	Default Buffer State			
					S4/S5	S3	Reset	Enter S0
GPIO_SUS[5:0]	I/O	-	3.3V	CMOS3.3	Off	Unknown	V <sub>ix</sub>	V <sub>ix</sub> /Unknown
GPIO[9:0]	I/O	-	3.3V	CMOS3.3	Off	Off	V <sub>ix</sub>	V <sub>ix</sub>

## 2.17 Power And Ground Pins

**Table 22. Power and Ground Pins (Sheet 1 of 2)**

Signal Name	Nominal Voltage	Lowest Active State	Description/Notes
OVOUT_1P0_S5	1.0V	S5	Unused output from internal LDO. Leave this pin No Connect
VCC1P0_S5			Standard 1.0V Rail for S5 Logic
VCCAICLKCB_1P0			ICLK Control Supply
VCCAICLKDBUFF_1P0			ICLK Differential Output Buffer Supply
VCCAICLKSSC1_1P0			ICLK SSC Supply
VCCDICKDIG_1P0			ICLK Digital Supply
VCCAICLKSFR_1P5			1.5V
OVOUT_1P8_S5	1.8V		S5 1.8V Rail Standby LDO Output
VCC1P8_S5			S5 1.8V CFIO Supply
VCC3P3_S5	3.3V		S5 3.3V Rail Standby LDO Input
VCCAICLKSE_3P3			ICLK Single Ended Output Buffer Supply
OVOUT_1P0_S3	1.0V	S3	S3 1.0V Rail Standby LDO Output
VCC1P0_S3			Standard 1.0V Rail for S3 logic
VCCCLKDDR_1P5	1.5V		DDR IO Clock Analog Thick Gate Isolated Quiet Supply
VCCDDR_1P5			DDR IO Analog Thick Gate Supply
OVOUT_1P8_S3	1.8V		S3 1.8V Rail Standby LDO Output
VCC1P8_S3			S3 1.8V CFIO Supply
VCCAUSB_1P8_S3			USB 1.8V Supply
VCC3P3_S3	3.3V		S3 3.3V Rail Standby LDO Input
VCC3P3_USB_S3			USB 3.3V Supply The USB PHY resides in the S3 power domain. However, from a functional point of view USB is only active in S0.

**Table 22. Power and Ground Pins (Sheet 2 of 2)**

Signal Name	Nominal Voltage	Lowest Active State	Description/Notes
VCC1P0_S0	1.0V	S0	Standard 1.0V Rail for HPLL (Host PLL) and USB Logic
VCCACKDDR_1P0			DDR IO Digital Clock Isolated Quiet Supply
VCCADDR_1P0			DDR IO Digital Supply
VCCADLLDDR_1P0			DDR IO Digital Isolated Quiet Supply
VCCAPCIE_1P0			PCIe Analog Supply
VCCAVISA_1P0			VISA IO Analog Supply
VCCPLLDDR_1P0			DDR IO Digital PLL High Voltage
VNN			Default 1.0V Standard Cell Rail including Core and Uncore Logic
OVOUT_1P05_S0	1.05V		S0 1.05V Rail Standby LDO Output
VCCFHSOC_1P05			SoC Fuses Supply
VCCFSOC_1P05			Fuse Digital Sensing
VCC1P5_S0	1.5V		PCIe Band-Gap Supply
VCCSFRPLDDR_1P5			DDR IO PLL High Voltage
OVOUT_1P8_S0	1.8V		S0 1.8V Rail Standby LDO Output
OVOUT_1P8_SLDO			S0 1.8V Rail Standby LDO Output (Currently Unused)
VCC1P8_S0			S0 1.8V CFIO Supply
VCCAA_1P8			1.8V Analog Supply
VCCAUSB_1P8			USB 1.8V Analog Supply
VCC3P3_A			3.3V
VCC3P3_S0	S0 3.3V Rail Standby LDO Input		
VCCRTC3P3	3.3V	G3	RTC Well Supply To be active in G3, the source supply for VCCRTC3P3 must be a 3.0V coin cell battery or equivalent. If the target application does not require the RTC to be operational in G3, VCCRTC3P3 should be supplied from a 3.3V supply that is active in S5.
VSS	0V	-	Ground
VSSA_USB			USB Low-Noise Ground

## 2.18 Hardware Straps

The pins used for hardware straps are output pins in functional mode. Initially during a cold boot, these strap pins are configured as inputs. These pins remain inputs until the external pull up or pull down values are sampled during S0 Power OK. Once sampled, the pins are enabled as outputs only.

Table 23. Hardware Straps

Signal Name	Default	Strap Description
SPIO_MOSI	1b	Reports the Strap status of Recovery Mode: 0 = Recovery Mode 1 = Normal Mode
{SPIO_SCK, SPI1_MOSI}	11b	Defines Memory Device Density 00b = Reserved 01b = 1Gb 10b = 2Gb 11b = 4Gb
LSPI_MOSI	1b	Defines the Number of Ranks Enabled 0b = 1 Rank 1b = 2 Ranks
{MAC0_TXDATA[1], MAC0_TXDATA[0], MAC1_TXDATA[1]}	010b	Frequency SKU Power Optimize Mode [2:1] CPU Clock/DDR Clock 00b = Reserved 01b = 400MHz/800MHz 10b = 200MHz/800MHz 11b = 100MHz/800MHz [0] 0b = Low Latency 1b = Low Power
MAC1_TXDATA[0]	0b	0b = FFF0_0000h 1b = FFD0_0000h
{LSPI_SCK, SD_CLK}	00b	SDIO Slot Type 00b = Removable Card Slot 01b = Embedded Slot for One Device 10b = Shared Bus Slot 11b = Reserved
PWR_BTN_B	0b	Power Button Disable 0b = Power Button Disabled 1b = Power Button Enabled

## 4.0 Electrical Characteristics

This chapter contains the DC and AC characteristics for Intel® Quark™ SoC X1000. AC timing diagrams are included.

### 4.1 Absolute Maximum Ratings

Table 26 specifies the absolute maximum and minimum ratings of the Intel® Quark™ SoC X1000 processor. At conditions outside of the functional operating condition limits, but within the absolute maximum and minimum ratings, neither functionality nor long-term reliability can be expected. If a device is returned to conditions within the functional operating limits after having been subjected to conditions outside these limits (but within the absolute maximum and minimum ratings) the device may be functional, but with its lifetime degraded depending on exposure to conditions exceeding the functional operating condition limits.

At conditions exceeding the absolute maximum and minimum ratings, neither functionality nor long-term reliability can be expected. Moreover, if a device is subjected to these conditions for any length of time, it will either not function or its reliability will be severely degraded when returned to conditions within the functional operating condition limits.

Although the SoC contains protective circuitry to resist damage from Electrostatic Discharge (ESD), precautions should always be taken to avoid high static voltages or electric fields.

All voltage values are given with respect to VSS.

**Table 26. Intel® Quark™ SoC X1000 Absolute Maximum Voltage Ratings (Sheet 1 of 2)**

Parameter	Minimum Limits	Maximum Limits
<b>Temperature</b>		
Junction Temperature (C)	0	110
Storage Temperature Range (C)	-55	125
<b>Supplies</b>		
3.3V Supply Voltage (V)	—	3.7
1.8V Supply Voltage (V)	—	2.0
1.5V Supply Voltage (V)	—	1.65
1.05V Supply Voltage (V)	—	1.3
1.0V Supply Voltage (V)	—	1.3
<b>Signals</b>		
Voltage on any 3.3 V Pin (V)	—	3.7 V

**Table 26. Intel® Quark™ SoC X1000 Absolute Maximum Voltage Ratings (Sheet 2 of 2)**

Parameter	Minimum Limits	Maximum Limits
Voltage on any 1.8 V Pin (V)	—	2.0
Voltage on any 1.5 V Pin (V)	—	1.65
Voltage on any 1.0V Tolerant Pin (V)	—	1.3

## 4.2 Recommended Power Supply Ranges

Table 27 shows the recommended operating voltage ranges for each SoC supply pin. Typically total tolerance (DC+AC +Ripple) is +/- 5% of the nominal value unless otherwise stated.

**Table 27. Power Supply Rail Ranges (Sheet 1 of 2)**

Package Ball	Description	Min (V)	Nom (V)	Max (V)	Notes
VCC3P3_S5	S5 3.3V rail Standby LDO input	3.20	3.30	3.40	+/-3%
VCC3P3_S3	S3 3.3V rail Standby LDO input	3.20	3.30	3.40	+/-3%
VCC3P3_S0	S0 3.3V rail Standby LDO input	3.20	3.30	3.40	+/-3%
VCC3P3_A	S0 3.3V rail Standby LDO input	3.20	3.30	3.40	+/-3%
VNN	Default 1.0V standard cell rail including Core and Uncore logic	0.95	1.00	1.10	Active in state S0 only
VCC1P0_S3	Standard 1.0V rail for S3 logic	0.95	1.00	1.05	+/-5%
VCC1P0_S5	Standard 1.0V rail for S5 logic	0.95	1.00	1.05	+/-5%
VCCPLDDR_1P0	DDR IO digital PLL high voltage	0.95	1.00	1.05	+/-5%
VCCADLLDDR_1P0	DDR IO digital isolated quiet supply	0.95	1.00	1.05	+/-5%
VCCCLKDDR_1P0	DDR IO digital clock isolated quiet supply	0.95	1.00	1.05	+/-5%
VCCADDR_1P0	DDR IO Digital supply	0.95	1.00	1.05	+/-5%
VCCDDR_1P5	DDR IO analog thick gate supply	1.42	1.50	1.57	+/-5%
VCCSFRPLDDR_1P5	DDR IO PLL high voltage	1.42	1.50	1.57	+/-5%
VCCCLKDDR_1P5	DDR IO clock analog thick gate isolated quiet supply	1.42	1.50	1.57	+/-5%
VCCAPCIE_1P0	PCIe analog supply	0.95	1.00	1.05	+/-5%
VCC1P5_S0	PCIe band-gap supply	1.42	1.50	1.57	+/-5%
VCC1P8_S0	S0 1.8V CFIO supply	1.71	1.80	1.89	+/-5%
VCC1P8_S3	S3 1.8V CFIO supply	1.71	1.80	1.89	+/-5%
VCC1P8_S5	S5 1.8V CFIO supply	1.71	1.80	1.89	+/-5%
VCCRTC_3P3	RTC well supply	2.00	-	3.40	+/-5%
VCCAUSB_1P8_S3	USB 1.8V analog supply - suspend rail	1.71	1.80	1.89	+/-5%
VCC3P3_USB_S3	USB 3.3V supply - suspend rail	3.13	3.30	3.46	+/-5%
VCCAUSB_1P8	USB 1.8V supply	1.71	1.80	1.89	+/-5%
VSSA_USB	USB low-noise ground	0.00	0.00	0.00	+/-5%
VCCAA_1P8	1.8V analog supply	1.71	1.80	1.89	+/-5%
VCC1P0_S0	Standard 1.0V rail for HPLL (host PLL) and USB logic	0.95	1.00	1.05	Active in S0-only; can in general be connected to VNN

Table 27. Power Supply Rail Ranges (Sheet 2 of 2)

Package Ball	Description	Min (V)	Nom (V)	Max (V)	Notes
VCCAVISA_1P0	VISA IO analog supply	0.95	1.00	1.05	+/-5%
VCCFHVSOC_1P05	SoC Fuses supply (sensing)	1.0	1.05	1.10	+/-5%
VCCFSOC_1P05	Fuse digital sensing	1.0	1.05	1.10	+/-5%
VCCAICLKCB_1P0	ICLK control supply	0.95	1.00	1.05	+/-5%
VCCAICLKSSC1_1P0	ICLK SSC supply	0.95	1.00	1.05	+/-5%
VCCAICLKDBUFF_1P0	ICLK differential output buffer supply	0.95	1.00	1.05	+/-5%
VCCDICKDIG_1P0	ICLK digital supply	0.95	1.00	1.05	+/-5%
VCCAICLKSF_1P5	ICLK SFR (for oscillator, IPLL)	1.42	1.50	1.57	+/-5%
VCCAICLKSE_3P3	ICLK single ended output buffer supply	3.13	3.30	3.46	+/-5%

### 4.3 Maximum Supply Current

Table 28. Maximum Supply Current: ICC Max (Sheet 1 of 2)

Voltage Rail	Voltage (V)	I <sub>CC</sub> Max (mA)
VCC3P3_S5	3.3	180
VCC3P3_S3	3.3	280
VCC3P3_S0	3.3	680
VCC3P3_A	3.3	5
VNN	1.0	480
VCC1P0_S3	1.0	70
VCC1P0_S5	1.0	40
VCCPLDDR_1P0	1.0	25
VCCADLLDDR_1P0	1.0	100
VCCACKDDR_1P0	1.0	15
VCCADDR_1P0	1.0	300
VCCDDR_1P5	1.5	580
VCCSFRPLDDR_1P5	1.5	35
VCCCLKDDR_1P5	1.5	90
VCCAPCIE_1P0	1.0	330
VCC1P5_S0	1.5	120
VCC1P8_S0	1.8	50
VCC1P8_S3	1.8	110
VCC1P8_S5	1.8	15
VCCRTC_3P3	3.3	3
VCCRTC_3P3 (Battery)	3.0	6uA
VCCAUSB_1P8_S3	1.8	20
VCC3P3_USB_S3	3.3	40
VSSA_USB	0.0	20

**Table 28. Maximum Supply Current: ICC Max (Sheet 2 of 2)**

Voltage Rail	Voltage (V)	I <sub>CC</sub> Max (mA)
VCCAA_1P8	1.8	10
VCC1P0_S0	1.0	120
VCCAVISA_1P0	1.0	280
VCCFHVSOC_1P05	1.05	100
VCCFSOC_1P05	1.05	40
VCCAICLKB_1P0	1.0	40
VCCAICLKSSC1_1P0	1.0	15
VCCAICLKDBUFF_1P0	1.0	30
VCCDICKDIG_1P0	1.0	15
VCCAICLSFR_1P5	1.5	40
VCCAICLKSE_3P3	3.3	15
VCCAUSB_1P8	1.8	20

### 4.4 Configurable IO Characteristics

The signals in Table 30 are brought on- and off-chip via standard configurable IO groups. This section describes the DC and AC characteristics associated with these signals.

**Table 30. Configurable IO (CFIO) Bi-directional Signal Groupings**

Group Name	Interfaces	Related Supply (V <sub>CC</sub> )	Signals
S0 CFIO Group 0	SPI Legacy SPI	VCCCFIO_0_3P3	SPI0_MOSI, SPI0_MISO, SPI0_SS_B, SPI0_SCK, SPI1_MOSI, SPI1_MISO, SPI1_SS_B, SPI1_SCK LSPI_MOSI, LSPI_MISO, LSPI_SS_B, LSPI_SCK
S0 CFIO Group 1	UART	VCCCFIO_1_3P3	SIU0_CTS_B, SIU0_DCD_B, SIU0_DSR_B, SIU0_DTR_B, SIU0_RI_B, SIU0_RTS_B, SIU0_RXD, SIU0_TXD, SIU1_CTS_B, SIU1_RTS_B, SIU1_RXD, SIU1_TXD
S0 CFIO Group 2	USB GPIO	VCCCFIO_2_3P3	USB_OC_0, USB_OC_1, USB_PWR_EN[0], USB_PWR_EN[1] GPIO[0], GPIO[1], GPIO[2], GPIO[3], GPIO[4], GPIO[5], GPIO[6], GPIO[7], GPIO[8], GPIO[9]
S0 CFIO Group 3	SDIO	VCCCFIO_3_3P3	SD_DATA[0], SD_DATA[1], SD_DATA[2], SD_DATA[3], SD_DATA[4], SD_DATA[5], SD_DATA[6], SD_DATA[7], SD_CMD, SD_CLK, SD_WP, SD_CD_B,
S0 CFIO Group 4	SDIO Ethernet MAC	VCCCFIO_4_3P3	SD_LED, SD_PWR_B MAC0_TXDATA[1], MAC0_TXDATA[0], MAC0_RXDV, MAC0_RXDATA[1], MAC0_RXDATA[0], MAC1_TXDATA[1], MAC1_TXDATA[0], MAC1_RXDV, MAC1_RXDATA[1], MAC1_RXDATA[0]

**Table 30. Configurable IO (CFIO) Bi-directional Signal Groupings**

Group Name	Interfaces	Related Supply (V <sub>CC</sub> )	Signals
S0 CFIO Group 5	Ethernet MAC I2C Legacy	VCCCFIO_5_3P3	MAC0_TXEN, MAC0_MDC, MAC0_MDIO, MAC1_TXEN, MAC1_MDC, MAC1_MDIO I2C_DATA, I2C_CLK THRM_B, SMI_B, RMII_REF_CLK, CLK14
S3 CFIO Group	Legacy Power Management Suspend GPIOs	VCCCFIO_S3_3P3	RESET_BTN_B, WAKE_B, GPE_B S0_3V3_EN, S0_1V5_EN, S0_1V0_EN GPIO_SUS[0], GPIO_SUS[1], GPIO_SUS[2], GPIO_SUS[3], GPIO_SUS[4], GPIO_SUS[5]
S5 CFIO Group	JTAG/Debug Power Management	VCCCFIO_S5_3P3	TCK, TDI, TDO, TMS, TRST_B PWR_BTN_B, S3_3V3_EN, S3_1V5_EN, ODRAM_PWROK, OSYSPWRGOOD, PRDY_B, PREQ_B

**Table 31. CFIO DC Characteristics**

Type	Symbol	Parameter	Min	Max	Unit	Condition	Notes
This data applies to all signals in <a href="#">Table 30</a> . To determine the correct V <sub>CC</sub> supply for a signal use the related supply shown in <a href="#">Table 30</a>							
	V <sub>CC</sub>	Supply Voltage Reference	3.13	3.49	V		
Input	V <sub>IH</sub>	Input High Voltage	0.625 x V <sub>CC</sub>	V <sub>CC</sub> + 0.3	V		2
	V <sub>IL</sub>	Input Low Voltage	—	0.25 x V <sub>CC</sub>	V		2
	I <sub>IL</sub>	Input Leakage Current	—	35	uA		
	C <sub>IN</sub>	Input Pin Capacitance	—	10	pF		
Output	V <sub>OH</sub>	Output High Voltage	0.75 x V <sub>CC</sub>	—	V	I <sub>out</sub> =2mA	1, 2
	V <sub>OL</sub>	Output Low Voltage	—	0.125 x V <sub>CC</sub>	V	I <sub>out</sub> =-2mA	2

**Notes:**

- The V<sub>OH</sub> specification does not apply to open-collector or open-drain drivers. Signals of this type must have an external pull-up resistor, and that's what determines the high-output voltage level. Refer to Chapter 2 for details on signal types.
- Input characteristics apply when a signal is configured as Input or to signals that are only Inputs. Output characteristics apply when a signal is configured as an Output or to signals that are only Outputs. Refer to Chapter 2 for details on signal types.

**Table 32. CFIO AC Characteristics**

Type	Symbol	Parameter	Min	Max	Units	Conditions
This data applies to all signals in <a href="#">Table 30</a> . To determine the correct V <sub>CC</sub> supply for a signal use the related supply shown in <a href="#">Table 30</a>						
	V <sub>CC</sub>	Supply Voltage Reference	3.13	3.49	V	
Output	S <sub>RISE</sub>	Slew Rate Rise	0.5	3.0	V/ns	C <sub>LOAD</sub> = 10pF
	S <sub>FALL</sub>	Slew Rate Fall	0.5	3.0	V/ns	C <sub>LOAD</sub> = 10pF
	T <sub>RISE</sub>	Output Rise Time	0.88	5.28	ns	0.10*V <sub>CC</sub> - 0.90*V <sub>CC</sub>
	T <sub>FALL</sub>	Output Fall Time	0.88	5.28	ns	0.90*V <sub>CC</sub> - 0.10*V <sub>CC</sub>

## 4.5 RTC DC Characteristics

Table 33. RTC DC Characteristics

Type	Symbol	Parameter	Min	Max	Unit	Condition	Notes
<b>Associated Signals:</b> RTCRST_B <b>Related Supply (V<sub>CC</sub>):</b> VCCRTC_3P3							
Input	V <sub>CC</sub>	Supply Voltage Reference	2.00	3.40	V	N/A	
	V <sub>IH</sub>	Input High Voltage	.7 x V <sub>CC</sub>	V <sub>CC</sub> + 0.5	V	N/A	2
	V <sub>IL</sub>	Input Low Voltage	-0.5	0.78	V	N/A	2
	C <sub>IN</sub>	Input Pin Capacitance	—	3	pF	N/A	
<b>Associated Signals:</b> S5_PG, RTC_EXT_CLK_EN_B, S0_PG <b>Related Supply (V<sub>CC</sub>):</b> VCCRTC_3P3							
Input	V <sub>CC</sub>	Supply Voltage Reference	2.0	3.40	V	N/A	
	V <sub>IH</sub>	Input High Voltage	2.0	V <sub>CC</sub> + 0.5	V	N/A	2
	V <sub>IL</sub>	Input Low Voltage	-0.5	0.78	V	N/A	2
	C <sub>IN</sub>	Input Pin Capacitance	—	3	pF	N/A	

## 4.6 PCI Express\* 2.0 DC/AC Characteristics

Table 34. PCI Express\* 2.0 Differential Signal DC Characteristics

Symbol	Parameter	Min	Max	Unit	Figures	Notes
<b>Associated Signals:</b> PCIE_PERN[1], PCIE_PERP[1], PCIE_PETN[1], PCIE_PETP[1], PCIE_PERN[0], PCIE_PERP[0], PCIE_PETN[0], PCIE_PETP[0] <b>Related Supply (V<sub>CC</sub>):</b> VCCAPCIE_1P0						
V <sub>TX-DIFF P-P</sub>	Differential Peak to Peak Output Voltage	0.8	1.2	V		1
V <sub>TX-DIFF P-P - Low</sub>	Low power differential Peak to Peak Output Voltage	0.4	1.2	V		
V <sub>TX-CM-ACp</sub>	TX AC Common Mode Output Voltage (2.5GT/s)	—	20	mV		
Z <sub>TX-DIFF-DC</sub>	DC Differential TX Impedance	80	120	Ω		
V <sub>RX-DIFF p-p</sub>	Differential Input Peak to Peak Voltage	0.175	1.2	V		1
V <sub>RX-CM-ACp</sub>	AC peak Common Mode Input Voltage	—	150	mV		

**Notes:**

1. PCI Express mVdiff p-p = 2\*|PETP[x] - PETN[x]|; PCI Express mVdiff p-p = 2\*|PERP[x] - PERN[x]|

Table 35. PCI Express\* 2.0 Interface Timings

Symbol	Parameter	Min	Max	Unit	Figures	Notes
<b>Transmitter and Receiver Timings</b>						
UI	Unit Interval – PCI Express*	399.88	400.12	ps		5,6
$T_{TX-EYE}$	Minimum Transmission Eye Width	0.7	—	UI	5	1,2,6
$T_{TX-RISE/Fall}$	D+/D- TX Out put Rise/Fall time	0.125		UI		1,2,6
$T_{RX-EYE}$	Minimum Receiver Eye Width	0.40	—	UI	6	3,4,6

**Notes:**

- Specified at the measurement point into a timing and voltage compliance test load and measured over any 250 consecutive TX UIs. (Also refer to the Transmitter compliance eye diagram)
- A  $T_{TX-EYE} = 0.70$  UI provides for a total sum of deterministic and random jitter budget of  $T_{TXJITTER-MAX} = 0.30$  UI for the Transmitter collected over any 250 consecutive TX UIs. The  $T_{TXEYE-MEDIAN-to-MAX-JITTER}$  specification ensures a jitter distribution in which the median and the maximum deviation from the median is less than half of the total TX jitter budget collected over any 250 consecutive TX UIs. It should be noted that the median is not the same as the mean. The jitter median describes the point in time where the number of jitter points on either side is approximately equal as opposed to the averaged time value.
- Specified at the measurement point and measured over any 250 consecutive UIs. The test load documented in the PCI Express\* specification 2.0 should be used as the RX device when taking measurements (also refer to the Receiver compliance eye diagram). If the clocks to the RX and TX are not derived from the same reference clock, the TX UI recovered from 3500 consecutive UI must be used as a reference for the eye diagram.
- A  $T_{RX-EYE} = 0.40$  UI provides for a total sum of 0.60 UI deterministic and random jitter budget for the Transmitter and interconnect collected any 250 consecutive UIs. The  $T_{RX-EYE-MEDIAN-to-MAX-JITTER}$  specification ensures a jitter distribution in which the median and the maximum deviation from the median is less than half of the total 0.6 UI jitter budget collected over any 250 consecutive TX UIs. It should be noted that the median is not the same as the mean. The jitter median describes the point in time where the number of jitter points on either side is approximately equal as opposed to the averaged time value. If the clocks to the RX and TX are not derived from the same reference clock, the TX UI recovered from 3500 consecutive UI must be used as the reference for the eye diagram.
- Nominal Unit Interval is 400 ps for 2.5 GT/s.
- Intel® Quark™ SoC X1000 supports PCI Gen 1 timing only: 2.5 GT/s

## 4.8 General Interface Timing

### 4.8.1 Legacy SPI Interface Timing

**Table 38. Legacy SPI Interface Timings (20 MHz) (Sheet 1 of 2)**

Sym	Parameter	Min	Max	Units	Fig
F	Serial Clock Frequency - 20M Hz Operation	—	20	MHz	
T <sub>CH</sub>	LSPI_SCK high time	20	—	ns	10
T <sub>CL</sub>	LSPI_SCK low time	30	—	ns	10
T <sub>DSCR</sub>	Setup of LSPI_MISO with respect to LPSI_SCK rising edge	11.7	—	ns	10
T <sub>CRDH</sub>	Hold time of LSPI_MISO with respect to LPSI_SCK rising edge	-3.0	—	ns	10
T <sub>CFDV</sub>	LSPI_SCK falling edge to LSPI_MOSI valid	-1.9	2.5	ns	10

**Table 38. Legacy SPI Interface Timings (20 MHz) (Sheet 2 of 2)**

Sym	Parameter	Min	Max	Units	Fig
T <sub>CFSF</sub>	LSPI_SCK falling edge to LSPI_SS_B low	-1.6	2.4	ns	10
T <sub>CFSR</sub>	LSPI_SCK falling edge to LSPI_SS_B high	-1.7	2.3	ns	10

**Notes:**

1. All input signals have a slope of 1.0ns measured between 20% and 80% V<sub>CC</sub> values.
2. All output signals are loaded with 20pF.
3. Measurements are made at 50% V<sub>CC</sub> levels.

### 4.8.2 SPI0/1 Interface Timing

**Table 39. SPI0/1 Interface Timings (25 MHz)**

Sym	Parameter	Min	Max	Units	Fig
F	Serial Clock Frequency - 25MHz Operation	—	25	MHz	
T <sub>CH</sub>	SPI0/1_SCK high time	20	—	ns	10
T <sub>CL</sub>	SPI0/1_SCK low time	20	—	ns	10
T <sub>DSCR</sub>	Setup of SPI0/1_MISO with respect to SPI0/1_SCK capturing edge	10.7	—	ns	10
T <sub>CRDH</sub>	Hold time of SPI0/1_MISO with respect to SPI0/1_SCK capturing edge	-2.5	—	ns	10
T <sub>CFDV</sub>	SPI0/1_SCK driving edge to SPI0/1_MOSI valid	-0.8	3.5	ns	10
T <sub>SSCF</sub>	Setup of SPI0/1_SS_B with respect to first edge out of inactive state of SPI0/1_SCK	20	—	ns	10
T <sub>CLSH</sub>	Hold of SPI0/1_SS_B with respect to last edge into inactive state of SPI0/1_SCK	20	—	ns	10

**Note:**

1. All input signals have a slope of 1.0ns measured between 20% and 80% V<sub>CC</sub> values
2. All output signals are loaded with 20pF
3. Measurements are made at 50% V<sub>CC</sub> levels
4. Driving edge and capturing edge of SPI0/1\_SCK are determined by SPI Control Register 1 settings SSCR1.SPH and SSCR1.SPO; [Figure 10](#) shows SPI\_SCK rising edge as the driving edge and SPI\_SCK falling edge as the capturing edge by way of example

Figure 10. SPI Interface Timing

### 4.8.3 SDIO Interface Timing

Table 40. SDIO Timing

Sym	Parameter	Min	Max	Units	Notes	Fig
F	Operating Frequency SD_CLK	-	50	MHz		
$T_{CH}$	Clock High Time SD_CLK	10	-	ns		11
$T_{CL}$	Clock Low Time SD_CLK	10	-	ns		11
$T_{DSCR}$	SD_DATA[7:0]/SD_CMD setup time with respect to SD_CLK rising	0.6	-	ns		11
$T_{CRDH}$	SD_DATA[7:0]/SD_CMD hold time with respect to SD_CLK rising	1.6	-			11
$T_{CFDV}$	SD_CLK falling to data valid on SD_DATA[7:0]/SD_CMD	-2.0	2.7	ns		11

**Note:**

1. All input signals have a slope of 1.0ns measured between 20% and 80%  $V_{CC}$  values
2. All output signals are loaded with 20pF
3. Measurements are made at 50%  $V_{CC}$  levels

Figure 11. SDIO Interface Timing

## 4.9 Clock AC Timing

### 4.9.1 Reference Clock AC Characteristics

Table 41. Reference Clocks AC Characteristics (Sheet 1 of 2)

Parameter	Description	Min	Max	Units	Notes	Fig
<b>Associated Signals:</b> REF0_OUTCLK_P, REF0_OUTCLK_N, REF1_OUTCLK_P, REF1_OUTCLK_N						
<b>Related Supply:</b> VCCAICLKDBUFF_1P0						
$T_{SLEW\_RISE}$	Rising slew rate	1.5	8.0	V/ns	2,3,10	12
$T_{SLEW\_FALL}$	Falling slew rate	1.5	8.0	V/ns	2,3,10	12
$P_{SLEW\_VAR}$	Slew rate matching	-	20	%	1,9,10	12
$V_{SWING}$	Differential output swing	300	-	mV	2,11	12
$V_{CROSS}$	Crossing point voltage	300	550	mV	1,4,5,11	12
$V_{CROSS\_DELTA}$	$V_{CROSS}$ variation	-	140	mV	1,4,8,11	12
$V_{MAX}$	Maximum output voltage	-	1.15	V	1,6,11	12

Table 41. Reference Clocks AC Characteristics (Sheet 2 of 2)

Parameter	Description	Min	Max	Units	Notes	Fig
V <sub>MIN</sub>	Minimum output voltage	-0.3	-	V	1,7,11	12
P <sub>DTY_CYC</sub>	Duty Cycle	40	60	%	2,10	12

**Note:**

1. Measurement taken from a single-ended waveform on a component test board
2. Measurement taken from a differential waveform on a component test board
3. Slew rate measured through V<sub>SWING</sub> voltage measured at differential zero
4. VCROSS is defined as the voltage where CLK\_P = CLK\_N
5. Only applies to differential rising edge (CLK\_P rising, CLK\_N falling)
6. The maximum voltage including over-shoot
7. The minimum voltage including under-shoot
8. The total variation of all VCROSS measurements in any particular system
9. Matching applies to rising edge rate for CLK\_P and falling edge rate for CLK\_N; It is measured using a ±75mV window centered on the average cross point where CLK\_P rising meets CLK\_N falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations
10. Average measurement
11. Instantaneous measurement

Figure 12. Measurement Points for Differential Clocks<sup>1</sup>

## 5.0 Register Access Methods

There are six different common register access methods:

- [Fixed I/O Register Access](#)
- [Fixed Memory Mapped Register Access](#)
- [I/O Referenced Register Access](#)
- [Memory Referenced Register Access](#)
- [PCI Configuration Register Access](#) (Indirect - via Memory or I/O registers)
- [Message Bus Register Access](#) (Indirect - via PCI Configuration Registers)

### 5.1 Fixed I/O Register Access

Fixed I/O registers are accessed by specifying their 16-bit address in a PORT IN and/or PORT OUT transaction from the CPU core. This allows direct manipulation of the registers. Fixed I/O registers are unmovable registers in I/O space.

**Table 42. Fixed I/O Register Access Method Example (NSC Register)**

<b>Type:</b> I/O Register (Size: 8 bits)	<b>NSC:</b> 61h
---	-----------------

### 5.2 Fixed Memory Mapped Register Access

Fixed Memory Mapped I/O (MMIO) registers are accessed by specifying their 32-bit address in a memory transaction from the CPU core. This allows direct manipulation of the registers. Fixed MMIO registers are unmovable registers in memory space.

**Table 43. Fixed Memory Mapped Register Access Method Example (IDX Register)**

<b>Type:</b> Memory Mapped I/O Register (Size: 32 bits)	<b>IDX:</b> FEC0000h
--	----------------------

### 5.3 I/O Referenced Register Access

I/O referenced registers use programmable base address registers (BARs) to select a range of I/O addresses that it uses to decode PORT IN and/or PORT OUT transactions from the CPU to directly access a register. Thus, the I/O BARs act as pointers to blocks of actual I/O registers. To access an I/O referenced register for a specific I/O base address, start with that base address and add the register's offset. Example pseudocode for an I/O referenced register read is shown below:

```
Register_Snapshot = IOREAD([IO_BAR]+Register_Offset)
```

Base address registers are often located in the PCI configuration space and are programmable by the BIOS/OS. Other base address register types may include fixed memory registers, fixed I/O registers or message bus registers.

Table 44. Referenced I/O Register Access Method Example (PM1S Register)

<b>Type:</b> I/O Register (Size: 16 bits)	<b>PM1S:</b> [PM1BLK] + 0h
	<b>PM1BLK Type:</b> PCI Configuration Register (Size: 32 bits)
	<b>PM1BLK Reference:</b> [B:0, D:31, F:0] + 48h

### 5.4 Memory Referenced Register Access

The SoC uses programmable base address registers (BARs) to set a range of physical address (memory) locations that it uses to decode memory reads and writes from the CPU to directly access a register. These BARs act as pointers to blocks of actual memory mapped I/O (MMIO) registers. To access a memory referenced register for a specific base address, start with that base address and add the register’s offset. Example pseudocode for a read is shown below:

```
Register_Snapshot = MEMREAD([Mem_BAR]+Register_Offset)
```

Base address registers are often located in the PCI configuration space and are programmable by the BIOS/OS. Other common base address register types include fixed memory registers and I/O registers that point to MMIO register blocks.

Table 45. Memory Mapped Register Access Method Example (ESD Register)

<b>Type:</b> Memory Mapped I/O Register (Size: 32 bits)	<b>ESD:</b> [RCBA] + 4h
	<b>RCBA Type:</b> PCI Configuration Register (Size: 32 bits)
	<b>RCBA Reference:</b> [B:0, D:31, F:0] + F0h

### 5.5 PCI Configuration Register Access

Access to PCI configuration space registers is performed through one of two different configuration access methods (CAMs):

- I/O indexed - PCI CAM
- Memory mapped - PCI Enhanced CAM (ECAM)

Each PCI function (see Section 6.3, “PCI Configuration Space” on page 97) has a standard PCI header consisting of 256 bytes for the I/O access scheme (CAM), or 4096 bytes for the enhanced memory access method (ECAM). Invalid read accesses return binary strings of 1s.

Table 46. PCI Register Access Method Example (PCI\_DEVICE\_VENDOR Register)

<b>Type:</b> PCI Configuration Register (Size: 32 bits)	<b>PCI_DEVICE_VENDOR:</b> [B:0, D:31, F:0] + 0h
--	---

#### 5.5.1 PCI Configuration Access - CAM: I/O Indexed Scheme

Accesses to configuration space using the I/O method rely on two 32-bit I/O registers:

- **CONFIG\_ADDRESS** - I/O Port CF8h
- **CONFIG\_DATA** - I/O Port CFCh

These two registers are both 32-bit registers in I/O space. Using this indirect access mode, software uses CONFIG\_ADDRESS (CF8h) as an index register, indicating which configuration space register to access, and CONFIG\_DATA (CFCh) acts as a window to

the register pointed to in CONFIG\_ADDRESS. Accesses to CONFIG\_ADDRESS (CF8h) are internally captured. Upon a read or write access to CONFIG\_DATA (CFCh), configuration cycles are generated to the PCI function specified by the address captured in CONFIG\_ADDRESS. The format of the address is shown in Table 47.

**Table 47. PCI CONFIG\_ADDRESS Register (I/O PORT CF8h) Mapping**

Field	CONFIG_ADDRESS Bits
Enable PCI Config. Space Mapping	31
Reserved	30:24
<b>Bus</b> Number	23:16
<b>Device</b> Number	15:11
<b>Function</b> Number	10:08
<b>Register/Offset</b> Number	07:02

*Note:* Bit 31 of CONFIG\_ADDRESS must be set for a configuration cycle to be generated.

Pseudocode for a PCI register read is shown below:

```
MyCfgAddr[23:16] = bus; MyCfgAddr[15:11] = device; MyCfgAddr[10:8] = funct;
MyCfgAddr[7:2] = dWordMask(offset); MyCfgAddr[31] = 1;
IOWRITE(0xCF8, MyCfgAddr)
Register_Snapshot = IOREAD(0xCFC)
```

## 5.5.2 PCI Configuration Access - ECAM: Memory Mapped Scheme

A flat, 256 Mbyte memory space may also be allocated to perform configuration transactions. This is enabled through the HECREG message bus register (Port: 3h, Register: 09h) found in the Host Bridge. HECREG allows remapping this 256 Mbyte region anywhere in physical memory space. Memory accesses within the programmed MMIO range result in configuration cycles to the appropriate PCI devices specified by the memory address as shown below.

**Table 48. PCI Configuration Memory Bar Mapping**

ECAM Memory Address Field	ECAM Memory Address Bits
Use from BAR: HECREG[31:28]	31:28
<b>Bus</b> Number	27:20
<b>Device</b> Number	19:15
<b>Function</b> Number	14:12
<b>Register</b> Number	11:02

*Note:* ECAM accesses are only possible when HECREG.EC\_ENABLE (bit 0) is set.

Pseudocode for an enhanced PCI configuration register read is shown below:

```
MyCfgAddr[27:20] = bus; MyCfgAddr[19:15] = device; MyCfgAddr[14:12] = funct;
MyCfgAddr[11:2] = dw_offset; MyCfgAddr[31:28] = HECREG[31:28];
Register_Snapshot = MEMREAD(MyCfgAddr)
```

## 5.6 Message Bus Register Access

Accesses to the message bus space are through the Host Bridge’s PCI configuration registers. This unit relies on three 32-bit PCI configuration registers to generate messages:

- Message Bus Control Register (MCR) - PCI[B:0,D:0,F:0] + D0h
- Message Data Register (MDR) - PCI[B:0,D:0,F:0] + D4h
- Message Control Register eXtension (MCRX) - PCI[B:0,D:0,F:0] + D8h

This indirect access mode is similar to PCI CAM. Software uses the MCR/MCRX as an index register, indicating which message bus space register to access (MCRX only when required), and MDR as the data register. Writes to the MCR trigger message bus transactions.

Writes to MCRX and MDR are captured. Writes to MCR generates an internal ‘message bus’ transaction with the opcode and target (port, offset, byte enable) specified in the MCR and the captured MCRX. When a write opcode is specified in MCR, the data that was captured by MDR is used for the write. When a data read opcode is specified in MCR, the data is available in the MDR register after the MCR write completes (non-posted). The format of MCR and MCRX are shown in Table 49 and Table 50.

Table 49. MCR Description

Field	MBPR Bits
OpCode (typically 10h for read, 11h for write)	31:24
Port	23:16
Offset/Register	15:08
Byte Enable	07:04

Table 50. MCRX Description

Field	MBPER Bits
<b>Offset/Register Extension.</b> This is used for messages sent to end points that require more than 8 bits for the offset/register. These bits are a direct extension of MCR[15:8].	31:08

Most message bus registers are located in the Host Bridge. The default opcode messages for those registers are as follows:

- Message ‘Read Register’ Opcode: 10h
- Message ‘Write Register’ Opcode: 11h

Registers with different opcodes are specified as applicable. Pseudocode of a message bus register read is shown below (where ReadOp==0x10):

```

MyMCR[31:24] = ReadOp; MyMCR[23:16] = port; MyMCR[15:8] = offset;

MyMCR[7:4] = 0xf

PCIWRITE(0, 0, 0, 0xD0, MyMCR)

Register_Snapshot = PCIREAD(0, 0, 0, 0xD4)

```

## 5.7 Register Field Access Types

**Table 51. Register Access Types and Definitions**

Access Type	Meaning	Description
RO	Read Only	In some cases, if a register is read only, writes to this register location have no effect. However, in other cases, two separate registers are located at the same location where a read accesses one of the registers and a write accesses the other register. See the I/O and memory map tables for details.
WO	Write Only	In some cases, if a register is write only, reads to this register location have no effect. However, in other cases, two separate registers are located at the same location where a read accesses one of the registers and a write accesses the other register. See the I/O and memory map tables for details.
RW	Read/Write	A register with this attribute can be read and written.
RW/C	Read/Write Clear	A register bit with this attribute can be read and written. However, a write of 1 clears (sets to 0) the corresponding bit and a write of 0 has no effect.
RW/O	Read/Write-Once	A register bit with this attribute can be written only once after power up. After the first write, the bit becomes read only.
RW/L	Read/Write Lockable	A register bit with the attribute can be read at any time but writes may only occur if the associated lock bit is set to unlock. If the associated lock bit is set to lock, this register bit becomes RO unless otherwise indicated.
RW/L/O	Read/Write, Lock-Once	A register bit with this attribute can be written to the non-locked value multiple times, but to the locked value only once. After the locked value has been written, the bit becomes read only.
RW/SN	Read/Write	Read/Write register initial value loaded from NVM.
Reserved	Reserved	The value of reserved bits must never be changed.
Default	Default	When the processor is reset, it sets its registers to predetermined default states. The default state represents the minimum functionality feature set required to successfully bring up the system. Hence, it does not represent the optimal system configuration. It is the responsibility of the system initialization software to determine configuration, operating parameters, and optional system features that are applicable, and to program the processor registers accordingly.

§ §

## 6.0 Mapping Address Spaces

---

The Intel® Quark™ SoC X1000 supports four different address spaces:

- [Physical Address Space Mappings](#) (Memory Space)
- [I/O Address Space](#)
- [PCI Configuration Space](#)
- [Message Bus Space](#)

The CPU core can only directly access *memory space* through memory reads and writes and *I/O space* through the IN and OUT I/O port instructions. *PCI configuration space* is indirectly accessed through I/O or memory space, and the *Message Bus space* is accessed through PCI configuration space. See [Chapter 5.0, “Register Access Methods”](#) for details.

This chapter describes how the memory, I/O, PCI, and Message Bus spaces are mapped to interfaces in the SoC.

*Note:* See [Chapter 12.0, “Host Bridge”](#) for registers specified in the chapter.

### 6.1 Physical Address Space Mappings

There are 4 Gbyte (32-bits) of physical address space that can be used as:

- Memory Mapped I/O (MMIO - I/O fabric)
- Physical Memory (DRAM)

The CPU core can access the full physical address space, while downstream devices can only access SoC DRAM, and the CPU core’s local APIC. Peer to peer transactions are not supported.

Most devices map their registers and memory to the physical address space. This chapter summarizes the possible mappings.

#### 6.1.1 Bridge Memory Map

The Host Bridge maps the physical address space as follows:

- CPU core to DRAM
- CPU core to I/O fabric (MMIO)
- CPU core to extended PCI registers (ECAM accesses)
- I/O fabric to CPU cores (local APIC interrupts)

This SoC has the following distinct memory regions:

- DOS DRAM + Low DRAM
- MMIO

The HMBOUND register is used to create these memory regions, as shown in [Figure 13](#).

Figure 13. Physical Address Space - Low DRAM & MMIO

### 6.1.1.1 MMIO

The MMIO mappings are shown in [Figure 14](#).

**Figure 14. Physical Address Space - MMIO**

By default, CPU core reads targeting the **Boot Vector** range (FFFFFFFFh-FFFE0000h) are sent to the Legacy Bridge, and write accesses target DRAM. For secure SKU's, reads targeting the Boot Vector are decoded and routed to a Secure Root of Trust Boot ROM. For non-secure SKU's, reads targeting this region are routed to a boot SPI flash device connected to the Legacy Bridge.

Upstream writes from the I/O fabric to the **Local APIC** range (FEE00000h-FEEFFFFFFh) are sent to the CPU core's APIC.

Accesses in the 256 Mbyte **PCI ECAM** range starting at HECREG generate enhanced PCI configuration register accesses when enabled (HECREG.EC\_ENABLE). Unlike traditional memory writes, writes to this range are non-posted when enabled. See [Chapter 5.0, "Register Access Methods"](#) for more details.

All other downstream accesses in the MMIO range are decoded based on PCI resource allocations. The subtractive agent (for unclaimed accesses) is the I/O Fabric. The I/O Fabric returns an UNSUPPORTED REQUEST for unclaimed accesses.

### 6.1.1.2 DOS DRAM

The DOS DRAM is the memory space below 1 MByte. In general, accesses from a processor targeting DOS DRAM target system DRAM. Exceptions are shown in Figure 15.

Figure 15. Physical Address Space - DOS DRAM

Processor writes to the 64 Kbyte (each) **E** and **F** segments (E0000h-EFFFFh and F0000h-FFFFFh) always target DRAM. The HMISC2 register is used to direct CPU core reads in these two segments to DRAM or the I/O fabric (MMIO).

CPU core accesses to the 128 Kbyte **VGA/CSEG** range (A0000h-BFFFFh) can target DRAM or the MMIO space depending on the setting of HMISC2.ABSEG\_IN\_DRAM. When targeting MMIO space, requests are sent to the PCIe\* port if legacy VGA is enabled in the PCIe controller.

### 6.1.1.3 Additional Mappings

There is one additional mapping available in the Host Bridge:

- SMM range

Figure 16 shows these mappings.

Figure 16. Physical Address Space - SMM Range

SMI handlers running on a CPU core execute out of SMRAM. To protect this memory from non-CPU core access, the **SMM Range** (HSM MCTL.SMM\_START - HSM MCTL.SMM\_END) may be programmed anywhere in low DRAM space (1 Mbyte aligned). This range only allows accesses from the CPU core while in SMM.

### 6.1.2 MMIO Map

Memory accesses targeting MMIO are routed by the programmed PCI ranges.

Fixed MMIO is claimed by the Legacy Bridge. The default regions are listed below. Movable ranges are not shown. See the register maps of all Legacy Bridge components for details.

Table 52. Fixed Memory Ranges in the Legacy Bridge

Device	Start Address	End Address	Comments
Low BIOS (Flash Boot)	000E0000h	000FFFFFFh	Starts 128 Kbyte below 1 Mbyte; Firmware/BIOS
I/O APIC	FEC00000h	FEC00040h	Starts 20 Mbyte below 4 Gbyte
HPET	FED00000h	FED003FFh	Starts 19 Mbyte below 4 Gbyte
High BIOS/Boot Vector	FFFE0000h	FFFFFFFFh	Starts 128 Kbyte below 4 Gbyte; Firmware/BIOS

PCI devices may also claim memory resources in MMIO space. For details see each device’s interface chapter.

**Warning:** Variable memory ranges should not be set to conflict with other memory ranges. There may be unpredictable results if the configuration software allows conflicts to occur. Hardware does not check for conflicts.

## 6.2 I/O Address Space

There are 64 Kbyte + 3 bytes of I/O space (0h-10002h) for accessing I/O registers. Most I/O registers exist for legacy functions in the Legacy Bridge or for PCI devices, while some are claimed by the Host Bridge for the PCI configuration space access registers.

## 6.2.1 Host Bridge I/O Map

The Host Bridge claims I/O transactions for VGA/Extended VGA found in the display/graphics interface. It also claims the two 32-bit registers at port CF8h and CFCh used to access PCI configuration space.

## 6.2.2 I/O Fabric I/O Map

### 6.2.2.1 Legacy Bridge Fixed I/O Address Ranges

Table 53 shows the fixed I/O space ranges seen by a processor.

Table 53. Fixed I/O Ranges in the Legacy Bridge

Device	I/O Address	Comments
8259 Master	20h-3Dh	
8254s	40h-43h, 50h-53h	
NMI Controller	61h, 63h, 65h, 67h	
RTC	70h-73h	
Scratch Pad	80h-83h	
8259 Slave	A0h-BDh	
Reset Control	CF9h	Overlaps PCI I/O registers

### 6.2.2.2 Variable I/O Address Ranges

Table 54 shows the variable I/O decode ranges. They are set using base address registers (BARs) or other similar means. Plug-and-play (PnP) software (PCI/ACPI) can use their configuration mechanisms to set and adjust these values.

**Warning:** The variable I/O ranges should not be set to conflict with other I/O ranges. There may be unpredictable results if the configuration software allows conflicts to occur. Hardware does not check for conflicts.

Table 54. Movable I/O Ranges Decoded by PCI Devices on the I/O Fabric

Device	Size (bytes)	Target
ACPI Power Management	16	PM1BLK: PCI[B:0,D:31,F:0] + 48h
ACPI General Purpose Event 0	64	GPE0BLK: PCI[B:0,D:31,F:0] + 4Ch
GPIO	128	GBA: PCI[B:0,D:31,F:0] + 44h
Watchdog Timer	64	WDTBA: PCI[B:0,D:31,F:0] + 84h
ACPI Processor Block	16	PMBA: Port[0x04] + 70h
SPI DMA Block	16	SPI_DMA_BAR: Port[0x04] + 7Ah

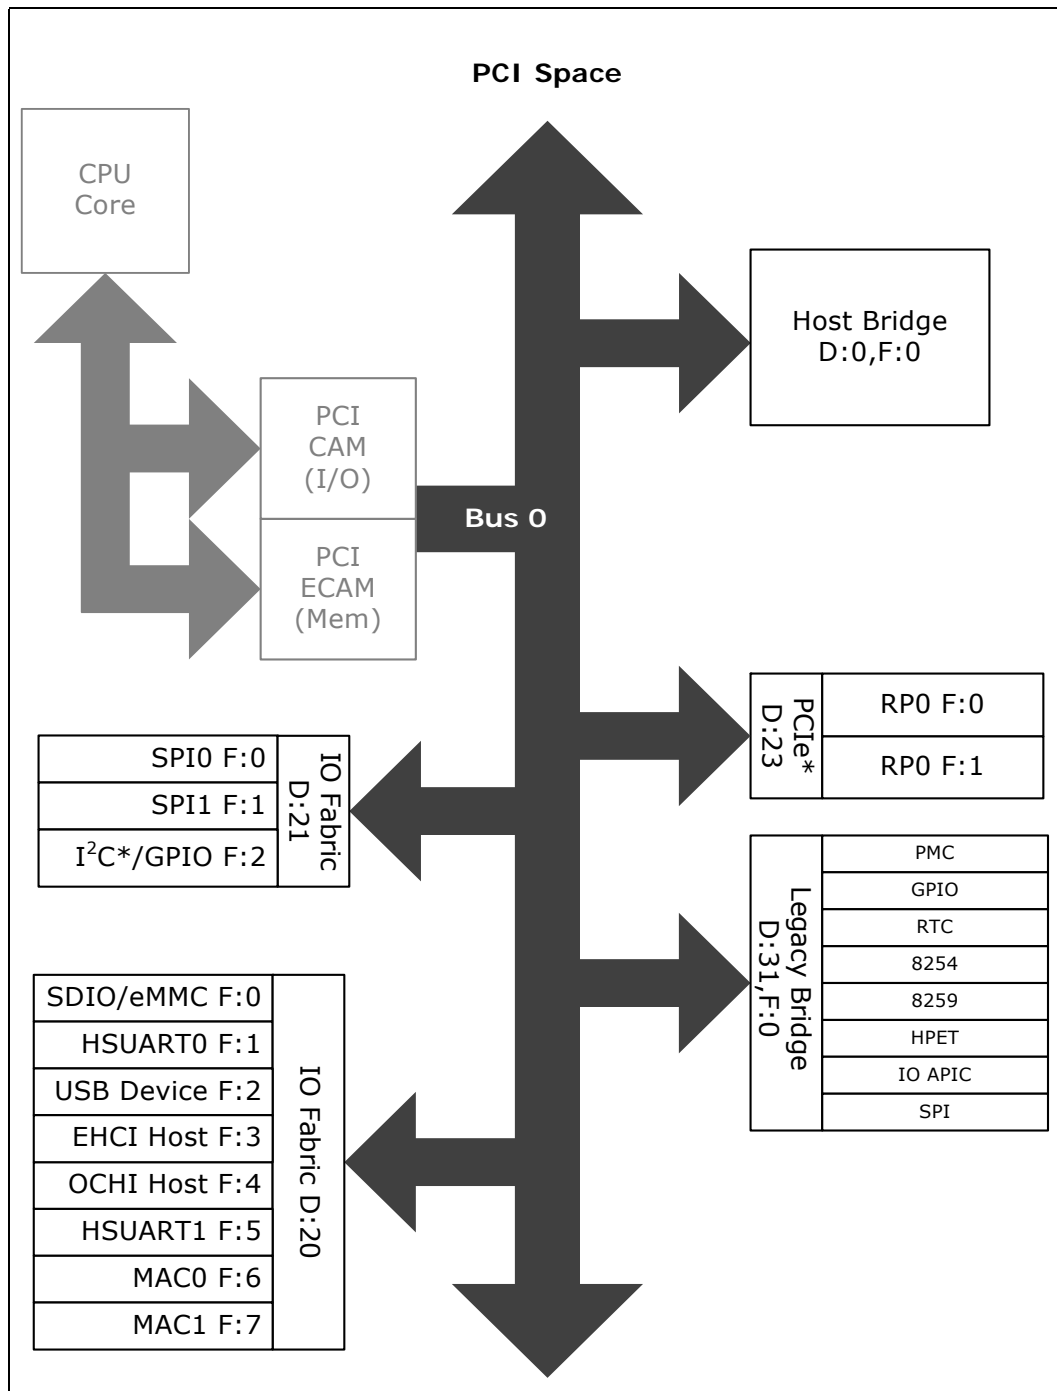

## 6.3 PCI Configuration Space

All PCI devices/functions are shown below.

**Table 55. PCI Devices and Functions**

Bus	Device	Function	Device Description	Function Description
0	0	0	Host Bridge	
	20	0	I/O Fabric	SDIO / eMMC
		1		HS-UART 0
		2		USB 2.0 Device
		3		USB EHCI
		4		USB OHCI
		5		HS-UART 1
		6		10/100 Ethernet MAC 0
		7		10/100 Ethernet MAC 1
	21	0	I/O Fabric	SPI 0
		1		SPI 1
		2		I <sup>2</sup> C* / GPIO
	23	0	PCI Express*	Root Port 0
		1		Root Port 1
	31	0	Legacy Bridge	Legacy Components

Figure 17. Bus 0 PCI Devices and Functions

## 6.4 Message Bus Space

Message bus space provides access to different units within the host bridge. These units are useful in configuring the memory map, power management, and more.

Figure 18. Message Bus with PCI Space

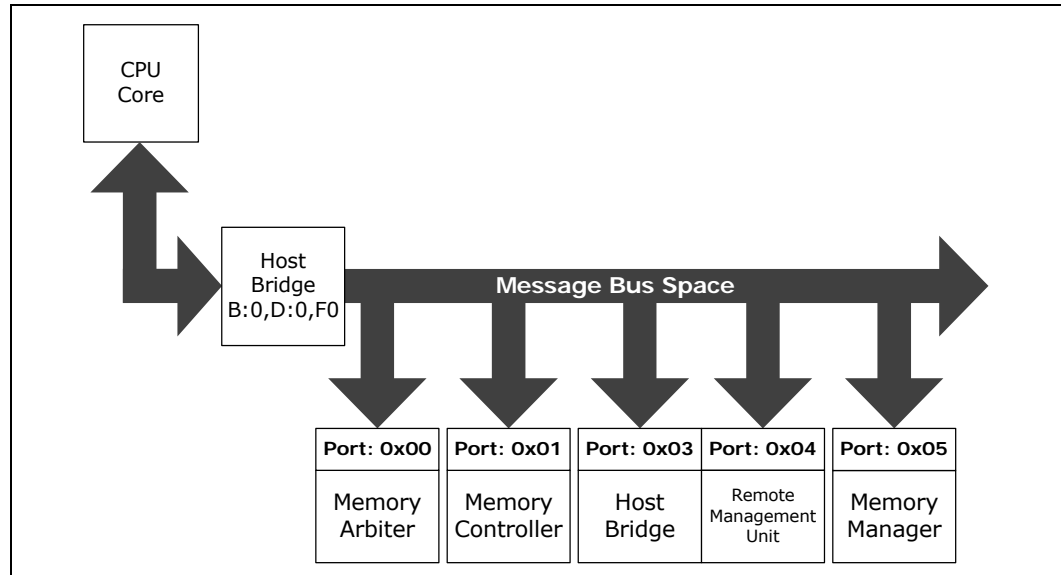

Table 56. Message Types

Msg Type	Message Description
RegWr	Register Write message - used to write to the 32-bit Dunit registers.
RegRd	Register Read message - used to read from the 32-bit Dunit registers.
Msg	Simple message without data - used to send atomic commands, such as Wake and Suspend.
MsgD	Simple Message with 4 bytes of data - used to communicate with the DRAM devices during initialization.

§ §

## 7.0 Clocking

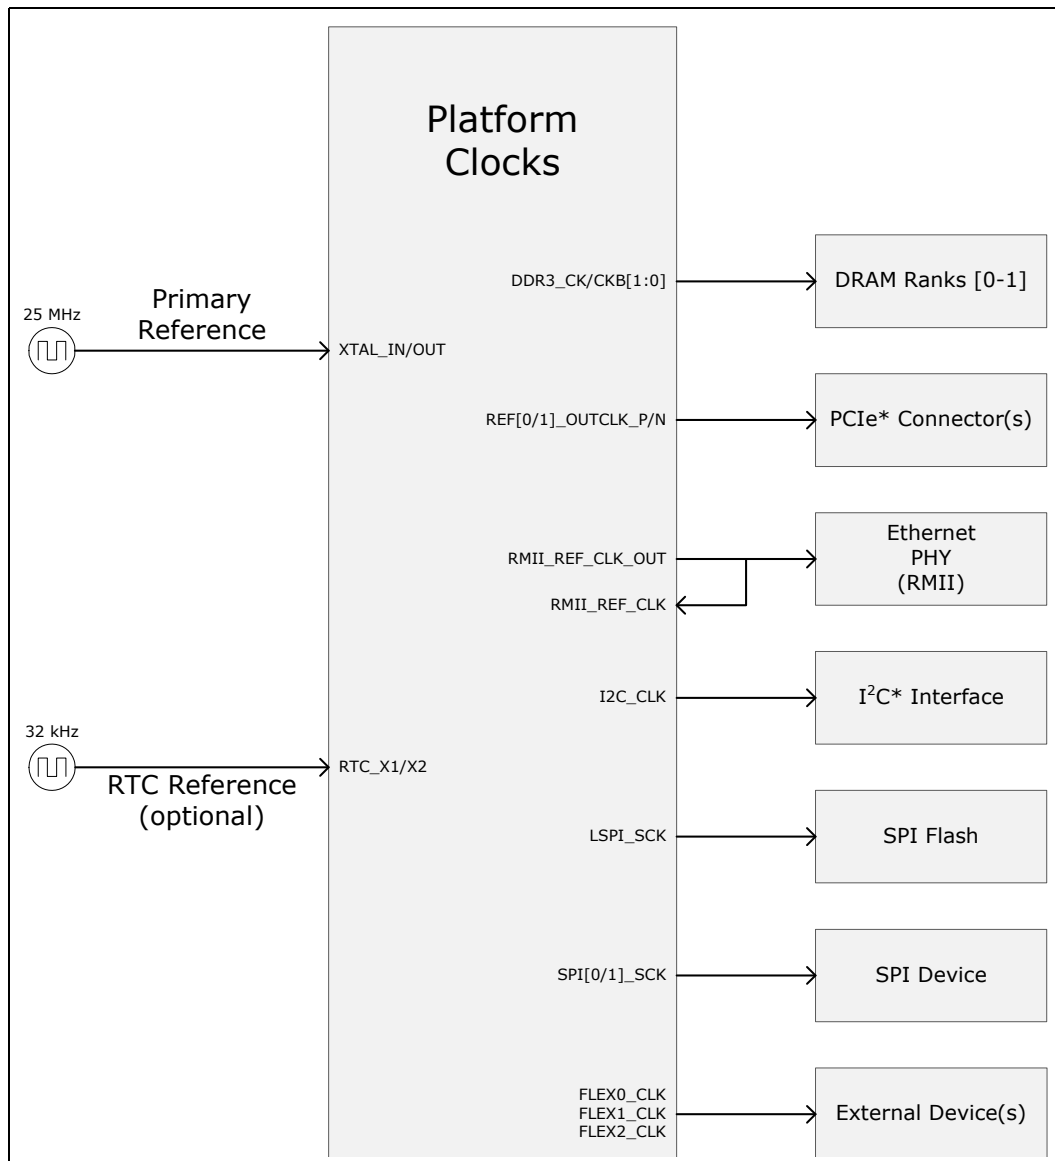

---

The SoC has a variable frequency, multiple clock domain, and multiple power plane clocking system. This clock architecture achieves a low power clocking solution that supports the various clocking requirements of the different IPs on the SoC. This is achieved by using an Integrated Clock module (iClock) that supplies the clocks to the entire platform.

### 7.1 Clocking Features

The SoC provides a complete system clocking solution through integrated clocking. All the required platform clocks are provided by the SoC using only one input: a 25 MHz primary reference for the integrated clock block. An optional 32 KHz reference for the Real Time Clock (RTC) block may be provided if required.

Figure 19. SoC Platform Clocking

The reference clocks required for the various interface PLLs (e.g., USB/PCIe\*) and the processor are internally generated by the Integrated Clocking unit.

## 7.2 Platform/System Clock Domains

The SoC contains multiple clock domains to support its various interfaces. [Table 57](#) and [Table 58](#) summarize the different clock inputs and outputs in the system.

**Table 57. Intel® Quark™ SoC X1000 Clock Inputs**

Clock Domain	Signal Name	Frequency	Usage/Description
Main	XTAL_IN XTAL_OUT	25 MHz	25 MHz reference for the iCLK PLL
RTC	RTCX1 RTCX2	32 kHz	RTC Crystal I/O for RTC block. This clock is optional and may be generated internally by the iCLK PLL.
Ethernet PHY	RMII_REF_CLK	50 MHz	RMII 50MHz Clock This clock is a loopback of RMII_REF_CLK_OUT
JTAG	TCK	25 MHz	JTAG Test Clock
CPU/PLL	OSC_COMP	Static current	Ext. precision R 10.5 kOhm to 1.5V

**Table 58. Intel® Quark™ SoC X1000 Clock Outputs**

Clock Domain	Signal Name	Frequency	Usage/Description
DDR	DDR3_CK[1:0] DDR3_CKB[3:0]	400 MHz	Drives the Memory ranks 0-1. Data rate is 2x the clock rate.
PCI Express*	REF[0/1]_OUTCLK_N REF[0/1]_OUTCLK_P	100 MHz	Differential Clocks supplied to external PCI Express* devices
Flex Clocks	FLEX0_CLK FLEX1_CLK FLEX2_CLK	33 MHz 33 MHz 48 MHz	Output clock for External devices
Legacy SPI	LSPI_SCK	20 MHz	Clock for external SPI Flash
SPI	SPI[0/1]_SCK	25 MHz	SPI serial clocks
Ethernet PHY	RMII_REF_CLK_OUT	50 MHz	Reference clock for RMII interface
I <sup>2</sup> C*	I2C_CLK	400 kHz	I <sup>2</sup> C clocks
SD	SD_CLK	50 MHz	SD Clock
Main	CKSYS25OUT	25 MHz	25 MHz Oscillator Output

§ §

## 8.0 Power Management

This chapter provides information on the following power management topics:

- ACPI States
- Processor Core
- PCI Express\*

### 8.1 Power Management Features

- ACPI 3.0 specification support
- ACPI Processor C States (C0, C1, and C2)
- ACPI Sleep State Support (S0, S3, S4, and S5)
- PCI Express L0, L1, L2, and L3

### 8.2 Signal Descriptions

See [Chapter 2.0, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Type:** The buffer type found in [Chapter 4.0, “Electrical Characteristics”](#)
- **Description:** A brief explanation of the signal’s function

**Table 59. Power Management (Sheet 1 of 2)**

Signal Name	Direction/ Type	Description
RESET_BTN_B	I PwrMgmt	Reset Button: With the SOC in S0 an activation of this input will result in a 'Warm Reset'. Active LOW
WAKE_B	I PwrMgmt	PCI Express Wake Event: This signal indicates a PCI Express port wants to wake the system. Can optionally be used by an external device to wake the system if the WAKE_B functionality is not required by PCI Express.
GPE_B	I PwrMgmt	General Purpose Event: GPE_B is asserted by an external device to log an event in the system's ACPI space and cause an SCI (if enabled).
PWR_BTN_B	I PwrMgmt	Power Button: Two modes of operation. 1. A power button press is required to complete cold boot. Active LOW. 2. The button is tied low, results in an automated start at power on.
S3_3V3_EN	O PwrMgmt	S3 Domain 3.3v platform rail enable. Active HIGH.

Table 59. Power Management (Sheet 2 of 2)

Signal Name	Direction/ Type	Description
S3_1V5_EN	O PwrMgmt	S3 Domain 1.5v platform rail enable. Active HIGH.
S3_PG	I PwrMgmt	S3 Power Good
S0_1P0_PG	I PwrMgmt	S0 Domain 1.0V Power Good
S0_3V3_EN	O PwrMgmt	S0 Domain 3.3v platform rail enable. Active HIGH.
S0_1V5_EN	O PwrMgmt	S0 Domain 1.5v platform rail enable. Active HIGH.
S0_1V0_EN	O PwrMgmt	S0 Domain 1.0v platform rail enable. Active HIGH.
ODRAM_PWROK	O PwrMgmt	DRAM Power Okay: Active HIGH.
OSYSPWRGOOD	O PwrMgmt	System Power Good: S0 power is good. Active HIGH
VNSENSE	IO PwrMgmt	VNN sense voltage for IMVP
VSSSENSE	IO PwrMgmt	VSS sense voltage for IMVP

## 8.3 ACPI Supported States

The ACPI states supported by the processor are described in this section.

### 8.3.1 S-State Definition

#### 8.3.1.1 S0 - Full On

This is the normal operating state of the processor. In S0, the core processor transitions in and out of the various processor C-States.

*Note:* The processor core does not support P-states.

#### 8.3.1.2 S3 - Suspend to RAM (Standby)

S3 is a suspend state in which the core power planes of the processor are turned off and the suspend wells remain powered.

- All power wells are disabled, except for the suspend and RTC wells.
- The core processor's macro-state is saved in memory.
- Memory is held in self-refresh and the memory interface is disabled, except the CKE pin as it is powered from the memory voltage rail. CKE is driven low.

#### 8.3.1.3 S4 - Suspend to Disk (Hibernate)

S4 is a suspend state in which most power planes of the processor are turned off, except for the suspend and RTC well. In this ACPI state, system context is saved to the mass storage device attached to SDIO/eMMC interface.

*Note:* This is a software based state that is the same as S5 to hardware. On S4 entry, the system saves the entire contents of data off to NVRAM. On S4 resume, the system restores the entire contents of memory after performing the a typical S5-S0 boot.

Key features:

- No activity is allowed.
- All power wells are disabled, except for the suspend and RTC well.

### 8.3.1.4 S5 - Soft Off

From a hardware perspective the S5 state is identical to the S4 state. The difference is purely software; software does not write system context to OS storage when entering S5.

## 8.3.2 System States

**Table 60. General Power States for System**

States/Sub-states	Legacy Name / Description
G0/S0/C0	<b>FULL ON:</b> CPU operating. Individual devices may be shut down to save power. The different CPU operating levels are defined by Cx states.
G0/S0/Cx	<b>Cx State:</b> CPU manages C-state itself.
G1/S3	<b>Suspend-To-RAM (STR):</b> The system context is maintained in system DRAM, but power is shut to non-critical circuits. Memory is retained, and refreshes continue. All external clocks are shut off; RTC clock and internal ring oscillator clocks are still toggling.
G1/S4	<b>Suspend-To-Disk (STD):</b> The context of the system is maintained on the disk. All power is shut down except power for the logic to resume.
G2/S5	<b>Soft-Off:</b> System context is not maintained. All power is shut down except power for the logic to restart. A full boot is required to restart. A full boot is required when waking.
G3	<b>Mechanical OFF.</b> System content is not maintained. All power shutdown except for the RTC. No "Wake" events are possible, because the system does not have any power. This state occurs if the user removes the batteries, turns off a mechanical switch, or if the system power supply is at a level that is insufficient to power the "waking" logic. When system power returns, transition depends on the state just prior to the entry to G3.

Table 61 shows the transition rules among the various states. Note that transitions among the various states may appear to temporarily transition through intermediate states. These intermediate transitions and states are not listed in the table.

**Table 61. ACPI PM State Transition Rules (Sheet 1 of 2)**

Present State	Transition Trigger	Next State
G0/S0/C0	P_LVL2 Read	G0/S0/C2
	PM1C.SLP_EN bit set	G1/Sx or G2/S5 state (specified by PM1C.SLP_TYPE)
	Power Button Override	G2/S5
	Mechanical Off/Power Failure	G3
G0/S0/C2	C2 break events which include: MSI, Legacy Interrupt	G0/S0/C0
	Power Button Override	G2/S5
	Resume Well Power Failure	G3

**Table 61. ACPI PM State Transition Rules (Sheet 2 of 2)**

Present State	Transition Trigger	Next State
G1/S3, G1/S4	Any Enabled Wake Event	G0/S0/C0
	Power button Override	G2/S5
	Resume Well Power Failure	G3
G2/S5	Any Enabled Wake Event	G0/S0/C0
	Power Failure or Removal	G3
G3	Power Returns	Option to go to S0/C0 (reboot) or G2/S5 (stay off until power button pressed or other enabled wake event) or G1/S4 (if system state was S4 prior to the power failure). Some wake events are preserved through a power failure.

### 8.3.3 Processor Idle States

**Table 62. Processor Core/ States Support**

State	Description
C0	Active mode, processor executing code
C1	AutoHALT state
C2	Stop Grant state

### 8.3.4 Integrated Memory Controller States

**Table 63. Main Memory States**

States	Description
Powerup	CKE asserted. Active mode.
Precharge Powerdown	CKE de-asserted (not self-refresh) with all banks closed.
Active Powerdown	CKE de-asserted (not self-refresh) with at least one bank active.
Self-Refresh	CKE de-asserted using device self-refresh

### 8.3.5 PCIe\* States

**Table 64. PCIe\* States**

States	Description
L0	Full on - Active transfer state
L0s	First Active Power Management low power state - Low exit latency
L1	Lowest Active Power Management - Longer exit latency
L3	Lowest power state (power-off) - Longest exit latency

### 8.3.6 Interface State Combinations

Table 65. G, S and C State Combinations

Global (G) State	Sleep (S) State	Processor Core (C) State	Processor State	System Clocks	Description
G0	S0	C0	Full On	On	Full On
G0	S0	C1	Auto-Halt	On	Auto-Halt
G0	S0	C2	Stop Grant	On	Stop Grant
G1	S3	Power Off		Off except RTC & internal ring OSC	Suspend to RAM
G1	S4	Power Off		Off except RTC & internal ring OSC	Suspend to Disk
G2	S5	Power Off		Off except RTC & internal ring OSC	Soft Off
G3	NA	Power Off		Power Off	Hard Off

## 8.4 Processor Core Power Management

When the processor is not executing code, it is idle. A low-power idle state is defined by ACPI as a C-state. In general, lower power C-states have longer entry and exit latencies.

### 8.4.1 Low-Power Idle States

When the processor core is idle, low-power idle states (C-states) are used to save power. More power savings actions are taken for numerically higher C-state. However, higher C-states have longer exit and entry latencies.

#### 8.4.1.1 Clock Control and Low-Power States

The processor core supports low power states at core level. States for processor core include Normal (C0), Auto-Halt (C1) and Stop Grant (C2).

Transition to processor core power states higher than C1 are triggered by initiating a P\_LVLx (P\_LVL2) I/O read.

The Cx state ends due to a break event. Based on the break event, the processor returns the system to C0. The following are examples of such break events:

- Any unmasked interrupt goes active
- Any internal event that will cause an NMI or SMI\_B
- CPU Pending Break Event (PBE\_B)
- MSI

### 8.4.2 Processor Core C-States Description

#### 8.4.2.1 Core C0 State

The normal operating state of a core where code is being executed.

#### 8.4.2.2 Core C1 State

C1 is a low power state entered when the core executes a HLT instruction.

A System Management Interrupt (SMI) handler returns execution to either Normal state or the C1 state. See the *Intel® 64 and IA-32 Architecture Software Developer's Manual, Volume 3A/3B: System Programmer's Guide* for more information.

While the core is in C1 state, it still processes snoops.

#### 8.4.2.3 Core C2 State

C2 is entered when the processor reads the P\_LVL2 register to trigger a transition from C0 to C2. While the core is in the C2 state, it processes snoops.

An interrupt or a reset is required to exit the C2 state and return to the C0 state.

### 8.5 Memory Controller Power Management

The main memory is power managed during normal operation and in low-power ACPI Cx states.

#### 8.5.1 Disabling Unused System Memory Outputs

When a given rank is not populated, the corresponding chip select and CKE signals are not driven.

At reset, all rows must be assumed to be populated, until it can be proven that they are not populated. This is due to the fact that when CKE is tri-stated the memory module is not guaranteed to maintain data integrity.

#### 8.5.2 DRAM Power Management and Initialization

The SoC implements extensive support for power management on the SDRAM interface. There are four SDRAM operations associated with the Clock Enable (CKE) signals, SRE, SRX, PDE and PDX, which the SDRAM controller supports. The SoC drives two CKE pins to perform these operations.

##### 8.5.2.1 Initialization Role of CKE

During power-up, CKE is the only input to the SDRAM that is recognized (other than the DDR3 reset pin) once power is applied. It must be driven LOW by the DDR controller to make sure the SDRAM components float DQ and DQS during power-up.

CKE signals remain LOW (while any reset is active) until the BIOS writes to a configuration register. Using this method, CKE is guaranteed to remain inactive for much longer than the specified 200 micro-seconds after power and clocks to SDRAM devices are stable.

##### 8.5.2.2 Dynamic Self-Refresh

When Dynamic Self-Refresh (SR) is enabled, via DPMC0.DYNSREN, the Memory Controller places the SDRAM in SR mode when the following conditions are true:

1. No requests are pending
2. Internal Request Status is low priority
3. No SR exit requests from the DDRIO (for RCOMP updates)

If one of the above conditions change prior to the SR Entry command being sent to the DRAM the process is terminated.

When Dynamic SR is enabled the Memory Controller exits SR mode when one of the following is true:

1. Requests are pending and the Internal Request Status is normal or urgent
2. A SR exit request from the DDRIO

### 8.5.2.3 Dynamic Power Down Operation

Dynamic power-down of memory is employed during normal operation. Based on idle conditions, a given memory rank may be powered down. The Memory Controller implements aggressive CKE control to dynamically put the DRAM devices in a power down state. The Memory Controller can be configured to put the devices in active power down (CKE de-assertion with open pages) or precharge power down (CKE de-assertion with all pages closed). Precharge power down provides greater power savings but has a bigger performance impact, since all pages will first be closed before putting the devices in power down mode.

If dynamic power-down is enabled, all ranks are powered up before doing a refresh cycle and all ranks are powered down at the end of refresh.

### 8.5.2.4 Functional Clock Gating

The Memory Controller has internal clock gating for the majority of its clocked logic. When enabled the clock gating is activated when all inputs are inactive and all commands are complete and DDR3 timing trackers are flushed. When Dynamic SR is enabled, clock gating is only applied when the SDRAM is in Self-Refresh.

§ §

## 9.0 Power Up and Reset Sequence

---

This chapter provides information on the following topics:

- Power up and down sequences, including wake events
- Reset behavior

### 9.1 Intel® Quark™ SoC X1000 System States

#### 9.1.1 System Sleep States Control (S-States)

The SoC supports the S0, S3, S4, and S5 sleep states. S4 and S5 states are identical from a hardware perspective.

The SoC integrates a Power Management Controller (PMC). No external power controller IC is required.

The SoC sleep states are described in [Chapter 8.0, “Power Management”](#).

### 9.2 Power Up and Down Sequences

*Note:* Delays in power sequences are dependent on components outside the SoC. As long as the sequencing is preserved, the SoC will operate.

#### 9.2.1 Power Up, Wake and Reset Overview

SoC power up is dependent on two supplies:

- VCC3P3\_S5, which is generated from AC power
- VCCRTC\_3P3, which powers the RTC well only

VCCRTC\_3P3 is derived directly from VCC3P3\_S5, if present. Otherwise it can be driven by a coin-cell battery.

- In the case where the coin-cell battery is present but not AC power, only the RTC well is powered up. The SoC can move to state G3 only. The SoC can subsequently be transitioned to state S4/S5 by applying AC power.
- In the case where AC power is present but there is no coin-cell battery, power up is initiated directly by the ramping of the VCC3P3\_S5 supply. The SoC transitions directly to state S4/S5.

Subsequent transition from S4/S5 to S0 is governed by activity on the power button pin, PWR\_BTN\_B:

- If PWR\_BTN\_B is strapped low (auto power button mode) when AC power is applied, the SoC transitions directly to S0 from S4/S5 via a transitional S3 state.
- If PWR\_BTN\_B is high when AC power is applied, the SoC transitions to S4/S5 only. A subsequent falling edge on PWR\_BTN\_B, with the low value being maintained for 2.5ms or more, is required to initiate a transition to S0 via the transitional S3 state.

Once in state S0 the SoC can be put to sleep, i.e., transitioned to sleep states S3 or S4/S5, through appropriate settings of the Legacy Bridge ACPI registers PM1C.SLPTYPE and PM1C.SLPEN.

A wake event is defined as a transition from state S3 to state S0. The chip can be woken up via a number of mechanisms including specific register settings, or by asserting specific SoC pins. A watchdog function in the Legacy Bridge can also trigger a wake event.

In auto power button mode, if the SoC is placed in sleep state S4/S5, the system can only be woken by the removal and reapplication of AC power. It does not resume from S4, rather it is a new start with context loss. Since PWR\_BTN\_B is low it will power up and transition directly back to S0 as described in the power up sequence.

There are two classes of reset associated with Intel® Quark™ SoC X1000:

- A **cold reset** means transitioning from S0 to S4/S5 and back to S0 again, independent of the PWR\_BTN\_B value. This can only be initiated from state S0 through the register RSTC.COLD\_RST. All registers except those driven by the RTC supply are effectively reset.
- A **warm reset** resets CPU and peripheral blocks without the removal of the power supplies. This can be initiated via a write to the register RSTC.WARM\_RST or by asserting the SoC pin, RESET\_BTN\_B (active low). It can occur only in state S0 and after reset the SoC remains in state S0. RTC well and suspend well registers are left unaffected.

A **cold boot** is the sequence where AC power is applied followed by an immediate transition to S0 using the PWR\_BTN\_B signal or directly in auto power button mode.

**Catastrophic shutdown** can be carried out by holding PWR\_BTN\_B low for at least 3s. This results in a direct return to the S4/S5 state. It can also be initiated by software under specific error conditions. See the *Intel® Quark™ SoC X1000 UEFI Firmware Writer's Guide* (Document # 330236) for more information.

The following sections provide more detail on these power-related functions.

## 9.2.2 RTC Power Well Transition: G5 to G3 State Transition

The transition to the G3 state is initiated when VCCRTC\_3P3 is ramped. The sequence is as follows:

1. VCCRTC\_3P3 ramps. RTCRST\_B should be low.
2. The SoC starts the real time clock oscillator.
3. A minimum of t1 units after VCCRTC\_3P3 ramps external circuitry deasserts RTCRST\_B. The system is now in the G3 state.

Figure 20. RTC Power Well Timing Diagrams

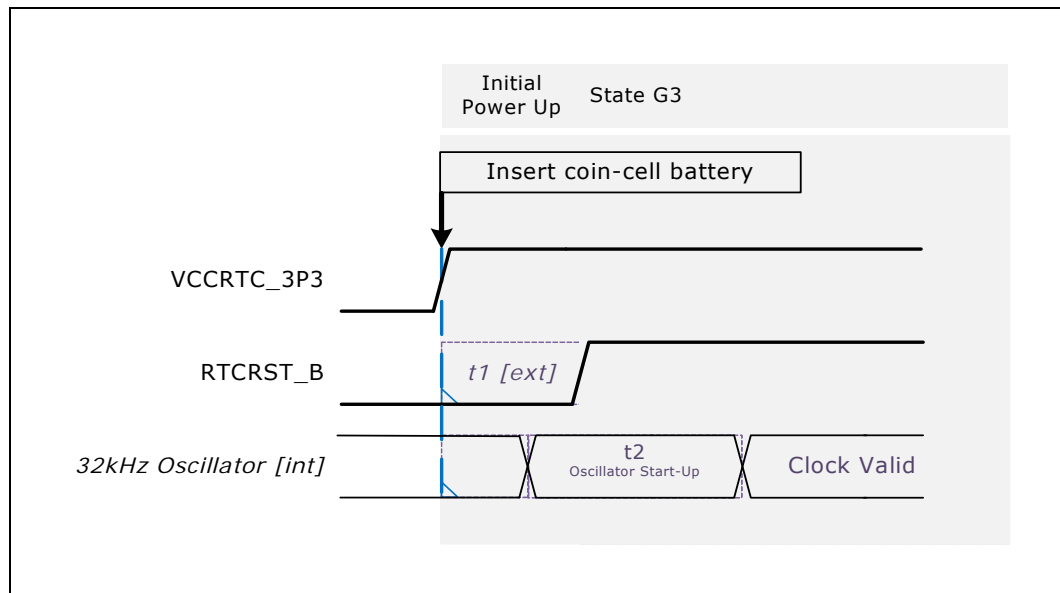

Table 66. RTC Power Well Timing Parameters

Parameter	Description	Min	Max	Units	Notes
t1	VCCRRTC_3P3 to RTCRST_B deassertion	9	N/A	ms	1
t2	Oscillator Startup Time	-N/A	-N/A	s	2

**Notes:**

1. This delay is typically created from an RC circuit.
2. The oscillator startup times are component and design specific. A crystal oscillator can take as long as 2 s to reach a large enough voltage swing. Whereas, a silicon oscillator can have startups times <10 ms.

### 9.2.3 AC Power Applied: G3 to S4/S5 State Transition

The timings shown in Figure 21 and Table 67 occur when AC power is applied. The following occurs:

1. The supplies VCC3P3\_S5, VCC1P0\_S5 and VCC1P5\_S5 are generated by the platform regulator. These voltages start ramping at [t1,t2,t3].
 

**Note:** It is required that the platform power sequence ensures that the 3 voltages ramp in this order (VCC3P3\_S5 --> VCC1P0\_S5 --> VCC1P5\_S5) All S5 voltages (3P3,1P8,1P0) must be stable prior to VCC1P5\_S5.
2. VCC3P3\_S5 drives an internal S5 LDO regulator that generates an internal 1.0V and 1.8V supplies. The 1.8V is driven off chip at time t4 on pin OVOUT\_1P8\_S5.
 

**Note:** It is intended the 1P8V generated by the LDO is connected back into the VCC1P8\_S5 input in order to eliminate the need to generate this voltage on the platform.

**Note:** The 1.0V supply output at pin OVOUT\_1P0\_S5 is unused and should remain not connected at the platform.
3. When the internal supplies are stable an internal S5 power-good signal is generated.

4. A platform S5 power good signal is generated when all Platform Generated S5 supplies are stable at 95% of nominal voltage. This signal is applied at the S5\_PG pin [t6]

**Note:** If the VCC1P8\_S5 is generated by the platform then this voltage must also be stable prior to assertion of the S5\_PG."

5. When both the internal S5 power-good and S5\_PG signals are asserted the system is in state S4/S5.

## 9.2.4 Using PWR\_BTN\_B: Transition from S4/S5 to S0

1. The internal power management controller detects an event: either PWR\_BTN\_B is actively brought low and remains low for at least 2.5ms [t7], or it is tied low for an automatic start from the S5 state (auto power button mode). This initiates the transition from S4/S5 to S0.

2. After a PLL settling time the internal PMC generates a switch enable S3\_3V3\_EN which should be used to switch on of the platform S3 supply VCC3P3\_S3 [t8, t8'].

3. This is followed by the assertion of S3\_1V5\_EN to switch on VCC1P5\_S3 [t9].

**Note:** The switch enables are active high and should be used to drive PFET switches or regulator enables on the platform.

**Note:** The switch enables are staggered because of SoC rail sequencing constraints.

4. After a switch-on time [t10] the S3 supply VCC3P3\_S3 starts ramping. This is followed in turn by VCC1P5\_S3 [t12].

5. VCC3P3\_S3 drives an internal S3 LDO regulator which generates internal 1.0V and 1.8V supplies. These are driven off chip via the OVOUT\_1P0\_S3 and OVOUT\_1P8\_S3 pins [t13, t14].

6. When the internal supplies are stable an internal S3 power-good signal is generated [t15].

7. The Platform S3\_PG pin [t16] is asserted when the Platform generated VCC1P5\_S3 Power rails is stable. Based on the power rail sequencing this will ensure that all platform generated S3 rails will be stable.

8. When both the internal S3 power-good and S3\_PG signals are asserted, the SoC is in a transitional S3 state.

9. The PMC now generates the switch enable S0\_3V3\_EN which should be used to switch on the S0 supply VCC3P3\_S0 [t17].

10. This is followed by the assertion of S0\_1V0\_EN to switch on VCC1P0\_S0 [t18].

11. After a switch-on time [t19], the S0 supply VCC3P3\_S0 starts ramping. This is followed in turn by VCC1P0\_S0 [t21].

12. VCC3P3\_S0 drives an internal S0 LDO regulator which generates internal 1.05V and 1.8V supplies. These are driven off chip via the OVOUT\_1P05\_S0 and OVOUT\_1P8\_S0 pins [t22, t23].

13. Once VCC1P0\_S0 is stable the platform should generate an active high power good signal which is applied to the S0\_1P0\_PG pin [t25].

14. The PMC now generates the switch enable S0\_1V5\_EN after S0\_1P0\_PG asserted.

15. This followed by the assertion of S0\_1V5\_EN to switch on VCC1P5\_S0 [t27].

16. The Platform S0\_PG pin [t28] is asserted when the Platform generated VCC1P5\_S0 Power rails is stable. Based on the power rail sequencing this will ensure that all platform generated S0 rails will be stable.

17. All supplies all now on and the system us in state S0.

Figure 21. Power Up Sequence

### 9.2.5 Power-Up Sequence without G2/G3: No Coin-Cell Battery

This sequence must be adhered to in cases where one of the following conditions apply:

1. The system does not implement an RTC battery (coin cell) or a main battery.
2. The coin cell is drained with no main or a dead main battery.
3. No coin cell implemented or dead coin cell and main battery is being swapped.

AND one of the following conditions also applies:

1. The platform does not implement a power button to initiate a sequence to S0, and AC power becomes available.
2. The platform does use a power button, but the default first sequence when power is available is entry into S0.

In these cases, the relative timing between RTC and suspend wells becomes important. The key point is that, as well as a minimum time, there is a maximum time by which RTCRST\_B must be deasserted. It must happen before an internal reset associated with the suspend well is deasserted. This is shown in Figure 22.

Figure 22. Power-Up Sequence without G2/G3

**Notes:**

1. This delay is typically created from an RC circuit.
2. The oscillator startup times are component and design specific. A crystal oscillator can take as long as 2 s to reach a large enough voltage swing. Whereas, a silicon oscillator can have startups times <10 ms.
3. System transitions automatically through S4/S5 to S0. See Section 9.2.4 for S0 power on sequence.

Table 67. S4/S5 to S0 Timing Parameters (Sheet 1 of 2)

Time	Internal (SoC)/ External (Platform)	Description	Min	Max	Units	Notes
t0	N/A	Apply AC power	N/A	N/A	N/A	Assume SoC is in state G3
t1	ext	VCC3P3_S5	Platform related and are specific to the voltage regulator selected.

1 - Must be asserted <i>after</i> internal power good assertions from respective [S5/S3/S0] LDO regulators						

### 9.2.6 Going to Sleep: Transitions from S0 to S3 or S4/S5

Entry to sleep states (S3, S4/S5) is initiated by any of the following methods:

- Setting the desired type in PM1C.SLPTYPE and setting PM1C.SLPEN in the Legacy Bridge ACPI registers.
- Detection of a catastrophic event causes a direct transition to S4/S5. This can occur when the main power well is on, i.e. in the S0 state. Such an event can be initiated by pressing PWR\_BTN\_B low for more than 3s. It can also be initiated by software after detection of a temperature (see [Chapter 10.0](#)) or other error event.

### 9.2.7 Wake Events: Transition from S3 to S0

Wake events are used to return the system to S0 and can only be initiated in state S3. They are controlled completely by the PMC. Upon exit from sleep states, the PM1S.WAKE bit in the Legacy Bridge ACPI registers will be set.

Table 68 describes these events:

Table 68. Intel® Quark™ SoC X1000 S3 Wake Events

Event	How Enabled	Description
RTC Alarm	Set both PM1S.RTC and PM1E.RTC in Legacy Bridge	Triggered by RTC asserting IRQ#8 in Legacy Block
Resume GPIO SUS	Set both GPE0STS.GPIO and GPE0EN.GPIO in Legacy Bridge	Generates SCI/SMI via ACPI GPE0 registers in Legacy Bridge
External GPE_B (pin)	Set both GPE0S.EGPE and GPE0E.EGPE in Legacy Bridge	Generates SCI/SMI via General Purpose Event Register in Legacy Bridge
WAKE_B (pin)	N/A	Input to SoC that indicates a PCI Express port wants to wake the system.
Power button	Press PWR_BTN_B	PWR_BTN_B press (active low) triggers transition to S0
Reset button	Press RESET_BTN_B	RESET_BTN_B press (active low) triggers transition to S0

## 9.2.8 System Reset Sequences

There are two types of reset:

- Cold Reset: Results in power cycling of all rails except the RTC well. The entire chip is reset except for the RTC well.
- Warm Reset: Results in a reset without the removal of power. All core logic gets reset. The suspend and RTC wells are not reset. The system remains in state S0.

Table 69. SoC Reset Events

Sequence Type	How Initiated
Cold Boot	Switch AC power off and then on again When not in auto power button mode PWR_BTN_B is asserted (low) for at least 2.5ms
Cold Reset (Internal)	RSTC.COLD_RST bit set
Warm Reset (External)	RESET_BTN_B pin asserted (low) for at least 2.5ms
Warm Reset (Internal)	RSTC.WARM_RST bit set

### 9.2.8.1 Cold Boot Sequence

Cold boot happens when AC power is turned off and on again. The power button is used to wake up the system: assert PWR\_BTN\_B low for at least 2.5ms. In auto power button mode (PWR\_BTN\_B strapped low) the system proceeds straight to state S0 once the AC power is applied, as documented in the power up sequence.

### 9.2.8.2 Cold Reset Sequence

Cold reset is initiated by the CPU writing to Reset Control Register bit RSTC.COLD\_RST in the Legacy Bridge. Cold reset causes a full cycling of power. The chip is transitioned to state S4/S5 and then back to S0, independent of the setting of PWR\_BTN\_B. All functions are reset except for those powered from the RTC well.

The Watchdog Timer in the Legacy Bridge can be enabled to generate a cold reset in the event of a timeout event. This is indistinguishable from a cold reset due to RSTC.COLD\_RST being set.

### 9.2.8.3 Warm Reset Sequence (Internal)

Warm reset is initiated by the CPU writing to Reset Control Register bit RSTC.WARM\_RST in the Legacy Bridge. Warm reset causes reset of the CPU and peripherals without switching off their power supplies.

The Watchdog Timer in the Legacy Bridge can be enabled to generate a warm reset in the event of a timeout event. This is indistinguishable from a warm reset due to RSTC.WARM\_RST being set.

### 9.2.8.4 Externally Initiated Warm Reset Sequence

Warm Reset can also be externally initiated by asserting the reset button RESET\_BTN\_B. It results in reset without removal of power on any of the supplies.

### 9.2.9 Handling Power Failures

When the power supply to SoC is removed in a disorderly fashion, either through removal of the coin-cell battery or a failure on the AC supply, a normal cold boot sequence should be initiated.

§ §

## 10.0 Thermal Management

### 10.1 Overview

The Intel® Quark™ SoC X1000 thermal management feature helps in managing the overall thermal profile of the system to prevent overheating and system breakdown. The architecture implements various proven methods of maintaining maximum performance while remaining within the thermal specification.

The thermal management features are:

- On-die thermal sensor
- Supports a hardware trip point and programmable trip points based on the temperature indicated by thermal sensor.
  - Hot trip point is usually used to indicate that the system has reached a threshold temperature at which damage may occur. A possible action might be to turn on a fan to cool the system.
  - Catastrophic trip point is usually used to indicate that the system has reached the maximum possible temperature. A possible action might be to shut down the system.
  - See [Section 12.7.3.9](#) for the register description.

### 10.2 Thermal Sensor

The SoC provides an on-die Thermal Sensor that can be read via Message Bus registers. The Thermal Sensor provides an 8-bit temperature reading with a resolution of 1 degree Celsius.

To use the Thermal Sensor:

1. It first must be taken out of reset by setting bit 0 of Msg Port 31:R34h (see [Section 12.7.6.1](#)) to 0 and subsequently enabled via bit 15 of Msg Port 04:RB0h (see [Section 12.7.3.7](#)).
2. Once enabled, registers within the Remote Management Unit can be used to configure trip points and read the current temperature value.

**Table 70. Thermal Sensor Signals**

Signal Name	Direction/ Type	Description
TS_TDA	I/O Analog	(Reference current – thermal diode anode) max voltage 0.7
TS_TDC	I/O Analog	(Reference current – thermal diode cathode) max voltage 0.7
TS_IREF_N	I/O Analog	(Reference current) max voltage 0.7

## 11.0 Processor Core

---

Processor core features on the Intel® Quark™ SoC X1000 include:

- Single processor core
- Single Instruction 5-stage pipeline
- 32-bit processor with 32-bit data bus
- Integrated Floating Point Unit
- 16 KByte, 4-way shared instruction and data L1 write-back cache
- Integrated local APIC
- Support for IA 32-bit Pentium x86 ISA compatibility
- Supports C0, C1, and C2 states
- Supports Supervisor Mode Execution Protection (SMEP)
- Supports Execute-Disable Page Protection (PAE.XD)

*Note:* The processor core provides an integrated Local APIC but does not support the IA32\_APIC\_BASE MSR. As a result, the Local APIC is always globally enabled and the Local APIC base address is fixed at FEE00000h. Attempting to access the IA32\_APIC\_BASE MSR causes a general protection fault.

See the *Intel® Quark™ SoC X1000 Core Hardware Reference Manual* (Order #329678) for more information.

## 12.0 Host Bridge

---

The Host Bridge is a central hub that routes transactions to and from the Intel® Quark™ SoC X1000's CPU core, DRAM controller, and other functional blocks. In general, it handles:

- CPU Core Interface: Requests for CPU Core-initiated memory and I/O read and write operations and processor-initiated message-signaled interrupt transactions
- Device MMIO and PCI configuration access routing
- Buffering and memory arbitration
- PCI Config and MMIO accesses to host device (0/0/0)

### 12.1 Embedded SRAM (eSRAM)

The Host Bridge contains an interface to 512KB of on-chip, low latency, embedded SRAM (eSRAM). The eSRAM memory may be used as either 128 x 4KB pages, or in block mode as a single contiguous 512KB block page. The eSRAM pages may be mapped anywhere in the physical address space as a DRAM overlay.

The eSRAM is a volatile memory and functionality is provided to flush eSRAM pages to DRAM as part of entry to an S3 system state. Sections of DRAM overlaid by eSRAM are inaccessible to all system agents.

#### 12.1.1 Initialization

Immediately on coming out of a warm or cold reset, the Host Bridge initializes eSRAM data to 0. While this is taking place the register fields ESRAMPGCTRL<sub>x</sub>.INIT\_IN\_PROG (where  $x=0-127$ ) and ESRAMPGCTRL\_BLOCK.BLOCK\_INIT\_IN\_PROG are 1. Software may map and enable eSRAM pages during this time, but accesses to an eSRAM 4KB page will not complete until the page has completed initialization.

#### 12.1.2 Configuration

Once an eSRAM page (4KB page or 512KB block page) is enabled (see [Section 12.1.2.1](#) and [Section 12.1.2.2](#)), it may only be flushed or disabled as part of an entry to an S3 system state. In order to re-configure an eSRAM page, the Host Bridge must be warm or cold reset.

##### 12.1.2.1 4KB Page Mode

The Host Bridge provides 128 registers (ESRAMPGCTRL<sub>x</sub>, where  $x=0-127$ ) that allow individual configuration of the 128\*4KB eSRAM pages. If the block page is already enabled, it is not possible to individually map 4KB pages.

To map and enable 4KB page  $x$ , the following steps should be followed:

- Set ESRAMPGCTRL<sub>x</sub>.PG\_SYSTEM\_ADDRESS\_4K to the required address value
- Set ESRAMPGCTRL<sub>x</sub>.ENABLE\_PG to 1

Software must be careful not to map different eSRAM pages to the same system address. There is no hardware protection against this.

Figure 23. eSRAM 4KB Page Mapping

### 12.1.2.2 512KB Block Page Mode

To map the eSRAM as a single 512KB block page, the register `ESRAMPGCTRL_BLOCK` is used. If any of the 4KB pages are already enabled, it is not possible to enable the block page.

To map and enable the 512KB block page, the following steps should be followed

- Set ESRAMPGCTRL\_BLOCK.BLOCK\_PG\_SYSTEM\_ADDRESS\_16MB to the required address value
- Set ESRAMPGCTRL\_BLOCK.BLOCK\_ENABLE\_PG to 1

**Figure 24. eSRAM 512KB Page Mapping**

### 12.1.3 Configuration Locking

Once an eSRAM page is enabled, the page configuration is implicitly locked and any further configuration change attempts will fail.

eSRAM page configuration may be explicitly locked on a per page basis with the ESRAMPGCTRLx.PAGE\_CSR\_LOCK and ESRAMPGCTRL\_BLOCK.BLOCK\_PAGE\_CSR\_LOCK fields. Locked eSRAM pages may still be flushed to DRAM.

All eSRAM configuration registers may be locked with the ESRAMCTRL.eSRAM\_GLOBAL\_CSR\_LOCK field.

#### 12.1.4 ECC Protection

The Host Bridge implements ECC protection for the eSRAM. The eSRAM ECC provides single bit error correction and double bit error detection (SECDED). It is enabled by default, but may be disabled/enabled by setting the register field ESRAMCTRL.SECDED\_ENABLE to 0/1.

The ESRAMCERR register provides debug information on the most recent single bit ECC error. Software may configure a threshold number of correctable ECC errors with the ESRAMCTRL.ECC\_THRESH field. If the ECC\_THRESH\_SB\_MSG\_EN field is set to 1, and the threshold number of correctable ECC errors is reached, the Memory Manager will send an interrupt to the Remote Management Unit with the opcode 0xD8.

The ESRAMUERR register provides debug information on un-correctable ECC errors. If an un-correctable eSRAM ECC error occurs the Memory Manager will send a message to inform the Remote Management Unit. A warm reset of the Host Bridge is required in this case.

The ESRAMSDROME register can be used to decode where in the eSRAM data word the most recent ECC error occurred.

#### 12.1.5 Flush to DRAM

In order to flush a page to DRAM, software must set the ESRAMPGCTRLx.FLUSH\_PG\_ENABLE field to 1 for 4KB pages or the ESRAMPGCTRL\_BLOCK.BLOCK\_FLUSH\_PG\_ENABLE to 1 for the 512KB block page. On an S3 entry or warm reset, firmware will flush pages configured in this way to DRAM.

### 12.2 Isolated Memory Regions (IMR)

The Host Bridge provides support for Isolated Memory Regions (IMRs). An IMR is an area of system memory that is accessible only to certain system agents. The range and access rights of an IMR are software configurable. There are 3 types of IMR

- General IMR
- Host Memory I/O Boundary (HMBOUND) IMR
- System Management Mode (SMM) IMR

There are 8 general IMRs available. The general IMRs allow any location of system memory- with a 1KB granularity, to have software controlled access rights. The upper and lower boundaries of a general IMR are set via the IMRxL.IMRL and IMRxH.IMRH register fields (where x=one of the 8 IMRs). Read access rights are controlled via the IMRxRM registers, write access rights are controlled via the IMRx.WM register fields.

General IMRs may be overlapping. In this case, in order to be allowed access a particular region in memory, an agent will need to have access rights to all the IMRs which contain that region.

The HMBOUND IMR prevents access by non host agents to any region of memory above HMBOUND. HMBOUND is software configured in the HMBOUND register.

The SMM IMR prevents access by non host agents to any region of memory contained within the SMM region. The SMM region access rights are configured in the HSMMCTL register.

### 12.2.1 IMR Violation

If an agent is blocked attempting to write to a region covered by an IMR, its write data is dropped, and system memory is not updated.

If an agent is blocked attempting to read to a region covered by an IMR, all 0s are returned for read data. The region of memory is still read (with ECC checking/correction performed if enabled), but false (all 0) data is returned to the agent instead of the real data from system memory.

If the register field BIMRVCTL.EnableIMRInt is set to 1, and an IMR violation occurs, an interrupt will be sent to the Remote Management Unit with opcode 0xC0. In this case, software may use the BIMRVCTL register to debug the cause of the violation.

### 12.2.2 IMR Locking

The following settings lock the relevant IMR

- General IMR: set IMRxL.IMR\_LOCK to 1
- HMBOUND IMR: set HMBOUND.HMBOUND\_LOCK to 1
- SMM IMR: set HSMMCTL.SMM\_LOCK to 1

Until HMBOUND is configured and locked, any General IMR region that is programmed will only be applied if the General IMR's register set is not locked. This allows software to configure a General IMR region and test it without locking it's register set. Once a General IMR register set is locked, however, HMBOUND is required to be configured and locked or the security mechanism will deny all accesses to that General IMR region.

Until HMBOUND is configured and locked, the SMM IMR region that is programmed will only be applied if the SMM IMR's register set is not locked. This allows software to configure the SMM IMR region and test it without locking it's register set. Once the SMM IMR register set is locked, however, HMBOUND is required to be configured and locked or the security mechanism will deny all accesses to the SMM IMR region.

## 12.3 Remote Management Unit DMA

The Remote Management Unit supports DMA transfers between System Memory and Legacy SPI Flash. The DMA engine is used on boot-up to perform the initial firmware fetch from SPI Flash. In addition, this can be used for shadowing firmware to DRAM or eSRAM.

Remote Management Unit message bus registers - SPI DMA Count Register (P\_CFG\_60), SPI DMA Destination Register (P\_CFG\_61) and SPI DMA Source Register (P\_CFG\_62) are used to control DMA transfers. These registers are managed by the Remote Management Unit firmware.

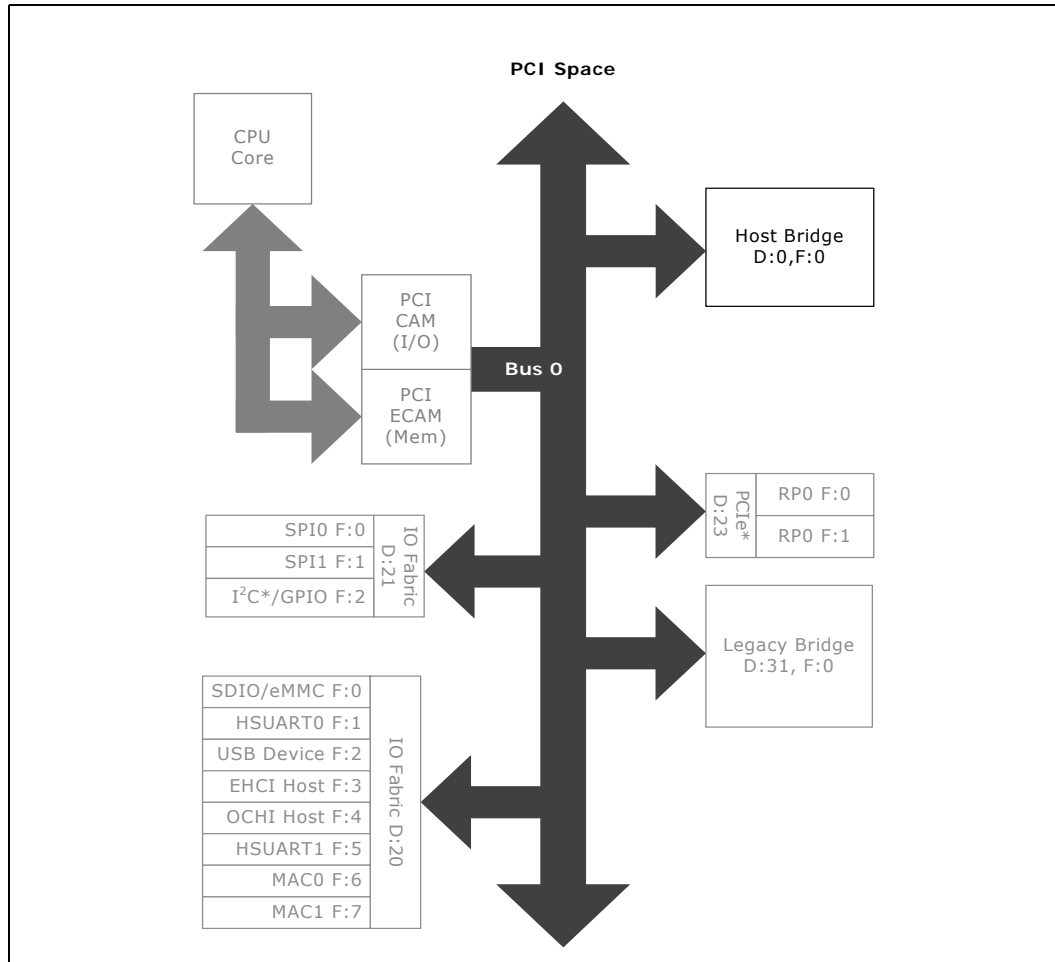

The SPI DMA Count Register (P\_CFG\_60) should be programmed after the SPI DMA Source Register (P\_CFG\_62) and the SPI DMA Destination Register (P\_CFG\_61) as writing to the SPI DMA Count Register (P\_CFG\_60) will trigger the start of the DMA transfer.

See Option Register 1(P\_CFG\_72) bit [0] for details on how to disable DMA functionality.

## 12.4 Register Map

See Chapter 5.0, “Register Access Methods” for additional information.

Figure 25. Intel® Quark™ SoC X1000 Host Bridge Register Map

## 12.5 PCI Configuration Registers

Table 71. Summary of PCI Configuration Registers—0/0/0

Offset Start	Offset End	Register ID—Description	Default Value
0h	3h	"PCI Device ID and Vendor ID Fields (PCI_DEVICE_VENDOR)—Offset 0h" on page 133	09588086h
4h	7h	"PCI Status and Command Fields (PCI_STATUS_COMMAND)—Offset 4h" on page 133	00000007h
8h	Bh	"PCI Class Code and Revision ID Fields (PCI_CLASS_REVISION)—Offset 8h" on page 134	06000000h
Ch	Fh	"PCI Miscellaneous Fields (PCI_MISC)—Offset Ch" on page 134	00000000h
2Ch	2Fh	"PCI Subsystem ID and Subsystem Vendor ID Fields (PCI_SUBSYSTEM)—Offset 2Ch" on page 135	00000000h

Bit Range	Default & Access	Description
31: 16	0000h RO	Status (STATUS): Hardwired to 0.
15: 0	0007h RO	Command (COMMAND): Hardwired to 0.

### 12.5.3 PCI Class Code and Revision ID Fields (PCI\_CLASS\_REVISION)—Offset 8h

PCI Revision ID

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

PCI\_CLASS\_REVISION: [B:0, D:0, F:0] + 8h

Default: 06000000h

31	28	24	20	16	12	8	4	0																															
0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
CLASS_CODE												REVISION_ID																											

Bit Range	Default & Access	Description
31: 8	060000h RO	Class Code (CLASS_CODE): PCI Class Code for Chipset.
7: 0	00h RO	Revision ID (REVISION_ID): PCI Revision ID

### 12.5.4 PCI Miscellaneous Fields (PCI\_MISC)—Offset Ch

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

PCI\_MISC: [B:0, D:0, F:0] + Ch

Default: 00000000h

31	28	24	20	16	12	8	4	0																											
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
BIST				HEADER				LATENCY				CACHE_LINE_SIZE																							

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
SB_OPCODE			SB_PORT			SB_ADDR		SB_BE	RSV

Bit Range	Default & Access	Description
31: 24	00h WO	<b>OpCode (SB_OPCODE):</b> The operation to be performed on the target port.
23: 16	00h WO	<b>Port (SB_PORT):</b> The device or unit to be targeted by the message bus transaction.
15: 8	00h WO	<b>Offset/Register (SB_ADDR):</b> Bits 7:0 of the private register offset to be targeted by the message bus transaction. This field applies only to register read and write operations.
7: 4	0h WO	<b>Byte Enable (SB_BE):</b> The byte enables to be used by the triggered transaction. This field applies only to register read and write operations.
3: 0	0h WO	<b>Reserved (RSV):</b> Reserved.

### 12.5.7 Message Data Register (MDR) (SB\_DATA\_REG)—Offset D4h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**SB\_DATA\_REG:** [B:0, D:0, F:0] + D4h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
SB_DATA								

Bit Range	Default & Access	Description
31: 0	0h RW	<b>Data (SB_DATA):</b> Used as the place to store the data when the operation triggered is a read semantic, or the place to get the data if the triggered operation is a data write semantic.

### 12.5.8 Message Control Register eXtension (MCRX) (SB\_ADDR\_EXTN\_REG)—Offset D8h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**SB\_ADDR\_EXTN\_REG:** [B:0, D:0, F:0] + D8h

**Default:** 00000000h

## 12.6 IO Mapped Register

### 12.6.1 ACPI Processor Block

Table 72. Summary of I/O Registers—PMBA

Offset Start	Offset End	Register ID—Description	Default Value
0h	3h	"Processor Control (P_CNT)—Offset 0h" on page 138	00000000h
4h	7h	"Level 2 Register (P_LVL2)—Offset 4h" on page 138	00000000h
Ch	Fh	"C6 Control Register (P_C6C)—Offset Ch" on page 139	00000000h

#### 12.6.1.1 Processor Control (P\_CNT)—Offset 0h

##### Access Method

Type: I/O Register  
(Size: 32 bits)

P\_CNT: [PMBA] + 0h

PMBA Type: Message Bus Register (Size: 32 bits)

PMBA Reference: [Port: 0x04] + 70h

Default: 00000000h

Bit Range	Default & Access	Description
31:5	0b RO	Reserved (P_CNT_RSV2): Reserved.
4	0b RW	<b>Throttle Enable (THROTL_EN)</b> : When set and the processor is in C0, it enables software-controlled STPCLK# throttling. The duty cycle is selected via THROTL_DUTY_CYCLE. It remains in effect on each re-entry to C0 as long as enabled.
3:1	000b RW	<b>Throttle Duty Cycle (THROTL_DUTY_CYCLE)</b> : This field determines the duty cycle of throttling (percentage of time STPCLK# is asserted) when throttling is enabled. 000b : 50% (Default) 001b : 87.5% 010b : 75% 011b : 62.5% 100b : 50% 101b : 37.5% 110b : 35% 111b : 12.5%
0	0b RO	Reserved (P_CNT_RSV1): Reserved.

#### 12.6.1.2 Level 2 Register (P\_LVL2)—Offset 4h

Level 2 Register is an 8-bit register that is used to generate requests to enter C2.

**Access Method**

Type: I/O Register  
(Size: 32 bits)

P\_LVL2: [PMBA] + 4h

PMBA Type: Message Bus Register (Size: 32 bits)

PMBA Reference: [Port: 0x04] + 70h

Default: 00000000h

Bit Range	Default & Access	Description
31:8	0b RW	Reserved (P_LVL2_RSV): Reserved.
7:0	00h RO	Go to C2 (GO_TO_C2): Reads to this register return all zeroes, writes have no effect. Reads to this register generate a C2 request.

**12.6.1.3 C6 Control Register (P\_C6C)—Offset Ch**

This is a read only register. It provides information on the last C-state entered and residency in the last entered C-state

**Access Method**

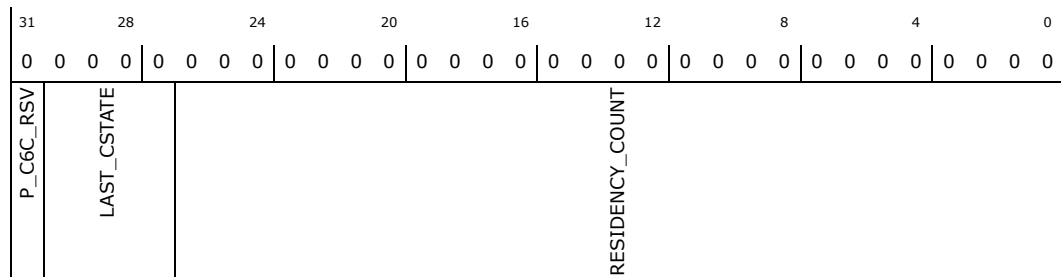

Type: I/O Register  
(Size: 32 bits)

P\_C6C: [PMBA] + Ch

PMBA Type: Message Bus Register (Size: 32 bits)

PMBA Reference: [Port: 0x04] + 70h

Default: 00000000h

Bit Range	Default & Access	Description
31	0b RO	Reserved (P_C6C_RSV): Reserved.
30:27	0b RO	Last Entered C-State (LAST_CSTATE): Once CPU transitions from C0 to C2, it updates this register. 0000b : C0 0010b : C2 All other values are reserved.

Bit Range	Default & Access	Description
26:0	0b RO	<b>Residency Count (RESIDENCY_COUNT)</b> : This register reports the residency in the last entered C-state. The granularity used is microseconds

## 12.6.2 SPI DMA Block

DMA functionality must be disabled on boot completion to prevent an attacker from using it to take control of the system.

### 12.6.2.1 Option Register 1 (P\_CFG\_72) —Offset 72h

#### Access Method

Type: I/O Register  
(Size: 32 bits)

Offset: [Port: 0x04] + 72h

SPI\_DMA\_BAR Type: Message Bus Register (Size: 32 bits)

SPI\_DMA\_BAR Reference: [Port: 0x04] + 72h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
Reserved								DMA_DISABLE

Bit Range	Default & Access	Field Name (ID): Description
31:1	0 RO	<b>Reserved (RSVD)</b> : Reserved.
0	0 RW	<b>DMA_DISABLE</b> : Remote Management Unit DMA disable. Once set RMU DMA functionality is disabled until system reset

## 12.7 Message Bus Register

### 12.7.1 Host Bridge Arbiter (Port 0x00)

Table 73. Summary of Message Bus Registers—0x00

Offset	Register ID—Description	Default Value
0h	"Enhanced Configuration Space (AEC_CTRL)—Offset 0h" on page 141	00000000h
21h	"STATUS—Offset 21h" on page 141	00000000h
50h	"Requester ID Match Control (ASUBCHAN_CTRL)—Offset 50h" on page 142	00000000h
51h	"Requester ID Match Sub-Channel 1 (ASUBCHAN1_MATCH)—Offset 51h" on page 143	00000000h
52h	"Requester ID Match Sub-Channel 2 (ASUBCHAN2_MATCH)—Offset 52h" on page 143	00000000h
53h	"Requester ID Match Sub-Channel 3 (ASUBCHAN3_MATCH)—Offset 53h" on page 144	00000000h

Type: Message Bus Register  
(Size: 32 bits)

ASUBCHAN2\_MATCH: [Port: 0x00] + 52h

Op Codes:  
10h - Read, 11h - Write

Default: 00000000h

Bit Range	Default & Access	Description
31:23	0b RO	Reserved (RSV2): Reserved.
22:16	0b RO	Reserved (RSV1): Reserved.
15:0	0b RW/L	Requester ID Match Value (SUB_CHAN2_MRQID): Value compared to an incoming Requester ID value to determine its Sub-Channel.

### 12.7.1.6 Requester ID Match Sub-Channel 3 (ASUBCHAN3\_MATCH)—Offset 53h

#### Access Method

Type: Message Bus Register  
(Size: 32 bits)

ASUBCHAN3\_MATCH: [Port: 0x00] + 53h

Op Codes:  
10h - Read, 11h - Write

Default: 00000000h

Bit Range	Default & Access	Description
31:23	0b RO	Reserved (RSV2): Reserved.
22:16	0b RO	Reserved (RSV1): Reserved.
15:0	0b RW/L	Requester ID Match Value (SUB_CHAN3_MRQID): Value compared to an incoming Requester ID value to determine its Sub-Channel.

## 12.7.2 Host Bridge (Port 0x03)

**Table 74. Summary of Message Bus Registers—0x03**

Offset	Register ID—Description	Default Value
3h	"Host Miscellaneous Controls 2 (HMISC2)—Offset 3h" on page 146	00170001h
4h	"Host System Management Mode Controls (HSMMCTL)—Offset 4h" on page 147	00060006h
8h	"Host Memory I/O Boundary (HMBOUND)—Offset 8h" on page 148	40000000h
9h	"Extended Configuration Space (HECREG)—Offset 9h" on page 148	00000000h

65h	"MTRR Variable Range Physical Mask 5 (MTRR_VAR_PHYSMASK5)—Offset 65h" on page 171	00000000h
66h	"MTRR Variable Range Physical Base 6 (MTRR_VAR_PHYSBASE6)—Offset 66h" on page 172	00000000h
67h	"MTRR Variable Range Physical Mask 6 (MTRR_VAR_PHYSMASK6)—Offset 67h" on page 172	00000000h
68h	"MTRR Variable Range Physical Base 7 (MTRR_VAR_PHYSBASE7)—Offset 68h" on page 173	00000000h
69h	"MTRR Variable Range Physical Mask 7 (MTRR_VAR_PHYSMASK7)—Offset 69h" on page 173	00000000h

**12.7.2.1 Host Miscellaneous Controls 2 (HMISC2)—Offset 3h**

**Access Method**

**Type:** Message Bus Register **HMISC2:** [Port: 0x03] + 3h  
 (Size: 32 bits)

**Op Codes:**  
 10h - Read, 11h - Write

**Default:** 00170001h

Bit Range	Default & Access	Description
31:23	0h RO	<b>Reserved (RSV43):</b> Reserved.
22	0b RO	<b>PBE Status (PBE_STATUS):</b> Reflects the value of the Pending Break Event pin from the processor
21	0b RO	<b>Reserved (RSV05):</b> Reserved.
20:16	10111b RW	<b>OR PM Signals from Legacy Bridge (OR_PM):</b> When set, the Host Bridge will OR the power management signals driven by the Legacy Bridge with the internal values generated by the Remote Management Unit. This field specifies, on a signal-by-signal basis, whether a given bit should be driven via a message from the Remote Management Unit or via a direct pin from the Legacy Bridge. [20] Reserved [19] SMI [18] NMI [17] INIT [16] INTR

Bit Range	Default & Access	Description
15:4	000h RW/L	<b>SMM Lower Bound (SMM_START)</b> : These bits are compared with bits [31:20] of the incoming address to determine the lower 1MB aligned value of the protected SMM range.
3	0b RO	<b>Reserved (RSV06)</b> : Reserved.
2	1b RW/L	<b>SMM Writes Open (SMM_WR_OPEN)</b> : Allow non-SMM writes to SMM space. This bit allows processor writes to the SMM space defined by the SMM Start and SMM End fields even when the processor is not in SMM mode
1	1b RW/L	<b>SMM Reads Open (SMM_RD_OPEN)</b> : Allow non-SMM reads to SMM space. This bit allows processor reads to the SMM space defined by the SMM Start and SMM End fields even when the processor is not in SMM mode
0	0b RW/O	<b>SMM Locked (SMM_LOCK)</b> : When set, this bit locks this register and prevents write access until the system is reset

### 12.7.2.3 Host Memory I/O Boundary (HMBOUND)—Offset 8h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**HMBOUND:** [Port: 0x03] + 8h

**Op Codes:**

10h - Read, 11h - Write

**Default:** 40000000h

31	28	24	20	16	12	8	4	0
0	1	0	0	0	0	0	0	0
HMBOUND						RSV10		IO_DISABLE HMBOUND_LOCK

Bit Range	Default & Access	Description
31:12	40000h RW/L	<b>Host IO Boundary (HMBOUND)</b> : This register field is compared with the bits [31:12] of incoming memory accesses to determine if the transaction should be routed to Memory space or MMIO space. If address bits[31:12] are greater than or equal to the Host IO Boundary then the transaction is routed to MMIO space. This allows the Host IO Boundary to be set to a 4KB aligned boundary. By default, the Host IO Boundary is set at 1GB.
11:2	000h RO	<b>Reserved (RSV10)</b> : Reserved.
1	0b RW/L	<b>Host IO Disable (IO_DISABLE)</b> : When this bit is set, all accesses will be sent to memory regardless of the address with the exception of accesses to the A, B, E and F Segments. Access to the segments is controlled by HMISC2
0	0b RW/O	<b>HMBOUND Lock (HMBOUND_LOCK)</b> : When this bit is set, the HMBOUND register is locked and can no longer be modified until Host Bridge is reset

### 12.7.2.4 Extended Configuration Space (HECREG)—Offset 9h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**HWFLUSH:** [Port: 0x03] + Ch

Op Codes:  
10h - Read, 11h - Write

**Default:** 00010000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	1	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSV18				ALL_FLUSHED	RSV17			HWM

Bit Range	Default & Access	Description
31:17	0000h RO	<b>Reserved (RSV18):</b> Reserved.
16	1b RO	<b>All Entries Flushed (ALL_FLUSHED):</b> Indicates all dirty entries have been flushed from the Host Bridge to the Memory Manager
15:8	00h RO	<b>Reserved (RSV17):</b> Reserved.
7:0	00h RW	<b>High Water Mark (HWM):</b> High Water Mark for Dirty Entries within the Host Bridge. When this threshold is exceeded, entries are flushed from the Host Bridge to the Memory Manager. Valid values are 0x00, 0x01 and 0x02

### 12.7.2.7 MTRR Capabilities (MTRR\_CAP)—Offset 40h

Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_CAP:** [Port: 0x03] + 40h

Op Codes:  
10h - Read, 11h - Write

**Default:** 00000908h

31	28	24	20	16	12	8	4	0		
0	0	0	0	0	0	0	0	0		
0	0	0	0	0	0	0	0	0		
0	0	0	0	0	0	0	0	0		
0	0	0	0	0	0	0	0	0		
0	0	0	0	0	0	0	0	0		
0	0	0	0	0	0	0	0	0		
0	0	0	0	0	0	0	0	0		
0	0	0	0	0	0	0	0	0		
0	0	0	0	0	0	0	0	0		
RSV21						SMRR	WC	RSV20	FIX	VCNT

Bit Range	Default & Access	Description
31:12	00000h RO	<b>Reserved (RSV21):</b> Reserved.
11	1b RO	<b>System Management Register Range Supported (SMRR):</b> System Management Register Range supported if set
10	0b RO	<b>Write Combining Memory Type Supported (WC):</b> Write Combining memory supported if set
9	0b RO	<b>Reserved (RSV20):</b> Reserved.

Bit Range	Default & Access	Description
8	1b RO	<b>Fixed Range Registers Supported (FIX)</b> : Indicates fixed range registers are supported if set
7:0	08h RO	<b>Variable Range Registers Count (VCNT)</b> : Indicates the number of variable range registers implemented in the Host Bridge

### 12.7.2.8 MTRR Default Type (MTRR\_DEF\_TYPE)—Offset 41h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_DEF\_TYPE:** [Port: 0x03] + 41h

Op Codes:

10h - Read, 11h - Write

**Default:** 00000000h

31	28	24	20	16	12	8	4	0											
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSV23						E	FE	RSV22		DEF_TYPE									

Bit Range	Default & Access	Description
31:12	00000h RO	<b>Reserved (RSV23)</b> : Reserved.
11	0b RW	<b>MTRR Enable (E)</b> : MTRRs are enabled when set and are disabled when clear and the UC memory type is applied to all of physical memory. When this flag is set, the FE flag can disable the fixed range MTRRs. When the flag is clear, the FE flag has no affect. When the E flag is set, the type specified in the default memory type field is used for areas of memory not already mapped by either a fixed or variable MTRR.
10	0b RW	<b>Fixed MTRR Enable (FE)</b> : Fixed range MTRRs are enabled when set and are disabled when clear. When the fixed range MTRRs are enabled, they take priority over the variable range MTRRs when overlaps in ranges occur. If the fixed range MTRRs are disabled, the variable range MTRRs can still be used and can map the range ordinarily covered by the fixed range MTRRs.
9:8	00b RO	<b>Reserved (RSV22)</b> : Reserved.
7:0	00h RW	<b>Default Memory Type (DEF_TYPE)</b> : Indicates the default memory type used for memory address ranges that do not have a memory type specified for them by an MTRR. Default value is UC (Uncached)

### 12.7.2.9 MTRR Fixed 64KB Range 0x00000 (MTRR\_FIX64K\_00000)—Offset 42h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_FIX64K\_00000:** [Port: 0x03] + 42h

Op Codes:

10h - Read, 11h - Write

**Default:** 00000000h

31	28	24	20	16	12	8	4	0															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
FIX64K_30000				FIX64K_20000				FIX64K_10000				FIX64K_00000											

Bit Range	Default & Access	Description
31:24	00h RW	<b>Fixed 64KB Range 0x30000 (FIX64K_30000)</b> : Maps the 64KB range from 0x30000 to 0x3FFFF
23:16	00h RW	<b>Fixed 64KB Range 0x20000 (FIX64K_20000)</b> : Maps the 64KB range from 0x20000 to 0x2FFFF
15:8	00h RW	<b>Fixed 64KB Range 0x10000 (FIX64K_10000)</b> : Maps the 64KB range from 0x10000 to 0x1FFFF
7:0	00h RW	<b>Fixed 64KB Range 0x00000 (FIX64K_00000)</b> : Maps the 64KB range from 0x00000 to 0x0FFFF

### 12.7.2.10 MTRR Fixed 64KB Range 0x40000 (MTRR\_FIX64K\_40000)—Offset 43h

#### Access Method

Type: Message Bus Register  
(Size: 32 bits)

MTRR\_FIX64K\_40000: [Port: 0x03] + 43h

Op Codes:

10h - Read, 11h - Write

Default: 00000000h

31	28	24	20	16	12	8	4	0											
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
FIX64K_70000				FIX64K_60000				FIX64K_50000				FIX64K_40000							

Bit Range	Default & Access	Description
31:24	00h RW	<b>Fixed 64KB Range 0x70000 (FIX64K_70000)</b> : Maps the 64KB range from 0x70000 to 0x7FFFF
23:16	00h RW	<b>Fixed 64KB Range 0x60000 (FIX64K_60000)</b> : Maps the 64KB range from 0x60000 to 0x6FFFF
15:8	00h RW	<b>Fixed 64KB Range 0x50000 (FIX64K_50000)</b> : Maps the 64KB range from 0x50000 to 0x5FFFF
7:0	00h RW	<b>Fixed 64KB Range 0x40000 (FIX64K_40000)</b> : Maps the 64KB range from 0x40000 to 0x4FFFF

### 12.7.2.11 MTRR Fixed 16KB Range 0x80000 (MTRR\_FIX16K\_80000)—Offset 44h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_FIX16K\_80000:** [Port: 0x03] + 44h

**Op Codes:**  
10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Description
31:24	00h RW	<b>Fixed 16KB Range 0x8C000 (FIX16K_8C000):</b> Maps the 16KB range from 0x8C000 to 0x8FFFF
23:16	00h RW	<b>Fixed 16KB Range 0x88000 (FIX16K_88000):</b> Maps the 16KB range from 0x88000 to 0x8BFFF
15:8	00h RW	<b>Fixed 16KB Range 0x84000 (FIX16K_84000):</b> Maps the 16KB range from 0x84000 to 0x87FFF
7:0	00h RW	<b>Fixed 16KB Range 0x80000 (FIX16K_80000):</b> Maps the 16KB range from 0x80000 to 0x83FFF

### 12.7.2.12 MTRR Fixed 16KB Range 0x90000 (MTRR\_FIX16K\_90000)—Offset 45h

**Access Method**

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_FIX16K\_90000:** [Port: 0x03] + 45h

**Op Codes:**  
10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Description
31:24	00h RW	<b>Fixed 16KB Range 0x9C000 (FIX16K_9C000):</b> Maps the 16KB range from 0x9C000 to 0x9FFFF
23:16	00h RW	<b>Fixed 16KB Range 0x98000 (FIX16K_98000):</b> Maps the 16KB range from 0x98000 to 0x9BFFF
15:8	00h RW	<b>Fixed 16KB Range 0x94000 (FIX16K_94000):</b> Maps the 16KB range from 0x94000 to 0x97FFF

31	28	24	20	16	12	8	4	0															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
FIX4K_C7000				FIX4K_C6000				FIX4K_C5000				FIX4K_C4000											

Bit Range	Default & Access	Description
31:24	00h RW	<b>Fixed 4KB Range 0xC7000 (FIX4K_C7000):</b> Maps the 4KB range from 0xC7000 to 0xC7FFF
23:16	00h RW	<b>Fixed 4KB Range 0xC6000 (FIX4K_C6000):</b> Maps the 4KB range from 0xC6000 to 0xC6FFF
15:8	00h RW	<b>Fixed 4KB Range 0xC5000 (FIX4K_C5000):</b> Maps the 4KB range from 0xC5000 to 0xC5FFF
7:0	00h RW	<b>Fixed 4KB Range 0xC4000 (FIX4K_C4000):</b> Maps the 4KB range from 0xC4000 to 0xC4FFF

### 12.7.2.17 MTRR Fixed 4KB Range 0xC8000 (MTRR\_FIX4K\_C8000)—Offset 4Ah

#### Access Method

Type: Message Bus Register  
(Size: 32 bits)

MTRR\_FIX4K\_C8000: [Port: 0x03] + 4Ah

Op Codes:  
10h - Read, 11h - Write

Default: 00000000h

31	28	24	20	16	12	8	4	0											
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
FIX4K_CB000				FIX4K_CA000				FIX4K_C9000				FIX4K_C8000							

Bit Range	Default & Access	Description
31:24	00h RW	<b>Fixed 4KB Range 0xCB000 (FIX4K_CB000):</b> Maps the 4KB range from 0xCB000 to 0xCBFFF
23:16	00h RW	<b>Fixed 4KB Range 0xCA000 (FIX4K_CA000):</b> Maps the 4KB range from 0xCA000 to 0xCAFFF
15:8	00h RW	<b>Fixed 4KB Range 0xC9000 (FIX4K_C9000):</b> Maps the 4KB range from 0xC9000 to 0xC9FFF
7:0	00h RW	<b>Fixed 4KB Range 0xC8000 (FIX4K_C8000):</b> Maps the 4KB range from 0xC8000 to 0xC8FFF

### 12.7.2.18 MTRR Fixed 4KB Range 0xCC000 (MTRR\_FIX4K\_CC000)—Offset 4Bh

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_FIX4K\_CC000:** [Port: 0x03] + 4Bh

Op Codes:

10h - Read, 11h - Write

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
	FIX4K_CF000		FIX4K_CE000		FIX4K_CD000		FIX4K_CC000	

Bit Range	Default & Access	Description
31:24	00h RW	<b>Fixed 4KB Range 0xCF000 (FIX4K_CF000):</b> Maps the 4KB range from 0xCF000 to 0xCFFFF
23:16	00h RW	<b>Fixed 4KB Range 0xCE000 (FIX4K_CE000):</b> Maps the 4KB range from 0xCE000 to 0xCEFFF
15:8	00h RW	<b>Fixed 4KB Range 0xCD000 (FIX4K_CD000):</b> Maps the 4KB range from 0xCD000 to 0xCDFFF
7:0	00h RW	<b>Fixed 4KB Range 0xCC000 (FIX4K_CC000):</b> Maps the 4KB range from 0xCC000 to 0xCCFFF

### 12.7.2.19 MTRR Fixed 4KB Range 0xD0000 (MTRR\_FIX4K\_D0000)—Offset 4Ch

Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_FIX4K\_D0000:** [Port: 0x03] + 4Ch

Op Codes:

10h - Read, 11h - Write

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
	FIX4K_D3000		FIX4K_D2000		FIX4K_D1000		FIX4K_D0000	

Bit Range	Default & Access	Description
31:24	00h RW	<b>Fixed 4KB Range 0xD3000 (FIX4K_D3000):</b> Maps the 4KB range from 0xD3000 to 0xD3FFF
23:16	00h RW	<b>Fixed 4KB Range 0xD2000 (FIX4K_D2000):</b> Maps the 4KB range from 0xD2000 to 0xD2FFF
15:8	00h RW	<b>Fixed 4KB Range 0xD1000 (FIX4K_D1000):</b> Maps the 4KB range from 0xD1000 to 0xD1FFF
7:0	00h RW	<b>Fixed 4KB Range 0xD0000 (FIX4K_D0000):</b> Maps the 4KB range from 0xD0000 to 0xD0FFF

### 12.7.2.20 MTRR Fixed 4KB Range 0xD4000 (MTRR\_FIX4K\_D4000)—Offset 4Dh

**Access Method**

Type: Message Bus Register  
(Size: 32 bits)

MTRR\_FIX4K\_D4000: [Port: 0x03] + 4Dh

Op Codes:  
10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Description
31:24	00h RW	<b>Fixed 4KB Range 0xD7000 (FIX4K_D7000):</b> Maps the 4KB range from 0xD7000 to 0xD7FFF
23:16	00h RW	<b>Fixed 4KB Range 0xD6000 (FIX4K_D6000):</b> Maps the 4KB range from 0xD6000 to 0xD6FFF
15:8	00h RW	<b>Fixed 4KB Range 0xD5000 (FIX4K_D5000):</b> Maps the 4KB range from 0xD5000 to 0xD5FFF
7:0	00h RW	<b>Fixed 4KB Range 0xD4000 (FIX4K_D4000):</b> Maps the 4KB range from 0xD4000 to 0xD4FFF

### 12.7.2.21 MTRR Fixed 4KB Range 0xD8000 (MTRR\_FIX4K\_D8000)—Offset 4Eh

**Access Method**

Type: Message Bus Register  
(Size: 32 bits)

MTRR\_FIX4K\_D8000: [Port: 0x03] + 4Eh

Op Codes:  
10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Description
31:24	00h RW	<b>Fixed 4KB Range 0xDB000 (FIX4K_DB000):</b> Maps the 4KB range from 0xDB000 to 0xDBFFF
23:16	00h RW	<b>Fixed 4KB Range 0xDA000 (FIX4K_DA000):</b> Maps the 4KB range from 0xDA000 to 0xDAFFF

Bit Range	Default & Access	Description
31:24	00h RW	<b>Fixed 4KB Range 0xE3000 (FIX4K_E3000)</b> : Maps the 4KB range from 0xE3000 to 0xE3FFF
23:16	00h RW	<b>Fixed 4KB Range 0xE2000 (FIX4K_E2000)</b> : Maps the 4KB range from 0xE2000 to 0xE2FFF
15:8	00h RW	<b>Fixed 4KB Range 0xE1000 (FIX4K_E1000)</b> : Maps the 4KB range from 0xE1000 to 0xE1FFF
7:0	00h RW	<b>Fixed 4KB Range 0xE0000 (FIX4K_E0000)</b> : Maps the 4KB range from 0xE0000 to 0xE0FFF

### 12.7.2.24 MTRR Fixed 4KB Range 0xE4000 (MTRR\_FIX4K\_E4000)—Offset 51h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_FIX4K\_E4000:** [Port: 0x03] + 51h

**Op Codes:**

10h - Read, 11h - Write

**Default:** 00000000h

0	0	0	0	0	0	0	0	0			
FIX4K_EF000			FIX4K_EE000			FIX4K_ED000			FIX4K_EC000		

Bit Range	Default & Access	Description
31:24	00h RW	<b>Fixed 4KB Range 0xEF000 (FIX4K_EF000):</b> Maps the 4KB range from 0xEF000 to 0xEFFFF
23:16	00h RW	<b>Fixed 4KB Range 0xEE000 (FIX4K_EE000):</b> Maps the 4KB range from 0xEE000 to 0xEEFFF
15:8	00h RW	<b>Fixed 4KB Range 0xED000 (FIX4K_ED000):</b> Maps the 4KB range from 0xED000 to 0xEDFFF
7:0	00h RW	<b>Fixed 4KB Range 0xEC000 (FIX4K_EC000):</b> Maps the 4KB range from 0xEC000 to 0xECFFF

### 12.7.2.27 MTRR Fixed 4KB Range 0xF0000 (MTRR\_FIX4K\_F0000)—Offset 54h

#### Access Method

Type: Message Bus Register  
(Size: 32 bits)

MTRR\_FIX4K\_F0000: [Port: 0x03] + 54h

Op Codes:  
10h - Read, 11h - Write

Default: 00000000h

31	28	24	20	16	12	8	4	0							
0	0	0	0	0	0	0	0	0							
FIX4K_F3000				FIX4K_F2000				FIX4K_F1000				FIX4K_F0000			

Bit Range	Default & Access	Description
31:24	00h RW	<b>Fixed 4KB Range 0xF3000 (FIX4K_F3000)</b> : Maps the 4KB range from 0xF3000 to 0xF3FFF
23:16	00h RW	<b>Fixed 4KB Range 0xF2000 (FIX4K_F2000)</b> : Maps the 4KB range from 0xF2000 to 0xF2FFF
15:8	00h RW	<b>Fixed 4KB Range 0xF1000 (FIX4K_F1000)</b> : Maps the 4KB range from 0xF1000 to 0xF1FFF
7:0	00h RW	<b>Fixed 4KB Range 0xF0000 (FIX4K_F0000)</b> : Maps the 4KB range from 0xF0000 to 0xF0FFF

### 12.7.2.28 MTRR Fixed 4KB Range 0xF4000 (MTRR\_FIX4K\_F4000)—Offset 55h

Access Method

Type: Message Bus Register  
(Size: 32 bits)

MTRR\_FIX4K\_F4000: [Port: 0x03] + 55h

Op Codes:  
10h - Read, 11h - Write

Default: 00000000h

31	28	24	20	16	12	8	4	0							
0	0	0	0	0	0	0	0	0							
FIX4K_F7000				FIX4K_F6000				FIX4K_F5000				FIX4K_F4000			

Bit Range	Default & Access	Description
31:24	00h RW	<b>Fixed 4KB Range 0xF7000 (FIX4K_F7000)</b> : Maps the 4KB range from 0xF7000 to 0xF7FFF
23:16	00h RW	<b>Fixed 4KB Range 0xF6000 (FIX4K_F6000)</b> : Maps the 4KB range from 0xF6000 to 0xF6FFF
15:8	00h RW	<b>Fixed 4KB Range 0xF5000 (FIX4K_F5000)</b> : Maps the 4KB range from 0xF5000 to 0xF5FFF
7:0	00h RW	<b>Fixed 4KB Range 0xF4000 (FIX4K_F4000)</b> : Maps the 4KB range from 0xF4000 to 0xF4FFF

### 12.7.2.29 MTRR Fixed 4KB Range 0xF8000 (MTRR\_FIX4K\_F8000)—Offset 56h

**Access Method**

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_FIX4K\_F8000:** [Port: 0x03] + 56h

**Op Codes:**  
10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Description
15:8	00h RW	<b>Fixed 4KB Range 0xFD000 (FIX4K_FD000)</b> : Maps the 4KB range from 0xFD000 to 0xFDFFF
7:0	00h RW	<b>Fixed 4KB Range 0xFC000 (FIX4K_FC000)</b> : Maps the 4KB range from 0xFC000 to 0xFCFFF

### 12.7.2.31 System Management Range Physical Base (MTRR\_SMRR\_PHYSBASE)—Offset 58h

This register may only be written while in SMM. Attempts to write this register outside of SMM will be ignored.

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_SMRR\_PHYSBASE:** [Port: 0x03] + 58h

**Op Codes:**

10h - Read, 11h - Write

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
SMRR_PHYSBASE						RSV24	SMRR_TYPE		

Bit Range	Default & Access	Description
31:12	0000h RW	<b>SMRR Physical Base (SMRR_PHYSBASE)</b> : Specifies the base address for the System Management Range. This 20 bit value is extended by 12 bits at the low end to form the base address
11:8	0000b RO	<b>Reserved (RSV24)</b> : Reserved.
7:0	00h RW	<b>SMRR Type (SMRR_TYPE)</b> : Specifies the memory type for System Management Range

### 12.7.2.32 System Management Range Physical Mask (MTRR\_SMRR\_PHYSMASK)—Offset 59h

This register may only be written while in SMM. Attempts to write this register outside of SMM will be ignored.

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_SMRR\_PHYSMASK:** [Port: 0x03] + 59h

**Op Codes:**

10h - Read, 11h - Write

**Default:** 00000000h

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_VAR\_PHYSMASK0:** [Port: 0x03] + 5Bh

**Op Codes:**  
10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Description
31:12	00000h RW	<b>Physical Mask (VAR_PHYSMASK0):</b> Specifies a mask value for Variable Range 0. The mask determines the range of the region begin mapped. The mask value is extended by 12 bits at the low end to form the mask value.
11	0b RW	<b>Valid (VAR_VALID0):</b> Enables the register pair for Variable Range 0 when set and disables the register pair when clear.
10:0	0000h RO	<b>Reserved (RSV27):</b> Reserved.

### 12.7.2.35 MTRR Variable Range Physical Base 1 (MTRR\_VAR\_PHYSBASE1)—Offset 5Ch

**Access Method**

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_VAR\_PHYSBASE1:** [Port: 0x03] + 5Ch

**Op Codes:**  
10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Description
31:12	00000h RW	<b>Physical Base (VAR_PHYSBASE1):</b> Specifies the base address for Variable Range 1. This 20 bit value is extended by 12 bits at the low end to form the base address
11:8	0000b RO	<b>Reserved (RSV28):</b> Reserved.
7:0	00h RW	<b>Type (VAR_TYPE1):</b> Specifies the memory type for Variable Range 1

### 12.7.2.36 MTRR Variable Range Physical Mask 1 (MTRR\_VAR\_PHYSMASK1)—Offset 5Dh

**Access Method**

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_VAR\_PHYSMASK1:** [Port: 0x03] + 5Dh

**Op Codes:**

10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Description
31:12	00000h RW	<b>Physical Mask (VAR_PHYSMASK1):</b> Specifies a mask value for Variable Range 1. The mask determines the range of the region begin mapped. The mask value is extended by 12 bits at the low end to form the mask value.
11	0b RW	<b>Valid (VAR_VALID1):</b> Enables the register pair for Variable Range 1 when set and disables the register pair when clear.
10:0	0000h RO	<b>Reserved (RSV29):</b> Reserved.

### 12.7.2.37 MTRR Variable Range Physical Base 2 (MTRR\_VAR\_PHYSBASE2)—Offset 5Eh

**Access Method**

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_VAR\_PHYSBASE2:** [Port: 0x03] + 5Eh

**Op Codes:**

10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Description
31:12	00000h RW	<b>Physical Base (VAR_PHYSBASE2):</b> Specifies the base address for Variable Range 2. This 20 bit value is extended by 12 bits at the low end to form the base address

Bit Range	Default & Access	Description
11:8	0000b RO	<b>Reserved (RSV30):</b> Reserved.
7:0	00h RW	<b>Type (VAR_TYPE2):</b> Specifies the memory type for Variable Range 2

### 12.7.2.38 MTRR Variable Range Physical Mask 2 (MTRR\_VAR\_PHYSMASK2)—Offset 5Fh

**Access Method**

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_VAR\_PHYSMASK2:** [Port: 0x03] + 5Fh

**Op Codes:**  
10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Description
31:12	00000h RW	<b>Physical Mask (VAR_PHYSMASK2):</b> Specifies a mask value for Variable Range 2. The mask determines the range of the region begin mapped. The mask value is extended by 12 bits at the low end to form the mask value.
11	0b RW	<b>Valid (VAR_VALID2):</b> Enables the register pair for Variable Range 2 when set and disables the register pair when clear.
10:0	0000h RO	<b>Reserved (RSV31):</b> Reserved.

### 12.7.2.39 MTRR Variable Range Physical Base 3 (MTRR\_VAR\_PHYSBASE3)—Offset 60h

**Access Method**

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_VAR\_PHYSBASE3:** [Port: 0x03] + 60h

**Op Codes:**  
10h - Read, 11h - Write

**Default:** 00000000h

Type: Message Bus Register  
(Size: 32 bits)

MTRR\_VAR\_PHYSBASE4: [Port: 0x03] + 62h

Op Codes:  
10h - Read, 11h - Write

Default: 00000000h

Bit Range	Default & Access	Description
31:12	00000h RW	<b>Physical Base (VAR_PHYSBASE4)</b> : Specifies the base address for Variable Range 4. This 20 bit value is extended by 12 bits at the low end to form the base address
11:8	0000b RO	<b>Reserved (RSV34)</b> : Reserved.
7:0	00h RW	<b>Type (VAR_TYPE4)</b> : Specifies the memory type for Variable Range 4

#### 12.7.2.42 MTRR Variable Range Physical Mask 4 (MTRR\_VAR\_PHYSMASK4)—Offset 63h

Access Method

Type: Message Bus Register  
(Size: 32 bits)

MTRR\_VAR\_PHYSMASK4: [Port: 0x03] + 63h

Op Codes:  
10h - Read, 11h - Write

Default: 00000000h

Bit Range	Default & Access	Description
31:12	00000h RW	<b>Physical Mask (VAR_PHYSMASK4)</b> : Specifies a mask value for Variable Range 4. The mask determines the range of the region begin mapped. The mask value is extended by 12 bits at the low end to form the mask value.
11	0b RW	<b>Valid (VAR_VALID4)</b> : Enables the register pair for Variable Range 4 when set and disables the register pair when clear.
10:0	0000h RO	<b>Reserved (RSV35)</b> : Reserved.

### 12.7.2.43 MTRR Variable Range Physical Base 5 (MTRR\_VAR\_PHYSBASE5)—Offset 64h

**Access Method**

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_VAR\_PHYSBASE5:** [Port: 0x03] + 64h

**Op Codes:**

10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Description
31:12	00000h RW	<b>Physical Base (VAR_PHYSBASE5):</b> Specifies the base address for Variable Range 5. This 20 bit value is extended by 12 bits at the low end to form the base address
11:8	0000b RO	<b>Reserved (RSV36):</b> Reserved.
7:0	00h RW	<b>Type (VAR_TYPE5):</b> Specifies the memory type for Variable Range 5

### 12.7.2.44 MTRR Variable Range Physical Mask 5 (MTRR\_VAR\_PHYSMASK5)—Offset 65h

**Access Method**

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_VAR\_PHYSMASK5:** [Port: 0x03] + 65h

**Op Codes:**

10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Description
31:12	00000h RW	<b>Physical Mask (VAR_PHYSMASK5):</b> Specifies a mask value for Variable Range 5. The mask determines the range of the region begin mapped. The mask value is extended by 12 bits at the low end to form the mask value.

Bit Range	Default & Access	Description
11	0b RW	<b>Valid (VAR_VALID5)</b> : Enables the register pair for Variable Range 5 when set and disables the register pair when clear.
10:0	0000h RO	<b>Reserved (RSV37)</b> : Reserved.

### 12.7.2.45 MTRR Variable Range Physical Base 6 (MTRR\_VAR\_PHYSBASE6)—Offset 66h

**Access Method**

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_VAR\_PHYSBASE6:** [Port: 0x03] + 66h

**Op Codes:**  
10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Description
31:12	00000h RW	<b>Physical Base (VAR_PHYSBASE6)</b> : Specifies the base address for Variable Range 6. This 20 bit value is extended by 12 bits at the low end to form the base address
11:8	0000b RO	<b>Reserved (RSV38)</b> : Reserved.
7:0	00h RW	<b>Type (VAR_TYPE6)</b> : Specifies the memory type for Variable Range 6

### 12.7.2.46 MTRR Variable Range Physical Mask 6 (MTRR\_VAR\_PHYSMASK6)—Offset 67h

**Access Method**

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_VAR\_PHYSMASK6:** [Port: 0x03] + 67h

**Op Codes:**  
10h - Read, 11h - Write

**Default:** 00000000h

**Type:** Message Bus Register  
(Size: 32 bits)

**MTRR\_VAR\_PHYSMASK7:** [Port: 0x03] + 69h

**Op Codes:**  
10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Description
31:12	00000h RW	<b>Physical Mask (VAR_PHYSMASK7):</b> Specifies a mask value for Variable Range 7. The mask determines the range of the region begin mapped. The mask value is extended by 12 bits at the low end to form the mask value.
11	0b RW	<b>Valid (VAR_VALID7):</b> Enables the register pair for Variable Range 7 when set and disables the register pair when clear.
10:0	0000h RO	<b>Reserved (RSV41):</b> Reserved.

### 12.7.3 Remote Management Unit (Port 0x04)

**Table 75. Summary of Message Bus Registers—0x04**

Offset	Register Name (Register Symbol)	Default Value
60h	"SPI DMA Count Register (P_CFG_60)—Offset 60h" on page 174	00000000h
61h	"SPI DMA Destination Register (P_CFG_61)—Offset 61h" on page 175	00000000h
62h	"SPI DMA Source Register (P_CFG_62)—Offset 62h" on page 175	00000000h
70h	"Processor Register Block (P_BLK) Base Address (P_CFG_70)—Offset 70h" on page 176	00000000h
71h	"Control Register (P_CFG_71)—Offset 71h" on page 176	00000009h
74h	"Watchdog Control Register (P_CFG_74)—Offset 74h" on page 177	00040000h
B0h	"Thermal Sensor Mode Register (P_CFG_B0)—Offset B0h" on page 178	00000000h
B1h	"Thermal Sensor Temperature Register (P_CFG_B1)—Offset B1h" on page 178	00000000h
B2h	"Thermal Sensor Programmable Trip Point Register (P_CFG_B2)—Offset B2h" on page 179	FFFFFFFFh

#### 12.7.3.1 SPI DMA Count Register (P\_CFG\_60)—Offset 60h

**Access Method**

**Type:** Message Bus Register  
(Size: 32 bits)

**Offset:** [Port: 0x04] + 60h

**Op Codes:**  
10h - Read, 11h - Write

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

CFG\_SPI\_DMA\_CNT

Bit Range	Default & Access	Field Name (ID): Description
31:0	0b RW	<b>SPI DMA Count (CFG_SPI_DMA_CNT)</b> : Count of 512 byte block transfers. Writing this register triggers the start of the transfer of the indicated number of blocks. Reading this register returns the number of blocks that are remaining to be transferred. A value of 0 indicates the transfer is complete.

### 12.7.3.2 SPI DMA Destination Register (P\_CFG\_61)—Offset 61h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**Offset:** [Port: 0x04] + 61h

**Op Codes:**  
10h - Read, 11h - Write

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

CFG\_SPI\_DMA\_DST

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>SPI DMA Destination (CFG_SPI_DMA_DST)</b> : 32-bit Destination Address of data in System Memory (eSRAM/DRAM).

### 12.7.3.3 SPI DMA Source Register (P\_CFG\_62)—Offset 62h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**Offset:** [Port: 0x04] + 62h

**Op Codes:**  
10h - Read, 11h - Write

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>SPI DMA Source (CFG_SPI_DMA_SRC):</b> 32-bit Source Address of data in Legacy SPI.

### 12.7.3.4 Processor Register Block (P\_BLK) Base Address (P\_CFG\_70)—Offset 70h

**Access Method**

**Type:** Message Bus Register (Size: 32 bits)      **Offset:** [Port: 0x04] + 70h

**Op Codes:**  
10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	<b>Enable (P_BLK_IO_EN):</b> When set to "1", decode of the IO range pointed to by the Base Address is enabled.
30:16	0b RO	<b>Reserved (CFG_70_RSV):</b> Reserved.
15:0	0b RW	<b>Base Address (P_BLK_IO_BAR):</b> IO Base Address for the Processor Register Block (P_BLK) decode range.

### 12.7.3.5 Control Register (P\_CFG\_71)—Offset 71h

**Access Method**

**Type:** Message Bus Register (Size: 32 bits)      **Offset:** [Port: 0x04] + 71h

**Op Codes:**  
10h - Read, 11h - Write

**Default:** 00000009h

**Type:** Message Bus Register (Size: 32 bits) **Offset:** [Port: 0x04] + B1h

**Op Codes:**  
10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0b RO	<b>Reserved (CFG_B1_RSV2):</b> Reserved.
23:16	0b RO	<b>Thermal Sensor Relative Temperature (THRM_SENSR_REL_TEMP):</b> The thermal sensor relative temperature value is an 8-bit signed value relative to the Hot Trip point. If the Hot Trip point minus the current temperature is greater than +127, this value is clipped at +127. If the Hot Trip point minus the current temperature is less than -127, this value is clipped at -127. Otherwise this value is a signed sum magnitude where bit[23] is the sign and bits[22:16] are the magnitude.
15:8	0b RO	<b>Reserved (CFG_B1_RSV1):</b> Reserved.
7:0	0b RO	<b>Thermal Sensor Temperature (THRM_SENSR_TEMP):</b> 8-bit Thermal Sensor Temperature. The temperature in degrees Celsius is calculated by subtracting an offset of 50 from the 8-bit register value. The temperature in degrees Celsius corresponds to: 00h: -50 01h: -49 ... FEh: 204 FFh: 205

### 12.7.3.9 Thermal Sensor Programmable Trip Point Register (P\_CFG\_B2)—Offset B2h

**Access Method**

**Type:** Message Bus Register (Size: 32 bits) **Offset:** [Port: 0x04] + B2h

**Op Codes:**  
10h - Read, 11h - Write

**Default:** FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:24	FFh RW/L	<b>Hot Clear Trip Point Threshold (HOT_TRIP_CLEAR_THOLD):</b> Sets the target value for the hot trip clear point
23:16	FFh RW/L	<b>Catastrophic Clear Trip Point Threshold (CAT_TRIP_CLEAR_THOLD):</b> Sets the target value for the catastrophic trip clear point
15:8	FFh RW/L	<b>Hot Set Trip Point Threshold (HOT_TRIP_SET_THOLD):</b> Sets the target value for the hot trip set point
7:0	FFh RW/L	<b>Catastrophic Set Trip Point Threshold (CAT_TRIP_SET_THOLD):</b> Sets the target value for the catastrophic trip set point

### 12.7.4 Memory Manager (Port 0x05)

Table 76. Summary of Message Bus Registers—0x05

Offset	Register ID—Description	Default Value
1h	"Control (BCTRL)—Offset 1h" on page 181	00000800h
2h	"Write Flush Policy (BWFLUSH)—Offset 2h" on page 182	0C070408h
19h	"Isolated Memory Region Violation Control (BIMRVCTL)—Offset 19h" on page 183	00000000h
31h	"Debug 1 (DEBUG1)—Offset 31h" on page 184	4F08C20Ch
40h	"Isolated Memory Region 0 Low Address (IMR0L)—Offset 40h" on page 186	00000000h
41h	"Isolated Memory Region 0 High Address (IMR0H)—Offset 41h" on page 186	00000000h
42h	"Isolated Memory Region 0 Read Mask (IMR0RM)—Offset 42h" on page 187	BFFFFFFFFh
43h	"Isolated Memory Region 0 Write Mask (IMR0WM)—Offset 43h" on page 189	FFFFFFFFh
44h	"Isolated Memory Region 1 Low Address (IMR1L)—Offset 44h" on page 190	00000000h
45h	"Isolated Memory Region 1 High Address (IMR1H)—Offset 45h" on page 191	00000000h
46h	"Isolated Memory Region 1 Read Mask (IMR1RM)—Offset 46h" on page 191	BFFFFFFFFh
47h	"Isolated Memory Region 1 Write Mask (IMR1WM)—Offset 47h" on page 193	FFFFFFFFh
48h	"Isolated Memory Region 2 Low Address (IMR2L)—Offset 48h" on page 195	00000000h
49h	"Isolated Memory Region 2 High Address (IMR2H)—Offset 49h" on page 196	00000000h
4Ah	"Isolated Memory Region 2 Read Mask (IMR2RM)—Offset 4Ah" on page 196	BFFFFFFFFh
4Bh	"Isolated Memory Region 2 Write Mask (IMR2WM)—Offset 4Bh" on page 198	FFFFFFFFh
4Ch	"Isolated Memory Region 3 Low Address (IMR3L)—Offset 4Ch" on page 200	00000000h

Bit Range	Default & Access	Description
31	0b RW	<b>Enable Interrupt on IMR Violation (EnableIMRInt)</b> : When set, the Memory Manager will latch violation information into this register and send an interrupt request to the Remote Management Unit. This bit is cleared upon triggering and must be reset by software in order to trigger again. Memory protection is maintained even while the interrupt/capture mechanism is disabled
30	0b RO	<b>Reserved (RSV2)</b> : Reserved.
29:16	0000h RO	<b>IMR Violation Region (IMRViolationRegion)</b> : This 14-bit value indicates which region the last IMR violation occurred on if the IMR interrupt is enabled. A bit of this field will be asserted for every IMR region, HMBOUND or SMM region violated by the transaction that caused EnableIMRInt to deassert. [29]: HMBOUND Violation [28]: SMM Bound Violation [27:24]: Reserved [23]: IMR7 Violation [22]: IMR6 Violation [21]: IMR5 Violation [20]: IMR4 Violation [19]: IMR3 Violation [18]: IMR2 Violation [17]: IMR1 Violation [16]: IMR0 Violation
15:12	0h RO	<b>Reserved (RSV1)</b> : Reserved.
11:8	0h RO	<b>IMR Violation Agent (IMRViolationAgent)</b> : This 4-bit value indicates which agent caused the last IMR violation if the IMR interrupt is enabled: 0000b : CPU 0001b : Host Bridge Arbiter VC0 0010b : Host Bridge Arbiter VC1 0011b : Reserved 0100b : Reserved 0101b : Reserved 0110b : Reserved 0111b : eSRAM Flush/Init 1000b : Remote Management Unit
7:3	00h RO	<b>Reserved (RSV0)</b> : Reserved.
2:0	0h RO	<b>IMR Violation Sub Agent (IMRViolationSubAgent)</b> : This 3-bit value indicates which sub-agent caused the last IMR violation, if the IMR interrupt is enabled 000b : Host Bridge Arbiter Sub-Channel 0 (Anonymous) 001b : Host Bridge Arbiter Sub-Channel 1 010b : Host Bridge Arbiter Sub-Channel 2 100b : Host Bridge Arbiter Sub-Channel 3

#### 12.7.4.4 Debug 1 (DEBUG1)—Offset 31h

##### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**DEBUG1:** [Port: 0x05] + 31h

Op Codes:

10h - Read, 11h - Write

**Default:** 4F08C20Ch

Bit Range	Default & Access	Description
1	0b RO	<b>Reserved (RSVD):</b> Reserved.
0	0b RO	<b>Reserved (RSVD):</b> Reserved.

### 12.7.4.5 Isolated Memory Region 0 Low Address (IMROL)—Offset 40h

**Access Method**

**Type:** Message Bus Register  
(Size: 32 bits)

**IMROL:** [Port: 0x05] + 40h

**Op Codes:**

10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Description
31	0b RW/O	<b>IMR Lock (IMR_LOCK):</b> Setting this bit to "1" locks the IMRX registers, preventing further updates.
30:24	00h RO	<b>Reserved (RSV1):</b> Reserved.
23:2	000000h RW/L	<b>IMR Low Address (IMRL):</b> These bits are compared with bits 31:10 of the incoming address to determine the lower 1KB aligned value of the protected range
1:0	00h RO	<b>Reserved (RSV0):</b> Reserved.

### 12.7.4.6 Isolated Memory Region 0 High Address (IMROH)—Offset 41h

**Access Method**

**Type:** Message Bus Register  
(Size: 32 bits)

**IMROH:** [Port: 0x05] + 41h

**Op Codes:**

10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Description
21	1b RO	<b>Reserved (RSVD):</b> Reserved.
20	1b RO	<b>Reserved (RSVD):</b> Reserved.
19	1b RO	<b>Reserved (RSVD):</b> Reserved.
18	1b RO	<b>Reserved (RSVD):</b> Reserved.
17	1b RO	<b>Reserved (RSVD):</b> Reserved.
16	1b RO	<b>Reserved (RSVD):</b> Reserved.
15	1b RW/L	<b>Host Bridge Arbiter VC1 Sub-Channel 3 (VC1_SAI_ID3):</b> Host Bridge Arbiter VC1 Sub-Channel 3 Read Accesses Allowed to memory delineated by IMRxL and IMRxH.
14	1b RW/L	<b>Host Bridge Arbiter VC1 Sub-Channel 2 (VC1_SAI_ID2):</b> Host Bridge Arbiter VC1 Sub-Channel 2 Read Accesses Allowed to memory delineated by IMRxL and IMRxH.
13	1b RW/L	<b>Host Bridge Arbiter VC1 Sub-Channel 1 (VC1_SAI_ID1):</b> Host Bridge Arbiter VC1 Sub-Channel 1 Read Accesses Allowed to memory delineated by IMRxL and IMRxH.
12	1b RW/L	<b>Host Bridge Arbiter VC1 Sub-Channel 0 (VC1_SAI_ID0):</b> Host Bridge Arbiter VC1 Sub-Channel 0 Read Accesses Allowed to memory delineated by IMRxL and IMRxH.
11	1b RW/L	<b>Host Bridge Arbiter VCO Sub-Channel 3 (VCO_SAI_ID3):</b> Host Bridge Arbiter VCO Sub-Channel 3 Read Accesses Allowed to memory delineated by IMRxL and IMRxH.
10	1b RW/L	<b>Host Bridge Arbiter VCO Sub-Channel 2 (VCO_SAI_ID2):</b> Host Bridge Arbiter VCO Sub-Channel 2 Read Accesses Allowed to memory delineated by IMRxL and IMRxH.
9	1b RW/L	<b>Host Bridge Arbiter VCO Sub-Channel 1 (VCO_SAI_ID1):</b> Host Bridge Arbiter VCO Sub-Channel 1 Read Accesses Allowed to memory delineated by IMRxL and IMRxH.
8	1b RW/L	<b>Host Bridge Arbiter VCO Sub-Channel 0 (VCO_SAI_ID0):</b> Host Bridge Arbiter VCO Sub-Channel 0 Read Accesses Allowed to memory delineated by IMRxL and IMRxH.
7	1b RO	<b>Reserved (RSVD):</b> Reserved.
6	1b RO	<b>Reserved (RSVD):</b> Reserved.
5	1b RO	<b>Reserved (RSVD):</b> Reserved.
4	1b RO	<b>Reserved (RSVD):</b> Reserved.

### 12.7.4.9 Isolated Memory Region 1 Low Address (IMR1L)—Offset 44h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**IMR1L:** [Port: 0x05] + 44h

Op Codes:

10h - Read, 11h - Write

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
IMR_LOCK	RSV1			IMRL				RSV0

Bit Range	Default & Access	Description
31	0b RW/O	<b>IMR Lock (IMR_LOCK):</b> Setting this bit to "1" locks the IMRX registers, preventing further updates.
30:24	00h RO	<b>Reserved (RSV1):</b> Reserved.
23:2	000000h RW/L	<b>IMR Low Address (IMRL):</b> These bits are compared with bits 31:10 of the incoming address to determine the lower 1KB aligned value of the protected range
1:0	00h RO	<b>Reserved (RSV0):</b> Reserved.

### 12.7.4.10 Isolated Memory Region 1 High Address (IMR1H)—Offset 45h

Access Method

**Type:** Message Bus Register (Size: 32 bits) **IMR1H:** [Port: 0x05] + 45h

Op Codes:  
10h - Read, 11h - Write

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSV1			IMRH				RSV0	

Bit Range	Default & Access	Description
31:24	00h RO	<b>Reserved (RSV1):</b> Reserved.
23:2	000000h RW/L	<b>IMR High Address (IMRH):</b> These bits are compared with bits 31:10 of the incoming address to determine the upper 1KB aligned value of the protected range
1:0	0h RO	<b>Reserved (RSV0):</b> Reserved.

### 12.7.4.11 Isolated Memory Region 1 Read Mask (IMR1RM)—Offset 46h

Access Method

**Type:** Message Bus Register (Size: 32 bits) **IMR1RM:** [Port: 0x05] + 46h

Op Codes:  
10h - Read, 11h - Write

**Default:** BFFFFFFFh

Bit Range	Default & Access	Description
12	1b RW/L	<b>Host Bridge Arbiter VC1 Sub-Channel 0 (VC1_SAI_ID0)</b> : Host Bridge Arbiter VC1 Sub-Channel 0 Read Accesses Allowed to memory delineated by IMRxL and IMRxH.
11	1b RW/L	<b>Host Bridge Arbiter VC0 Sub-Channel 3 (VC0_SAI_ID3)</b> : Host Bridge Arbiter VC0 Sub-Channel 3 Read Accesses Allowed to memory delineated by IMRxL and IMRxH.
10	1b RW/L	<b>Host Bridge Arbiter VC0 Sub-Channel 2 (VC0_SAI_ID2)</b> : Host Bridge Arbiter VC0 Sub-Channel 2 Read Accesses Allowed to memory delineated by IMRxL and IMRxH.
9	1b RW/L	<b>Host Bridge Arbiter VC0 Sub-Channel 1 (VC0_SAI_ID1)</b> : Host Bridge Arbiter VC0 Sub-Channel 1 Read Accesses Allowed to memory delineated by IMRxL and IMRxH.
8	1b RW/L	<b>Host Bridge Arbiter VC0 Sub-Channel 0 (VC0_SAI_ID0)</b> : Host Bridge Arbiter VC0 Sub-Channel 0 Read Accesses Allowed to memory delineated by IMRxL and IMRxH.

Bit Range	Default & Access	Description
31:27	0h RO	<b>Reserved (RSV2):</b> Reserved.
26:25	2h RO	<b>Reserved (RSVD):</b> Reserved.
24:16	07Fh RO	<b>eSRAM Size (eSRAM_SIZE):</b> eSRAM size in 4k pages ( 0 means 1)
15:8	3Fh RW/L	<b>ECC Threshold (ECC_THRESH):</b> Total correctable ECC threshold until the eSRAM Correctable Error Threshold Reached message (opcode 0xD8) is sent to Remote Management Unit. Valid values are 0x1-0xFF. 0x0 may be used as a test mode to send the message immediately without waiting for occurrence of any correctable ECC errors. Once the message has been sent in this way, ESRAMCERR.CORRECTABLE_ERR_CNT_RST must be written with 1, before another message can be generated using this test mode. Note that the test mode generation of an eSRAM Correctable Error Threshold Reached message is not dependent on the value of ESRAMCTRL.SECDED_ENABLE.
7	1h RW/L	<b>ECC Threshold Message Enable (ECC_THRESH_SB_MSG_EN):</b> Set to 1 to enable the message to the Remote Management Unit which is generated when ECC_THRESH correctable ECC errors have been generated. If this field is 0, no ECC threshold message will be generated.
6	0h RO	<b>Reserved (RSV1):</b> Reserved.
5	0h RO	<b>Reserved (RSV0):</b> Reserved.
4	1h RO	<b>eSRAM Available (eSRAM_AVAILABLE):</b> Indicates eSRAM is available. Used as qualifier for eSRAM_SIZE.
3	0h RW/C	<b>eSRAM Enable All Ranges (eSRAM_ENABLE_ALL):</b> Used during the early BIOS stage to enable eSRAM mapping into the system address space. Forces all eSRAM pages which are not already enabled, and are unlocked to be ECC initialized and enabled, and stays 0x1 until all such pages have been initialized. NOTE: This is a locking field, locks on ESRAM_GLOBAL_CSR_LOCK.
2	0h RW	<b>eSRAM Global CSR Lock (eSRAM_GLOBAL_CSR_LOCK):</b> When set to 1, all eSRAM global and page (4KB and 512KB) registers are locked. A locked page can still be flushed if FLUSH_PG_ENABLE/BLOCK_FLUSH_PG_ENABLE is set to 1. Once set, this field can only be cleared by a warm reset. This is a locking field, it is locked by being set to 1.
1	0h RO	<b>Reserved (RSVD):</b> Reserved.
0	1h RW/L	<b>SECDED Enable (SECDED_ENABLE):</b> SECDED ECC enable for the eSRAM memory array.

### 12.7.4.38 eSRAM Block Page Control (ESRAMPGCTRL\_BLOCK)—Offset 82h

This register allows all eSRAM pages to be mapped and controlled as a single 512KB block page. If this page is enabled, no 4KB pages may be individually mapped.

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**ESRAMPGCTRL\_BLOCK:** [Port: 0x05] + 82h

**Op Codes:**  
10h - Read, 11h - Write

**Default:** 850000FFh

31	28	24	20	16	12	8	4	0
1	0 0 0	0 1 0 1	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	1 1 1 1	1 1 1 1
BLOCK_FLUSH_PG_ENABLE	RSVD BLOCK_DISABLE_PG BLOCK_ENABLE_PG	BLOCK_PAGE_CSR_LOCK BLOCK_INIT_IN_PROG RSV1 BLOCK_PG_BUSY	RSVD			BLOCK_PG_SYSTEM_ADDRESS_16MB		

Bit Range	Default & Access	Description
31	1h RW/L	<b>Block Flush Page Enable (BLOCK_FLUSH_PG_ENABLE):</b> This field is used to enable or disable flushing of the block page to DRAM by the S3 entry firmware code. The block page may be flushed only by the S3 entry firmware code.
30	0h RO	<b>Reserved (RSVD):</b> Reserved.
29	0h RW/C	<b>Block Disable Page (BLOCK_DISABLE_PG):</b> When written with 0x1 disables block page decoding by eSRAM. This bit stays 0x1 until the block page has been disabled and ECC initialized. Note that this is a locking field, which locks on BLOCK_PAGE_CSR_LOCK=1 and ESRAMCTRL.eSRAM_GLOBAL_CSR_LOCK. This field should only be used by BIOS code.
28	0h RW/C	<b>Block Enable Page (BLOCK_ENABLE_PG):</b> When written with 0x1 enables block page mapping of the eSRAM. When the block page is enabled, address mapping for all pages will be controlled by the block page address, instead of the 4KB page address fields. Cleared when the page flush/disable completes. Note that this is a locking field, locks on BLOCK_PAGE_CSR_LOCK=1 and ESRAMCTRL.eSRAM_GLOBAL_CSR_LOCK.
27	0h RW	<b>Block Page Register Lock (BLOCK_PAGE_CSR_LOCK):</b> When set to 1, the block page register (ESRAMPGCTRL_BLOCK) is locked. When locked, the block page may still be flushed to DRAM by the firmware S3 entry code by setting BLOCK_FLUSH_PG_ENABLE to 1.
26	1h RO/V	<b>Block Page Initialization in Progress (BLOCK_INIT_IN_PROG):</b> Reads 0x1 as long as the block page is being re-initialized following the disable. Note that while page is being flushed or re-initialized the eSRAM will block the access to the page stalling any requestor trying to access it. It also stays high until the ECC initialization completes after the reset.
25	0h RO	<b>Reserved (RSV1):</b> Reserved.
24	1h RO/V	<b>Block Page Busy (BLOCK_PG_BUSY):</b> Reads 0x1 when the block page is enabled and stays 0x1 until the block page has been flushed (if flush was to be performed) and reinitialized following disable. It also stays high until the ECC initialization completes after the reset.
23:8	0000h RO	<b>Reserved (RSVO):</b> Reserved.
7:0	Ffh RW/L	<b>Block Page Base Address (BLOCK_PG_SYSTEM_ADDRESS_16MB):</b> Base address of the 512KB eSRAM block page (bits [31:24] of the system memory address). The eSRAM block page may only be placed on 16MB boundaries. Writes to this register will only update the contents when ESRAMPCTRL_BLOCK.BLOCK_ENABLE_PG is 0. Note that the value in this register field is locked until the page has been disabled and is free.

Bit Range	Default & Access	Description
31:18	0000h RO	<b>Reserved (RSV0):</b> Reserved.
17	0h RW/1C/P	<b>Uncorrectable Error Occurred during Flush (UNCORRECTABLE_ERR_OCCURED_FLUSH):</b> Sticky register field which asserts when an uncorrectable ECC error has occurred during an eSRAM flush to DRAM. Set by hardware, cleared by software writing a 1.
16	0h RW/1C/P	<b>Uncorrectable Error Occurred (UNCORRECTABLE_ERR_OCCURED):</b> Sticky register field which asserts when an uncorrectable ECC error has occurred. Set by hardware, cleared by software writing a 1.
15:9	0h RO/P	<b>Uncorrectable Error Page DW Offset (UNCORRECTABLE_ERR_PG_DW_OFFSET):</b> Page DW offset for the uncorrectable ECC Error
8:0	0h RO/P	<b>Uncorrectable Error Page Number (UNCORRECTABLE_ERR_PG_NUM):</b> Page number for the uncorrectable ECC Error

### 12.7.4.41 eSRAM ECC Error Syndrome (ESRAMSDROME)—Offset 88h

**Access Method**

**Type:** Message Bus Register  
(Size: 32 bits)

**ESRAMSDROME:** [Port: 0x05] + 88h

**Op Codes:**  
10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
30	0h RW/C	<b>Flush Page (FLUSH_PG)</b> : Initiates flushing the page to DRAM, the page has to have a DRAM overlay and can't be mapped on top of physical memory. After being set, reads as 0x1 until the page has been flushed to DRAM. Note that while the page is being flushed, the eSRAM will block accesses to the page stalling any other requestor trying to access it.
29	0h RW/C	<b>Disable Page (DISABLE_PG)</b> : When written with 0x1 disables page decoding by eSRAM. When set in the same cycle as Flush Page, the flushing takes place prior to disabling and reinitializing. This bit stays 0x1 until the page has been flushed, disabled and ECC initialized. Note that this is a locking field, locks on PAGE_CSR_LOCK.
28	0h RW/C	<b>Enable Page (ENABLE_PG)</b> : When written with 0x1 enables page decoding by eSRAM. Same effect will be achieved on all eSRAM page CSRs when the ESRAMCTRL.eSRAM_Enable_All is set. Cleared when the page flush/disable completes. Note that this is a locking field, locks on PAGE_CSR_LOCK.
27	0h RW	<b>Lock Page (PAGE_CSR_LOCK)</b> : When set to 1, the per page (ESRAMPGCTRLX) register for this page is locked. While the page is locked, it may still be flushed via the FLUSH_PG field of this register or via ESRAMCTRL.eSRAM_Flush_and_Disable if FLUSH_PG_ENABLE is set to 1.
26	1h RO/V	<b>Initialisation In Progress (INIT_IN_PROG)</b> : Reads 0x1 as long as the page is being re-initialized following the disable. Note that while page is being flushed or re-initialized the eSRAM will block the access to the page stalling any requestor trying to access it. It also stays high until the ECC initialization completes after the reset.
25	0h RO	<b>Reserved (RSV1)</b> : Reserved.
24	1h RO/V	<b>Page Busy (PG_BUSY)</b> : Reads 0x1 when the page is enabled and stays 0x1 until the page has been flushed (if flush was to be performed) and reinitialized following disable. It also stays high until the ECC initialization completes after the reset.
23:20	0h RO	<b>Reserved (RSV0)</b> : Reserved.
19:0	1FFFFFFh RW/L	<b>Page 4K Address (PG_SYSTEM_ADDRESS_4K)</b> : 20b of base address for the 4K page. Needs to be stable before the page is enabled and must stay untouched until the page has been disabled and flushed. Software may pool the PG_BUSY bit to find out the status of the page allocation, and attempt to allocate address and enable new page only when the previous deallocation has successfully completed. Another less read intensive method is using the dynamic pool mechanism as per the global ESRAMPGPPOOL register. Note that the value in this CSR is locked until the page has been disabled and is free.

## 12.7.6 SoC Unit (Port 0x31)

**Table 78. Summary of Message Bus Registers—0x31**

Offset	Register Name (Register Symbol)	Default Value
34h	"Thermal Sensor Configuration 4 (SCU_TSCFG4_Config)—Offset 34h" on page 229	00057801h
50h	"Sticky Write Once (CFGSTICKY_W1)—Offset 50h" on page 230	00000000h
51h	"Sticky Read/Write (CFGSTICKY_RW)—Offset 51h" on page 231	00000000h
52h	"Non-Sticky Read/Write Once (CFGNONSTICKY_W1)—Offset 52h" on page 231	00000000h

### 12.7.6.1 Thermal Sensor Configuration 4 (SCU\_TSCFG4\_Config)—Offset 34h

Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**Offset:** [Port: 0x31] + 34h

Op Codes:  
06h - Read, 07h - Write

**Default:** 00057801h

31	28	24	20	16	12	8	4	0				
0	0	0	0	0	0	0	0	0				
0	0	0	0	0	1	0	1	0

0	0	0	0	0	0	0	0	1				
RSVD				RSVD	RSVD			RSVD	RSVD	RSVD	RSVD	ts_itsrst

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	Reserved (RSVD): Reserved.
24:23	0h RO	Reserved (RSVD): Reserved.
22:11	AFh RO	Reserved (RSVD): Reserved.
10:8	0h RO	Reserved (RSVD): Reserved.
7	0h RO	Reserved (RSVD): Reserved.
6:5	0h RO	Reserved (RSVD): Reserved.
4:3	0h RO	Reserved (RSVD): Reserved.
2:1	0h RO	Reserved (RSVD): Reserved.
0	1h RW	Thermal Sensor Reset (ts_itsrst): Resets all Thermal Sensor registers.

### 12.7.6.2 Sticky Write Once (CFGSTICKY\_W1)—Offset 50h

Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**Offset:** [Port: 0x31] + 50h

Op Codes:  
06h - Read, 07h - Write

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0000h RW/O	<b>Sticky Write Once Scratchpad (STICKY_W1_STRATCH)</b> : Assigned by Software, write once requires a S0 exit to clear

### 12.7.6.3 Sticky Read/Write (CFGSTICKY\_RW)—Offset 51h

**Access Method**

**Type:** Message Bus Register (Size: 32 bits)      **Offset:** [Port: 0x31] + 51h

**Op Codes:**  
06h - Read, 07h - Write

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0000h RW/P	<b>Sticky Read/Write Scratchpad (STRICKY_RW_STRATCH)</b> : Assigned by Software, reset by a S0 exit

### 12.7.6.4 Non-Sticky Read/Write Once (CFGNONSTICKY\_W1)—Offset 52h

**Access Method**

**Type:** Message Bus Register (Size: 32 bits)      **Offset:** [Port: 0x31] + 52h

**Op Codes:**  
06h - Read, 07h - Write

**Default:** 00000000h

## 13.0 System Memory Controller

The system memory controller supports DDR3 protocol with one 16-bit wide data channel and up to 2 ranks of memory, allowing for population of up to 2Gbyte of system memory using 1, 2 or 4 Gbit standard DDR3 devices. It is capable of data rates up to 800 MT/s.

### 13.1 Signal Descriptions

See [Chapter 2.0, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Type:** The buffer type found in [Chapter 4.0, “Electrical Characteristics”](#)
- **Description:** A brief explanation of the signal’s function

**Table 79. Memory Signals (Sheet 1 of 2)**

Signal Name	Direction Type	Description
DDR3_CK[1:0] DDR3_CKB[1:0]	O DDR3	DRAM Differential Clock Pair: (1 pair per Rank) The differential clock pair is used to latch the command into DRAM. Each pair corresponds to a rank on the DRAM side.
DDR3_CSB[1:0]	O DDR3	Chip Select: (1 per Rank). Used to qualify the command on the command bus for a particular rank.
DDR3_CKE[1:0]	O DDR3	Clock Enable: (power management - 1 per Rank) It is used during DRAM power up/power down and self refresh.
DDR3_MA[15:0]	O DDR3	Memory Address: Multiplexed Memory address bus (Row, Column) for writing data to memory and reading data from memory. These signals follow common clock protocol w.r.t. DDR3_CK, DDR3_CKB pairs.
DDR3_BS[2:0]	O DDR3	Bank Select: These signals define which banks are selected within each DRAM rank.
DDR3_RASB	O DDR3	Row Address Select: Used with DDR3_CASB and DDR3_WEB (along with DDR3_CSB) to define the DRAM Commands.
DDR3_CASB	O DDR3	Column Address Select: Used with DDR3_RASB and DDR3_WEB (along with DDR3_CSB) to define the DRAM Commands.
DDR3_WEB	O DDR3	Write Enable Control Signal: Used with DDR3_WEB and DDR3_CASB (along with control signal, DDR3_CSB) to define the DRAM Commands.
DDR3_DQ[15:0]	I/O DDR3	Bidirectional Data Lines

Table 79. Memory Signals (Sheet 2 of 2)

Signal Name	Direction Type	Description
DDR_DM[1:0]	O DDR3	Data Mask: DM is an output mask signal for write data. Output data is masked when DM is sampled HIGH coincident with that output data during a Write access. DM is sampled on both edges of DQS.
DDR3_DQS[1:0] DDR3_DQSB[1:0]	I/O DDR3	Data Strokes: DDR3_DQSB[1:0] and its complement signal group make up a differential strobe pair for each 8 data bits - DQ. The data is captured at the crossing point of DDR3_DQS[1:0] and its DDR3_DQSB[1:0] during read and write transactions. For Read, the Strobe crossover and data are edge aligned, whereas in the Write command, the strobe crossing is in the centre of the data window.
DDR3_ODT[1:0]	O DDR3	ODT signal (One per rank) going to DRAM in order to turn ON the DRAM ODT during Write.
DDR3_ODTPU	O Analog	This signal must be terminated to VSS on board (refer to the <i>Platform Design Guide</i> for resistor value). This external resistor termination scheme is used for Resistor compensation of DRAM ODT strength.
DDR3_DQPU	O Analog	This signal must be terminated to VSS on board (refer to the <i>Platform Design Guide</i> for resistor value). This external resistor termination scheme is used for Resistor compensation of DQ buffers
DDR3_CMDPU	O Analog	This signal must be terminated to VSS on board (refer to the <i>Platform Design Guide</i> for resistor value). This external resistor termination scheme is used for Resistor compensation of CMD buffers.
DDR3_VREF	I Analog	DRAM Interface Reference Voltage: This signal voltage level is used for qualifying logical levels on the DQ bits on reads. The Memory interface can also use internally generated reference voltage to qualify the crossing point between logical levels on Data bits. Internal Vref is a default setting for Memory Interface and this interface signal and can be tied to VSS on board.
DDR3_ISYSPWRGOOD	I Asynchronous CMOS	This signal indicates the status of the DRAM Core power supply.
DDR3_IDRAM_PWROK	I Asynchronous CMOS	This signal indicates the status of the DRAM S3 power supply. Used primarily in the DRAM PHY to determine ACPI S3 power state.
DDR3_DRAMRSTB	O	This signal is used to reset DRAM devices.

## 13.2 Features

### 13.2.1 System Memory Technology Supported

The system memory controller supports the following DDR3 Data Transfer Rates and DRAM Device Technologies:

- DDR3 Data Transfer Rate: 800 MT/s
- DDR3 (1.5V DRAM interface I/Os)
- DDR3 x8 memory modules

*Note:* x8 means that each DRAM component has 8 data lines. Standard 1Gbit, 2Gbit, and 4Gbit technologies and addressing are supported for x8 devices.

**Table 80. Supported DDR3 DRAM Devices**

DRAM Density	Data Width	Banks	Bank Address	Row Address	Column Address	Page Size
1 Gbit	x8	8	BA[2:0]	A[13:0]	A[9:0]	1 Kbyte
2 Gbit	x8	8	BA[2:0]	A[14:0]	A[9:0]	1 Kbyte
4 Gbit	x8	8	BA[2:0]	A[15:0]	A[9:0]	1 Kbyte

**Table 81. Supported DDR3 Memory Configurations**

DRAM Chip Density	DRAM Device Width	# of DRAM Devices per Rank	Rank Size	# of Ranks	Total Memory Size
1 Gbit	x8	2	256 Mbyte	1	256 Mbyte
1 Gbit	x8	2	256 Mbyte	2	512 Mbyte
2 Gbit	x8	2	512 Mbyte	1	512 Mbyte
2 Gbit	x8	2	512 Mbyte	2	1 Gbyte
4 Gbit	x8	2	1 Gbyte	1	1 Gbyte
4 Gbit	x8	2	1 Gbyte	2	2 Gbyte

### 13.2.2 Rules for Populating Memory Down Ranks

The devices density and width for both ranks must be the same. Rank0 must be always populated and Rank1 is optional.

### 13.2.3 DRAM Error Detection & Correction (EDC)

For high reliability applications the system memory controller supports inclusion of Error Correction Codes (ECC) in DRAM transactions. In ECC mode, the 8th bank of each rank is allocated for ECC data storage, thus reducing the total available physical memory for the system by 12.5% or 1/8. Additionally each transaction to memory requires an associated ECC transaction reducing the useful memory bandwidth.

The algorithm used allows for on-the-fly correction of single bit errors and detection of double bit errors.

A separate bank is used for ECC data storage to avoid the page-miss (row pre-charge) time penalty on ECC and next data fetch that would have been introduced in majority of cases if the ECC was interleaved across banks. The ECC bank can be configured to always issue RD/WR with Auto Precharge or dynamic page close policy similar to other data banks. Since the configuration is on a per bank basis, the ECC bank is not required to have the same policy as other banks.

When ECC is enabled, the Address Map field in the [DRAM Rank Population \(DRP\)—Offset 0h](#) register MUST be set to 2. In a two ranks system, the size of both ranks can be the same or different. Therefore, each rank can have different DRAM device width and density, and thus different rank size. Setting the address map to 2 applies to both ranks.

### 13.2.4 DRAM Data Scrambling

The Memory Controller supports data scrambling. This feature helps in lowering the MTBF (Mean Time Between Failures) by reducing the probability of occurrence of the specific bit patterns on the DRAM I/O interface that could cause unpredictable behavior at the platform design stage, i.e., signal integrity issues.

### 13.2.5 Power Management

The System Memory Controller Power Management features are detailed in [Section 8.5](#).

## 13.3 Register Map

See [Chapter 5.0, “Register Access Methods”](#) for additional information.

**Figure 26. Register Map**

## 13.4 Message Bus Registers

**Table 82. Summary of Message Bus Registers—0x01**

Offset	Register Name (Register Symbol)	Default Value

### 13.4.1 DRAM Rank Population (DRP)—Offset 0h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**Offset:** [Port: 0x01] + 0h

Op Codes:

10h - Read, 11h - Write

**Default:** 00000000h

31	28	24	20	16	12	8	4	0					
0	0	0	0	0	0	0	0	0					
0	0	0	0	0	0	0	0	0					
0	0	0	0	0	0	0	0	0					
Rsvd_4	MODE32	Rsvd_3		ADDRMAP	PRIG4BSPLITEN	DIMMDDEN1	DIMMDWID1	Rsvd_1	DIMMDDEN0	DIMMDWID0	Rsvd_0	RKEN1	RKEN0

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	<b>Rsvd_4:</b> Reserved
30	0h RW/P/L	<b>16-bit/32-bit Mode Select (MODE32):</b> 0 - Selects 16-bit DRAM Data Interface. 1 - Selects 32-bit DRAM Data Interface.
29:16	0000h RO	<b>Rsvd_3:</b> Reserved

Bit Range	Default & Access	Field Name (ID): Description
31:28	4h RW	<b>Clock Valid To Self-Refresh Exit Delay (CKEDLY):</b> Additional delay between CK/CKB start and SRX command. This delay is needed for clock to stabilize to meet JEDEC requirements. Delay is CKEDLY multiples of 256 DRAM Clocks. 0ns to 9,600ns (DDR3-800) 0ns to 7,200ns (Future DDR3-1066)
27:26	0h RO	<b>Rsvd_13:</b> Reserved
25:24	3h RW	<b>Power Mode Entry Delay (PMEDLY):</b> The delay, in DRAM clocks, between SR Entry command and Power-Mode message to DDRIO. 0h - 6 DRAM Clocks. 1h - 8 DRAM Clocks. 2h - 10 DRAM Clocks. 3h - 12 DRAM Clocks.
23	0h RO	<b>Rsvd_12:</b> Reserved
22	0h RW	<b>ZQCal Long Delay (tZQoper):</b> The delay, in DRAM clocks, between ZQC-Long command to any command. Note: ZQCL command during DRAM Init flow requires longer latency which is controlled by BIOS. 0h - 256 DRAM Clocks. 1h - 384 DRAM Clocks. Note: This field defines the ZQ Calibration Long delay during normal operation. It is not the same as tZQinit, which uses the same ZQCL command but the delay is longer. tZQinit applies only during power-on initialization of the DRAM devices, and tZQoper applies during normal operation. BIOS executes the DRAM initialization sequence, so it has to ensure tZQinit is met, and not the Memory Controller.
21	0h RO	<b>Rsvd_11:</b> Reserved
20	0h RW	<b>ZQCal Short Delay (tZQCS):</b> The delay, in DRAM clocks, between a ZQC-Short command to any command. 0h - 64 DRAM Clocks. 1h - 96 DRAM Clocks.
19	0h RO	<b>Rsvd_10:</b> Reserved
18	0h RW	<b>Self-Refresh Exit To DLL Delay (tXSDLL):</b> The delay, in DRAM clocks, between SRX command to any command requiring locked DLL. Only ZQCL can be sent before tXSDLL is done. 0h - tXS + 256 DRAM Clocks. 1h - tXS + 384 DRAM Clocks.
17	0h RO	<b>Rsvd_9:</b> Reserved
16	0h RW	<b>Self-Refresh Exit Delay (tXS):</b> The delay, in DRAM clocks, between SRX command to command not requiring locked DLL. The Memory Controller can send a ZQCL command after tXS. JEDEC defines MAX(5CK, tRFC(min))+10ns) so both values take safety margin. 0h - 256 DRAM Clocks. 1h - 384 DRAM Clocks.
15	0h RO	<b>Rsvd_8:</b> Reserved
14:12	1h RW	<b>CAS Latency (tCL):</b> Specifies the delay, in DRAM clocks, between the issue of a RD command and the return of valid data on the DQ bus. 0h - 5 DRAM Clocks (DDR3-800) 1h - 6 DRAM Clocks (DDR3-800) 2h - Reserved 3h - Reserved 4h - Reserved 5h - Reserved 6h - Reserved 7h - Reserved

Bit Range	Default & Access	Field Name (ID): Description
11:8	1h RW	<b>Activate (RAS) to CAS Delay (tRCD):</b> Specifies the delay, in DRAM clocks, between an ACT command and a RD/WR command to the same bank. 0h - 5 DRAM Clocks (DDR3-800) 1h - 6 DRAM Clocks (DDR3-800) 2h - Reserved 3h - Reserved 4h - Reserved 5h - Reserved 6h - Reserved 7h - Reserved

The Memory Controller allows to pull-in by 1 clock in 2N mode and by 1-2 clocks in 3N mode. For most DIMM configurations, this register should be programmed to same value as tCMD. A value of tCMD - ODT_PULLIN can be used according to the table below which shows the ODT command assertion with respect to the WR command assertion. For 1N Command Mode 0h WR 1h N/A 2h N/A 3h Reserved For 2N Command Mode 0h WR-1 1h WR 2h N/A 3h Reserved For 3N Command Mode 0h WR-2 1h WR-1 2h WR 3h Reserved

### 13.4.7 DRAM Power Management Control 0 (DPMC0)—Offset 6h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**Offset:** [Port: 0x01] + 6h

Op Codes:

10h - Read, 11h - Write

**Default:** 03000000h

31	28	24	20	16	12	8	4	0																							
0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Rsvd_31	ENPHCLKGATE	REUTCLKGTDIS	Rsvd27	DISPWRDN	CLKGTDIS	DYNSREN	Rsvd_30	PREAPWDEN	PCLSWKOK	Rsvd_29	PCLSTO	Rsvd_28	RSVD	SREDLY																	

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	<b>Rsvd_31:</b> Reserved
29	0h RW	<b>Enable PHY Clock Gate Disable During SR (ENPHYCLKGATE):</b> When set to 1, the Memory Controller will turn off the 1x and 2x clock trees to the DDRIO PHY during Self Refresh. The Memory Controller will re-enable the clocks upon Self Refresh exit.
28	0h RW	<b>MTE Clock Gate Disable (REUTCLKGTDIS):</b> 0h MTE clock is gated when DCO.PMICTL is set to 0. 1h MTE clock is ungated, overriding the DCO.PMICTL config bit. Note: The DCO.CPGCLOCK bit overrides this bit.
27:26	0h RO	<b>Rsvd27:</b> Reserved
25	1h RW	<b>Disable Power Down (DISPWRDN):</b> Setting this bit to 1 will block CKE high-)low transitions. May be used by BIOS during init flow and should be set to 0 for functional mode. 0 - The Memory Controller dynamically controls the CKE pins to place the DRAM device in power down mode. 1 - The Memory Controller constantly drives the CKE pins high.
24	1h RW	<b>Clock Gating Disabled (CLKGTDIS):</b> Setting this bit to 0 allows a large number of internal Memory Controller clocks to be gated when there is no activity in order to save power. When set to 1, internal clock-gating is disabled. 0 - Enable. 1 - Disable. Note: This bit should be set to 0 for normal operation.
23	0h RW	<b>Dynamic Self-Refresh Enable (DYSNREN):</b> Setting this bit to 1, enables automatic SR command to DRAM and PM message to DDRIO when the PRI bus is idle, all pending requests have been served and the and PRI status is less than 2, SREDLY has timed-out, and all JEDEC requirements are satisfied. This register may be changed by BIOS/FW on-the-fly.
22	0h RO	<b>Rsvd_30:</b> Reserved
21	0h RW	<b>Close All Pages before Power-Down (PREAPWDEN):</b> Send Precharge All Command to a Rank before PD-Enter. Setting this bit to 1 will allow sending a PREA command before PDE command. 0 - Disable. 1 - Enable.
20	0h RW	<b>Wake Allowed for Page Close Timeout (PCLSWKOK):</b> Setting this bit to 1 indicates the Memory Controller can send DRAM devices a PD-Exit command in order to close single bank if the page timer expired. Note this bit applies only to cases where at least one other bank in the same rank is open but not timed-out. If all banks in the rank timed-out, a PD-Exit command will be sent regardless of this bit. Must be set to 0 during init/training mode. 0 - Disable. 1 - Enable.
19	0h RO	<b>Rsvd_29:</b> Reserved
18:16	0h RW	<b>Page Close Timeout Period (PCLSTO):</b> Specifies the time frame, in ns, from last access to a DRAM page until that page may be scheduled for closing (by sending a PRE command). 0h - Disable page close timer (init/training). 1h - Immediate page close. 2h - 30-60 ns to page close. 3h - 60-120 ns to page close. 4h - 120-240 ns to page close. 5h - 240-480 ns to page close. 6h - 480-960 ns to page close. 7h - 1-2 s to page close.
15:13	0h RO	<b>Rsvd_28:</b> Reserved
12:8	0h RO	<b>Reserved (RSVD):</b> Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	<b>Self-Refresh Entry delay (SREDLY):</b> The delay, in core-clocks, between PRI idle (no pending requests and PRI status is less than 2) and SR Entry when the Memory Controller is in Dynamic SR mode.

### 13.4.8 DRAM Refresh Control (DRFC)—Offset 8h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**Offset:** [Port: 0x01] + 8h

Op Codes:

10h - Read, 11h - Write

**Default:** 00012CA7h

31	28	24	20	16	12	8	4	0							
0	0	0	0	0	0	1	0	0	1	1	0	0	1	1	1
Rsvd_36				REFDBTCLR	REFSKWDIS	Rsvd_35	REFCNTMAX	Rsvd_34	tREFI	REFWMPNC	REFWMHI	REFWMLO			

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	<b>Rsvd_36:</b> Reserved
21	0h RW	<b>Clear Refresh Debit before Self Refresh Entry (REFDBTCLR):</b> To ensure that the Memory Controller sends enough REF commands to the DRAM, it calculates tREFI period with 2% less than the JEDEC tREFI value. So instead of tREFI equaling 7.8us, it's 7.6us, which means over 1000 x tREFI interval, the Memory Controller would have sent 20 REF commands more than required by the JEDEC spec. When this bit is set to 1 and if the Memory Controller was awake for at least 1000 x tREFI period and then enters Self Refresh, the Memory Controller clears the refresh counter and enters Self Refresh without having to send the accumulated REF commands, since it has already issued 20 more REF commands than required by JEDEC. 0h - Disabled. 1h - Enabled.
20	0h RW	<b>Disable Skewing of Refresh Counting between Ranks (REFSKWDIS):</b> Each rank has its own refresh counter. By default, incrementing these refresh counters are skewed by 1/4 the tREFI period. Setting this bit to a 1 disables this feature and all refresh counters will increment at the same time per tREFI period. Skewing the tREFI counters can improve performance, since traffic to all ranks does not have to be block to perform refresh. 0h - counters are updated per rank every tREFI. 1h - all counters are updated every tREFI.
19:18	0h RO	<b>Rsvd_35:</b> Reserved
17:16	1h RW	<b>Refresh Max tREFI Interval (REFCNTMAX):</b> The maximum interval between ant two REF commands per rank. JEDEC allows a maximum of 9 x tREFI intervals. 0h - 6 x tREFI. 1h - 7 x tREFI. 2h - 8 x tREFI. 3h - Reserved. Should not be changed after initial setting.
15	0h RO	<b>Rsvd_34:</b> Reserved

Bit Range	Default & Access	Field Name (ID): Description
14:12	2h RW	<b>Refresh Period (tREFI)</b> : Specifies the average time between sending REF commands to DRAM. The Memory Controller will guarantee that the average time is met, but maintains a certain degree of flexibility in the exact REF scheduling in order to increase overall performance. 0h - Refresh disabled 1h - Reserved for pre-silicon simulation. 2h - 3.9 s (Extended Temperature Range, 85-95 C) 3h - 7.8 s (Normal Temperature Range, 0-85 C)
11:8	Ch RW	<b>Refresh Panic Watermark (REFWMPNC)</b> : When the refresh debit counter, per rank, is greater than this value, the Memory Controller will send a REF command even if there are some pending requests and regardless of the PRI status level. See DDR3 spec for Refresh Postponing/Pulling-In flexibility. May be changed to functional value after init sequence. Value should be greater than, or equal, to REFWMHI. 0-6h - Reserved 7h - Postpone 2 REF commands. 8h - Postpone 3 REF commands. 9h - Postpone 4 REF commands. Ah - Postpone 5 REF commands. Bh - Postpone 6 REF commands. Ch - Postpone 7 REF commands. Dh - Postpone 8 REF commands. E-Fh - Reserved.
7:4	Ah RW	<b>Refresh High Watermark (REFWMHI)</b> : When the refresh debit counter, per rank, is greater than this value, the Memory Controller will send a REF command even if there are some pending requests to the rank but not if the PRI status is equal to 3. See DDR3 spec for Refresh Postponing/Pulling-In flexibility. May be changed to functional value after init sequence. Value should be greater than, or equal, to REFWMLO. 0-6h - Reserved 7h - Postpone 2 REF commands. 8h - Postpone 3 REF commands. 9h - Postpone 4 REF commands. Ah - Postpone 5 REF commands. Bh - Postpone 6 REF commands. Ch - Postpone 7 REF commands. Dh - Postpone 8 REF commands. E-Fh - Reserved.
3:0	7h RW	<b>Refresh Low Watermark (REFWMLO)</b> : When the refresh debit counter, per rank, is greater than this value, the Memory Controller will send a REF command only if there are no pending requests to the rank and the PRI status is less than 3. See DDR3 spec for Refresh Postponing/Pulling-In flexibility. May be changed to functional value after init sequence. 0-6h - Reserved 7h - Postpone 2 REF commands. 8h - Postpone 3 REF commands. 9h - Postpone 4 REF commands. Ah - Postpone 5 REF commands. Bh - Postpone 6 REF commands. Ch - Postpone 7 REF commands. Dh - Postpone 8 REF commands. E-Fh - Reserved.

### 13.4.9 DRAM Scheduler Control (DSCH)—Offset 9h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**Offset:** [Port: 0x01] + 9h

#### Op Codes:

10h - Read, 11h - Write

12	0h RW	<b>ODT Control Mode (ODTMODE):</b> 0 - Memory Controller auto controls the ODT pins based on DRAM Write transactions. 1 - The value of ODTVAL above directly controls the ODT pins.
11:10	0h RO	<b>Rsvd1_DRMC:</b> Reserved
9:8	0h RW	<b>ODT Control Value (ODTVAL):</b> When ODTMODE is set to 1, ODT pins to DRAM are overridden by ODTVAL. Used only during init flow by BIOS.
7:5	0h RO	<b>Rsvd_44:</b> Reserved
4	0h RW	<b>CKE Control Mode (CKEMODE):</b> 0 - Memory Controller auto controls the CKE pins based on Power-Down and Self Refresh entry and exit . 1 - The value of CKEVAL directly controls the CKE pins
3:2	0h RO	<b>Rsvd0_DRMC:</b> Reserved
1:0	0h RW	<b>CKE Control Value (CKEVAL):</b> When CKEMODE is set to 1, CKE pins to DRAM are overridden by CKEVAL. Used only during init flow by BIOS.

### 13.4.12 Power Management Status (PMSTS)—Offset Ch

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**Offset:** [Port: 0x01] + Ch

Op Codes:

10h - Read, 11h - Write

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
Rsvd_48						WRO	Rsvd_47		DISR

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Rsvd_48:</b> Reserved
8	0h RW/P	<b>Warm Reset Occurred (WRO):</b> The Remote Management Unit writes a 1 to this bit to indicate to BIOS a warm reset has just occurred. Can write a 0 to clear it. This is also cleared when powergood = 0. This bit will not clear with reset
7:1	0h RO	<b>Rsvd_47:</b> Reserved
0	0h RW/P	<b>DRAM In Self-Refresh Status (DISR):</b> The Memory Controller sets this bit to a 1 after it has placed the DRAM devices in Self Refresh mode. The Memory Controller clears this bit when it brings the DRAM devices out of Self Refresh mode. Writing a 1 to this bit, when the COLDWAKE bit is set to 0, will also clear it. This will not clear with system reset, but will clear when powergood = 0. 0 - DRAM not guaranteed to be in Self-Refresh. 1 - DRAM in Self-Refresh

### 13.4.13 DRAM Control Operation (DCO)—Offset Fh

**Access Method**

**Type:** Message Bus Register  
(Size: 32 bits)

**Offset:** [Port: 0x01] + Fh

**Op Codes:**

10h - Read, 11h - Write

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0

0	0	0	0	0	0	0	0	0	
IC	DIOIC	PMIDIS	PMICTL	Rsvd_50			CPGCLOCK	Rsvd_49	DRPLOCK

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>Memory Controller Initialization Complete (IC):</b> Indicates that initialization of the Memory Controller has completed. Memory accesses are permitted and maintenance operation begins. Until this bit is set to a 1, the memory controller will not accept DRAM requests from the Memory Manager or the MTE. Note: Set this bit to 1 only when all other Memory Controller registers has been configured. Usually set at the last configuration step.
30	0h RO	<b>DDRIO PHY initialization complete (DIOIC):</b> Status indication that DDRIO initialization is complete.
29	0h RW	<b>Disable PRI interface (PMIDIS):</b> When this bit is set to 1, the Memory Controller will not respond to requests from either the Memory Manager or the MTE. Note: This bit should be set to 1, when issuing DRAM Read and Write commands through message 68h. It prevents the Memory Controller trying to pull data from the Memory Manager or the MTE for Writes through message 68h, and also prevents the Memory Manager and the MTE from taking read data returned from Reads through message 68h.
28	0h RW	<b>PRI Control Select (PMICTL):</b> 0 - Memory Controller PRI is connected to Memory Manager. 1 - Memory Controller PRI is connected to MTE. When this bit is toggled, the Memory Controller will flush all pending DRAM requests from the previous unit before taking requests from the new unit
27:9	0h RO	<b>Rsvd_50:</b> Reserved
8	0h RW/P/L	<b>MTE Lock (CPGCLOCK):</b> After this bit is set to 1, the MTE is clock gated and locked and cannot be used. CPGCLOCK can be set only once, and will only reset when powergood = 0.
7:1	0h RO	<b>Rsvd_49:</b> Reserved
0	0h RW/P/L	<b>DRP Register Lock (DRPLOCK):</b> Write a 1 to this bit to lock the DRP and DTRC registers, and to disable the ability to issues the DRAM Read and Write commands through message 68h. Once locked, the DRP and DTRC registers cannot be written again. Once set to 1, this bit can only be cleared when powergood = 0.

### 13.4.14 Sticky Scratchpad 0 (SSKPDO)—Offset 4Ah

**Access Method**

**Type:** Message Bus Register  
(Size: 32 bits)

**Offset:** [Port: 0x01] + 4Ah

**Op Codes:**

10h - Read, 11h - Write

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/P	<b>General Purpose Scratchpad (VAL):</b> May be used for BIOS for data storage. Value is preserved in warm-reset.

### 13.4.15 Sticky Scratchpad 1 (SSKPD1)—Offset 4Bh

Access Method

Type: Message Bus Register      Offset: [Port: 0x01] + 4Bh  
(Size: 32 bits)

Op Codes:  
10h - Read, 11h - Write

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/P	<b>General Purpose Scratchpad (VAL):</b> May be used for BIOS for data storage. Value is preserved in warm-reset.

### 13.4.16 DRAM ECC Control Register (DECCCTRL)—Offset 60h

Access Method

Type: Message Bus Register      Offset: [Port: 0x01] + 60h  
(Size: 32 bits)

Op Codes:  
10h - Read, 11h - Write

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	<b>Rsvd_58:</b> Reserved
18	0h RO	<b>Reserved (RSVD):</b> Reserved.

Bit Range	Default & Access	Field Name (ID): Description

6:5	00h RW	<b>Syndrom Select (SYNSEL):</b> ECC Syndrome Bits Select for Observation: The Syndrome Bits are generated from read data returned from DRAM and used to detect ECC errors. Each 64 bits of read data is used to generate 8 Syndrome Bits. SYNSEL selects which set of Syndrome Bits to mux to the DECCSTAT register for observation. 00 - Selects Syndrome Bits from read data [63:0]. 01 - Selects Syndrome Bits from read data [127:64]. 10 - Selects Syndrome Bits from read data [191:128]. 11 - Selects Syndrome Bits from read data [255:192].
4:2	000h RO	<b>Reserved (RSVD):</b> Reserved.
1	0h RW	<b>Double Bit Enable (DBEEN):</b> Enable Double Bit Error Detect 0: disable double bit error detect. 1: enable double bit error detect.
0	0h RW	<b>Single Bit Enable (SBEEN):</b> Enable Single Bit Error Detect and Correct 0: disable single bit error detect and correct. 1: enable single bit error detect and correct.

### 13.4.17 DRAM ECC Status (DECCSTAT)—Offset 61h

Access Method

Type: Message Bus Register  
(Size: 32 bits)

Offset: [Port: 0x01] + 61h

Op Codes:

10h - Read, 11h - Write

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Rsvd_59:</b> Reserved
7:0	0h RO	<b>ECC Syndrome Bits (ECCSYN):</b> This is the 8 ECC Syndrome Bits selected for observation. Selection is made through the DECCCTRL register.

### 13.4.18 DRAM ECC Single Bit Error Count (DECCSBECNT)—Offset 62h

Access Method

**Type:** Message Bus Register (Size: 32 bits) **Offset:** [Port: 0x01] + 62h

**Op Codes:**  
10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	<b>ECC Single Bit Error Count (ECCSBECNT):</b> Write a 1 to the CLRSBECNT bit in the DECCCTRL register to clear this register.

### 13.4.19 DRAM Single Bit ECC Error Captured Address (DECCSBECA)— Offset 68h

**Note:** Write any value to this register to clear both this register and the DRAM Single Bit ECC Error Captured Syndrome register

**Access Method**

**Type:** Message Bus Register (Size: 32 bits) **Offset:** [Port: 0x01] + 68h

**Op Codes:**  
10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	<b>Reserved (RSVD):</b> Reserved.
30	0h RO/P	<b>Single Bit ECC Error Valid (SBE_VLD):</b> 0 - No Single Bit ECC Error was detected. 1 - A Single Bit ECC Error was detected.
29	0h RO/P	<b>Captured Rank Address (SBE_RANK):</b> Captured rank address of a read with a Single Bit ECC Error
28:26	0h RO/P	<b>Captured Bank Address (SBE_BANK):</b> Captured bank address of a read with a Single Bit ECC Error
25:10	0h RO/P	<b>Captured Row Address (SBE_ROW):</b> Captured row address of a read with a Single Bit ECC Error

Bit Range	Default & Access	Field Name (ID): Description
9:0	0h RO/P	<b>Captured Column Address (SBE_COL)</b> : Captured column address of a read with a Single Bit ECC Error

### 13.4.20 DRAM Single Bit ECC Error Captured Syndrome (DECCSBECS)—Offset 69h

**Access Method**

**Type:** Message Bus Register  
(Size: 32 bits)

**Offset:** [Port: 0x01] + 69h

**Op Codes:**  
10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/P	<b>Captured Syndrome (SBE_SDROME)</b> : Captured syndrome of a read with a Single Bit ECC Error

### 13.4.21 DRAM Double Bit ECC Error Captured Address (DECCDBECA)—Offset 6Ah

**Note:** Write any value to this register to clear both this register and the DRAM Double Bit ECC Error Captured Syndrome register

**Access Method**

**Type:** Message Bus Register  
(Size: 32 bits)

**Offset:** [Port: 0x01] + 6Ah

**Op Codes:**  
10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	<b>Reserved (RSVD)</b> : Reserved.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RO/P	<b>Double Bit ECC Error Valid (DBE_VLD)</b> : 0 - No Double Bit ECC Error was detected. 1 - A Double Bit ECC Error was detected.
29	0h RO/P	<b>Captured Rank Address (DBE_RANK)</b> : Captured rank address of a read with a Double Bit ECC Error
28:26	0h RO/P	<b>Captured Bank Address (DBE_BANK)</b> : Captured bank address of a read with a Double Bit ECC Error
25:10	0h RO/P	<b>Captured Row Address (DBE_ROW)</b> : Captured row address of a read with a Double Bit ECC Error
9:0	0h RO/P	<b>Captured Column Address (DBE_COL)</b> : Captured column address of a read with a Double Bit ECC Error

### 13.4.22 DRAM Double Bit ECC Error Captured Syndrome (DECCDBECS)—Offset 6Bh

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**Offset:** [Port: 0x01] + 6Bh

Op Codes:

10h - Read, 11h - Write

**Default:** 00000000h

31	28	24	20	16	12	8	4	0																							
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DBE_SDROME																															

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/P	<b>Captured Syndrome (DBE_SDROME)</b> : Captured syndrome of a read with a Double Bit ECC Error

### 13.4.23 Memory Controller Fuse Status (DFUSESTAT)—Offset 70h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**Offset:** [Port: 0x01] + 70h

Op Codes:

10h - Read, 11h - Write

**Default:** 00000000h

31	28	24	20	16	12	8	4	0																			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
FUSESTAT																											

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	<b>Fuse Status (FUSESTAT):</b> Memory Controller fuse bits are captured in this register. [0] ECC Disable [31:1] Reserved

### 13.4.24 Scrambler Seed (DSCRMSEED)—Offset 80h

Dynamic data scrambler seed register

Access Method

**Type:** Message Bus Register                      **Offset:** [Port: 0x01] + 80h  
(Size: 32 bits)

Op Codes:  
10h - Read, 11h - Write

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	<b>Rsvd_71:</b> Reserved
17:0	0h RW/P	<b>Scrambler Seed (SCRMSEED):</b> Holds 18 bit scrambler seed value used to feed into LFSR array matrix.

## 13.5 Message Bus Commands

**Table 78. Message Opcode Definition**

Opcode	Operation	Type	Description
00h	NOP	Msg	No operation
CAh	Wake	Msg	Wakes the memory from Self-Refresh mode or puts the Memory Controller in working mode after cold-boot. An ACK is sent after the Wake has completed and memory is accessible.
68h	DRAM Init	MsgD	<p>This message enables accessing the DRAM internal registers.</p> <p>Message Data Payload Bits:</p> <p>31:23 Reserved (set to 0)</p> <p>22 Rank Address</p> <p>21:6 Multiplexed Address: Determines the value of MA[15:0] when the initialization command is sent.</p> <p>5:3 Bank Address: Determines the value of BA[2:0] when the initialization command is sent.</p> <p>2:0 Command (DDR3_RAS_B, DDR3_CAS_B, DDR3_WE_B): Determines the value driven on the DDR3_RAS_B, DDR3_CAS_B, and DDR3_WE_B signals respectively when the initialization command is sent. The supported commands are listed below:</p> <p>000 – MRS (Extended) Mode Register Set</p> <p>001 – Refresh</p> <p>010 – Precharge (single or all as specified by MA[10])</p> <p>011 – Bank Activate</p> <p>100 – Reserved</p> <p>101 – Reserved</p> <p>110 – ZQ Calibration (Long/Short as specified by MA[10])</p> <p>111 – NOP</p>

§ §

## 14.0 PCI Express\* 2.0

There are two lanes and two PCI Express\* root ports, each supporting the *PCI Express\* Base Specification*, Rev. 2.0 at a maximum 2.5 GT/s signaling rate.

### 14.1 Signal Descriptions

Please see [Chapter 2.0, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Type:** The buffer type found in [Chapter 4.0, “Electrical Characteristics”](#)
- **Description:** A brief explanation of the signal’s function

**Table 83. PCI Express\* 2.0 Signals**

Signal Name	Direction/ Type	Description
PCIE_PETP[1:0] PCIE_PETN[1:0]	O PCIe*	PCI Express* Transmit PCI Express* Transmit pair (P and N) signals. Each pair makes up the transmit half of a lane.
PCIE_PERP[1:0] PCIE_PERN[1:0]	I PCIe*	PCI Express* Receive PCI Express* Receive pair (P and N) signals. Each pair makes up the receive half of lane.
PCIE_IRCOMP	IO Analog	Note: Please check the Platform Design Guide for connection details for this COMP pin.
PCIE_RBIAIS	I Analog	Note: Please check the Platform Design Guide for connection details for this BIAS pin.

**Note:** PCIe reference clocks are supplied by the following:  
REF[0/1]\_OUTCLKP  
REF[0/1]\_OUTCLKN

### 14.2 Features

- Conforms to *PCI Express\* Base Specification*, Rev. 2.0
- 2.5 GT/s operation per root port (limited for power saving)
- Virtual Channel support for VC0
- x1 widths
- Supports 2 x1 Root port configurations
- Interrupts and Events
  - Legacy (INT<sub>x</sub>) and MSI Interrupts
  - General Purpose Events

- Express Card Hot Plug Events
- System Error Events
- Power Management
  - Link State support for L0s, L1, and L2
  - Powered down in ACPI S3 state - L3

### 14.2.1 Interrupts and Events

A root port is capable of handling interrupts and events from an end point device. A root port can also generate its own interrupts for some events, including power management and hot plug events, and also including error events.

There are two interrupt types a root port receives from an end point device: INTx (legacy), and MSI. MSIs are automatically passed upstream by the root port, just as other memory writes would be. INTx messages are delivered to the Legacy Bridge’s interrupt decoding and routing logic by the root port.

Events and interrupts that are handled by the root port are shown in Table 84, with the possible interrupts they can deliver to the interrupt decoder/router.

Table 84. Possible Interrupts Generated From Events/Packets

Packet/Event	Type	INTx	MSI	SERR	SCI	SMI	GPE
INTx	Packet	X	X				
PM_PME	Packet	X	X				
Power Management (PM)	Event	X	X		X	X	
Hot Plug (HP)	Event	X	X		X	X	
ERR_CORR	Packet			X			
ERR_NONFATAL	Packet			X			
ERR_FATAL	Packet			X			
Internal Error	Event			X			
VDM	Packet						X

Note: Table 84 lists the possible interrupts and events generated based on packets received, or events generated in the root port. Configuration is performed by the software to enable the different interrupts as applicable.

Note: GPE is reported as SCI by the root port.

#### 14.2.1.1 Express Card Hot Plug Events

Express Card Hot Plug is available based on Presence Detection for each root port.

Note: A full Hot Plug Controller is not implemented.

Presence detection occurs when a PCI Express\* device is plugged in and power is supplied. The physical layer detects the presence of the device, and the root port sets the SLCTL\_SLSTS.PDS and SLCTL\_SLSTS.PDC bits.

When a device is removed and detected by the physical layer, the root port clears the SLCTL\_SLSTS.PDS bit, and sets the SLCTL\_SLSTS.PDC bit.

Interrupts can be generated by the root port when a hot plug event occurs. A hot plug event is defined as the transition of the SLCTL\_SLSTS.PDC bit from 0 to 1. Software can set the SLCTL\_SLSTS.PDE and SLCTL\_SLSTS.HPE bits to allow hot plug events to generate an interrupt.

If SLCTL\_SLSTS.PDE and SLCTL\_SLSTS.HPE are both set, and SLCTL\_SLSTS.PDC transitions from 0 to 1, an interrupt is generated.

#### 14.2.1.2 System Error (SERR)

System Error events are supported by both internal and external sources. See the *PCI Express\* Base Specification*, Rev. 2.0 for details.

#### 14.2.2 Power Management

Each root port's link supports L0s, L1, and L2/3 link states per PCI Express\* Base Specification, Rev. 2.0. L2/3 is entered on entry to S3.

#### 14.3 References

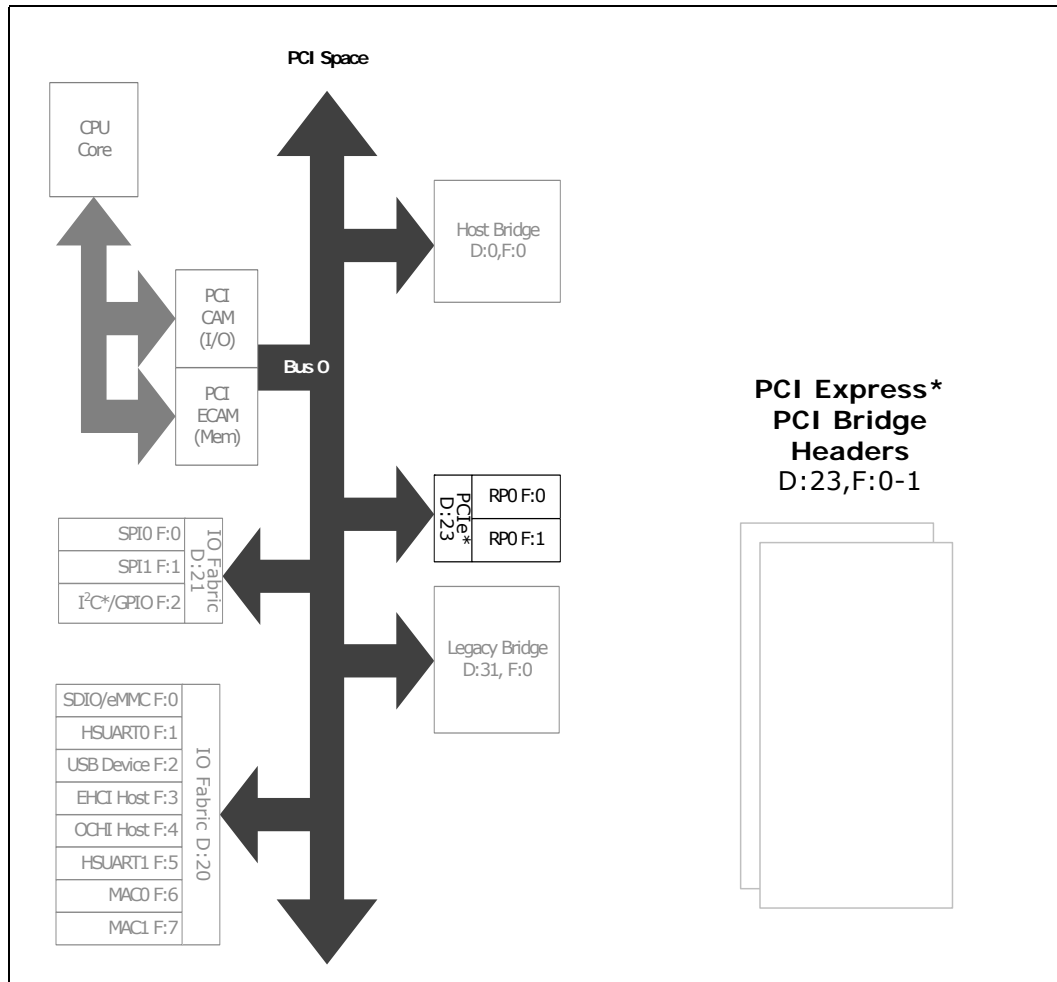

*PCI Express\* Base Specification*, Rev. 2.0

#### 14.4 Register Map

Each root port supports its own extended PCI bridge header in PCI configuration space. These headers are located on PCI bus 0, device 23, functions 0-1 as shown below. There are no other registers implemented by the root ports or their controller.

See [Chapter 5.0, "Register Access Methods"](#) for details on accessing different register types.

Figure 27. PCI Express Register Map

## 14.5 PCI Configuration Registers

Registers listed are for Function 0 (Root Port 0). Function 1 (Root Port 1) contains the same registers. Differences between Root Ports are noted in the individual registers.

Table 85. Summary of PCI Configuration Registers—0/23/0

114h	117h	"Correctable Error Mask (CEM)—Offset 114h" on page 303	00002000h
118h	11Bh	"Advanced Error Capabilities and Control (AECC)—Offset 118h" on page 304	00000000h
11Ch	11Fh	"Header Log (HL_DW1)—Offset 11Ch" on page 304	00000000h

Bit Range	Default & Access	Field Name (ID): Description
30	0b RWC	<b>Signaled System Error (SSE)</b> : Set when the root port signals a system error to the internal SERR# logic.
29	0b RWC	<b>Received Master Abort (RMA)</b> : Set when the root port receives a completion with unsupported request status from the backbone.
28	0b RWC	<b>Received Target Abort (RTA)</b> : Set when the root port receives a completion with completer abort from the backbone.
27	0b RWC	<b>Signaled Target Abort (STA)</b> : Set whenever the root port forwards a target abort received from the downstream device onto the backbone.
26:25	00b RO	<b>Primary DEVSEL# Timing Status (PDTs)</b> : Reserved per PCI-Express spec.
24	0b RWC	<b>Master Data Parity Error Detected (DPD)</b> : Set when the root port receives a completion with a data parity error on the backbone and PCMD.PERE is set.
23	0b RO	<b>Primary Fast Back to Back Capable (PFBC)</b> : Reserved per PCI-Express spec.
22	0b RO	<b>Reserved (RSVD_1)</b> : Reserved.
21	0b RO	<b>Primary 66 MHz Capable (PC66)</b> : Reserved per PCI-Express spec.
20	1b RO	<b>Capabilities List (CLIST)</b> : Indicates the presence of a capabilities list.
19	0b RO/V	<b>Interrupt Status (IS)</b> : Indicates status of hot plug and power management interrupts on the root port that result in INTx# message generation. This bit is not set if MSI is enabled. If MSI is not enabled, this bit is set regardless of the state of CMD.ID.
18:16	000b RO	<b>Reserved (RSVD_2)</b> : Reserved.
15:11	00h RO	<b>Reserved (RSVD)</b> : Reserved.
10	0b RW/RO	<b>Interrupt Disable (ID)</b> : This disables pin-based INTx# interrupts on enabled hot plug and power management events. This bit has no effect on MSI operation. When set, internal INTx# messages will not be generated. When cleared, internal INTx# messages are generated if there is an interrupt for hot plug or power management and MSI is not enabled. This bit does not affect interrupt forwarding from devices connected to the root port. Assert_INTx and Deassert_INTx messages will still be forwarded to the internal interrupt controllers if this bit is set.
9	0b RO	<b>Fast Back to Back Enable (FBE)</b> : Reserved per PCI-Express spec.
8	0b RW	<b>SERR# Enable (SEE)</b> : When set, enables the root port to generate an SERR# message when PSTS.SSE is set.
7	0b RO	<b>Wait Cycle Control (WCC)</b> : Reserved per PCI-Express spec.
6	0b RW	<b>Parity Error Response Enable (PERE)</b> : Indicates that the device is capable of reporting parity errors as a master on the backbone.
5	0b RO	<b>VGA Palette Snoop (VGA_PSE)</b> : Reserved per PCI-Express spec.
4	0b RO	<b>Memory Write and Invalidate Enable (MWIE)</b> : Reserved per PCI-Express spec.
3	0b RO	<b>Special Cycle Enable (SCE)</b> : Reserved per PCI-Express and PCI bridge spec.

Bit Range	Default & Access	Field Name (ID): Description
2	0b RW	<b>Bus Master Enable (BME):</b> When set, allows the root port to forward Memory and I/O Read/Write cycles onto the backbone from a PCI-Express device. When this bit is 0b, Memory and I/O requests received at a Root Port must be handled as Unsupported Requests (UR). This bit does not affect forwarding of Completions in either the Upstream or Downstream direction. The forwarding of Requests other than Memory or I/O requests is not controlled by this bit.
1	0b RW	<b>Memory Space Enable (MSE):</b> When set, memory cycles within the range specified by the memory base and limit registers can be forwarded to the PCI-Express device. When cleared, these memory cycles are master aborted on the backbone.
0	0b RW	<b>I/O Space Enable (IOSE):</b> When set, I/O cycles within the range specified by the I/O base and limit registers can be forwarded to the PCI-Express device. When cleared, these cycles are master aborted on the backbone.

### 14.5.3 Class Code (RID\_CC)—Offset 8h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 8h

Power Well: Core

Default: 06040000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	1	1	0	0	0	0	0	0
0	0	0	0	0	1	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
	BCC		SCC		PI		RID	

Bit Range	Default & Access	Field Name (ID): Description
31:24	06h RO	<b>Base Class Code (BCC):</b> Indicates the device is a bridge device.
23:16	04h RO/V	<b>Sub-Class Code (SCC):</b> The default indicates the device is a PCI-to-PCI bridge.
15:8	00h RO/V	<b>Programming Interface (PI):</b> This is a read only register.
7:0	00h RO/V	<b>Revision ID (RID):</b> Indicates the revision of the bridge.

### 14.5.4 Header Type (CLS\_PLT\_HTYPE)—Offset Ch

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + Ch

Default: 00810000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	1	0	0	0	0
0	0	0	0	0	0	0	1	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
	RSVD0		MFD		HTYPE		CT	
						RSVD		LS

Bit Range	Default & Access	Field Name (ID): Description
31:24	0b RO	<b>RSVDO</b> : Reserved
23	1b RO	<b>Multi-function Device (MFD)</b> : This bit is '1' to indicate a multi-function device.
22:16	01h RO/V	<b>Header Type (HTYPE)</b> : The default mode identifies the header layout of the configuration space, which is a PCI-to-PCI bridge.
15:11	00h RO	<b>Latency Count (CT)</b> : Reserved per PCI-Express spec.
10:8	000b RO	<b>Reserved (RSVD)</b> : Reserved.
7:0	00h RW	<b>Line Size (LS)</b> : This is read/write but contains no functionality, per PCI-Express spec.

### 14.5.5 Secondary Latency Timer (BNUM\_SLT)—Offset 18h

This register is reserved for a root port per PCI-Express spec.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 18h

**Power Well:** Core

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW/RO	<b>Secondary Latency Timer (SLT)</b> : This register is RO and returns 0. This register does not affect the behavior of any HW logic.
23:16	00h RW	<b>Subordinate Bus Number (SBBN)</b> : Indicates the highest PCI bus number below the bridge.
15:8	00h RW	<b>Secondary Bus Number (SCBN)</b> : Indicates the bus number the port.
7:0	00h RW	<b>Primary Bus Number (PBN)</b> : Indicates the bus number of the backbone.

### 14.5.6 Secondary Status (IOBL\_SSTS)—Offset 1Ch

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 1Ch

**Power Well:** Core

**Default:** 00000000h

31	28	24	20	16	12	8	4	0						
0	0	0	0	0	0	0	0	0						
0	0	0	0	0	0	0	0	0						
0	0	0	0	0	0	0	0	0						
DPE	RSE	RMA	RTA	STA	SDTS	DPD	SFBC	RSVD	SC66	RSVD_1	IOLA	IOLC	IOBA	IOBC

Bit Range	Default & Access	Field Name (ID): Description
31	0b RWC	<b>Detected Parity Error (DPE)</b> : Set when the port receives a poisoned TLP.
30	0b RWC	<b>Received System Error (RSE)</b> : Set when the port receives an ERR_FATAL or ERR_NONFATAL message from the device.
29	0b RWC	<b>Received Master Abort (RMA)</b> : Set when the port receives a completion with Unsupported Request status from the device.
28	0b RWC	<b>Received Target Abort (RTA)</b> : Set when the port receives a completion with Completion Abort status from the device.
27	0b RWC	<b>Signaled Target Abort (STA)</b> : Set when the port generates a completion with Completion Abort status to the device.
26:25	00b RO/V	<b>Secondary DEVSEL# Timing Status (SDTS)</b> : Reserved per PCI-Express spec.
24	0b RWC	<b>Data Parity Error Detected (DPD)</b> : Set when the BCTRL.PERE, and either of the following two conditions occurs: Port receives completion marked poisoned. Port poisons a write request to the secondary side.
23	0b RO/V	<b>Secondary Fast Back to Back Capable (SFBC)</b> : Reserved per PCI-Express spec.
22	0b RO	<b>Reserved (RSVD)</b> : Reserved.
21	0b RO	<b>Secondary 66 MHz Capable (SC66)</b> : Reserved per PCI Express spec.
20:16	00h RO	<b>Reserved (RSVD_1)</b> : Reserved.
15:12	0h RW	<b>I/O Address Limit (IOLA)</b> : I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to FFFh.
11:8	0h RO	<b>I/O Limit Address Capability (IOLC)</b> : Indicates that the bridge does not support 32-bit I/O addressing.
7:4	0h RW	<b>I/O Base Address (IOBA)</b> : I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to 000h.
3:0	0h RO	<b>I/O Base Address Capability (IOBC)</b> : Indicates that the bridge does not support 32-bit I/O addressing.

### 14.5.7 Memory Base and Limit (MBL)—Offset 20h

Accesses that are within the ranges specified in this register will be sent to the attached device if CMD.MSE is set. Accesses from the attached device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 20h

**Power Well:** Core

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
ML				RSVD	MB			RSVD_1

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RW	<b>Memory Limit (ML)</b> : These bits are compared with bits 31:20 of the incoming address to determine the upper 1MB aligned value of the range.
19:16	0h RO	<b>Reserved (RSVD)</b> : Reserved.
15:4	000h RW	<b>Memory Base (MB)</b> : These bits are compared with bits 31:20 of the incoming address to determine the lower 1MB aligned value of the range.
3:0	0h RO	<b>Reserved (RSVD_1)</b> : Reserved.

### 14.5.8 Prefetchable Memory Base and Limit (PMBL)—Offset 24h

Accesses that are within the ranges specified in this register will be sent to the device if CMD.MSE is set. Accesses from the device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set.

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 24h

Power Well: Core

Default: 00010001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
PML				I64L	PMB			I64B

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RW	<b>Prefetchable Memory Limit (PML)</b> : These bits are compared with bits 31:20 of the incoming address to determine the upper 1MB aligned value of the range.
19:16	1h RO	<b>64-bit Indicator (I64L)</b> : Indicates support for 64-bit addressing.
15:4	000h RW	<b>Prefetchable Memory Base (PMB)</b> : These bits are compared with bits 31:20 of the incoming address to determine the lower 1MB aligned value of the range.
3:0	1h RO	<b>64-bit Indicator (I64B)</b> : Indicates support for 64-bit addressing.

### 14.5.9 Prefetchable Memory Base Upper 32 Bits (PMBU32)—Offset 28h

#### Access Method

Bit Range	Default & Access	Field Name (ID): Description
31:8	0000000h RO	<b>Reserved (RSVD1):</b> Reserved
7:0	40h RWO	<b>Capabilities Pointer (PTR):</b> Indicates that the pointer for the first entry in the capabilities list. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value. Capability Linked List (Default Settings) Offset Capability Next Pointer 40h PCI Express 80h 80h Message Signaled Interrupt (MSI) 90h 90h Subsystem Vendor A0h A0h PCI Power Management 00h Extended PCIe Capability Linked List Offset Capability Next Pointer 100h Advanced Error Reporting 000h

### 14.5.12 Bridge Control (INTR\_BCTRL)—Offset 3Ch

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 3Ch

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSVD	DTSE	DTS	SDT	PDT	FBE	SBR	MAM	V16
				VE	IE	SE	PERE	
						IPIN		ILINE

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	<b>Reserved (RSVD):</b> Reserved.
27	0b RO/RW	<b>Discard Timer SERR# Enable (DTSE):</b> Reserved per PCI-Express spec.
26	0b RO	<b>Discard Timer Status (DTS):</b> Reserved per PCI-Express spec.
25	0b RO/RW	<b>Secondary Discard Timer (SDT):</b> Reserved per PCI-Express spec.
24	0b RO/RW	<b>Primary Discard Timer (PDT):</b> Reserved per PCI-Express spec.
23	0b RO	<b>Fast Back to Back Enable (FBE):</b> Reserved per Express spec.
22	0b RW	<b>Secondary Bus Reset (SBR):</b> Triggers a Hot Reset on the PCI-Express port.
21	0b RO/RW	<b>Master Abort Mode (MAM):</b> Reserved per PCI-Express spec.

Bit Range	Default & Access	Field Name (ID): Description
12	0b RO	<b>Reserved (RSVD_4):</b> On previous version of the specification this was Attention Button Present (ABP).
11:9	000b RO	<b>Endpoint L1 Acceptable Latency (E1AL):</b> Reserved for Root port.
8:6	000b RO	<b>Endpoint L0 Acceptable Latency (EOAL):</b> Reserved for Root port.
5	0b RO	<b>Extended Tag Field Supported (ETFS):</b> The PCH root port never needs to initiate a transaction as a Requester with the Extended Tag bits being set. This bit does not affect the root port's ability to forward requests as a bridge as the root port always supports forwarding requests with extended tags.
4:3	00b RO	<b>Phantom Functions Supported (PFS):</b> No phantom functions supported.
2:0	000b RO	<b>Max Payload Size Supported (MPS):</b> Indicates the maximum payload size supported is 128B.

### 14.5.15 Device Status (DCTL\_DSTS)—Offset 48h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 48h

Power Well: Core

Default: 00100000h

31	28	24	20	16	12	8	4	0												
0	0	0	0	0	0	0	0	0												
0	0	0	0	0	0	0	0	0												
0	0	0	1	0	0	0	0	0												
RSVD_1			TDP	APD	URD	FED	NFED	CED	RSVD	MRRS	ENS	APME	PFE	ETFE	MPS	ERO	URE	FEE	NFE	CEE

Bit Range	Default & Access	Field Name (ID): Description
31:22	000h RO	<b>Reserved (RSVD_1):</b> Reserved.
21	0b RO	<b>Transactions Pending (TDP):</b> This bit has no meaning for the root port since it never initiates a non-posted request with its own RequesterID.
20	1b RO	<b>AUX Power Detected (APD):</b> The root port contains AUX power for wakeup.
19	0b RWC	<b>Unsupported Request Detected (URD):</b> Indicates an unsupported request was detected.
18	0b RWC	<b>Fatal Error Detected (FED):</b> Indicates a fatal error was detected. Set when a fatal error occurred from a data link protocol error, buffer overflow, or malformed TLP.
17	0b RWC	<b>Non-Fatal Error Detected (NFED):</b> Indicates a non-fatal error was detected. Set when received a non-fatal error occurred from a poisoned TLP, unexpected completions, unsupported requests, completer abort, or completer timeout.
16	0b RWC	<b>Correctable Error Detected (CED):</b> Indicates a correctable error was detected. Set when received an internal correctable error from receiver errors / framing errors, TLP CRC error, DLLP CRC error, replay number rollover, or replay timeout.
15	0b RO	<b>Reserved (RSVD):</b> Reserved.

Bit Range	Default & Access	Field Name (ID): Description
14:12	000b RO	<b>Max Read Request Size (MRRS):</b> Hardwired to 0
11	0b RO	<b>Enable No Snoop (ENS):</b> Not supported. The root port will never issue non-snoop requests.
10	0b RW/P	<b>Aux Power PM Enable (APME):</b> Must be RW for OS testing. The OS will set this bit to '1' if the device connected has detected aux power. It has no effect on the root port otherwise. This registers is in the resume well.
9	0b RO	<b>Phantom Functions Enable (PFE):</b> Not supported.
8	0b RO	<b>Extended Tag Field Enable (ETFE):</b> Not supported.
7:5	000b RO	<b>Max Payload Size (MPS):</b> The root port only supports 128B payloads.
4	0b RO	<b>Enable Relaxed Ordering (ERO):</b> Not supported.
3	0b RW	<b>Unsupported Request Reporting Enable (JRE):</b> When set, allows signaling ERR_NONFATAL, ERR_FATAL, or ERR_COR to the Root Control register when detecting an unmasked Unsupported Request (UR). An ERR_COR is signaled when a unmasked Advisory Non-Fatal UR is received. An ERR_FATAL, ERR_ or NONFATAL, is sent to the Root Control Register when an uncorrectable non-Advisory UR is received with the severity set by the Uncorrectable Error Severity register.
2	0b RW	<b>Fatal Error Reporting Enable (FEE):</b> Enables signaling of ERR_FATAL to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.
1	0b RW	<b>Non-Fatal Error Reporting Enable (NFE):</b> When set, enables signaling of ERR_NONFATAL to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.
0	0b RW	<b>Correctable Error Reporting Enable (CEE):</b> When set, enables signaling of ERR_CORR to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.

### 14.5.16 Link Capabilities (LCAP)—Offset 4Ch

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 4Ch

Power Well: Core

Default: 00110C01h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	1	1	0
0	0	0	0	1	0	0	0	0
0	0	0	1	0	0	0	0	1
PN		RSVD	RSVD_1	LARC	SDERC	CPM	EL1	ELO
						APMS	MLW	SLS

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO/V	<b>Port Number (PN):</b> Indicates the port number for the root port. This value is different for each implemented port: Port # Value of PN field 1 01h 2 02h 3 03h 4 04h 5 05h 6 06h 7 07h 8 08h
23:22	00b RO	<b>Reserved (RSVD):</b> Reserved.
21	0b RO	<b>Reserved (RSVD_1):</b> This port does not support Link Bandwidth Notification Capability.
20	1b RO	<b>Link Active Reporting Capable (LARC):</b> This port supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine.
19	0b RO	<b>Surprise Down Error Reporting Capable (SDERC):</b> Set to '0' to indicate the PCH does not support Surprise Down Error Reporting.
18	0b RO	<b>Clock Power Management (CPM):</b> '0' Indicates that PCH root ports do not support the CLKREQ# mechanism.
17:15	010b RWO	<b>L1 Exit Latency (EL1):</b> Indicates an exit latency of 2 s to 4 s. 000b Less than 1 s 001b 1 s to less than 2 s 010b 2 s to less than 4 s 011b 4 s to less than 8 s 100b 8 s to less than 16 s 101b 16 s to less than 32 s 110b 32 s to 64 s 111b More than 64 s Note: If PXP PLL shutdown is enabled, BIOS should program this latency to comprehend PLL lock latency.
14:12	000b RO/V	<b>LOs Exit Latency (ELO):</b> Indicates an exit latency based upon common-clock configuration: LCAP.CCC Value 0 MPC.UCEL 1 MPC.CCEL
11:10	11b RWO	<b>Active State Link PM Support (APMS):</b> Indicates the level of active state power management on this link: Bits Definition 00 (Reserved) 01 L0s Entry supported 10 Reserved 11 Both L0s and L1 supported
9:4	000000b RO/V	<b>Maximum Link Width (MLW):</b> For the root ports, several values can be taken, based upon the value of the chipset configuration register field RPC.PC1 for ports 1-4 and RPC.PC2 for ports 5-6: Port # Value of PN field RPC.PC1 00 01 10 11 1 01h 02h 02h 04h 2 01h 01h 01h 01h 3 01h 01h 02h 01h 4 01h 01h 01h 01h Port # Value of PN field RPC.PC2 00 01 10 11 5 01h 02h 02h 04h 6 01h 01h 01h 01h 7 01h 01h 02h 01h 8 01h 01h 01h 01h
3:0	1h RO/V	<b>Supported Link Speeds (SLS):</b> Indicates the supported link speeds of the Root Port. 0001b 2.5 GT/s Link speed supported 0010b 5.0 GT/s and 2.5GT/s Link speeds supported

Bit Range	Default & Access	Field Name (ID): Description
19:16	1h RO/V	<b>Current Link Speed (CLS):</b> 0001b Link is 2.5 GT/s Link 0010b Link is 5.0 GT/s Link The value of this field is undefined if the link is not up.
15:12	0h RO	<b>Reserved (RSVD):</b> Reserved.
11	0b RW	<b>Link Autonomous Bandwidth Interrupt Enable (LABIE):</b> When Set, this bit enables the generation of an interrupt to indicate that the Link Autonomous Bandwidth Status bit has been Set.
10	0b RW	<b>Link Bandwidth Management Interrupt Enable (LBMIE):</b> When Set, this bit enables the generation of an interrupt to indicate that the Link Bandwidth Management Status bit has been Set. This bit is not applicable and is reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. Functions that do not implement the Link Bandwidth Notification Capability must hardwire this bit to 0b. Default value of this bit is 0b.
9	0b RW	<b>Hardware Autonomous Width Disable (HAWD):</b> When Set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width. Default value of this bit is 0b.
8	0b RO	<b>Enable Clock Power Management (ECPM):</b> Reserved. Not supported on PCH Root Ports.
7	0b RW	<b>Extended Synch (ES):</b> When set, forces extended transmission of FTS ordered sets in FTS and extra TS2 at exit from L1 prior to entering L0.
6	0b RW	<b>Common Clock Configuration (CCC):</b> When set, indicates that the PCH and device are operating with a distributed common reference clock.
5	0b WO	<b>Retrain Link (RL):</b> When set, the root port will train its downstream link. This bit always returns '0' when read. Software uses LSTS.LT and LSTS.LTE to check the status of training. It is permitted to write 1b to this bit while simultaneously writing modified values to other fields in this register. If the LTSSM is not already in Recovery or Configuration, the resulting Link training must use the modified values. If the LTSSM is already in Recovery or Configuration, the modified values are not required to affect the Link training that's already in progress.
4	0b RW	<b>Link Disable (LD):</b> When set, the root port will disable the link by directing the LTSSM to the Disabled state.
3	0b RO	<b>Read Completion Boundary Control (RCBC):</b> Indicates the read completion boundary is 64 bytes.
2	0b RO	<b>Reserved (RSVD_1):</b> Reserved.
1:0	00b RW	<b>Active State Link PM Control (ASPM):</b> Indicates whether the root port should enter L0s or L1 or both. Bits Definition 00 Disabled 01 L0s Entry Enabled 10 L1 Entry Enabled 11 L0s and L1 Entry Enabled The value of this register is used unless the Root Port ASPM Control Override Enable register is set, in which case the Root Port ASPM Control Override value is used.

## 14.5.18 Slot Capabilities (SLCAP)—Offset 54h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 54h

**Power Well:** Core

**Default:** 00040060h

31	28	24	20	16	12	8	4	0															
0	0	0	0	0	0	0	0	0															
RSVD_1		DLLSC	EMIS	PDS	MS	CC	PDC	MSC	PFD	ABP	RSVD		DLLSCE	EMIC	PCC	PIC	AIC	HPE	CCE	PDE	MSE	PFE	ABE

Bit Range	Default & Access	Field Name (ID): Description
31:25	00h RO	<b>Reserved (RSVD_1):</b> Reserved.
24	0b RWC	<b>Data Link Layer State Changed (DLLSC):</b> This bit is set when the value reported in Data Link Layer Link Active field of the Link Status register is changed. In response to a Data Link Layer State Changed event, software must read Data Link Layer Link Active field of the Link Status register to determine if the link is active before initiating configuration cycles to the hot plugged device.
23	0b RO	<b>Electromechanical Interlock Status (EMIS):</b> Reserved as this port does not support and electromechanical interlock.
22	0b RO/V	<b>Presence Detect State (PDS):</b> If XCAP.SI is set (indicating that this root port spawns a slot), then this bit indicates whether a device is connected ('1') or empty ('0'). If XCAP.SI is cleared, this bit is a '1'.
21	0b RO	<b>MRL Sensor State (MS):</b> Reserved as the MRL sensor is not implemented.
20	0b RO	<b>Command Completed (CC):</b> This register is RO as this port does not implement a Hot Plug Controller.
19	0b RWC	<b>Presence Detect Changed (PDC):</b> This bit is set by the root port when the PD bit changes state.
18	0b RO	<b>MRL Sensor Changed (MSC):</b> Reserved as the MRL sensor is not implemented.
17	0b RO	<b>Power Fault Detected (PFD):</b> Reserved as a power controller is not implemented.
16	0b RO	<b>Attention Button Pressed (ABP):</b> This register is RO as this port does not implement an attention button.
15:13	000b RO	<b>Reserved (RSVD):</b> Reserved.
12	0b RW	<b>Data Link Layer State Changed Enable (DLLSCE):</b> When set, this field enables generation of a hot plug interrupt when the Data Link Layer Link Active field is changed.
11	0b RO	<b>Electromechanical Interlock Control (EMIC):</b> Reserved as this port does not support an Electromechanical Interlock.
10	0b RO	<b>Power Controller Control (PCC):</b> This bit has no meaning for module based hot plug.
9:8	00b RO	<b>Power Indicator Control (PIC):</b> This register is RO as this port does not implement a Hot Plug Controller.
7:6	00b RO	<b>Attention Indicator Control (AIC):</b> This register is RO as this port does not implement a Hot Plug Controller.
5	0b RW	<b>Hot Plug Interrupt Enable (HPE):</b> When set, enables generation of a hot plug interrupt on enabled hot plug events.
4	0b RO	<b>Command Completed Interrupt Enable (CCE):</b> This register is RO as this port does not implement a Hot Plug Controller.
3	0b RW	<b>Presence Detect Changed Enable (PDE):</b> When set, enables the generation of a hot plug interrupt or wake message when the presence detect logic changes state.

Bit Range	Default & Access	Field Name (ID): Description
2	0b RO	<b>MRL Sensor Changed Enable (MSE)</b> : This register is RO as this port does not implement a Hot Plug Controller.
1	0b RO	<b>Power Fault Detected Enable (PFE)</b> : This register is RO as this port does not implement a Hot Plug Controller.
0	0b RO	<b>Attention Button Pressed Enable (ABE)</b> : This register is RO as this port does not implement a Hot Plug Controller.

### 14.5.20 Root Control (RCTL)—Offset 5Ch

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 5Ch

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0			
0	0	0	0	0	0	0	0	0			
0	0	0	0	0	0	0	0	0			
RSVD1				RSVD				PIE	SFE	SNE	SCE

Bit Range	Default & Access	Field Name (ID): Description
31:16	00000h RO	<b>Reserved (RSVD1)</b> : Reserved
15:4	000h RO	<b>Reserved (RSVD)</b> : Reserved.
3	0b RW	<b>PME Interrupt Enable (PIE)</b> : When set, enables interrupt generation when RSTS.PS is in a set state (either due to a '0' to '1' transition, or due to this bit being set with RSTS.PS already set).
2	0b RW	<b>System Error on Fatal Error Enable (SFE)</b> : When set, an SERR# will be generated if a fatal error is reported by any of the devices in the hierarchy of this root port, including fatal errors in this root port. This register is not dependent on CMD.SEE being set.
1	0b RW	<b>System Error on Non-Fatal Error Enable (SNE)</b> : When set, an SERR# will be generated if a non-fatal error is reported by any of the devices in the hierarchy of this root port, including non-fatal errors in this root port. This register is not dependent on CMD.SEE being set.
0	0b RW	<b>System Error on Correctable Error Enable (SCE)</b> : When set, an SERR# will be generated if a correctable error is reported by any of the devices in the hierarchy of this root port, including correctable errors in this root port. This register is not dependent on CMD.SEE being set.

### 14.5.21 Root Status (RSTS)—Offset 60h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 60h

Power Well: Core

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
3:0	6h RO	<p><b>Completion Timeout Ranges Supported (CTRS):</b> This field indicates device support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express.</p> <p>For all other devices this field is reserved and must be hardwired to 0000b. Four time value ranges are defined:                      Range A: 50us to 10ms                      Range B: 10ms to 250ms                      Range C: 250ms to 4s                      Range D: 4s to 64s</p> <p>Bits are set according to the table below to show timeout value ranges supported.</p> <p>0000b Completion Timeout programming not supported.                      0001b Range A                      0010b Range B                      0011b Ranges A and B                      0110b Ranges B and C                      0111b Ranges A, B and C                      1110b Ranges B, C and D                      1111b Ranges A, B, C and D                      All other values are reserved.</p>

### 14.5.23 Device Status 2 (DCTL2\_DSTS2)—Offset 68h

#### Access Method

Type: PCI Configuration Register  
 (Size: 32 bits)

Offset: [B:0, D:23, F:0] + 68h

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
		RSVD_2			RSVD	LTREN	RSVD_1	CTD	CTV

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	<b>Reserved (RSVD_2):</b> Reserved.
15:11	00h RO	<b>Reserved (RSVD):</b> Reserved.
10	0b RW	<b>LTR Mechanism Enable (LTREN):</b> When Set to 1b, this bit enables the Latency Tolerance Reporting (LTR) mechanism.
9:5	00h RO	<b>Reserved (RSVD_1):</b> Reserved.
4	0b RW	<p><b>Completion Timeout Disable (CTD):</b> When set to 1b, this bit disables the Completion Timeout mechanism. This field is required for all devices that support the Completion Timeout Disable Capability. Software is permitted to set or clear this bit at any time. When set, the Completion Timeout detection mechanism is disabled. If there are outstanding requests when the bit is cleared, it is permitted but not required for hardware to apply the completion timeout mechanism to the outstanding requests. If this is done, it is permitted to base the start time for each request on either the time this bit was cleared or the time each request was issued. Only the value from Port 1 (for ports 1-4) or Port 5 (for ports 5-8) is used.</p>

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RW	<p><b>Completion Timeout Value (CTV):</b> In Devices that support Completion Timeout programmability, this field allows system software to modify the Completion Timeout value. This field is applicable to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. A Device that does not support this optional capability must hardwire this field to 0000b and is required to implement a timeout value in the range 50us to 50ms. Devices that support Completion Timeout programmability must support the values given below corresponding to the programmability ranges indicated in the Completion Timeout Values Supported field.</p> <p>The PCH targeted configurable ranges are listed below, along with the range allowed by the PCI Express 2.0 specification.</p> <p>Defined encodings:            0000b Default range: 40-50ms (spec range 50us to 50ms)            Values available if Range B (10ms to 250ms) programmability range is supported:            0101b 40-50ms (spec range is 16ms to 55ms)            0110b 160-170ms (spec range is 65ms to 210ms)            Values available if Range C (250ms to 4s) programmability range is supported:            1001b 400-500ms (spec range is 260ms to 900ms)            1010b 1.6-1.7s (spec range is 1s to 3.5s)            Values not defined above are Reserved.</p> <p>Software is permitted to change the value in this field at any time. For requests already pending when the Completion Timeout Value is changed, hardware is permitted to use either the new or the old value for the outstanding requests, and is permitted to base the start time for each request either on when this value was changed or on when each request was issued.</p>

### 14.5.24 Link Capability 2 (LCAP2)—Offset 6Ch

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 6Ch

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0																							
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD																															

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Reserved (RSVD): Reserved.

### 14.5.25 Link Status 2 (LCTL2\_LSTS2)—Offset 70h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 70h

Power Well: Core

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0000h RO	<b>Reserved (RSVD_1):</b> Reserved.
16	0b RO/V	<b>Current De-emphasis Level (CDL):</b> When the Link is operating at 5 GT/s speed, this bit reflects the level of de-emphasis. Encodings: 1b -3.5 dB 0b -6 dB The value in this bit is undefined when the Link is operating at 2.5 GT/s speed.
15:13	000b RO	<b>Reserved (RSVD):</b> Reserved.
12	0b RW/P	<b>Compliance De-emphasis (CD):</b> This bit sets the de-emphasis level in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Encodings: 1b -3.5 dB 0b -6 dB When the Link is operating at 2.5 GT/s, the setting of this bit has no effect. The default value of this bit is 0b. This bit is intended for debug, compliance testing purposes. System firmware and software is allowed to modify this bit only during debug or compliance testing.
11	0b RW/P	<b>Compliance SOS (CSOS):</b> When set to 1b, the LTSSM is required to send SKP Ordered Sets periodically in between the (modified) compliance patterns. The default value of this bit is 0b.
10	0b RW/P	<b>Enter Modified Compliance (EMC):</b> When this bit is set to 1b, the device transmits Modified Compliance Pattern if the LTSSM enters Polling.Compliance substate. Default value of this bit is 0b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
9:7	000b RW/P	<b>Transmit Margin (TM):</b> This field controls the value of the nondeemphasized voltage level at the Transmitter pins. This field is reset to 000b on entry to the LTSSM Polling.Configuration substate (see PCI Express Chapter 4 for details of how the Transmitter voltage level is determined in various states). Encodings: 000b Normal operating range 001b 800-1200 mV for full swing and 400-700 mV for half-swing 010b-(n-1) Values must be monotonic with a non-zero slope. The value of n must be greater than 3 and less than 7. At least two of these must be below the normal operating range of n : 200-400 mV for full-swing and 100-200 mV for half-swing n-111b reserved For a Multi-Function device associated with an Upstream Port, the field in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this field is of type RsvdP. Default value of this field is 000b. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 000b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
6	0b RW/P	<b>Selectable De-emphasis (SD):</b> When the Link is operating at 5.0 GT/s speed, this bit selects the level of de-emphasis for an Upstream component. Encodings: 1b -3.5 dB 0b -6 dB When the Link is operating at 2.5 GT/s speed, the setting of this bit has no effect.

Bit Range	Default & Access	Field Name (ID): Description
5	0b RO	<b>Hardware Autonomous Speed Disable (HASD):</b> This port cannot autonomously change speeds.
4	0b RW/P	<b>Enter Compliance (EC):</b> Software is permitted to force a Link to enter Compliance mode at the speed indicated in the Target Link Speed field by setting this bit to 1b in both components on a Link and then initiating a hot reset on the Link. Default value of this bit following Fundamental Reset is 0b.
3:0	1h RW/F/P	<b>Target Link Speed (TLS):</b> This field sets an upper limit on Link operational speed by restricting the values advertised by the upstream component in its training sequences.

### 14.5.26 Slot Capabilities 2 (SLCAP2)—Offset 74h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 74h

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>Reserved (RSVD):</b> Reserved.

### 14.5.27 Slot Status 2 (SLCTL2\_SLSTS2)—Offset 78h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 78h

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVD_1				RSVD				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	<b>Reserved (RSVD_1):</b> Reserved.
15:0	0000h RO	<b>Reserved (RSVD):</b> Reserved.

### 14.5.28 Message Signaled Interrupt Message Control (MID\_MC)—Offset 80h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 80h

Power Well: Core

Default: 00009005h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	1	0	0	1
RSVD				C64	MME	MMC	MSIE	NEXT
								CID

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	<b>Reserved (RSVD):</b> Reserved.
23	0b RO	<b>64-Bit Address Capable (C64):</b> Capable of generating a 32-bit message only.
22:20	000b RW	<b>Multiple Message Enable (MME):</b> These bits are RW for software compatibility, but only one message is ever sent by the root port.
19:17	000b RO	<b>Multiple Message Capable (MMC):</b> Only one message is required.
16	0b RW	<b>MSI Enable (MSIE):</b> If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. CMD.BME must be set for an MSI to be generated. If CMD.BME is cleared, and this bit is set, no interrupts (not even pin based) are generated.
15:8	90h RWO	<b>Next Pointer (NEXT):</b> Indicates the location of the next capability in the list. The default value of this register is 90h which points to the Subsystem Vendor capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	05h RO	<b>Capability ID (CID):</b> Capabilities ID indicates MSI.

### 14.5.29 Message Signaled Interrupt Message Address (MA)—Offset 84h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 84h

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	<b>Address (ADDR):</b> Lower 32 bits of the system specified message address, always DW aligned.
1:0	00b RO	<b>Reserved (RSVD):</b> Reserved.

### 14.5.30 Message Signaled Interrupt Message Data (MD)—Offset 88h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 88h

**Power Well:** Core

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVD1				DATA				

Bit Range	Default & Access	Field Name (ID): Description
31:16	00000h RO	<b>Reserved (RSVD1):</b> Reserved
15:0	0000h RW	<b>Data (DATA):</b> This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD[15:0]) during the data phase of the MSI memory write transaction.

### 14.5.31 Subsystem Vendor Capability (SVCAP)—Offset 90h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 90h

**Power Well:** Core

**Default:** 0000A00Dh

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
RSVD1				NEXT	CID			

Bit Range	Default & Access	Field Name (ID): Description
31:16	00000h RO	<b>Reserved (RSVD1):</b> Reserved

Bit Range	Default & Access	Field Name (ID): Description
26	0b RO	<b>D2 Support (D2S)</b> : The D2 state is not supported.
25	0b RO	<b>D1 Support (D1S)</b> : The D1 state is not supported.
24:22	000b RO	<b>Aux Current (AC)</b> : Reports 375mA maximum suspend well current required when in the D3COLD state.
21	0b RO	<b>Device Specific Initialization (DSI)</b> : Indicates that no device-specific initialization is required.
20	0b RO	<b>Reserved (RSVD)</b> : Reserved.
19	0b RO	<b>PME Clock (PMEC)</b> : Indicates that PCI clock is not required to generate PME#.
18:16	010b RO	<b>Version (VS)</b> : Indicates support for Revision 1.1 of the PCI Power Management Specification.
15:8	00h RO	<b>Next Capability (NEXT)</b> : Indicates this is the last item in the list.
7:0	01h RO	<b>Capability Identifier (CID)</b> : Value of 01h indicates this is a PCI power management capability.

### 14.5.34 PCI Power Management Control And Status (PMCS)—Offset A4h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + A4h

**Power Well:** Core

**Default:** 00000000h

31	28	24	20	16	12	8	4	0															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DTA				BPCE	B23S	RSVD				PMES	DSC	DSEL		PMEE	RSVD_1		PS						

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	<b>Data (DTA)</b> : Reserved
23	0b RO	<b>Bus Power / Clock Control Enable (BPCE)</b> : Reserved per PCI Express specification.
22	0b RO	<b>B2/B3 Support (B23S)</b> : Reserved per PCI Express specification.
21:16	00h RO	<b>Reserved (RSVD)</b> : Reserved.
15	0b RO	<b>PME Status (PMES)</b> : Indicates a PME was received on the downstream link.
14:13	00b RO	<b>Data Scale (DSC)</b> : Reserved

Bit Range	Default & Access	Field Name (ID): Description
12:9	0h RO	<b>Data Select (DSEL):</b> Reserved
8	0b RW/W	<b>PME Enable (PMEE):</b> Indicates PME is enabled. The root port takes no action on this bit, but it must be RW for legacy Microsoft operating systems to enable PME# on devices connected to this root port. This register resides in the resume well and is not reset on a resume from S3/S4/S5. The reset for this register is RSMRST# which is not asserted during a Warm Reset.
7:2	00h RO	<b>Reserved (RSVD_1):</b> Reserved.
1:0	00b RW	<b>Power State (PS):</b> This field is used both to determine the current power state of the root port and to set a new power state. The values are: 00 D0 state 11 D3HOT state When in the D3HOT state, the controller's configuration space is available, but the I/O and memory spaces are not. Type 1 configuration cycles are also not accepted. Interrupts are not required to be blocked as software will disable interrupts prior to placing the port into D3HOT. If software attempts to write a '10' or '01' to these bits, the write will be ignored.

### 14.5.35 Channel Configuration (CCFG)—Offset D0h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + D0h

**Power Well:** Core

**Default:** 01000000h

### 14.5.36 Miscellaneous Port Configuration 2 (MPC2)—Offset D4h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + D4h

**Power Well:** Core

**Default:** 00000000h

31	28	24	20	16	12	8	4	0															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD												IPF	RSVD	RSVD	RSVD	RSVD	RSVD	RSVD	RSVD	RSVD	RSVD	RSVD	

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RO	<b>Reserved (RSVD):</b> Reserved.

Bit Range	Default & Access	Field Name (ID): Description
27	0b RO	<b>Reserved (RSVD):</b> Reserved.
26	0b RO	<b>Reserved (RSVD):</b> Reserved.
25	0b RO	<b>Reserved (RSVD):</b> Reserved.
24	1b RO	<b>Reserved (RSVD):</b> Reserved.
23	0b RO	<b>Reserved (RSVD):</b> Reserved.
22	0b RO	<b>Reserved (RSVD):</b> Reserved.
21	0b RO	<b>Reserved (RSVD):</b> Reserved.
20:18	100b RW	<b>Unique Clock Exit Latency (UCEL):</b> This value represents the L0s Exit Latency for unique-clock configurations (LCAP.CCC = '0'). It defaults to 512ns to less than 1us, but may be overridden by BIOS.
17:15	010b RW	<b>Common Clock Exit Latency (CCEL):</b> This value represents the L0s Exit Latency for common-clock configurations (LCAP.CCC = '1'). It defaults to 128ns to less than 256ns, but may be overridden by BIOS.
14	0b RO	<b>Reserved (RSVD):</b> Reserved.
13	0b RO	<b>Reserved (RSVD):</b> Reserved.
12	0b RO	<b>Reserved (RSVD):</b> Reserved.
11:8	0h RO	<b>Reserved (RSVD):</b> Reserved.
7	0b RO	<b>Reserved (RSVD):</b> Reserved.
6:4	000b RO	<b>Reserved (RSVD):</b> Reserved.
3	0b RO	<b>Reserved (RSVD):</b> Reserved.
2	0b RO	<b>Reserved (RSVD):</b> Reserved.
1	0b RW	<b>Hot Plug SMI Enable (HPME):</b> Enables the root port to generate SMI whenever a hot plug event is detected.
0	0b RW	<b>Power Management SMI Enable (PMME):</b> Enables the root port to generate SMI whenever a power management event is detected.

### 14.5.38 SMI / SCI Status (SMSCS)—Offset DCh

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + DCh

**Power Well:** Core

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
17:16	00b RW	<b>Message Bus Idle Counter (SBIC)</b> : This register provides configuration flexibility to govern when the Message Bus interface transitions to IDLE. BIOS must program this field to 11b to prevent transitions to IDLE on the Message Bus interface.
15:14	00b RO	<b>Reserved (RSVD)</b> : Reserved.
13:12	11b RO	<b>Reserved (RSVD)</b> : Reserved.
11:9	000b RO	<b>Reserved (RSVD)</b> : Reserved.
8	0b RO	<b>Reserved (RSVD)</b> : Reserved.
7	0b RO	<b>Reserved (RSVD)</b> : Reserved.
6:5	10b RO	<b>Reserved (RSVD)</b> : Reserved.
4	0b RO	<b>Reserved (RSVD)</b> : Reserved.
3:2	00b RO	<b>Reserved (RSVD)</b> : Reserved.
1:0	11b RO	<b>Reserved (RSVD)</b> : Reserved.

### 14.5.40 Advanced Error Reporting Capability Header (AECH)—Offset 100h

The AER capability can optionally be included or excluded from the capabilities list. The full AER is supported.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 100h

**Power Well:** Core

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RWO	<b>Next Capability Offset (NCO)</b> : Set to 000h as this is the last capability in the list.
19:16	0h RWO	<b>Capability Version (CV)</b> : For systems that support AER, BIOS should write a 1h to this register else it should write 0

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RWO	<b>Capability ID (CID):</b> For systems that support AER, BIOS should write a 0001h to this register else it should write 0

### 14.5.41 Uncorrectable Error Status (UES)—Offset 104h

This register must maintain its state through a platform reset. It loses its state upon loss of core power.

Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 104h

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
		RSVD	AVS	URE	EE	MT	RO	UC
						CA	CT	FCPE
						PT		
						RSVD_1	SDE	DLPE
								RSVD_2
								TE

Bit Range	Default & Access	Field Name (ID): Description
31:22	000h RO	<b>Reserved (RSVD):</b> Reserved.
21	0b RO	<b>ACS Violation Status (AVS):</b> Reserved. Access Control Services are not supported.
20	0b RWC/P	<b>Unsupported Request Error Status (URE):</b> Indicates an unsupported request was received.
19	0b RO	<b>ECRC Error Status (EE):</b> ECRC is not supported.
18	0b RWC/P	<b>Malformed TLP Status (MT):</b> Indicates a malformed TLP was received.
17	0b RWC/P	<b>Receiver Overflow Status (RO):</b> Indicates a receiver overflow occurred.
16	0b RWC/P	<b>Unexpected Completion Status (UC):</b> Indicates an unexpected completion was received.
15	0b RWC/P	<b>Completer Abort Status (CA):</b> Indicates a completer abort was received.
14	0b RWC/P	<b>Completion Timeout Status (CT):</b> Indicates a completion timed out. This is signaled if Completion Timeout is enabled and a completion fails to return within the amount of time specified by the Completion Timeout Value.
13	0b RO	<b>Flow Control Protocol Error Status (FCPE):</b> Not supported.
12	0b RWC/P	<b>Poisoned TLP Status (PT):</b> Indicates a poisoned TLP was received.
11:6	00h RO	<b>Reserved (RSVD_1):</b> Reserved.
5	0b RO	<b>Surprise Down Error Status (SDE):</b> Surprise Down is not supported.

Bit Range	Default & Access	Field Name (ID): Description
12	0b RW/P	<b>Poisoned TLP Mask (PT)</b> : Mask for poisoned TLPs.
11:6	00h RO	<b>Reserved (RSVD_1)</b> : Reserved.
5	0b RO	<b>Surprise Down Error Mask (SDE)</b> : Surprise Down is not supported.
4	0b RW/P	<b>Data Link Protocol Error Mask (DLPE)</b> : Mask for data link protocol errors.
3:1	000b RO	<b>Reserved (RSVD_2)</b> : Reserved.
0	0b RO	<b>Training Error Mask (TE)</b> : Not supported.

### 14.5.43 Uncorrectable Error Severity (UEV)—Offset 10Ch

This register gives the option to make an uncorrectable error fatal or non-fatal. An error is fatal if the bit is set. An error is non-fatal if the bit is cleared. This register is only reset by a loss of core power.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 10Ch

**Power Well:** Core

**Default:** 00060011h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
		RSVD	AVS	URE	EE	MT	RO	UC
						CA	CT	FCPE
						PT		RSVD_1
							SDE	DLPE
								RSVD_2
								TE

Bit Range	Default & Access	Field Name (ID): Description
31:22	000h RO	<b>Reserved (RSVD)</b> : Reserved.
21	0b RO	<b>ACS Violation Severity (AVS)</b> : Reserved. Access Control Services are not supported.
20	0b RW/P	<b>Unsupported Request Error Severity (URE)</b> : Severity for unsupported request reception.
19	0b RO	<b>ECRC Error Severity (EE)</b> : ECRC is not supported.
18	1b RW/P	<b>Malformed TLP Severity (MT)</b> : Severity for malformed TLP reception.
17	1b RW/P	<b>Receiver Overflow Severity (RO)</b> : Severity for receiver overflow occurrences.
16	0b RW/P	<b>Unexpected Completion Severity (UC)</b> : Severity for unexpected completion reception.

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW/P	<b>Completer Abort Severity (CA)</b> : Severity for completer abort.
14	0b RW/P	<b>Completion Timeout Severity (CT)</b> : Severity for completion timeout.
13	0b RO	<b>Flow Control Protocol Error Severity (FCPE)</b> : Not supported.
12	0b RW/P	<b>Poisoned TLP Severity (PT)</b> : Severity for poisoned TLP reception.
11:6	00h RO	<b>Reserved (RSVD_1)</b> : Reserved.
5	0b RO	<b>Surprise Down Error Severity (SDE)</b> : Surprise Down is not supported.
4	1b RW/P	<b>Data Link Protocol Error Severity (DLPE)</b> : Severity for data link protocol errors.
3:1	000b RO	<b>Reserved (RSVD_2)</b> : Reserved.
0	1b RO	<b>Training Error Severity (TE)</b> : TE not supported. This bit is left as RO='1' for ease of implementation.

#### 14.5.44 Correctable Error Status (CES)—Offset 110h

This register is only reset by a loss of core power.

Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 110h

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
RSVD				ANFES	RTT	RSVD_1	RNR	BD	BT	RSVD_2	RE

Bit Range	Default & Access	Field Name (ID): Description
31:14	00000h RO	<b>Reserved (RSVD)</b> : Reserved.
13	0b RWC/P	<b>Advisory Non-Fatal Error Status (ANFES)</b> : When set, indicates that a Advisory Non-Fatal Error occurred.
12	0b RWC/P	<b>Replay Timer Timeout Status (RTT)</b> : Indicates the replay timer timed out.
11:9	000b RO	<b>Reserved (RSVD_1)</b> : Reserved.
8	0b RWC/P	<b>Replay Number Rollover Status (RNR)</b> : Indicates the replay number rolled over.

Bit Range	Default & Access	Field Name (ID): Description
0	0b RW/P	<b>Receiver Error Mask (RE)</b> : Mask for receiver errors.

### 14.5.46 Advanced Error Capabilities and Control (AECC)—Offset 118h

This register is only reset by a loss of core power.

Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 118h

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0		
0	0	0	0	0	0	0	0	0		
0	0	0	0	0	0	0	0	0

0	0	0	0	0	0	0	0	0		
0	0	0	0	0	0	0	0	0		
0	0	0	0	0	0	0	0	0		
0	0	0	0	0	0	0	0	0		
RSVD						ECE	ECC	EGE	EGC	FEP

Bit Range	Default & Access	Field Name (ID): Description
31:9	000000h RO	<b>Reserved (RSVD)</b> : Reserved.
8	0b RO	<b>ECRC Check Enable (ECE)</b> : ECRC is not supported.
7	0b RO	<b>ECRC Check Capable (ECC)</b> : ECRC is not supported.
6	0b RO	<b>ECRC Generation Enable (EGE)</b> : ECRC is not supported.
5	0b RO	<b>ECRC Generation Capable (EGC)</b> : ECRC is not supported.
4:0	00000b RO/V/P	<b>First Error Pointer (FEP)</b> : Identifies the bit position of the first error reported in the Uncorrectable Error Status Register.

### 14.5.47 Header Log (HL\_DW1)—Offset 11Ch

These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 11Ch

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
DW1								

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V/P	4th DWord of TLP (DW1): Byte12 and Byte13 and Byte14 and Byte15

### 14.5.48 Header Log (HL\_DW2)—Offset 120h

These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 120h

Power Well: Core

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V/P	3rd DWord of TLP (DW2): Byte8 and Byte9 and Byte10 and Byte11

### 14.5.49 Header Log (HL\_DW3)—Offset 124h

These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 124h

Power Well: Core

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V/P	2nd DWord of TLP (DW2): Byte4 and Byte5 and Byte6 and Byte7

### 14.5.50 Header Log (HL\_DW4)—Offset 128h

These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 128h

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
DW1								

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V/P	1st DWord of TLP (DW1): Byte0 and Byte1 and Byte2 and Byte3

### 14.5.51 Root Error Command (REC)—Offset 12Ch

This register allows errors to generate interrupts.

Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 12Ch

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVD								FERE NERE CERE

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000000h RO	Reserved (RSVD): Reserved.
2	0b RW	<b>Fatal Error Reporting Enable (FERE)</b> : When set, the root port will generate an interrupt when a fatal error is reported by the attached device.
1	0b RW	<b>Non-fatal Error Reporting Enable (NERE)</b> : When set, the root port will generate an interrupt when a non-fatal error is reported by the attached device.
0	0b RW	<b>Correctable Error Reporting Enable (CERE)</b> : When set, the root port will generate an interrupt when a correctable error is reported by the attached device.

### 14.5.52 Root Error Status (RES)—Offset 130h

This register can track more than one error and set the multiple bits if a second or subsequent error occurs and the first has not been serviced. This register is only reset by a loss of core power.

Access Method

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO/V/P	<b>ERR_FATAL/NONFATAL Source Identification (EFNFSID)</b> : Loaded with the Requester ID indicated in the received ERR_FATAL or ERR_NONFATAL Message with the ERR_FATAL/NONFATAL Received register is not already set.
15:0	0000h RO/V/P	<b>ERR_COR Source Identification (ECSID)</b> : Loaded with the Requester ID indicated in the received ERR_COR Message with the ERR_COR Received register is not already set.

§ §

## 15.0 10/100 Mbps Ethernet

The Intel® Quark™ SoC X1000 provides two 10/100 Mbps Ethernet controllers. Each controller includes a MAC but not a PHY. The integrated controller is compatible with an industry standard, RMIi based Ethernet PHY.

### 15.1 Signal Descriptions

See [Chapter 2.0, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Type:** The buffer type found in [Chapter 4.0, “Electrical Characteristics”](#)
- **Description:** A brief explanation of the signal’s function

**Table 86. 10/100 Ethernet Interface Signals**

Signal Name	Direction/ Type	Description
RMII_REF_CLK	I	50 MHz reference clock for the RMII interface
MAC[0/1]_TXDATA[1:0]	O	RMII Transmit data
MAC[0/1]_TXEN	O	RMII Transmit data enable
MAC[0/1]_RXDATA[1:0]	I	RMII Receive data
MAC[0/1]_RXDV	I	RMII Receive data valid
MAC[0/1]_MDC	O	Management data clock
MAC[0/1]_MDIO	I/O	Management data

### 15.2 Features:

- 10 and 100 Mbps data transfer rates with RMII interface to communicate with an external Fast Ethernet PHY
- Compliant with RMII specification version 1.2 from RMII consortium
- Full-duplex operation:
  - IEEE\* 802.3x flow control automatic transmission of zero-quanta pause frame on flow control input de-assertion
  - Optional forwarding of received pause control frames to the user application
- Half-duplex operation:
  - CSMA/CD Protocol support
- Preamble and start-of-frame data (SFD) insertion in transmit path
- Preamble and SFD deletion in the receive path

- Automatic CRC and pad generation controllable on a per-frame basis
- Automatic Pad and CRC Stripping options for receive frames
- Flexible address filtering modes:
  - 64-bit hash filter for multicast and unicast (DA) addresses
  - Option to pass all multicast addressed frames
  - Promiscuous mode to pass all frames without any filtering for network monitoring
  - Pass all incoming packets (as per filter) with a status report
- Programmable frame length.
- Programmable Interframe Gap (IFG) (40-96 bit times in steps of 8)
- Option to transmit frames with reduced preamble size
- Separate 32-bit status for transmit and receive packets
- IEEE 802.1Q VLAN tag detection for reception frames
- Additional frame filtering:
  - VLAN tag-based: hash-based filtering
- Separate transmission, reception, and control interfaces to the application
- Little-endian configuration for transmit and receive paths
- 32-bit data transfer interface on system-side
- Network statistics with RMON/MIB Counters (RFC2819/RFC2665)
- Enhanced receive module for checking IPv4 header checksum and TCP, UDP, or ICMP checksum encapsulated in IPv4 or IPv6 datagrams (Type 2)
- Support Ethernet frame time stamping as described in IEEE 1588-2002 and IEEE 1588-2008 The 64-bit timestamps are given in the transmit or receive status of each frame
- MDIO master interface for PHY device configuration and management
- CRC replacement, source address field insertion or replacement, and VLAN insertion, replacement, and deletion in transmitted frames with per-frame control

## 15.4 Register Map

Figure 28. Ethernet Register Map

See Chapter 5.0, “Register Access Methods” for additional information.

## 15.5 PCI Configuration Registers

Registers listed are for Function 6 (MAC 0). Function 7 (MAC 1) contain the same registers. Differences between MACs are noted in individual registers.

Table 87. Summary of PCI Configuration Registers—0/20/6

Offset Start	Offset End	Register ID—Description	Default Value
0h	1h	“Vendor ID (VENDOR_ID)—Offset 0h” on page 312	8086h
2h	3h	“Device ID (DEVICE_ID)—Offset 2h” on page 313	0937h
4h	5h	“Command Register (COMMAND_REGISTER)—Offset 4h” on page 313	0000h
6h	7h	“Status Register (STATUS)—Offset 6h” on page 314	0010h

Bit Range	Default & Access	Description
15: 0	8086h RO	<b>Vendor ID (value):</b> PCI Vendor ID for Intel

### 15.5.2 Device ID (DEVICE\_ID)—Offset 2h

**Access Method**

Type: PCI Configuration Register  
(Size: 16 bits)

DEVICE\_ID: [B:0, D:20, F:6] + 2h

Default: 0937h

15	12	8	4	0
0	0	0	0	0
1	0	0	1	1
0	0	1	1	0
1	1	1	1	1
value				

Bit Range	Default & Access	Description
15: 0	0937h RO	<b>Device ID (value):</b> PCI Device ID

### 15.5.3 Command Register (COMMAND\_REGISTER)—Offset 4h

**Access Method**

Type: PCI Configuration Register  
(Size: 16 bits)

COMMAND\_REGISTER: [B:0, D:20, F:6] + 4h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
RSVD0	IntrDis	RSVD	SERREn	RSVD
MasEn	MEMen	RSVD	MasEn	MEMen
RSVD	RSVD	RSVD	RSVD	RSVD

Bit Range	Default & Access	Description
15: 11	0h RO	<b>RSVD0 (RSVD0):</b> Reserved
10	0b RW	<b>Interrupt Disable (IntrDis):</b> Interrupt disable. Disables generation of interrupt messages in the PCI Express function. 1 =) disabled, 0 =) not disabled
9	0h RO	<b>Reserved (RSVD):</b> Reserved.
8	0b RW	<b>SERR Enable (SERREn):</b> When set, this bit enables the non-fatal and fatal errors detected by the function to be reported to the root complex.
7: 3	00h RO	<b>Reserved (RSVD):</b> Reserved.
2	0b RW	<b>Bus Master Enable (MasEn):</b> 0=)disables upstream requests 1=)enables upstream requests.

Bit Range	Default & Access	Description
1	0b RW	<b>Memory Space Enable (MEMen)</b> : Device support for Memory transactions. 0 =) not supported. 1 =) supported.
0	0h RO	<b>Reserved (RSVD)</b> : Reserved.

### 15.5.4 Status Register (STATUS)—Offset 6h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

STATUS: [B:0, D:20, F:6] + 6h

Default: 0010h

15	12	8	4	0
0	0	0	1	0
RSVD0	SigSysErr	RcdMasAb	RSVD	DEVSEL
			RSVD	FastB2B
			capable_66Mhz	hasCapList
			IntrStatus	RSVD1

Bit Range	Default & Access	Description
15	0h RO	<b>RSVD0 (RSVD0)</b> : Reserved
14	0b RW	<b>Signaled System Error (SigSysErr)</b> : Set when a function detects a system error and the SERR Enable bit is set
13	0b RW	<b>Received master abort (RcdMasAb)</b> : Set when requester receives a completion with Unsupported Request completion status
12: 11	0h RO	<b>Reserved (RSVD)</b> : Reserved.
10: 9	0b RO	<b>DEVSEL Timing (DEVSEL)</b> : Deprecated: Hardwired to 0
8	0h RO	<b>Reserved (RSVD)</b> : Reserved.
7	0b RO	<b>Fast Back-to-Back Capable (FastB2B)</b> : Deprecated: Hardwired to 0
6	0h RO	<b>Reserved (RSVD)</b> : Reserved.
5	0b RO	<b>66MHz-Capable (capable_66Mhz)</b> : Deprecated: Hardwired to 0
4	1h RO	<b>Capabilities List (hasCapList)</b> : Indicates the presence of one or more capability register sets.
3	0b RO	<b>Interrupt Status (IntrStatus)</b> : Indicates that the function has a legacy interrupt request outstanding. This bit has no meaning if Message Signaled Interrupts are being used
2: 0	0h RO	<b>RSVD1 (RSVD1)</b> : Reserved

### 15.5.5 Revision ID and Class Code (REV\_ID\_CLASS\_CODE)—Offset 8h

**Access Method**

**Type:** PCI Configuration Register  
(Size: 32 bits)

**REV\_ID\_CLASS\_CODE:** [B:0, D:20, F:6] + 8h

**Default:** 02000010h

31	28	24	20	16	12	8	4	0
0	0	0	0	1	0	0	0	0
classCode			subClassCode			progIntf		rev_id

Bit Range	Default & Access	Description
31: 24	02h RO	<b>Class Code (classCode):</b> Broadly classifies the type of function that the device performs.
23: 16	00h RO	<b>Sub-Class Code (subClassCode):</b> Identifies more specifically (than the class_code byte) the function of the device.
15: 8	00h RO	<b>Programming Interface (progIntf):</b> Used to define the register set variation within a particular sub-class.
7: 0	10h RO	<b>Revision ID (rev_id):</b> Assigned by the function manufacturer and identifies the revision number of the function.

### 15.5.6 Cache Line Size (CACHE\_LINE\_SIZE)—Offset Ch

**Access Method**

**Type:** PCI Configuration Register  
(Size: 8 bits)

**CACHE\_LINE\_SIZE:** [B:0, D:20, F:6] + Ch

**Default:** 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RW	<b>Cache Line Size (value):</b> Implemented as a R/W register for legacy purposes but has no effect on device functionality.

### 15.5.7 Latency Timer (LATENCY\_TIMER)—Offset Dh

**Access Method**

**Type:** PCI Configuration Register  
(Size: 8 bits)

**LATENCY\_TIMER:** [B:0, D:20, F:6] + Dh

**Default:** 00h

Bit Range	Default & Access	Description
31: 0	0h RO	Cardbus CIS Pointer (value): Reserved. Hardwire to 0.

### 15.5.12 Subsystem Vendor ID (SUB\_SYS\_VENDOR\_ID)—Offset 2Ch

**Access Method**

Type: PCI Configuration Register  
(Size: 16 bits)

SUB\_SYS\_VENDOR\_ID: [B:0, D:20, F:6] + 2Ch

Default: 0000h

Bit Range	Default & Access	Description
15: 0	0h RO	Subsystem Vendor ID (value): PCI Subsystem Vendor ID

### 15.5.13 Subsystem ID (SUB\_SYS\_ID)—Offset 2Eh

**Access Method**

Type: PCI Configuration Register  
(Size: 16 bits)

SUB\_SYS\_ID: [B:0, D:20, F:6] + 2Eh

Default: 0000h

Bit Range	Default & Access	Description
15: 0	0h RO	Subsystem ID (value): PCI Subsystem ID

### 15.5.14 Expansion ROM Base Address (EXP\_ROM\_BASE\_ADR)—Offset 30h

**Access Method**

Type: PCI Configuration Register  
(Size: 32 bits)

EXP\_ROM\_BASE\_ADR: [B:0, D:20, F:6] + 30h

Default: 00000000h

Bit Range	Default & Access	Description
31: 11	0h RW	<b>ROM Start Address (ROM_base_addr):</b> Used to determine the size of memory required by the ROM and to assign a start address for this required amount of memory.
10: 1	000h RO	<b>Reserved (RSVD):</b> Reserved.
0	0h RW	<b>Address Decode Enable (AddrDecodeEn):</b> A 1 in this field enables the function's ROM address decoder assuming that the Memory Space bit in the Command Register is also set to 1

### 15.5.15 Capabilities Pointer (CAP\_POINTER)—Offset 34h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

CAP\_POINTER: [B:0, D:20, F:6] + 34h

Default: 00000080h

Bit Range	Default & Access	Description
31: 8	0h RO	<b>RSVD0 (RSVD0):</b> Reserved
7: 0	80h RO	<b>Capabilities Pointer (value):</b> Pointer to memory location of first entry of linked list of configuration register sets each of which supports a feature. Points to PM (power management) register set at location 0x80

### 15.5.16 Interrupt Line Register (INTR\_LINE)—Offset 3Ch

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

INTR\_LINE: [B:0, D:20, F:6] + 3Ch

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RW	<b>Interrupt Line Register (value):</b> The value in this register tells which input of the system interrupt controller(s) the device's interrupt pin is connected to. The device itself does not use this value, rather it is used by device drivers and operating systems. Device drivers and operating systems can use this information to determine priority and vector information.

### 15.5.17 Interrupt Pin Register (INTR\_PIN)—Offset 3Dh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

INTR\_PIN: [B:0, D:20, F:6] + 3Dh

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	03h RO	<b>Interrupt Pin Register (value):</b> The Interrupt Pin register tells which interrupt pin the device (or device function) uses. A value of 1 corresponds to INTA#. A value of 2 corresponds to INTB#. A value of 3 corresponds to INTC#. A value of 4 corresponds to INTD#. Devices (or device functions) that do not use an interrupt pin must put a 0 in this register. The values 05h through FFh are reserved. For this system function 0 is connected to INTA, 1 to INTB, 2 to INTC 3 to INTD, 4 to INTA, 5 to INTB etc.

### 15.5.18 MIN\_GNT (MIN\_GNT)—Offset 3Eh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MIN\_GNT: [B:0, D:20, F:6] + 3Eh

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RO	<b>MIN_GNT (value):</b> Hardwired to 0

### 15.5.19 MAX\_LAT (MAX\_LAT)—Offset 3Fh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MAX\_LAT: [B:0, D:20, F:6] + 3Fh

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RO	<b>MAX_LAT (value)</b> : Hardwired to 0

### 15.5.20 Capability ID (PM\_CAP\_ID)—Offset 80h

**Access Method**

**Type:** PCI Configuration Register (Size: 8 bits)      **PM\_CAP\_ID:** [B:0, D:20, F:6] + 80h

**Default:** 01h

Bit Range	Default & Access	Description
7: 0	01h RO	<b>Capability ID (value)</b> : Identifies the feature associated with this register set. Hardwired value as per PCI SIG assigned capability ID

### 15.5.21 Next Capability Pointer (PM\_NXT\_CAP\_PTR)—Offset 81h

**Access Method**

**Type:** PCI Configuration Register (Size: 8 bits)      **PM\_NXT\_CAP\_PTR:** [B:0, D:20, F:6] + 81h

**Default:** A0h

Bit Range	Default & Access	Description
7: 0	a0h RO	<b>Next Capability Pointer (value)</b> : Pointer to the next register set of feature specific configuration registers. Hardwired to 0xA0 to point to the MSI Capability Structure

### 15.5.22 Power Management Capabilities (PMC)—Offset 82h

**Access Method**

**Type:** PCI Configuration Register (Size: 16 bits)      **PMC:** [B:0, D:20, F:6] + 82h

Default: 4803h

15	12	8	4	0				
0	1	0	0	1				
0	0	1	0	0				
0	0	0	0	0				
0	0	0	0	0				
0	0	0	0	0				
0	0	1	1					
PME_support		D2_support	D1_support	aux_curr	DSI	RSVD	PME_clock	version

Bit Range	Default & Access	Description
15: 11	09h RO	<b>PME Support (PME_support)</b> : PME_Support field Indicates the PM states within which the function is capable of sending a PME (Power Management Event) message. 0 in a bit (=) PME is not supported in the corresponding PM state, where bit indexes 11,12,13,14,15 correspond to PM states D0, D1, D2, D3hot, D3cold respectively.
10	0h RO	<b>D2 Support (D2_support)</b> : Hardwired to 0 as the D2 state is not supported
9	0h RO	<b>D1 Support (D1_support)</b> : Hardwired to 0 as the D1 state is not supported
8: 6	0h RO	<b>Aux Current (aux_curr)</b> : Hardwired to 0 as the D3hot state is not supported
5	0h RO	<b>Device Specific Initialisation (DSI)</b> : Hardwired to 0 to indicate that the device does not require a device specific initialisation sequence following transition to the D0 uninitialised state
4	0h RO	<b>Reserved (RSVD)</b> : Reserved.
3	0h RO	<b>PME Clock (PME_clock)</b> : Deprecated. Hardwired to 0
2: 0	011b RO	<b>Version (version)</b> : This function complies with revision 1.2 of the PCI Power Management Interface Specification

### 15.5.23 Power Management Control/Status Register (PMCSR)—Offset 84h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

PMCSR: [B:0, D:20, F:6] + 84h

Default: 0008h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
1	0	0	0	0
no_soft_reset	RSVD	power_state		
PME_status	Data_scale	Data_select	PME_en	RSVD

Bit Range	Default & Access	Description
15	0h RW	<b>PME Status (PME_status)</b> : Set if function has experienced a PME (even if PME_en (bit 8 of PMCSR register) is not set).
14: 13	0h RO	<b>Data Scale (Data_scale)</b> : Hardwired to 0 as the data register is not supported

Bit Range	Default & Access	Description
12: 9	0h RO	<b>Data Select (Data_select)</b> : Hardwired to 0 as the data register is not supported
8	0b RW	<b>PME Enable (PME_en)</b> : Enable device function to send PME messages when an event occurs. 1=)enabled. 0=)disabled
7: 4	0h RO	<b>Reserved (RSVD)</b> : Reserved.
3	1b RO	<b>No Soft Reset (no_soft_reset)</b> : Devices do perform an internal reset when transitioning from D3hot to D0
2	0h RO	<b>Reserved (RSVD)</b> : Reserved.
1: 0	00b RW	<b>Power State (power_state)</b> : Allows software to read current PM state or transition device to a new PM state, where 2'b00 = D0, 2'b01=D1, 2'b10=D2, 2'b11=D3hot

### 15.5.24 PM CSR PCI-to-PCI Bridge Support Extension (PMCSR\_BSE)—Offset 86h

**Access Method**

Type: PCI Configuration Register  
(Size: 8 bits)

PMCSR\_BSE: [B:0, D:20, F:6] + 86h

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RO	<b>PM CSR PCI-to-PCI Bridge Support Extension (value)</b> : Not Supported. Hardwired to 0.

### 15.5.25 Power Management Data Register (DATA\_REGISTER)—Offset 87h

**Access Method**

Type: PCI Configuration Register  
(Size: 8 bits)

DATA\_REGISTER: [B:0, D:20, F:6] + 87h

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RO	<b>Power Management Data Register (value)</b> : Not Supported. Hardwired to 0

### 15.5.26 Capability ID (MSI\_CAP\_ID)—Offset A0h

**Access Method**

Type: PCI Configuration Register  
(Size: 8 bits)

MSI\_CAP\_ID: [B:0, D:20, F:6] + A0h

Default: 05h

7	4	0
0	0	1
value		

Bit Range	Default & Access	Description
7: 0	05h RO	<b>Capability ID (value):</b> Identifies the feature associated with this register set. Hardwired value as per PCI SIG assigned capability ID

### 15.5.27 Next Capability Pointer (MSI\_NXT\_CAP\_PTR)—Offset A1h

**Access Method**

Type: PCI Configuration Register  
(Size: 8 bits)

MSI\_NXT\_CAP\_PTR: [B:0, D:20, F:6] + A1h

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	00h RO	<b>Next Capability Pointer (value):</b> Hardwired to 0 as this is the last capability structure in the chain

### 15.5.28 Message Control (MESSAGE\_CTRL)—Offset A2h

**Access Method**

Type: PCI Configuration Register  
(Size: 16 bits)

MESSAGE\_CTRL: [B:0, D:20, F:6] + A2h

Default: 0100h

15	12	8	4	0
0	0	0	0	0
RSVD0		perVecMskCap	bit64Cap	multiMsgEn
		multiMsgCap	MSIEnable	

Bit Range	Default & Access	Description
15: 9	0h RO	<b>RSVDO (RSVDO)</b> : Reserved
8	1h RO	<b>Per Vector Masking Capable (perVecMskCap)</b> : Hardwired to 1 to indicate the function supports PVM
7	0h RO	<b>64 bit Address Capable (bit64Cap)</b> : This bit is hardwired to 0 to indicate that the function is not capable of sending a 64-bit message address.
6: 4	0h RW	<b>Multi-Message Enable (multiMsgEn)</b> : As only one vector is supported per function, software should only write a value of 0x0 to this field
3: 1	0h RO	<b>Multiple Message Enable (multiMsgCap)</b> : This field is hardwired to 0x0 to indicate that the function is requesting a single vector
0	0h RW	<b>MSI Enable (MSIEnable)</b> : Set to enable MSI to request service. If set then it's prohibited to use the INTx pin. System configuration software sets this bit to enable MSI.

### 15.5.29 Message Address (MESSAGE\_ADDR)—Offset A4h

**Access Method**

Type: PCI Configuration Register  
(Size: 32 bits)

MESSAGE\_ADDR: [B:0, D:20, F:6] + A4h

Default: 00000000h

Bit Range	Default & Access	Description
31: 2	0h RW	<b>Message Address (address)</b> : If the Message Enable bit (bit 0 of the Message Control register) is set, the contents of this register specify the DWORD-aligned address (AD[31:2]) for the MSI memory write transaction. AD[1:0] are driven to zero during the address phase. This field is read/write
1: 0	0h RO	<b>RSVDO (RSVDO)</b> : Reserved

### 15.5.30 Message Data (MESSAGE\_DATA)—Offset A8h

**Access Method**

Type: PCI Configuration Register  
(Size: 16 bits)

MESSAGE\_DATA: [B:0, D:20, F:6] + A8h

Default: 0000h

Bit Range	Default & Access	Description
15: 0	0h RW	<b>Data Field (MsgData):</b> System-specified message data. If the Message Enable bit (bit 0 of the Message Control register) is set, the message data is driven onto the lower word (AD[15:0]) of the memory write transactions data phase. AD[31:16] are driven to zero during the memory write transactions data phase. C/BE[3::0]# are asserted during the data phase of the memory write transaction. None of the message bits will be changed by hardware

### 15.5.31 Mask Bits for MSI (PER\_VEC\_MASK)—Offset ACh

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

PER\_VEC\_MASK: [B:0, D:20, F:6] + ACh

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSVDO								MSIMask

Bit Range	Default & Access	Description
31: 1	0h RO	<b>RSVDO (RSVDO):</b> Reserved
0	0h RW	<b>Vector 0 Mask (MSIMask):</b> Mask Bit for Vector 0. If this bit is set, the function will not send MSI messages

### 15.5.32 Pending Bits for MSI (PER\_VEC\_PEND)—Offset B0h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

PER\_VEC\_PEND: [B:0, D:20, F:6] + B0h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSVDO								value

Bit Range	Default & Access	Description
31: 1	0h RO	<b>RSVDO (RSVDO):</b> Reserved
0	0h RO	<b>Vector 0 Pending (value):</b> Pending Bit for Vector 0.

## 15.6 Memory Mapped Registers

**Table 88. Summary of Memory Mapped I/O Registers—BAR0**

Offset Start	Offset End	Register Name (Register Symbol)	Default Value
0h	3h	"MAC Configuration Register (Register 0) (GMAC_REG_0)—Offset 0h" on page 331	00008000h
4h	7h	"MAC Frame Filter (Register 1) (GMAC_REG_1)—Offset 4h" on page 334	00000000h
8h	Bh	"Hash Table High Register (Register 2) (GMAC_REG_2)—Offset 8h" on page 336	00000000h
Ch	Fh	"Hash Table Low Register (Register 3) (GMAC_REG_3)—Offset Ch" on page 336	00000000h
10h	13h	"GMII Address Register (Register 4) (GMAC_REG_4)—Offset 10h" on page 337	00000000h
14h	17h	"GMII Data Register (Register 5) (GMAC_REG_5)—Offset 14h" on page 338	00000000h
18h	1Bh	"Flow Control Register (Register 6) (GMAC_REG_6)—Offset 18h" on page 339	00000000h
1Ch	1Fh	"VLAN Tag Register (Register 7) (GMAC_REG_7)—Offset 1Ch" on page 340	00000000h
20h	23h	"Version Register (Register 8) (GMAC_REG_8)—Offset 20h" on page 341	00001037h
24h	27h	"Debug Register (Register 9) (GMAC_REG_9)—Offset 24h" on page 342	00000000h
38h	3Bh	"Interrupt Register (Register 14) (GMAC_REG_14)—Offset 38h" on page 343	00000000h
3Ch	3Fh	"Interrupt Mask Register (Register 15) (GMAC_REG_15)—Offset 3Ch" on page 344	00000000h
40h	43h	"MAC Address0 High Register (Register 16) (GMAC_REG_16)—Offset 40h" on page 345	8000FFFFh
44h	47h	"MAC Address0 Low Register (Register 17) (GMAC_REG_17)—Offset 44h" on page 345	FFFFFFFFh
100h	103h	"MMC Control Register (Register 64) (GMAC_REG_64)—Offset 100h" on page 346	00000000h
104h	107h	"MMC Receive Interrupt Register (MMC_INTR_RX)—Offset 104h" on page 347	00000000h
108h	10Bh	"MMC Transmit Interrupt Register (MMC_INTR_TX)—Offset 108h" on page 349	00000000h
10Ch	10Fh	"MMC Receive Interrupt Mask Register (MMC_INTR_MASK_RX)—Offset 10Ch" on page 351	00000000h
110h	113h	"MMC Transmit Interrupt Mask Register (MMC_INTR_MASK_TX)—Offset 110h" on page 353	00000000h
114h	117h	"MMC Transmit Good Bad Octet Counter Register (TXOCTETCOUNT_GB)—Offset 114h" on page 355	00000000h
118h	11Bh	"MMC Transmit Good Bad Frame Counter Register (TXFRAMECOUNT_GB)—Offset 118h" on page 355	00000000h
11Ch	11Fh	"MMC Transmit Broadcast Good Frame Counter Register (TXBROADCASTFRAMES_G)—Offset 11Ch" on page 356	00000000h
120h	123h	"MMC Transmit Multicast Good Frame Counter Register (TXMULTICASTFRAMES_G)—Offset 120h" on page 356	00000000h
124h	127h	"MMC Transmit 64 Octet Good Bad Frame Counter Register (TX64OCTETS_GB)—Offset 124h" on page 357	00000000h
128h	12Bh	"MMC Transmit 65 to 127 Octet Good Bad Frame Counter Register (TX65TO127OCTETS_GB)—Offset 128h" on page 357	00000000h
12Ch	12Fh	"MMC Transmit 128 to 255 Octet Good Bad Frame Counter Register (TX128TO255OCTETS_GB)—Offset 12Ch" on page 358	00000000h
130h	133h	"MMC Transmit 256 to 511 Octet Good Bad Frame Counter Register (TX256TO511OCTETS_GB)—Offset 130h" on page 358	00000000h
134h	137h	"MMC Transmit 512 to 1023 Octet Good Bad Frame Counter Register (TX512TO1023OCTETS_GB)—Offset 134h" on page 358	00000000h
138h	13Bh	"MMC Transmit 1024 to Maximum Octet Good Bad Frame Counter Register (TX1024TOMAXOCTETS_GB)—Offset 138h" on page 359	00000000h
13Ch	13Fh	"MMC Transmit Unicast Good Bad Frame Counter Register (TXUNICASTFRAMES_GB)—Offset 13Ch" on page 359	00000000h

**Table 88. Summary of Memory Mapped I/O Registers—BAR0 (Continued)**

Offset Start	Offset End	Register Name (Register Symbol)	Default Value
140h	143h	"MMC Transmit Multicast Good Bad Frame Counter Register (TXMULTICASTFRAMES_GB)—Offset 140h" on page 360	00000000h
144h	147h	"MMC Transmit Broadcast Good Bad Frame Counter Register (TXBROADCASTFRAMES_GB)—Offset 144h" on page 360	00000000h
148h	14Bh	"MMC Transmit Underflow Error Frame Counter Register (TXUNDERFLOWERROR)—Offset 148h" on page 361	00000000h
14Ch	14Fh	"MMC Transmit Single Collision Good Frame Counter Register (TXSINGLECOL_G)—Offset 14Ch" on page 361	00000000h
150h	153h	"MMC Transmit Multiple Collision Good Frame Counter Register (TXMULTICOL_G)—Offset 150h" on page 362	00000000h
154h	157h	"MMC Transmit Deferred Frame Counter Register (TXDEFERRED)—Offset 154h" on page 362	00000000h
158h	15Bh	"MMC Transmit Late Collision Frame Counter Register (TXLATECOL)—Offset 158h" on page 362	00000000h
15Ch	15Fh	"MMC Transmit Excessive Collision Frame Counter Register (TXEXCESSCOL)—Offset 15Ch" on page 363	00000000h
160h	163h	"MMC Transmit Carrier Error Frame Counter Register (TXCARRIERERROR)—Offset 160h" on page 363	00000000h
164h	167h	"MMC Transmit Good Bad Octet Counter Register (TXOCTETCOUNT_GB)—Offset 164h" on page 355	00000000h
168h	16Bh	"MMC Transmit Good Bad Frame Counter Register (TXFRAMECOUNT_GB)—Offset 168h" on page 355	00000000h
16Ch	16Fh	"MMC Transmit Excessive Deferral Frame Counter Register (TXEXCESSDEF)—Offset 16Ch" on page 365	00000000h
170h	173h	"MMC Transmit Pause Frame Counter Register (TXPAUSEFRAMES)—Offset 170h" on page 365	00000000h
174h	177h	"MMC Transmit VLAN Good Frame Counter Register (TXVLANFRAMES_G)—Offset 174h" on page 366	00000000h
178h	17Bh	"MMC Transmit Oversize Good Frame Counter Register (TXOVERSIZE_G)—Offset 178h" on page 366	00000000h
180h	183h	"MMC Receive Good Bad Frame Counter Register (RXFRAMECOUNT_GB)—Offset 180h" on page 366	00000000h
184h	187h	"MMC Receive Good Bad Octet Counter Register (RXOCTETCOUNT_GB)—Offset 184h" on page 367	00000000h
188h	18Bh	"MMC Receive Good Bad Octet Counter Register (RXOCTETCOUNT_GB)—Offset 184h" on page 367	00000000h
18Ch	18Fh	"MMC Receive Broadcast Good Frame Counter Register (RXBROADCASTFRAMES_G)—Offset 18Ch" on page 368	00000000h
190h	193h	"MMC Receive Multicast Good Frame Counter Register (RXMULTICASTFRAMES_G)—Offset 190h" on page 368	00000000h
194h	197h	"MMC Receive CRC Error Frame Counter Register (RXCRCERROR)—Offset 194h" on page 369	00000000h
198h	19Bh	"MMC Receive Alignment Error Frame Counter Register (RXALIGNMENTERROR)—Offset 198h" on page 369	00000000h
19Ch	19Fh	"MMC Receive Runt Frame Counter Register (RXRUNTERERROR)—Offset 19Ch" on page 370	00000000h
1A0h	1A3h	"MMC Receive Jabber Error Frame Counter Register (RXJABBERERROR)—Offset 1A0h" on page 370	00000000h
1A4h	1A7h	"MMC Receive Undersize Good Frame Counter Register (RXUNDERSIZE_G)—Offset 1A4h" on page 370	00000000h

**Table 88. Summary of Memory Mapped I/O Registers—BAR0 (Continued)**

Offset Start	Offset End	Register Name (Register Symbol)	Default Value
1A8h	1ABh	"MMC Receive Oversize Good Frame Counter Register (RXOVERSIZE_G)—Offset 1A8h" on page 371	00000000h
1ACh	1AFh	"MMC Receive 64 Octet Good Bad Frame Counter Register (RX64OCTETS_GB)—Offset 1ACh" on page 371	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	<b>Reserved (RSV3):</b> Reserved.
30:28	000b RW	<b>Source Address Insertion or Replacement Control (SARC):</b> This field controls the source address insertion or replacement for all transmitted frames. When Bit 30 is set to 0, the MAC replaces the content of the MAC Address 0 registers (registers 16 and 17) in the SA field of all transmitted frames based on the values of Bits [29:28]: - 2b0x: SA insertion is controlled by the internal signal from the MTL layer. - 2b10: if Bit 30 is set to 0, the MAC inserts the content of the MAC Address 0 registers (registers 16 and 17) in the SA field of all transmitted frames. - 2b11: if Bit 30 is set to 0, the MAC replaces the content of the MAC Address 0 registers (registers 16 and 17) in the SA field of all transmitted frames. <b>NOTE:</b> Changes to this field take effect only on the start of a frame. If you write this register field when a frame is being transmitted, only the subsequent frame can use the updated value, that is, the current frame does not use the updated value.
27	0b RW	<b>IEEE 802.3as support for 2K packets Enable (PE2K):</b> When set, the MAC considers all frames, with up to 2,000 bytes length, as normal packets. When Bit 20 (Jumbo Enable) is not set, the MAC considers all received frames of size more than 2K bytes as Giant frames. When this bit is reset and Bit 20 (Jumbo Enable) is not set, the MAC considers all received frames of size more than 1,518 bytes (1,522 bytes for tagged) as Giant frames. When Bit 20 (Jumbo Enable) is set, setting this bit has no effect on Giant Frame status.
26:24	000b RO	<b>Reserved (RSV1):</b> Reserved.
23	0b RW	<b>Watchdog Disable (WD):</b> When this bit is set, the MAC disables the watchdog timer on the receiver. The MAC can receive frames of up to 16,384 bytes. When this bit is reset, the MAC does not allow more than 2,048 bytes (10,240 if JE is set high) of the frame being received. The MAC cuts off any bytes received after 2,048 bytes.
22	0b RW	<b>Jabber Disable (JD):</b> When this bit is set, the MAC disables the jabber timer on the transmitter. The MAC can transfer frames of up to 16,384 bytes. When this bit is reset, the MAC cuts off the transmitter if the application sends out more than 2,048 bytes of data (10,240 if JE is set high) during transmission.
21	0b RW	<b>Reserved (BE):</b> Reserved.
20	0b RW	<b>Jumbo Frame Enable (JE):</b> When this bit is set, the MAC allows Jumbo frames of 9,018 bytes (9,022 bytes for VLAN tagged frames) without reporting a giant frame error in the receive frame status.
19:17	000b RW	<b>Inter-Frame Gap (IFG):</b> These bits control the minimum IFG between frames during transmission. 000: 96 bit times 001: 88 bit times 010: 80 bit times 111: 40 bit times In the half-duplex mode, the minimum IFG can be configured only for 64 bit times (IFG = 100). Lower values are not considered.

Bit Range	Default & Access	Field Name (ID): Description
16	0b RW	<b>Disable Carrier Sense During Transmission (DCRS):</b> When set high, this bit makes the MAC transmitter ignore the MII CRS signal during frame transmission in the half-duplex mode. This request results in no errors generated because of Loss of Carrier or No Carrier during such transmission. When this bit is low, the MAC transmitter generates such errors because of Carrier Sense and can even abort the transmissions.
15	1b RO	<b>GMII/MII configuration (RSVO):</b> This bit identifies the supported interface: 0: GMII (1000 Mbps) 1: MII (10/100 Mbps)
14	0b RW	<b>RMII Speed (FES):</b> This bit selects the speed in the RMII interface: 0: 10 Mbps 1: 100 Mbps
13	0b RW	<b>Disable Receive Own (DO):</b> When this bit is set, the MAC disables the reception of frames when the gmii_txen_o is asserted in the half-duplex mode. When this bit is reset, the MAC receives all packets that are given by the PHY while transmitting. This bit is not applicable if the MAC is operating in the full-duplex mode.
12	0b RW	<b>Loopback Mode (LM):</b> When this bit is set, the MAC operates in the loopback mode at MII.
11	0b RW	<b>Duplex Mode (DM):</b> When this bit is set, the MAC operates in the full-duplex mode where it can transmit and receive simultaneously.
10	0b RW	<b>Checksum Offload (IPC):</b> When this bit is set, the MAC calculates the 16-bit ones complement of the ones complement sum of all received Ethernet frame payloads. It also checks whether the IPv4 Header checksum (assumed to be bytes 2526 or 2930 (VLAN-tagged) of the received Ethernet frame) is correct for the received frame and gives the status in the receive status word. The MAC also appends the 16-bit checksum calculated for the IP header datagram payload (bytes after the IPv4 header) and appends it to the Ethernet frame transferred to the application (when Type 2 COE is deselected). When this bit is reset, this function is disabled. As Type 2 COE (Checksum Offload Engine) is supported, this bit, when set, enables the IPv4 header checksum checking and IPv4 or IPv6 TCP, UDP, or ICMP payload checksum checking. When this bit is reset, the COE function in the receiver is disabled and the corresponding PCE and IP HCE status bits are always cleared.
9	0b RW	<b>Disable Retry (DR):</b> When this bit is set, the MAC attempts only one transmission. When a collision occurs on the MII interface, the MAC ignores the current frame transmission and reports a Frame Abort with excessive collision error in the transmit frame status. When this bit is reset, the MAC attempts retries based on the settings of the BL field (Bits [6:5]). This bit is applicable only in the half-duplex mode.
8	0b RO	<b>Reserved (LUD):</b> Reserved.
7	0b RW	<b>Automatic Pad or CRC Stripping (ACS):</b> When this bit is set, the MAC strips the Pad or FCS (Frame Check Sequence) field on the incoming frames only if the value of the length field is less than 1,536 bytes. All received frames with length field greater than or equal to 1,536 bytes are passed to the application without stripping the Pad or FCS field. When this bit is reset, the MAC passes all incoming frames, without modifying them, to the Host.
6:5	00b RW	<b>Back-Off Limit (BL):</b> The Back-Off limit determines the random integer number (r) of slot time delays (512 bit times for 10/100 Mbps) for which the MAC waits before rescheduling a transmission attempt during retries after a collision. This bit is applicable only in the half-duplex mode. 00: k = min (n, 10) 01: k = min (n, 8) 10: k = min (n, 4) 11: k = min (n, 1) where n = retransmission attempt. The random integer r takes the value in the range 0 (= r (kth power of 2

Bit Range	Default & Access	Field Name (ID): Description
4	0b RW	<b>Deferral Check (DC):</b> When this bit is set, the deferral check function is enabled in the MAC. The MAC issues a Frame Abort status, along with the excessive deferral error bit set in the transmit frame status, when the transmit state machine is deferred for more than 24,288 bit times in the 10 or 100 Mbps mode. If the Jumbo frame mode is enabled in the 10 or 100 Mbps mode, the threshold for deferral is 155,680 bits times. Deferral begins when the transmitter is ready to transmit, but is prevented because of an active carrier sense signal (CRS) on MII. Defer time is not cumulative. When the transmitter defers for 10,000 bit times, it transmits, collides, backs off, and then defers again after completion of back-off. The deferral timer resets to 0 and restarts. When this bit is reset, the deferral check function is disabled and the MAC defers until the CRS signal goes inactive. This bit is applicable only in the half-duplex mode.
3	0b RW	<b>Transmitter Enable (TE):</b> When this bit is set, the transmit state machine of the MAC is enabled for transmission on the MII. When this bit is reset, the MAC transmit state machine is disabled after the completion of the transmission of the current frame, and does not transmit any further frames.
2	0b RW	<b>Receiver Enable (RE):</b> When this bit is set, the receiver state machine of the MAC is enabled for receiving frames from the MII. When this bit is reset, the MAC receive state machine is disabled after the completion of the reception of the current frame, and does not receive any further frames from the MII.
1:0	00b RW	<b>Preamble Length for Transmit Frames (PRELEN):</b> These bits control the number of preamble bytes that are added to the beginning of every Transmit frame. The preamble reduction occurs only when the MAC is operating in the full-duplex mode. 2'b00: 7 bytes of preamble 2'b01: 5 byte of preamble 2'b10: 3 bytes of preamble 2'b11: reserved

### 15.6.2 MAC Frame Filter (Register 1) (GMAC\_REG\_1)—Offset 4h

The MAC Frame Filter register contains the filter controls for receiving frames. Some of the controls from this register go to the address check block of the MAC, which performs the first level of address filtering. The second level of filtering is performed on the incoming frame, based on other controls such as Pass Bad Frames and Pass Control Frames.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 4h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0							
0	0	0	0	0	0	0	0	0							
0	0	0	0	0	0	0	0	0							
0	0	0	0	0	0	0	0	0							
RA	RSV1			VTFE	RSV0	HPF	SAF	SAIF	PCF	DBF	PM	DAIF	HMC	HUC	PR

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	<b>Receive All (RA):</b> When this bit is set, the MAC Receiver module passes all received frames, irrespective of whether they pass the address filter or not, to the Application. The result of the SA or DA filtering is updated (pass or fail) in the corresponding bits in the Receive Status Word. When this bit is reset, the Receiver module passes only those frames to the Application that pass the SA or DA address filter.
30:17	0b RO	<b>Reserved (RSV1):</b> Reserved.

Bit Range	Default & Access	Field Name (ID): Description
16	0b RW	<b>VLAN Tag Filter Enable (VTFE)</b> : When set, this bit enables the MAC to drop VLAN tagged frames that do not match the VLAN Tag comparison. When reset, the MAC forwards all frames irrespective of the match status of the VLAN Tag.
15:11	00000b RO	<b>Reserved (RSVO)</b> : Reserved.
10	0b RW	<b>Hash or Perfect Filter (HPF)</b> : When this bit is set, it configures the address filter to pass a frame if it matches either the perfect filtering or the hash filtering as set by the HMC or HUC bits. When this bit is low and the HUC or HMC bit is set, the frame is passed only if it matches the Hash filter.
9	0b RW	<b>Source Address Filter Enable (SAF)</b> : When this bit is set, the MAC compares the SA field of the received frames with the values programmed in the enabled SA registers. If the comparison matches, then the SA Match bit of RxStatus Word is set high. When this bit is set high and the SA filter fails, the MAC drops the frame. When this bit is reset, the MAC forwards the received frame to the application and with the updated SA Match bit of the RxStatus depending on the SA address comparison.
8	0b RW	<b>SA Inverse Filtering (SAIF)</b> : When this bit is set, the Address Check block operates in inverse filtering mode for the SA address comparison. The frames whose SA matches the SA registers are marked as failing the SA Address filter. When this bit is reset, frames whose SA does not match the SA registers are marked as failing the SA Address filter.
7:6	00b RW	<b>Pass Control Frames (PCF)</b> : These bits control the forwarding of all control frames (including unicast and multicast PAUSE frames). 00: MAC filters all control frames from reaching the application. 01: MAC forwards all control frames except PAUSE control frames to application even if they fail the Address filter. 10: MAC forwards all control frames to application even if they fail the Address Filter. 11: MAC forwards control frames that pass the Address Filter. The following conditions should be true for the PAUSE control frames processing: Condition 1: The MAC is in the full-duplex mode and flow control is enabled by setting Bit 2 (RFE) of Register 6 (Flow Control Register) to 1. Condition 2: The destination address (DA) of the received frame matches the special multicast address or the MAC Address 0 when Bit 3 (UP) of the Register 6 (Flow Control Register) is set. Condition 3: The Type field of the received frame is 0x8808 and the OPCODE field is 0x0001. NOTE: This field should be set to 01 only when the Condition 1 is true, that is, the MAC is programmed to operate in the full-duplex mode and the RFE bit is enabled. Otherwise, the PAUSE frame filtering may be inconsistent. When Condition 1 is false, the PAUSE frames are considered as generic control frames. Therefore, to pass all control frames (including PAUSE control frames) when the full-duplex mode and flow control is not enabled, you should set the PCF field to 10 or 11 (as required by the application).
5	0b RW	<b>Disable Broadcast Frames (DBF)</b> : When this bit is set, the AFM module filters all incoming broadcast frames. In addition, it overrides all other filter settings. When this bit is reset, the AFM module passes all received broadcast frames.
4	0b RW	<b>Pass All Multicast (PM)</b> : When set, this bit indicates that all received frames with a multicast destination address (first bit in the destination address field is '1') are passed. When reset, filtering of multicast frame depends on HMC bit.
3	0b RW	<b>DA Inverse Filtering (DAIF)</b> : When this bit is set, the Address Check block operates in inverse filtering mode for the DA address comparison for both unicast and multicast frames. When reset, normal filtering of frames is performed.
2	0b RW	<b>Hash Multicast (HMC)</b> : When set, MAC performs destination address filtering of received multicast frames according to the hash table. When reset, the MAC performs a perfect destination address filtering for multicast frames, that is, it compares the DA field with the values programmed in DA registers.
1	0b RW	<b>Hash Unicast (HUC)</b> : When set, MAC performs destination address filtering of unicast frames according to the hash table. When reset, the MAC performs a perfect destination address filtering for unicast frames, that is, it compares the DA field with the values programmed in DA registers.

Bit Range	Default & Access	Field Name (ID): Description
0	0b RW	<b>Promiscuous Mode (PR):</b> When this bit is set, the Address Filter module passes all incoming frames regardless of its destination or source address. The SA or DA Filter Fails status bits of the Receive Status Word are always cleared when PR is set.

### 15.6.3 Hash Table High Register (Register 2) (GMAC\_REG\_2)—Offset 8h

The Hash Table High register contains the higher 32 bits of the Hash table. The 64-bit Hash table is used for group address filtering. For hash filtering, the contents of the destination address in the incoming frame is passed through the CRC logic, and the upper 6 bits of the CRC register are used to index the contents of the Hash table. The most significant bit determines the register to be used (Hash Table High or Hash Table Low), and the other 5 bits determine which bit within the register. A hash value of 5b'00000 selects Bit 0 of the selected register, and a value of 5b'11111 selects Bit 31 of the selected register. The hash value of the destination address is calculated in the following way: 1. Calculate the 32-bit CRC for the DA (See IEEE 802.3, Section 3.2.8 for the steps to calculate CRC32). 2. Perform bitwise reversal for the value obtained in Step 1. 3. Take the upper 6 bits from the value obtained in Step 2. For example, if the DA of the incoming frame is received as 0x1F52419CB6AF (0x1F is the first byte received on MII interface), then the internally calculated 6-bit Hash value is 0x2C and Bit 12 of Hash Table High register is checked for filtering. If the DA of the incoming frame is received as 0xA00A98000045, then the calculated 6-bit Hash value is 0x07 and Bit 7 of Hash Table Low register is checked for filtering. If the corresponding bit value of the register is 1'b1, the frame is accepted. Otherwise, it is rejected. If the PM (Pass All Multicast) bit is set in Register 1, then all multicast frames are accepted regardless of the multicast hash values.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 8h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>Hash Table High (HTH):</b> This field contains the upper 32 bits of the Hash table.

### 15.6.4 Hash Table Low Register (Register 3) (GMAC\_REG\_3)—Offset Ch

The Hash Table Low register contains the lower 32 bits of the Hash table.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>Hash Table Low (HTL):</b> This field contains the lower 32 bits of the Hash table.

### 15.6.5 GMII Address Register (Register 4) (GMAC\_REG\_4)—Offset 10h

The GMII Address register controls the management cycles to the external PHY through the management interface.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 10h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	<b>Reserved (RSV0):</b> Reserved.
15:11	00000b RW	<b>Physical Layer Address (PA):</b> This field indicates which of the 32 possible PHY devices are being accessed.
10:6	00000b RW	<b>GMII Register (GR):</b> These bits select the desired GMII register in the selected PHY device.

Bit Range	Default & Access	Field Name (ID): Description
5:2	0000b RW	<p><b>CSR Clock Range (CR):</b> The CSR Clock Range selection determines the frequency of the serial management clock (MDC) according to the system clock (clk_csr_i) frequency used in your design, which is 133MHz. When Bit[5] = 0 allowed values are:</p> <ul style="list-style-type: none"> <li>- 0001: The frequency of the clk_csr_i clock is 100-150 MHz and the MDC clock is clk_csr_i/62.</li> <li>- 0010: The frequency of the clk_csr_i clock is 20-35 MHz and the MDC clock is clk_csr_i/16.</li> <li>- 0011: The frequency of the clk_csr_i clock is 35-60 MHz and the MDC clock is clk_csr_i/26.</li> <li>- 0100: The frequency of the clk_csr_i clock is 150-250 MHz and the MDC clock is clk_csr_i/102.</li> <li>- 0100: The frequency of the clk_csr_i clock is 250-300 MHz and the MDC clock is clk_csr_i/124.</li> <li>- 0110 and 0111: Reserved</li> </ul> <p>Based on a system clock of 133MHz, the CR value that ensures the MDC clock is approximately between the frequency range 1.0 MHz - 2.5 MHz is 0010</p> <p>When Bit 5 is set, you can achieve MDC clock of frequency higher than the IEEE 802.3 specified frequency limit of 2.5 MHz and program a clock divider of lower value.</p> <p>Program the following values only if the interfacing chips support faster MDC clocks:</p> <ul style="list-style-type: none"> <li>- 1000: clk_csr_i/4</li> <li>- 1001: clk_csr_i/6</li> <li>- 1010: clk_csr_i/8</li> <li>- 1011: clk_csr_i/10</li> <li>- 1100: clk_csr_i/12</li> <li>- 1101: clk_csr_i/14</li> <li>- 1110: clk_csr_i/16</li> <li>- 1111: clk_csr_i/18</li> </ul>
1	0b RW	<p><b>GMII Write (GW):</b> When set, this bit indicates to the PHY that this is a Write operation using the GMII Data register. If this bit is not set, it indicates that this is a Read operation, that is, placing the data in the GMII Data register.</p>
0	0b RW	<p><b>GMII Busy (GB):</b> This bit should read logic 0 before writing to Register 4 and Register 5. During a PHY register access, the software sets this bit to 1'b1 to indicate that a Read or Write access is in progress.</p> <p>The Register 5 is invalid until this bit is cleared by the MAC. Therefore, Register 5 (GMII Data) should be kept valid until the MAC clears this bit during a PHY Write operation. Similarly for a read operation, the contents of Register 5 are not valid until this bit is cleared.</p> <p>The subsequent read or write operation should happen only after the previous operation is complete. Because there is no acknowledgment from the PHY to MAC after a read or write operation is completed, there is no change in the functionality of this bit even when the PHY is not present.</p>

### 15.6.6 GMII Data Register (Register 5) (GMAC\_REG\_5)—Offset 14h

The GMII Data register stores Write data to be written to the PHY register located at the address specified in Register 4 (GMII Address Register). This register also stores the Read data from the PHY register located at the address specified by Register 4.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 14h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSV0				0				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	<b>Reserved (RSVO):</b> Reserved.
15:0	0000h RW	<b>GMI Data (GD):</b> This field contains the 16-bit data value read from the PHY after a Management Read operation or the 16-bit data value to be written to the PHY before a Management Write operation.

### 15.6.7 Flow Control Register (Register 6) (GMAC\_REG\_6)—Offset 18h

The Flow Control register controls the generation and reception of the Control (Pause Command) frames by the MAC's Flow control module. A Write to a register with the Busy bit set to '1' triggers the Flow Control block to generate a Pause Control frame. The fields of the control frame are selected as specified in the 802.3x specification, and the Pause Time value from this register is used in the Pause Time field of the control frame. The Busy bit remains set until the control frame is transferred onto the cable. The Host must make sure that the Busy bit is cleared before writing to the register.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 18h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<b>Pause Time (PT):</b> This field holds the value to be used in the Pause Time field in the transmit control frame. If the Pause Time bits is configured to be double-synchronized to the MII clock domain, then consecutive writes to this register should be performed only after at least four clock cycles in the destination clock domain.
15:8	00h RO	<b>Reserved (RSV1):</b> Reserved.
7	0b RW	<b>Disable Zero-Quanta Pause (DZPQ):</b> When this bit is set, it disables the automatic generation of the Zero-Quanta Pause Control frames on the de-assertion of the flow-control signal from the FIFO layer. When this bit is reset, normal operation with automatic Zero-Quanta Pause Control frame generation is enabled.
6	0b RO	<b>Reserved (RSVO):</b> Reserved.

Bit Range	Default & Access	Field Name (ID): Description
5:4	00b RW	<b>Pause Low Threshold (PLT):</b> This field configures the threshold of the PAUSE timer at which the flow-control signal from the FIFO layer is checked for automatic retransmission of PAUSE Frame. The threshold values should be always less than the Pause Time configured in Bits[31:16]. For example, if PT = 100H (256 slot-times), and PLT = 01, then a second PAUSE frame is automatically transmitted if the flow-control signal from the FIFO layer is asserted at 228 (256 - 28) slot times after the first PAUSE frame is transmitted. The following list provides the threshold values for different values: 00: The threshold is Pause time minus 4 slot times (PT - 4 slot times). 01: The threshold is Pause time minus 28 slot times (PT - 28 slot times). 10: The threshold is Pause time minus 144 slot times (PT - 144 slot times). 11: The threshold is Pause time minus 256 slot times (PT - 256 slot times). The slot time is defined as the time taken to transmit 512 bits (64 bytes) on the MII interface.
3	0b RW	<b>Unicast Pause Frame Detect (UP):</b> When this bit is set, then in addition to the detecting Pause frames with the unique multicast address, the MAC detects the Pause frames with the station's unicast address specified in the MAC Address0 High Register and MAC Address0 Low Register. When this bit is reset, the MAC detects only a Pause frame with the unique multicast address specified in the 802.3x standard.
2	0b RW	<b>Receive Flow Control Enable (RFE):</b> When this bit is set, the MAC decodes the received Pause frame and disables its transmitter for a specified (Pause) time. When this bit is reset, the decode function of the Pause frame is disabled.
1	0b RW	<b>Transmit Flow Control Enable (TFE):</b> In the full-duplex mode, when this bit is set, the MAC enables the flow control operation to transmit Pause frames. When this bit is reset, the flow control operation in the MAC is disabled, and the MAC does not transmit any Pause frames. In half-duplex mode, when this bit is set, the MAC enables the back-pressure operation. When this bit is reset, the back-pressure feature is disabled.
0	0b RW	<b>Flow Control Busy or Backpressure Activate (FCB_BPA):</b> This bit initiates a Pause Control frame in the full-duplex mode and activates the backpressure function in the half-duplex mode if the TFE bit is set. In the full-duplex mode, this bit should be read as 1'b0 before writing to the Flow Control register. To initiate a Pause control frame, the Application must set this bit to 1'b1. During a transfer of the Control Frame, this bit continues to be set to signify that a frame transmission is in progress. After the completion of Pause control frame transmission, the MAC resets this bit to 1'b0. The Flow Control register should not be written to until this bit is cleared. In the half-duplex mode, when this bit is set (and TFE is set), then backpressure is asserted by the MAC. During backpressure, when the MAC receives a new frame, the transmitter starts sending a JAM pattern resulting in a collision. This control register bit is logically ORed with the flow-control signal from the FIFO layer for the backpressure function. When the MAC is configured for the full-duplex mode, the BPA is automatically disabled.

### 15.6.8 VLAN Tag Register (Register 7) (GMAC\_REG\_7)—Offset 1Ch

The VLAN Tag register contains the IEEE 802.1Q VLAN Tag to identify the VLAN frames. The MAC compares the 13th and 14th bytes of the receiving frame (Length/Type) with 16'h8100, and the following two bytes are compared with the VLAN tag. If a match occurs, the MAC sets the received VLAN bit in the receive frame status. The legal length of the frame is increased from 1,518 bytes to 1,522 Bytes.

#### Access Method

**Type:** Memory Mapped I/O Register  
**(Size:** 32 bits)

**Offset:** [BAR0] + 1Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RO	<b>Reserved (RSVO):</b> Reserved.
19	0b RW	<b>VLAN Tag Hash Table Match Enable (VTHM):</b> When set, the most significant four bits of the VLAN tags CRC are used to index the content of Register 354 (VLAN Hash Table Register). A value of 1 in the VLAN Hash Table register, corresponding to the index, indicates that the frame matched the VLAN hash table. When Bit 16 (ETV) is set, the CRC of the 12-bit VLAN Identifier (VID) is used for comparison whereas when ETV is reset, the CRC of the 16-bit VLAN tag is used for comparison. When reset, the VLAN Hash Match operation is not performed.
18	0b RW	<b>Enable S-VLAN (ESVL):</b> When this bit is set, the MAC transmitter and receiver also consider the S-VLAN (Type = 0x88A8) frames as valid VLAN tagged frames.
17	0b RW	<b>VLAN Tag Inverse Match Enable (VTIM):</b> When set, this bit enables the VLAN Tag inverse matching. The frames that do not have matching VLAN Tag are marked as matched. When reset, this bit enables the VLAN Tag perfect matching. The frames with matched VLAN Tag are marked as matched.
16	0b RW	<b>Enable 12-Bit VLAN Tag Comparison (ETV):</b> When this bit is set, a 12-bit VLAN identifier is used for comparing and filtering instead of the complete 16-bit VLAN tag. Bits [11:0] of VLAN tag are compared with the corresponding field in the received VLAN-tagged frame. Similarly, when enabled, only 12 bits of the VLAN tag in the received frame are used for hash-based VLAN filtering. When this bit is reset, all 16 bits of the 15th and 16th bytes of the received VLAN frame are used for comparison and VLAN hash filtering.
15:0	0000h RW	<b>VLAN Tag Identifier for Receive Frames (VL):</b> This field contains the 802.1Q VLAN tag to identify the VLAN frames and is compared to the 15th and 16th bytes of the frames being received for VLAN frames. The following list describes the bits of this field: Bits [15:13]: User Priority Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI) Bits[11:0]: VLAN tag's VLAN Identifier (VID) field When the ETV bit is set, only the VID (Bits[11:0]) is used for comparison. If VL (VL[11:0] if ETV is set) is all zeros, the MAC does not check the fifteenth and 16th bytes for VLAN tag comparison, and declares all frames with a Type field value of 0x8100 or 0x88a8 as VLAN frames.

### 15.6.9 Version Register (Register 8) (GMAC\_REG\_8)—Offset 20h

The Version registers identifies the version of the MAC. This register contains two bytes: one identifies the core IP release number, and the other that identifies the user release.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 20h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00001037h

Bit Range	Default & Access	Field Name (ID): Description
19	0b RO	<b>MAC transmitter in PAUSE (TXPAUSED)</b> : When high, this bit indicates that the MAC transmitter is in the PAUSE condition (in the full-duplex only mode) and hence does not schedule any frame for transmission.
18:17	00b RO	<b>MAC Transmit Frame Controller Status (TFCSTS)</b> : This field indicates the state of the MAC Transmit Frame Controller module: 00: IDLE state 01: Waiting for Status of previous frame or IFG or backoff period to be over 10: Generating and transmitting a PAUSE control frame (in the full-duplex mode) 11: Transferring input frame for transmission
16	0b RO	<b>MAC MII Transmit Protocol Engine Status (TPESTS)</b> : When high, this bit indicates that the MAC MII transmit protocol engine is actively transmitting data and is not in the IDLE state.
15:10	000000b RO	<b>Reserved (RSV2)</b> : Reserved.
9:8	00b RO	<b>MTL Rx FIFO Fill-level Status (RXFSTS)</b> : This field gives the status of the fill-level of the Rx FIFO: 00: Rx FIFO Empty 01: Rx FIFO fill level is below the flow-control deactivate threshold 10: Rx FIFO fill level is above the flow-control activate threshold 11: Rx FIFO Full
7	0b RO	<b>Reserved (RSV1)</b> : Reserved.
6:5	00b RO	<b>MTL Rx FIFO Read Controller State (RRCSTS)</b> : This field gives the state of the Rx FIFO read Controller: 00: IDLE state 01: Reading frame data 10: Reading frame status (or timestamp) 11: Flushing the frame data and status
4	0b RO	<b>MTL Rx FIFO Write Controller Active Status (RWCSTS)</b> : When high, this bit indicates that the MTL Rx FIFO Write Controller is active and is transferring a received frame to the FIFO.
3	0b RO	<b>Reserved (RSV0)</b> : Reserved.
2:1	00b RO	<b>MAC Receive Frame Controller FIFO Status (RFCFCSTS)</b> : When high, this field indicates the active state of the small FIFO Read and Write controllers of the MAC Receive Frame Controller Module.
0	0b RO	<b>MAC MII Receive Protocol Engine Status (RPESTS)</b> : When high, this bit indicates that the MAC MII receive protocol engine is actively receiving data and not in IDLE state.

### 15.6.11 Interrupt Register (Register 14) (GMAC\_REG\_14)—Offset 38h

The Interrupt Status register identifies the events in the MAC that can generate interrupt.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 38h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	000000h RO	<b>Reserved (RSV4):</b> Reserved.
9	0b RO	<b>Timestamp Interrupt Status (TSIS):</b> When the Advanced Timestamp feature is enabled, this bit is set when any of the following conditions is true: The system time value equals or exceeds the value specified in the Target Time High and Low registers. There is an overflow in the seconds register. The Auxiliary snapshot trigger is asserted. This bit is cleared on reading Bit 0 of the Register 458 (Timestamp Status Register). If default Timestamping is enabled, when set, this bit indicates that the system time value is equal to or exceeds the value specified in the Target Time registers. In this mode, this bit is cleared after the completion of the read of this bit. In all other modes, this bit is reserved.
8	0b RO	<b>Reserved (RSV2):</b> Reserved.
7	0b RO	<b>MMC Receive Checksum Offload Interrupt Status (MMCRXIPIS):</b> This bit is set high when an interrupt is generated in the MMC Receive Checksum Offload Interrupt Register. This bit is cleared when all the bits in this interrupt register are cleared.
6	0b RO	<b>MMC Transmit Interrupt Status (MMCTXIS):</b> This bit is set high when an interrupt is generated in the MMC Transmit Interrupt Register. This bit is cleared when all the bits in this interrupt register are cleared.
5	0b RO	<b>MMC Receive Interrupt Status (MMCRXIS):</b> This bit is set high when an interrupt is generated in the MMC Receive Interrupt Register. This bit is cleared when all the bits in this interrupt register are cleared.
4	0b RO	<b>MMC Interrupt Status (MMICIS):</b> This bit is set high when any of the Bits [7:5] is set high and cleared only when all of these bits are low.
3:0	0000b RO	<b>Reserved (RSV0):</b> Reserved.

### 15.6.12 Interrupt Mask Register (Register 15) (GMAC\_REG\_15)—Offset 3Ch

The Interrupt Mask Register bits enable you to mask the interrupt signal because of the corresponding event in the Interrupt Status Register.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 3Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	000000h RO	<b>Reserved (RSV3):</b> Reserved.
9	0b RW	<b>Timestamp Interrupt Mask (TSIM):</b> When set, this bit disables the assertion of the interrupt signal because of the setting of Timestamp Interrupt Status bit in Register 14 (Interrupt Status Register). This bit is valid only when IEEE1588 timestamping is enabled. In all other modes, this bit is reserved.
8:0	0b RO	<b>Reserved (RSV0):</b> Reserved.

### 15.6.13 MAC Address0 High Register (Register 16) (GMAC\_REG\_16)—Offset 40h

The MAC Address0 High register holds the upper 16 bits of the first 6-byte MAC address of the station. The first DA byte that is received on the MII interface corresponds to the LS byte (Bits [7:0]) of the MAC Address Low register. For example, if 0x112233445566 is received (0x11 in lane 0 of the first column) on the MII as the destination address, then the MacAddress0 Register [47:0] is compared with 0x665544332211. Using the standard IEEE 802 format for printing MAC-48 addresses this corresponds to 11:22:33:44:55:66 where 0x11 is the LS byte (Bits [7:0]) of the MAC Address Low register.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 40h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 8000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	1b RO	<b>Address Enable (AE):</b> This bit is always set to 1.
30:16	0000h RO	<b>Reserved (RSV0):</b> Reserved.
15:0	ffffh RW	<b>MAC Address0 High (ADDRHI):</b> This field contains the upper 16 bits (47:32) of the first 6-byte MAC address. The MAC uses this field for filtering the received frames and inserting the MAC address in the Transmit Flow Control (PAUSE) Frames.

### 15.6.14 MAC Address0 Low Register (Register 17) (GMAC\_REG\_17)—Offset 44h

The MAC Address0 Low register holds the lower 32 bits of the first 6-byte MAC address of the station.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 44h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** FFFFFFFFh

31	28	24	20	16	12	8	4	0
1	1	1	1	1	1	1	1	1
ADDRLO								

Bit Range	Default & Access	Field Name (ID): Description
31:0	fffffffh RW	<b>MAC Address0 Low (ADDRLO):</b> This field contains the lower 32 bits of the first 6-byte MAC address. This is used by the MAC for filtering the received frames and inserting the MAC address in the Transmit Flow Control (PAUSE) Frames.

### 15.6.15 MMC Control Register (Register 64) (GMAC\_REG\_64)—Offset 100h

The MMC Control register establishes the operating mode of the management counters. NOTE: The bit 0 (Counters Reset) has higher priority than bit 4 (Counter Preset). Therefore, when the Software tries to set both bits in the same write cycle, all counters are cleared and the bit 4 is not set.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 100h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0						
0	0	0	0	0	0	0	0	0						
RSV1							UCDBC	RSV0	CNTPRSTLVL	CNTPRST	CNTFREEZ	RSTONRD	CNTSTOPRO	CNRST

Bit Range	Default & Access	Field Name (ID): Description
31:9	000000h RO	<b>Reserved (RSV1):</b> Reserved.
8	0b RW	<b>Update MMC Counters for Dropped Broadcast Frames (UCDBC):</b> When set, this bit enables MAC to update all the related MMC Counters for Broadcast frames dropped due to setting of DBF bit (Disable Broadcast Frames) of MAC Filter Register at offset 0x0004. When reset, MMC Counters are not updated for dropped Broadcast frames.
7:6	00b RO	<b>Reserved (RSV0):</b> Reserved.

Bit Range	Default & Access	Field Name (ID): Description
5	0b RW	<b>Full-Half Preset (CNTPRSTLVL)</b> : When low and bit 4 is set, all MMC counters get preset to almost-half value. All octet counters get preset to 0x7FFF_F800 (half - 2KBytes) and all frame-counters gets preset to 0x7FFF_FFF0 (half - 16). When this bit is high and bit 4 is set, all MMC counters get preset to almost-full value. All octet counters get preset to 0xFFFF_F800 (full - 2KBytes) and all frame-counters gets preset to 0xFFFF_FFF0 (full - 16). For 16-bit counters, the almost-half preset values are 0x7800 and 0x7FF0 for the respective octet and frame counters. Similarly, the almost-full preset values for the 16-bit counters are 0xF800 and 0xFFFF0.
4	0b RW	<b>Counters Preset (CNTPRST)</b> : When this bit is set, all counters are initialized or preset to almost full or almost half according to bit 5. This bit is cleared automatically after 1 clock cycle. This bit, along with bit 5, is useful for debugging and testing the assertion of interrupts because of MMC counter becoming half-full or full.
3	0b RW	<b>MMC Counter Freeze (CNTFREEZ)</b> : When this bit is set, it freezes all MMC counters to their current value. Until this bit is reset to 0, no MMC counter is updated because of any transmitted or received frame. If any MMC counter is read with the Reset on Read bit set, then that counter is also cleared in this mode
2	0b RW	<b>Reset on Read (RSTONRD)</b> : When this bit is set, the MMC counters are reset to zero after Read (self-clearing after reset). The counters are cleared when the least significant byte lane (bits[7:0]) is read.
1	0b RW	<b>Counters Stop Rollover (CNTSTOPRO)</b> : When this bit is set, after reaching maximum value, the counter does not roll over to zero.
0	0b RW	<b>Counters Reset (CNTRST)</b> : When this bit is set, all counters are reset. This bit is cleared automatically after one clock cycle.

### 15.6.16 MMC Receive Interrupt Register (MMC\_INTR\_RX)—Offset 104h

The MMC Receive Interrupt Register maintains the interrupt generated from all of the receive statistic counters. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read.

#### Access Method

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>Counter value (CNT):</b> Reserved.

### 15.6.21 MMC Transmit Good Bad Frame Counter Register (TXFRAMECOUNT\_GB)—Offset 118h

Number of good and bad frames transmitted, exclusive of retried frames.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 118h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.22 MMC Transmit Broadcast Good Frame Counter Register (TXBROADCASTFRAMES\_G)—Offset 11Ch

Number of good broadcast frames transmitted.

**Access Method**

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [BAR0] + 11Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.23 MMC Transmit Multicast Good Frame Counter Register (TXMULTICASTFRAMES\_G)—Offset 120h

Number of good multicast frames transmitted.

**Access Method**

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [BAR0] + 120h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.24 MMC Transmit 64 Octet Good Bad Frame Counter Register (TX64OCTETS\_GB)—Offset 124h

Number of good and bad frames transmitted with length 64 bytes, exclusive of preamble and retried frames.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 124h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.25 MMC Transmit 65 to 127 Octet Good Bad Frame Counter Register (TX65TO127OCTETS\_GB)—Offset 128h

Number of good and bad frames transmitted with length between 65 and 127 (inclusive) bytes, exclusive of preamble and retried frames.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 128h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.26 MMC Transmit 128 to 255 Octet Good Bad Frame Counter Register (TX128TO255OCTETS\_GB)—Offset 12Ch

Number of good and bad frames transmitted with length between 128 and 255 (inclusive) bytes, exclusive of preamble and retried frames.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 12Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.27 MMC Transmit 256 to 511 Octet Good Bad Frame Counter Register (TX256TO511OCTETS\_GB)—Offset 130h

Number of good and bad frames transmitted with length between 256 and 511 (inclusive) bytes, exclusive of preamble and retried frames.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 130h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.28 MMC Transmit 512 to 1023 Octet Good Bad Frame Counter Register (TX512TO1023OCTETS\_GB)—Offset 134h

Number of good and bad frames transmitted with length between 512 and 1,023 (inclusive) bytes, exclusive of preamble and retried frames.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 134h

**BARO Type:** PCI Configuration Register (Size: 32 bits)  
**BARO Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.29 MMC Transmit 1024 to Maximum Octet Good Bad Frame Counter Register (TX1024TOMAXOCTETS\_GB)—Offset 138h

Number of good and bad frames transmitted with length between 1,024 and maxsize (inclusive) bytes, exclusive of preamble and retried frames.

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 138h

**BARO Type:** PCI Configuration Register (Size: 32 bits)  
**BARO Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.30 MMC Transmit Unicast Good Bad Frame Counter Register (TXUNICASTFRAMES\_GB)—Offset 13Ch

Number of good and bad unicast frames transmitted.

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 13Ch

**BARO Type:** PCI Configuration Register (Size: 32 bits)  
**BARO Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
CNT											
Bit Range	Default & Access	Field Name (ID): Description									
31:0	00000000h RO	Counter value (CNT): Reserved.									

### 15.6.31 MMC Transmit Multicast Good Bad Frame Counter Register (TXMULTICASTFRAMES\_GB)—Offset 140h

Number of good and bad multicast frames transmitted.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 140h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
CNT											
Bit Range	Default & Access	Field Name (ID): Description									
31:0	00000000h RO	Counter value (CNT): Reserved.									

### 15.6.32 MMC Transmit Broadcast Good Bad Frame Counter Register (TXBROADCASTFRAMES\_GB)—Offset 144h

Number of good and bad broadcast frames transmitted.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 144h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
CNT											

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.33 MMC Transmit Underflow Error Frame Counter Register (TXUNDERFLOWERROR)—Offset 148h

Number of frames aborted because of frame underflow error.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 148h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.34 MMC Transmit Single Collision Good Frame Counter Register (TXSINGLECOL\_G)—Offset 14Ch

Number of successfully transmitted frames after a single collision in the half-duplex mode.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 14Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.35 MMC Transmit Multiple Collision Good Frame Counter Register (TXMULTICOL\_G)—Offset 150h

Number of successfully transmitted frames after multiple collisions in the half-duplex mode.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 150h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.36 MMC Transmit Deferred Frame Counter Register (TXDEFERRED)—Offset 154h

Number of successfully transmitted frames after a deferral in the half-duplex mode.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 154h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.37 MMC Transmit Late Collision Frame Counter Register (TXLATECOL)—Offset 158h

Number of frames aborted because of late collision error.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 158h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.38 MMC Transmit Excessive Collision Frame Counter Register (TXEXESSCOL)—Offset 15Ch

Number of frames aborted because of excessive (16) collision errors.

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 15Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.39 MMC Transmit Carrier Error Frame Counter Register (TXCARRIERERROR)—Offset 160h

Number of frames aborted because of carrier sense error (no carrier or loss of carrier).

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 160h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.40 MMC Transmit Good Octet Counter Register (TXOCTETCOUNT\_G)—Offset 164h

Number of bytes transmitted, exclusive of preamble, in good frames only.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 164h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.41 MMC Transmit Good Frame Counter Register (TXFRAMECOUNT\_G)—Offset 168h

Number of good frames transmitted.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 168h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.42 MMC Transmit Excessive Deferral Frame Counter Register (TXEXCESSDEF)—Offset 16Ch

Number of frames aborted because of excessive deferral error (deferred for more than two max-sized frame times).

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 16Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.43 MMC Transmit Pause Frame Counter Register (TXPAUSEFRAMES)—Offset 170h

Number of good PAUSE frames transmitted.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 170h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.44 MMC Transmit VLAN Good Frame Counter Register (TXVLANFRAMES\_G)—Offset 174h

Number of good VLAN frames transmitted, exclusive of retried frames.

**Access Method**

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [BAR0] + 174h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.45 MMC Transmit Oversize Good Frame Counter Register (TXOVERSIZE\_G)—Offset 178h

Number of frames transmitted without errors and with length greater than the maxsize (1,518 or 1,522 bytes for VLAN tagged frames; 2000 bytes if enabled in Bit 27 of Register 0 (MAC Configuration Register)).

**Access Method**

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [BAR0] + 178h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.46 MMC Receive Good Bad Frame Counter Register (RXFRAMECOUNT\_GB)—Offset 180h

Number of good and bad frames received.

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 180h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.47 MMC Receive Good Bad Octet Counter Register (RXOCTETCOUNT\_GB)—Offset 184h

Number of bytes received, exclusive of preamble, in good and bad frames.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 184h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.48 MMC Receive Good Octet Counter Register (RXOCTETCOUNT\_G)—Offset 188h

Number of bytes received, exclusive of preamble, only in good frames.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 188h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.49 MMC Receive Broadcast Good Frame Counter Register (RXBROADCASTFRAMES\_G)—Offset 18Ch

Number of good broadcast frames received.

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [BAR0] + 18Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.50 MMC Receive Multicast Good Frame Counter Register (RXMULTICASTFRAMES\_G)—Offset 190h

Number of good multicast frames received.

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [BAR0] + 190h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.51 MMC Receive CRC Error Frame Counter Register (RXCRCERROR)—Offset 194h

Number of frames received with CRC error.

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 194h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:6] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.52 MMC Receive Alignment Error Frame Counter Register (RXALIGNMENTERROR)—Offset 198h

Number of frames received with alignment (dribble) error.

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 198h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:6] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.53 MMC Receive Runt Frame Counter Register (RXRUNTERROR)—Offset 19Ch

Number of frames received with runt ((64 bytes and CRC error) error.

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 19Ch

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:6] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
CNT											

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.54 MMC Receive Jabber Error Frame Counter Register (RXJABBERERROR)—Offset 1A0h

Number of giant frames received with length (including CRC) greater than 1,518 bytes (1,522 bytes for VLAN tagged) and with CRC error. If Jumbo Frame mode is enabled, then frames of length greater than 9,018 bytes (9,022 for VLAN tagged) are considered as giant frames.

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 1A0h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:6] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
CNT											

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.55 MMC Receive Undersize Good Frame Counter Register (RXUNDERSIZE\_G)—Offset 1A4h

Number of frames received with length less than 64 bytes, without any errors.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1A4h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.56 MMC Receive Oversize Good Frame Counter Register (RXOVERSIZE\_G)—Offset 1A8h

Number of frames received without errors, with length greater than the maxsize (1,518 or 1,522 for VLAN tagged frames; 2,000 bytes if enabled in Bit 27 of Register 0 (MAC Configuration Register)).

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1A8h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.57 MMC Receive 64 Octet Good Bad Frame Counter Register (RX64OCTETS\_GB)—Offset 1ACh

Number of good and bad frames received with length 64 bytes, exclusive of preamble.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1ACh

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
CNT											
Bit Range	Default & Access	Field Name (ID): Description									
31:0	00000000h RO	Counter value (CNT): Reserved.									

### 15.6.58 MMC Receive 65 to 127 Octet Good Bad Frame Counter Register (RX65TO127OCTETS\_GB)—Offset 1B0h

Number of good and bad frames received with length between 65 and 127 (inclusive) bytes, exclusive of preamble.

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [BAR0] + 1B0h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
CNT											
Bit Range	Default & Access	Field Name (ID): Description									
31:0	00000000h RO	Counter value (CNT): Reserved.									

### 15.6.59 MMC Receive 128 to 255 Octet Good Bad Frame Counter Register (RX128TO255OCTETS\_GB)—Offset 1B4h

Number of good and bad frames received with length between 128 and 255 (inclusive) bytes, exclusive of preamble.

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [BAR0] + 1B4h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.60 MMC Receive 256 to 511 Octet Good Bad Frame Counter Register (RX256TO511OCTETS\_GB)—Offset 1B8h

Number of good and bad frames received with length between 256 and 511 (inclusive) bytes, exclusive of preamble.

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 1B8h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:6] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.61 MMC Receive 512 to 1023 Octet Good Bad Frame Counter Register (RX512TO1023OCTETS\_GB)—Offset 1BCh

Number of good and bad frames received with length between 512 and 1,023 (inclusive) bytes, exclusive of preamble.

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 1BCh

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:6] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.62 MMC Receive 1024 to Maximum Octet Good Bad Frame Counter Register (RX1024TOMAXOCTETS\_GB)—Offset 1C0h

Number of good and bad frames received with length between 1,024 and maxsize (inclusive) bytes, exclusive of preamble and retried frames.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1C0h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.63 MMC Receive Unicast Good Frame Counter Register (RXUNICASTFRAMES\_G)—Offset 1C4h

Number of received good unicast frames.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1C4h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.64 MMC Receive Length Error Frame Counter Register (RXLENGTHERROR)—Offset 1C8h

Number of frames received with length error (Length type field doesn't match frame size), for all frames with valid length field.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1C8h

**BARO Type:** PCI Configuration Register (Size: 32 bits)  
**BARO Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.65 MMC Receive Out Of Range Error Frame Counter Register (RXOUTOFRANGETYPE)—Offset 1CCh

Number of frames received with length field not equal to the valid frame size (greater than 1,500 but less than 1,536).

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1CCh

**BARO Type:** PCI Configuration Register (Size: 32 bits)  
**BARO Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.66 MMC Receive Pause Frame Counter Register (RXPAUSEFRAMES)—Offset 1D0h

Number of good and valid PAUSE frames received.

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1D0h

**BARO Type:** PCI Configuration Register (Size: 32 bits)  
**BARO Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31:0	00000000h RO	Counter value (CNT): Reserved.									

### 15.6.67 MMC Receive FIFO Overflow Frame Counter Register (RXFIFOOVERFLOW)—Offset 1D4h

Number of missed received frames because of FIFO overflow.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1D4h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0

31:0	00000000h RO	Counter value (CNT): Reserved.									

### 15.6.68 MMC Receive VLAN Good Bad Frame Counter Register (RXVLANFRAMES\_GB)—Offset 1D8h

Number of good and bad VLAN frames received.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1D8h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
CNT											

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.69 MMC Receive Watchdog Error Frame Counter Register (RXWATCHDOGERROR)—Offset 1DCh

Number of frames received with error because of watchdog timeout error (frames with a data load larger than 2,048 bytes).

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1DCh

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.70 MMC Receive Error Frame Counter Register (RXRCVERROR)—Offset 1E0h

Number of frames received with Receive error or Frame Extension error on the MII interface.

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1E0h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

1	0b RW	<b>MMC Receive IPv4 Header Error Frame Counter Interrupt Mask (RXIPV4HERFIM)</b> : Setting this bit masks the interrupt when the rxipv4_hdrerr_frms counter reaches half of the maximum value or the maximum value.
0	0b RW	<b>MMC Receive IPv4 Good Frame Counter Interrupt Mask (RXIPV4GFIM)</b> : Setting this bit masks the interrupt when the rxipv4_gd_frms counter reaches half of the maximum value or the maximum value.

### 15.6.73 MMC Receive Checksum Offload Interrupt Register (MMC\_IPC\_INTR\_RX)—Offset 208h

The MMC Receive Checksum Offload Interrupt register maintains the interrupts generated when receive IPC statistic counters reach half their maximum values, and when they cross their maximum values. When Counter Stop Rollover is set, then interrupts are set but the counter remains at all-ones. When the MMC IPC counter that caused the interrupt is read, its corresponding interrupt bit is cleared.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 208h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

### 15.6.74 MMC Receive IPV4 Good Frame Counter Register (RXIPV4\_GD\_FRMS)—Offset 210h

Number of good IPv4 datagrams received with the TCP, UDP, or ICMP payload.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 210h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.75 MMC Receive IPV4 Header Error Frame Counter Register (RXIPV4\_HDRERR\_FRMS)—Offset 214h

Number of IPv4 datagrams received with header (checksum, length, or version mismatch) errors.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 214h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.76 MMC Receive IPV4 No Payload Frame Counter Register (RXIPV4\_NOPAY\_FRMS)—Offset 218h

Number of IPv4 datagram frames received that did not have a TCP, UDP, or ICMP payload processed by the Checksum engine.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 218h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.77 MMC Receive IPV4 Fragmented Frame Counter Register (RXIPV4\_FRAG\_FRMS)—Offset 21Ch

Number of good IPv4 datagrams with fragmentation.

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 21Ch

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:6] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.78 MMC Receive IPV4 UDP Checksum Disabled Frame Counter Register (RXIPV4\_UDSBL\_FRMS)—Offset 220h

Number of good IPv4 datagrams received that had a UDP payload with checksum disabled.

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 220h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:6] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.79 MMC Receive IPV6 Good Frame Counter Register (RXIPV6\_GD\_FRMS)—Offset 224h

Number of good IPv6 datagrams received with TCP, UDP, or ICMP payloads.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 224h

**BARO Type:** PCI Configuration Register (Size: 32 bits)

**BARO Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.80 MMC Receive IPv6 Header Error Frame Counter Register (RXIPV6\_HDRERR\_FRMS)—Offset 228h

Number of IPv6 datagrams received with header errors (length or version mismatch).

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 228h

**BARO Type:** PCI Configuration Register (Size: 32 bits)

**BARO Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.81 MMC Receive IPv6 No Payload Frame Counter Register (RXIPV6\_NOPAY\_FRMS)—Offset 22Ch

Number of IPv6 datagram frames received that did not have a TCP, UDP, or ICMP payload. This includes all IPv6 datagrams with fragmentation or security extension headers.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 22Ch

**BARO Type:** PCI Configuration Register (Size: 32 bits)

**BARO Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.82 MMC Receive UDP Good Frame Counter Register (RXUDP\_GD\_FRMS)—Offset 230h

Number of good IP datagrams with a good UDP payload. This counter is not updated when the rxipv4\_udsbl\_frms counter is incremented.

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [BAR0] + 230h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.83 MMC Receive UDP Error Frame Counter Register (RXUDP\_ERR\_FRMS)—Offset 234h

Number of good IP datagrams whose UDP payload has a checksum error.

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [BAR0] + 234h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.84 MMC Receive TCP Good Frame Counter Register (RXTCP\_GD\_FRMS)—Offset 238h

Number of good IP datagrams with a good TCP payload.

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 238h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:6] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.85 MMC Receive TCP Error Frame Counter Register (RXTCP\_ERR\_FRMS)—Offset 23Ch

Number of good IP datagrams whose TCP payload has a checksum error.

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 23Ch

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:6] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.86 MMC Receive ICMP Good Frame Counter Register (RXICMP\_GD\_FRMS)—Offset 240h

Number of good IP datagrams with a good ICMP payload.

#### Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR0] + 240h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:6] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.87 MMC Receive ICMP Error Frame Counter Register (RXICMP\_ERR\_FRMS)—Offset 244h

Number of good IP datagrams whose ICMP payload has a checksum error.

#### Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR0] + 244h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:6] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.88 MMC Receive IPV4 Good Octet Counter Register (RXIPV4\_GD\_OCTETS)—Offset 250h

Number of bytes received in good IPv4 datagrams encapsulating TCP, UDP, or ICMP data. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter or in the octet counters listed below).

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 250h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.89 MMC Receive IPV4 Header Error Octet Counter Register (RXIPV4\_HDRERR\_OCTETS)—Offset 254h

Number of bytes received in IPv4 datagrams with header errors (checksum, length, version mismatch). The value in the Length field of IPv4 header is used to update this counter.

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 254h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.90 MMC Receive IPV4 No Payload Octet Counter Register (RXIPV4\_NOPAY\_OCTETS)—Offset 258h

Number of bytes received in IPv4 datagrams that did not have a TCP, UDP, or ICMP payload. The value in the IPv4 headers Length field is used to update this counter.

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 258h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
CNT											
Bit Range	Default & Access	Field Name (ID): Description									
31:0	00000000h RO	Counter value (CNT): Reserved.									

### 15.6.91 MMC Receive IPV4 Fragmented Octet Counter Register (RXIPV4\_FRAG\_OCTETS)—Offset 25Ch

Number of bytes received in fragmented IPv4 datagrams. The value in the IPv4 headers Length field is used to update this counter.

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [BAR0] + 25Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
CNT											
Bit Range	Default & Access	Field Name (ID): Description									
31:0	00000000h RO	Counter value (CNT): Reserved.									

### 15.6.92 MMC Receive IPV4 UDP Checksum Disabled Octet Counter Register (RXIPV4\_UDSBL\_OCTETS)—Offset 260h

Number of bytes received in a UDP segment that had the UDP checksum disabled. This counter does not count IP Header bytes.

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [BAR0] + 260h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
CNT											

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.93 MMC Receive IPV6 Good Octet Counter Register (RXIPV6\_GD\_OCTETS)—Offset 264h

Number of bytes received in good IPv6 datagrams encapsulating TCP, UDP or ICMPv6 data.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 264h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.94 MMC Receive IPV6 Good Octet Counter Register (RXIPV6\_HDRERR\_OCTETS)—Offset 268h

Number of bytes received in IPv6 datagrams with header errors (length, version mismatch). The value in the IPv6 headers Length field is used to update this counter.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 268h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.95 MMC Receive IPV6 Header Error Octet Counter Register (RXIPV6\_NOPAY\_OCTETS)—Offset 26Ch

Number of bytes received in IPv6 datagrams that did not have a TCP, UDP, or ICMP payload. The value in the IPv6 headers Length field is used to update this counter.

#### Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR0] + 26Ch

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:6] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.96 MMC Receive IPV6 No Payload Octet Counter Register (RXUDP\_GD\_OCTETS)—Offset 270h

Number of bytes received in a good UDP segment. This counter (and the counters below) does not count IP header bytes.

#### Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR0] + 270h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:6] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.97 MMC Receive UDP Good Octet Counter Register (RXUDP\_ERR\_OCTETS)—Offset 274h

Number of bytes received in a UDP segment that had checksum errors.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 274h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.98 MMC Receive TCP Good Octet Counter Register (RXTCP\_GD\_OCTETS)—Offset 278h

Number of bytes received in a good TCP segment.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 278h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.99 MMC Receive TCP Error Octet Counter Register (RXTCP\_ERR\_OCTETS)—Offset 27Ch

Number of bytes received in a TCP segment with checksum errors.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 27Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0

### 15.6.100 MMC Receive ICMP Good Octet Counter Register (RXICMP\_GD\_OCTETS)—Offset 280h

Number of bytes received in a good ICMP segment.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 280h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
CNT											
Bit Range	Default & Access	Field Name (ID): Description									
31:0	00000000h RO	Counter value (CNT): Reserved.									

### 15.6.101 MMC Receive ICMP Error Octet Counter Register (RXICMP\_ERR\_OCTETS)—Offset 284h

Number of bytes received in an ICMP segment with checksum errors.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 284h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
CNT											

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Counter value (CNT): Reserved.

### 15.6.102 VLAN Tag Inclusion or Replacement Register (Register 353) (GMAC\_REG\_353)—Offset 584h

The VLAN Tag Inclusion or Replacement register contains the VLAN tag for insertion or replacement in the transmit frames.

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 584h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:6] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	000h RO	Reserved (RSVO): Reserved.
19	0b RW	<b>C-VLAN or S-VLAN (CSVL):</b> When this bit is set, S-VLAN type (0x88A8) is inserted or replaced in the 13th and 14th bytes of transmitted frames. When this bit is reset, C-VLAN type (0x8100) is inserted or replaced in the transmitted frames.
18	0b RW	<b>VLAN Priority Control (VLP):</b> When this bit is set, the control Bits [17:16] are used for VLAN deletion, insertion, or replacement. When this bit is reset, the internal control signal from the MTL layer is used, and Bits [17:16] are ignored.
17:16	00b RW	<b>VLAN Tag Control in Transmit Frames (VLC):</b> 2'b00: No VLAN tag deletion, insertion, or replacement 2'b01: VLAN tag deletion. The MAC removes the VLAN type (bytes 13 and 14) and VLAN tag (bytes 15 and 16) of all transmitted frames with VLAN tags. 2'b10: VLAN tag insertion. The MAC inserts VLT in bytes 15 and 16 of the frame after inserting the Type value (0x8100/0x88a8) in bytes 13 and 14. This operation is performed on all transmitted frames, irrespective of whether they already have a VLAN tag. 2'b11: VLAN tag replacement. The MAC replaces VLT in bytes 15 and 16 of all VLAN-type transmitted frames (Bytes 13 and 14 are 0x8100/0x88a8). NOTE: Changes to this field take effect only on the start of a frame. If you write this register field when a frame is being transmitted, only the subsequent frame can use the updated value, that is, the current frame does not use the updated value.
15:0	0000h RW	<b>VLAN Tag for Transmit Frames (VLT):</b> This field contains the value of the VLAN tag to be inserted or replaced. The value must only be changed when the transmit lines are inactive or during the initialization phase. Bits[15:13] are the User Priority, Bit 12 is the CFI/DEI, and Bits[11:0] are the VLAN tags VID field.

### 15.6.103 VLAN Hash Table Register (Register 354) (GMAC\_REG\_354)—Offset 588h

The 16-bit Hash table is used for group address filtering based on VLAN tag when Bit 18 (VTHM) of Register 7 (VLAN Tag Register) is set. For hash filtering, the content of the 16-bit VLAN tag or 12-bit VLAN ID (based on Bit 16 (ETV) of VLAN Tag Register) in the incoming frame is passed through the CRC logic and the upper four bits of the calculated CRC are used to index the contents of the VLAN Hash table. For example, a hash value of 4b'1000 selects Bit 8 of the VLAN Hash table. The hash value of the destination address is calculated in the following way: 1. Calculate the 32-bit CRC for the VLAN tag or ID (See IEEE 802.3, Section 3.2.8 for the steps to calculate CRC32). 2. Perform bitwise reversal for the value obtained in Step 1. 3. Take the upper four bits from the value obtained in Step 2. If the corresponding bit value of the register is 1'b1, the frame is accepted. Otherwise, it is rejected.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 588h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	<b>Reserved (RSV0):</b> Reserved.
15:0	0000h RW	<b>VLAN Hash Table (VLHT):</b> This field contains the 16-bit VLAN Hash Table.

### 15.6.104 Timestamp Control Register (Register 448) (GMAC\_REG\_448)—Offset 700h

This register controls the operation of the System Time generator and the processing of PTP packets for timestamping in the Receiver.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 700h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00002000h

RSV4				TSENMACADDR	SNAPTPSEL	TSMSTRENA	TSEVNTENA	TSIPV4ENA	TSIPV6ENA	TSIPENA	TSVER2ENA	TSCTRLSSR	TSENALL	RSV0	TSADDRESS	TSTRIG	TSUPDT	TSINIT	TSCFUPDT	TSENA

Bit Range	Default & Access	Field Name (ID): Description
31:19	0b RO	<b>Reserved (RSV4):</b> Reserved.
18	0b RW	<b>Enable MAC address for PTP Frame Filtering (TSENMADDR):</b> When set, the DA MAC address (that matches any MAC Address register) is used to filter the PTP frames when PTP is directly sent over Ethernet.
17:16	00b RW	<b>Select PTP packets for Taking Snapshots (SNAPTYPSEL):</b> These bits along with Bits 15 and 14 decide the set of PTP packet types for which snapshot needs to be taken.
15	0b RW	<b>Enable Snapshot for Messages Relevant to Master (TSMSTRENA):</b> When set, the snapshot is taken only for the messages relevant to the master node. Otherwise, the snapshot is taken for the messages relevant to the slave node.
14	0b RW	<b>Enable Timestamp Snapshot for Event Messages (TSEVNTENA):</b> When set, the timestamp snapshot is taken only for event messages (SYNC, Delay_Req, Pdelay_Req, or Pdelay_Resp). When reset, the snapshot is taken for all messages except Announce, Management, and Signaling.
13	1b RW	<b>Enable Processing of PTP Frames Sent over IPv4-UDP (TSIPV4ENA):</b> When set, the MAC receiver processes the PTP packets encapsulated in UDP over IPv4 packets. When this bit is clear, the MAC ignores the PTP transported over UDP-IPv4 packets. This bit is set by default.
12	0b RW	<b>Enable Processing of PTP Frames Sent Over IPv6-UDP (TSIPV6ENA):</b> When set, the MAC receiver processes PTP packets encapsulated in UDP over IPv6 packets. When this bit is clear, the MAC ignores the PTP transported over UDP-IPv6 packets.
11	0b RW	<b>Enable Processing of PTP over Ethernet Frames (TSIPENA):</b> When set, the MAC receiver processes the PTP packets encapsulated directly in the Ethernet frames. When this bit is clear, the MAC ignores the PTP over Ethernet packets.
10	0b RW	<b>Enable PTP packet Processing for Version 2 Format (TSVER2ENA):</b> When set, the PTP packets are processed using the 1588 version 2 format. Otherwise, the PTP packets are processed using the version 1 format.
9	0b RW	<b>Timestamp Digital or Binary Rollover Control (TSCTRLSSR):</b> When set, the Timestamp Low register rolls over after 0x3B9A_C9FF value (that is, 1 nanosecond accuracy) and increments the timestamp (High) seconds. When reset, the rollover value of sub-second register is 0x7FFF_FFFF. The sub-second increment has to be programmed correctly depending on the PTP reference clock frequency and the value of this bit.
8	0b RW	<b>Enable Timestamp for All Frames (TSENALL):</b> When set, the timestamp snapshot is enabled for all frames received by the MAC.
7:6	00b RO	<b>Reserved (RSV0):</b> Reserved.
5	0b RW	<b>Addend Reg Update (TSADDREG):</b> When set, the content of the Timestamp Addend register is updated in the PTP block for fine correction. This is cleared when the update is completed. This register bit should be zero before setting it.
4	0b RW	<b>Timestamp Interrupt Trigger Enable (TSTRIG):</b> When set, the timestamp interrupt is generated when the System Time becomes greater than the value written in the Target Time register. This bit is reset after the generation of the Timestamp Trigger Interrupt.
3	0b RW	<b>Timestamp Update (TSUPDT):</b> When set, the system time is updated (added or subtracted) with the value specified in Register 452 (System Time - Seconds Update Register) and Register 453 (System Time - Nanoseconds Update Register). This bit should be read zero before updating it. This bit is reset when the update is completed in hardware. The Timestamp Higher Word register (if enabled during core configuration) is not updated.
2	0b RW	<b>Timestamp Initialize (TSINIT):</b> When set, the system time is initialized (overwritten) with the value specified in the Register 452 (System Time - Seconds Update Register) and Register 453 (System Time - Nanoseconds Update Register). This bit should be read zero before updating it. This bit is reset when the initialization is complete. The Timestamp Higher Word register (if enabled during core configuration) can only be initialized.

Bit Range	Default & Access	Field Name (ID): Description
1	0b RW	<b>Timestamp Fine or Coarse Update (TSCFUPDT):</b> When set, this bit indicates that the system times update should be done using the fine update method. When reset, it indicates the system timestamp update should be done using the Coarse method.
0	0b RW	<b>Timestamp Enable (TSENA):</b> When set, the timestamp is added for the transmit and receive frames. When disabled, timestamp is not added for the transmit and receive frames and the Timestamp Generator is also suspended. You need to initialize the Timestamp (system time) after enabling this mode. On the receive side, the MAC processes the 1588 frames only if this bit is set.

### 15.6.105 Sub-Second Increment Register (Register 449) (GMAC\_REG\_449)—Offset 704h

In the Coarse Update mode (TSCFUPDT bit in Register 448), the value in this register is added to the system time every clock cycle of the internal 50MHz PTP reference clock. In the Fine Update mode, the value in this register is added to the system time whenever the Accumulator gets an overflow.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 704h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVO						SSINC		

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	<b>Reserved (RSVO):</b> Reserved.
7:0	00h RW	<b>Sub-second Increment Value (SSINC):</b> The value programmed in this field is accumulated every clock cycle (of clk_ptp_i) with the contents of the sub-second register. For example, when PTP clock is 50 MHz (period is 20 ns), you should program 20 (0x14) when the System Time-Nanoseconds register has an accuracy of 1 ns (TSCTRLSSR bit is set). When TSCTRLSSR is clear, the Nanoseconds register has a resolution of ~0.465ns. In this case, you should program a value of 43 (0x2B) that is derived by 20ns/0.465.

### 15.6.106 System Time - Seconds Register (Register 450) (GMAC\_REG\_450)—Offset 708h

The System Time -Seconds register, along with System-TimeNanoseconds register, indicates the current value of the system time maintained by the MAC. Though it is updated on a continuous basis, there is some delay from the actual time because of clock domain transfer latencies.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 708h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>Timestamp Second (TSS):</b> The value in this field indicates the current value in seconds of the System Time maintained by the MAC.

### 15.6.107 System Time - Nanoseconds Register (Register 451) (GMAC\_REG\_451)—Offset 70Ch

The value in this field has the sub second representation of time, with an accuracy of 0.46 ns. When TSCTRLSSR is set, each bit represents 1 ns and the maximum value is 0x3B9A\_C9FF, after which it rolls-over to zero.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 70Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	<b>Reserved (RSV0):</b> Reserved.
30:0	00000000h RO	<b>Timestamp Sub Seconds (TSSS):</b> The value in this field has the sub second representation of time, with an accuracy of 0.46 ns. When bit 9 (TSCTRLSSR) is set in Register 448 (Timestamp Control Register), each bit represents 1 ns and the maximum value is 0x3B9A_C9FF, after which it rolls-over to zero.

### 15.6.108 System Time - Seconds Update Register (Register 452) (GMAC\_REG\_452)—Offset 710h

The System Time - Seconds Update register, along with the System Time - Nanoseconds Update register, initializes or updates the system time maintained by the MAC. You must write both of these registers before setting the TSINIT or TSUPDT bits in the Timestamp Control register.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 710h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>Timestamp Second (TSS):</b> The value in this field indicates the time in seconds to be initialized or added to the system time.

### 15.6.109 System Time - Nanoseconds Update Register (Register 453) (GMAC\_REG\_453)—Offset 714h

The System Time - Nanoseconds Update register, along with the System Time - Seconds Update register, initializes or updates the system time maintained by the MAC. You must write both of these registers before setting the TSINIT or TSUPDT bits in the Timestamp Control register.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 714h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
ADDSUB	TSSS										

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	<b>Add or subtract time (ADDSUB):</b> When this bit is set, the time value is subtracted with the contents of the update register. When this bit is reset, the time value is added with the contents of the update register.
30:0	00000000h RW	<b>Timestamp Sub Second (TSSS):</b> The value in this field has the sub second representation of time, with an accuracy of 0.46 ns. When bit 9 (TSCTRLSSR) is set in Register 448 (Timestamp Control Register), each bit represents 1 ns and the programmed value should not exceed 0x3B9A_C9FF.

### 15.6.110 Timestamp Addend Register (Register 454) (GMAC\_REG\_454)—Offset 718h

This register value is used only when the system time is configured for Fine Update mode (TSCFUPDT bit in Register 448). This register content is added to a 32-bit accumulator in every clock cycle (of the internal 50MHz PTP reference clock) and the system time is updated whenever the accumulator overflows.

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 720h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	<b>Target Time Register Busy (TRGTBUSY):</b> The MAC sets this bit when the PPSCMD field (Bits[3:0]) in Register 459 (PPS Control Register) is programmed to 010 or 011. Programming the PPSCMD field to 010 or 011, instructs the MAC to synchronize the Target Time Registers to the PTP clock domain. The MAC clears this bit after synchronizing the Target Time Registers to the PTP clock domain. The application must not update the Target Time Registers when this bit is read as 1. Otherwise, the synchronization of the previous programmed time gets corrupted. This bit is reserved when the Enable Flexible Pulse-Per-Second Output feature is not selected.
30:0	00000000h RW	<b>Target Timestamp Low (TTSLO):</b> The Target Time Nanoseconds register, along with Target Time Seconds register, is used to schedule an interrupt event (Register 458[1] when Advanced Timestamping is enabled; otherwise, TS interrupt bit in Register14[9]) when the system time exceeds the value programmed in these registers.

### 15.6.113 System Time - Higher Word Seconds Register (Register 457) (GMAC\_REG\_457)—Offset 724h

Contains the most significant 16-bits of the timestamp seconds value.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 724h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	<b>Reserved (RSVO):</b> Reserved.
15:0	0000h RW	<b>Timestamp Higher Word (TSHWR):</b> This field contains the most significant 16-bits of the timestamp seconds value. The register is directly written to initialize the value. This register is incremented when there is an overflow from the 32-bits of the System Time - Seconds register.

### 15.6.114 Timestamp Status Register (Register 458) (GMAC\_REG\_458)—Offset 728h

All non reserved bits are cleared when the host reads this register.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 728h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

4	0b RO/CR	<b>Timestamp Target Time Reached for Target Time PPS1 (TSTARGET1):</b> When set, this bit indicates that the value of system time is greater than or equal to the value specified in Register 480 (PPS1 Target Time High Register) and Register 481 (PPS1 Target Time Low Register).
3	0b RO/CR	<b>Timestamp Target Time Error (TSTRGTERR):</b> This bit is set when the target time, being programmed in Target Time Registers, is already elapsed. This bit is cleared when read by the application.
2	0b RO	<b>Reserved (AUXSTRIG):</b> Reserved.
1	0b RO/CR	<b>Timestamp Target Time Reached (TSTARGET):</b> When set, this bit indicates that the value of system time is greater than or equal to the value specified in the Register 455 (Target Time Seconds Register) and Register 456 (Target Time Nanoseconds Register).
0	0b RO/CR	<b>Timestamp Seconds Overflow (TSSOVF):</b> When set, this bit indicates that the seconds value of the timestamp (when supporting version 2 format) has overflowed beyond 32'hFFFF_FFFF.

### 15.6.115 Bus Mode Register (Register 0) (DMA\_REG\_0)—Offset 1000h

The Bus Mode register establishes the bus operating modes for the DMA.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1000h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00020101h

31	28	24	20	16	12	8	4	0							
0	0	0	0	0	0	0	0	1							
RIX	RSVO	PRWG	TXPR	MB	AAL	PBL8X	USP	RPBL	FB	PR	PBL	ATDS	DSL	DA	SWR

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	<b>RIX:</b> Rebuild INCRx Burst When this bit is set high and the AHB master gets an EBT (Retry, Split, or Losing bus grant), the AHB master interface rebuilds the pending beats of any burst transfer initiated with INCRx. The AHB master interface rebuilds the beats with a combination of specified bursts with INCRx and SINGLE. By default, the AHB master interface rebuilds pending beats of an EBT with an unspecified (INCR) burst. This bit is valid only in the GMAC-AHB configuration. It is reserved in all other configuration.
30	0b RO	<b>Reserved (RSVO):</b> Reserved.
29:28	00b RO	<b>Channel Priority Weights (PRWG):</b> This field sets the priority weights for Channel 0 during the round-robin arbitration between the DMA channels for the system bus. 00: The priority weight is 1. 01: The priority weight is 2. 10: The priority weight is 3. 11: The priority weight is 4.
27	0b RW	<b>Transmit Priority (TXPR):</b> When set, this bit indicates that the transmit DMA has higher priority than the receive DMA during arbitration for the system-side bus.
26	0b RW	<b>Mixed Burst (MB):</b> When this bit is set high and the FB bit is low, the AHB Master interface starts all bursts of length more than 16 with INCR (undefined burst) whereas it reverts to fixed burst transfers (INCRx and SINGLE) for burst length of 16 and less. NOTE: for bandwidth reason, it is recommended to avoid using mixed bursts. Recommended setting is MB=0, FB=1.
25	0b RW	<b>Address Aligned Beats (AAL):</b> When this bit is set high and the FB bit is equal to 1, the AHB interface generates all bursts aligned to the start address LS bits. If the FB bit is equal to 0, the first burst (accessing the data buffer's start address) is not aligned, but subsequent bursts are aligned to the address.
24	0b RW	<b>8xPBL Mode (PBL8X):</b> When set high, this bit multiplies the programmed PBL value (Bits[22:17] and Bits[13:8]) eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. NOTE: This bit function is not backward compatible. Before release 3.50a, this bit was 4xPBL.
23	0b RW	<b>Use Separate PBL (USP):</b> When set high, this bit configures the Rx DMA to use the value configured in Bits[22:17] as PBL. The PBL value in Bits[13:8] is applicable only to the Tx DMA operations. When reset to low, the PBL value in Bits[13:8] is applicable for both DMA engines.

Bit Range	Default & Access	Field Name (ID): Description
22:17	000001b RW	<b>Rx DMA PBL (RPBL):</b> This field indicates the maximum number of beats to be transferred in one Rx DMA transaction. This is the maximum value that is used in a single block Read or Write. The Rx DMA always attempts to burst as specified in the RPBL bit each time it starts a Burst transfer on the host bus. You can program RPBL with values of 1, 2, 4, 8, 16, and 32. Any other value results in undefined behavior. This field is valid and applicable only when USP is set high.
16	0b RW	<b>Fixed Burst (FB):</b> This bit controls whether the AHB or AXI Master interface performs fixed burst transfers or not. When set, the AHB interface uses only SINGLE, INCR4, INCR8, or INCR16 during start of the normal burst transfers. When reset, the AHB or AXI interface uses SINGLE and INCR burst transfer operations. NOTE: for bandwidth reason, it is recommended to avoid using mixed bursts. Recommended setting is MB=0, FB=1.
15:14	00b RW	<b>Priority Ratio (PR):</b> These bits control the priority ratio in the weighted round-robin arbitration between the Rx DMA and Tx DMA. These bits are valid only when Bit 1 (DA) is reset. The priority ratio is Rx:Tx or Tx:Rx depending on whether Bit 27 (TXPR) is reset or set. 00: The Priority Ratio is 1:1. 01: The Priority Ratio is 2:1. 10: The Priority Ratio is 3:1. 11: The Priority Ratio is 4:1.
13:8	000001b RW	<b>Programmable Burst Length (PBL):</b> These bits indicate the maximum number of beats to be transferred in one DMA transaction. This is the maximum value that is used in a single block Read or Write. The DMA always attempts to burst as specified in PBL each time it starts a Burst transfer on the host bus. PBL can be programmed with permissible values of 1, 2, 4, 8, 16, and 32. Any other value results in undefined behavior. When USP is set high, this PBL value is applicable only for Tx DMA transactions. If the number of beats to be transferred is more than 32, then perform the following steps: 1. Set the 8xPBL mode. 2. Set the PBL. For example, if the maximum number of beats to be transferred is 64, then first set 8xPBL to 1 and then set PBL to 8. All values up to 256 are allowed using a combination of PBL and 8xPBL. All PBL values are supported in the full-duplex mode and half-duplex modes.
7	0b RW	<b>Alternate (Enhanced) Descriptor Size (ATDS):</b> When set, the size of the alternate descriptor increases to 32 bytes (8 DWORDS). This is required when the Advanced Timestamp feature or the IPC Full Offload Engine (Type 2) is enabled in the receiver. The enhanced descriptor is not required if the Advanced Timestamp and IPC Full Checksum Offload (Type 2) features are not enabled. In such cases, you can use the 16 bytes descriptor to save 4 bytes of memory. When reset, the descriptor size reverts back to 4 DWORDs (16 bytes). This bit preserves the backward compatibility for the descriptor size.
6:2	00000b RW	<b>Descriptor Skip Length (DSL):</b> This bit specifies the number of Word, Dword, or Lword (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of current descriptor to the start of next descriptor. When the DSL value is equal to zero, then the descriptor table is taken as contiguous by the DMA in Ring mode.
1	0b RW	<b>DMA Arbitration Scheme (DA):</b> This bit specifies the arbitration scheme between the transmit and receive paths of Channel 0. 0: Weighted round-robin with Rx:Tx or Tx:Rx. The priority between the paths is according to the priority specified in bits 15:14 (PR) and priority weights specified in Bit 27 (TXPR). 1: Fixed priority. The transmit path has priority over receive path when Bit 27 (TXPR) is set. Otherwise, receive path has priority over the transmit path.
0	1b RW	<b>Software Reset (SWR):</b> When this bit is set, the MAC DMA Controller resets the logic and all internal registers of the MAC. It is cleared automatically after the reset operation has completed in all of the MAC clock domains. Before reprogramming any register of the MAC, you should read a zero (0) value in this bit. NOTE: The reset operation is completed only when all resets in all active clock domains are de-asserted. Therefore, it is essential that all the PHY inputs clocks (applicable for the selected PHY interface) are present for the software reset completion.

### 15.6.116 Transmit Poll Demand Register (Register 1) (DMA\_REG\_1)— Offset 1004h

The Transmit Poll Demand register enables the Tx DMA to check whether or not the DMA owns the current descriptor. The Transmit Poll Demand command is given to wake up the Tx DMA if it is in the Suspend mode. The Tx DMA can go into the Suspend mode because of an Underflow error in a transmitted frame or the unavailability of descriptors owned by it. You can give this command anytime and the Tx DMA resets this command when it again starts fetching the current descriptor from host memory.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1004h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000b RW	<b>Transmit Poll Demand (TPD):</b> When these bits are written with any value, the DMA reads the current descriptor pointed to by Register 18 (Current Host Transmit Descriptor Register). If that descriptor is not available (owned by the Host), the transmission returns to the Suspend state and the Bit 2 (TU) of Register 5 (Status Register) is asserted. If the descriptor is available, the transmission resumes.

### 15.6.117 Receive Poll Demand Register (Register 2) (DMA\_REG\_2)— Offset 1008h

The Receive Poll Demand register enables the receive DMA to check for new descriptors. This command is used to wake up the Rx DMA from the Suspend state. The RxDMA can go into the Suspend state only because of the unavailability of descriptors it owns.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1008h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000b RW	<b>Receive Poll Demand (RPD)</b> : When these bits are written with any value, the DMA reads the current descriptor pointed to by Register 19 (Current Host Receive Descriptor Register). If that descriptor is not available (owned by the Host), the reception returns to the Suspended state and the Bit 7 (RU) of Register 5 (Status Register) is not asserted. If the descriptor is available, the Rx DMA returns to the active state.

### 15.6.118 Receive Descriptor List Address Register (Register 3) (DMA\_REG\_3)—Offset 100Ch

The Receive Descriptor List Address register points to the start of the Receive Descriptor List. The descriptor lists reside in the host's physical memory space and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, Bit 1 (SR) is set to zero in Register 6 (Operation Mode Register). When stopped, this register can be written with a new descriptor list address. When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address. If this register is not changed when the SR bit is set to 0, then the DMA takes the descriptor address where it was stopped earlier.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 100Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RW	<b>Start of Receive List (RDESLA_32BIT)</b> : This field contains the base address of the first descriptor in the Receive Descriptor list. The LSB bits (1:0) for 32-bit bus width are ignored and internally taken as all-zero by the DMA. Therefore, these LSB bits are read-only (RO).
1:0	00b RO	<b>Reserved (RSVO)</b> : Reserved.

### 15.6.119 Transmit Descriptor List Address Register (Register 4) (DMA\_REG\_4)—Offset 1010h

The Transmit Descriptor List Address register points to the start of the Transmit Descriptor List. The descriptor lists reside in the host's physical memory space and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding

LSB to low. You can write to this register only when the Tx DMA has stopped, that is, Bit 13 (ST) is set to zero in Register 6 (Operation Mode Register). When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly programmed descriptor base address. If this register is not changed when the ST bit is set to 0, then the DMA takes the descriptor address where it was stopped earlier.

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1010h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

31:2	00000000h RW	<b>Start of Transmit List (TDESLA_32BIT):</b> This field contains the base address of the first descriptor in the Transmit Descriptor list. The LSB bits (1:0) for 32-bit bus width are ignored and are internally taken as all-zero by the DMA. Therefore, these LSB bits are read-only (RO).
1:0	00b RO	<b>Reserved (RSV0):</b> Reserved.

**15.6.120 Status Register (Register 5) (DMA\_REG\_5)—Offset 1014h**

The Status register contains all status bits that the DMA reports to the host. The Software driver reads this register during an interrupt service routine or polling. Most of the fields in this register cause the host to be interrupted. The bits of this register are not cleared when read. Writing 1'b1 to (unreserved) Bits[16:0] of this register clears these bits and writing 1'b0 has no effect. Each field (Bits[16:0]) can be masked by masking the appropriate bit in Register 7 (Interrupt Enable Register).

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1014h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

16	0b RW	<b>Normal Interrupt Summary (NIS):</b> Normal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in Register 7 (Interrupt Enable Register): Register 5[0]: Transmit Interrupt Register 5[2]: Transmit Buffer Unavailable Register 5[6]: Receive Interrupt Register 5[14]: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in Register 7) affect the Normal Interrupt Summary bit. This is a sticky bit and must be cleared (by writing 1 to this bit) each time a corresponding bit, which causes NIS to be set, is cleared.

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW	<b>Abnormal Interrupt Summary (AIS):</b> Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in Register 7 (Interrupt Enable Register): Register 5[1]: Transmit Process Stopped Register 5[3]: Transmit Jabber Timeout Register 5[4]: Receive FIFO Overflow Register 5[5]: Transmit Underflow Register 5[7]: Receive Buffer Unavailable Register 5[8]: Receive Process Stopped Register 5[9]: Receive Watchdog Timeout Register 5[10]: Early Transmit Interrupt Register 5[13]: Fatal Bus Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit and must be cleared each time a corresponding bit, which causes AIS to be set, is cleared.
14	0b RW	<b>Early Receive Interrupt (ERI):</b> This bit indicates that the DMA had filled the first data buffer of the packet. Bit 6 (RI) of this register automatically clears this bit.
13	0b RW	<b>Fatal Bus Error Interrupt (FBI):</b> This bit indicates that a bus error occurred, as described in Bits[25:23]. When this bit is set, the corresponding DMA engine disables all of its bus accesses.
12:11	00b RO	<b>Reserved (RSV0):</b> Reserved.
10	0b RW	<b>Early Transmit Interrupt (ETI):</b> This bit indicates that the frame to be transmitted is fully transferred to the MTL Transmit FIFO.
9	0b RW	<b>Receive Watchdog Timeout (RWT):</b> This bit is asserted when a frame with length greater than 2,048 bytes is received (10, 240 when Jumbo Frame mode is enabled).
8	0b RW	<b>Receive Process Stopped (RPS):</b> This bit is asserted when the Receive Process enters the Stopped state.
7	0b RW	<b>Receive Buffer Unavailable (RU):</b> This bit indicates that the host owns the Next Descriptor in the Receive List and the DMA cannot acquire it. The Receive Process is suspended. To resume processing Receive descriptors, the host should change the ownership of the descriptor and issue a Receive Poll Demand command. If no Receive Poll Demand is issued, the Receive Process resumes when the next recognized incoming frame is received. This bit is set only when the previous Receive Descriptor is owned by the DMA.
6	0b RW	<b>Receive Interrupt (RI):</b> This bit indicates that the frame reception is complete. When reception is complete, the Bit 31 of RDES1 (Disable Interrupt on Completion) is reset in the last Descriptor, and the specific frame status information is updated in the descriptor. The reception remains in the Running state.
5	0b RW	<b>Transmit Underflow (UNF):</b> This bit indicates that the Transmit Buffer had an Underflow during frame transmission. Transmission is suspended and an Underflow Error TDES0[1] is set.
4	0b RW	<b>Receive Overflow (OVF):</b> This bit indicates that the Receive Buffer had an Overflow during frame reception. If the partial frame is transferred to the application, the overflow status is set in RDES0[11].
3	0b RW	<b>Transmit Jabber Timeout (TJT):</b> This bit indicates that the Transmit Jabber Timer expired, which happens when the frame size exceeds 2,048 (10,240 bytes when the Jumbo frame is enabled). When the Jabber Timeout occurs, the transmission process is aborted and placed in the Stopped state. This causes the Transmit Jabber Timeout TDES0[14] flag to assert.
2	0b RW	<b>Transmit Buffer Unavailable (TU):</b> This bit indicates that the host owns the Next Descriptor in the Transmit List and the DMA cannot acquire it. Transmission is suspended. Bits[22:20] explain the Transmit Process state transitions. To resume processing Transmit descriptors, the host should change the ownership of the descriptor by setting TDES0[31] and then issue a Transmit Poll Demand command.
1	0b RW	<b>Transmit Process Stopped (TPS):</b> This bit is set when the transmission is stopped.

Bit Range	Default & Access	Field Name (ID): Description
0	0b RW	<b>Transmit Interrupt (TI)</b> : This bit indicates that the frame transmission is complete. When transmission is complete, the Bit 31 (Interrupt on Completion) of TDES1 is reset in the first descriptor, and the specific frame status information is updated in the descriptor.

### 15.6.121 Operation Mode Register (Register 6) (DMA\_REG\_6)—Offset 1018h

The Operation Mode register establishes the Transmit and Receive operating modes and commands. This register should be the last CSR to be written as part of the DMA initialization.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1018h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSV8	DT	RSF	DFF	RFA_2	RFD_2	TSF	FTF	RSV5
				TTC	ST	RFD	RFA	EFC
								FEF
								FUF
								RSV1
								RTC
								OSF
								SR
								RSV0

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	<b>Reserved (RSV8)</b> : Reserved.
26	0b RW	<b>Disable Dropping of TCP/IP Checksum Error Frames (DT)</b> : When this bit is set, the MAC does not drop the frames which only have errors detected by the Receive Checksum Offload engine. Such frames do not have any errors (including FCS error) in the Ethernet frame received by the MAC but have errors only in the encapsulated payload. When this bit is reset, all error frames are dropped if the FEF bit is reset.
25	0b RW	<b>Receive Store and Forward (RSF)</b> : When this bit is set, the MTL reads a frame from the Rx FIFO only after the complete frame has been written to it, ignoring the RTC bits. When this bit is reset, the Rx FIFO operates in the cut-through mode, subject to the threshold specified by the RTC bits.
24	0b RW	<b>Disable Flushing of Received Frames (DFF)</b> : When this bit is set, the Rx DMA does not flush any frames because of the unavailability of receive descriptors or buffers as it does normally when this bit is reset.
23	0b RW	<b>MSB of Threshold for Activating Flow Control (RFA_2)</b> : If the Rx FIFO depth is 8 KB or more, this bit (when set) provides additional threshold levels for activating the flow control in both half-duplex and full-duplex modes. This bit (as Most Significant Bit) along with the RFA (Bits[10:9]) gives the following thresholds for activating flow control: 100: Full minus 5 KB, that is, FULL - 5KB 101: Full minus 6 KB, that is, FULL - 6KB 110: Full minus 7 KB, that is, FULL - 7KB 111: Reserved

Bit Range	Default & Access	Field Name (ID): Description
22	0b RW	<b>MSB of Threshold for Deactivating Flow Control (RFD_2)</b> : If the Rx FIFO size is 8 KB or more, this bit (when set) provides additional threshold levels for deactivating the flow control in both half-duplex and full-duplex modes. This bit (as Most Significant Bit) along with the RFD (Bits[12:11]) gives the following thresholds for deactivating flow control: 100: Full minus 5 KB, that is, FULL - 5KB 101: Full minus 6 KB, that is, FULL - 6KB 110: Full minus 7 KB, that is, FULL - 7KB 111: Reserved
21	0b RW	<b>Transmit Store and Forward (TSF)</b> : When this bit is set, transmission starts when a full frame resides in the MTL Transmit FIFO. When this bit is set, the TTC values specified in Bits[16:14] are ignored. This bit should be changed only when the transmission is stopped.
20	0b RW	<b>Flush Transmit FIFO (FTF)</b> : When this bit is set, the transmit FIFO controller logic is reset to its default values and thus all data in the Tx FIFO is lost or flushed. This bit is cleared internally when the flushing operation is completed. The Operation Mode register should not be written to until this bit is cleared. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt frame transmission. NOTE: The flush operation is complete only when the Tx FIFO is emptied of its contents and all the pending Transmit Status of the transmitted frames are accepted by the host. To complete this flush operation, the PHY transmit clock is required to be active.
19:17	000b RO	<b>Reserved (RSV5)</b> : Reserved.
16:14	000b RW	<b>Transmit Threshold Control (TTC)</b> : These bits control the threshold level of the MTL Transmit FIFO. Transmission starts when the frame size within the MTL Transmit FIFO is larger than the threshold. In addition, full frames with a length less than the threshold are also transmitted. These bits are used only when Bit 21 (TSF) is reset. 000: 64 001: 128 010: 192 011: 256 100: 40 101: 32 110: 24 111: 16
13	0b RW	<b>Start or Stop Transmission Command (ST)</b> : When this bit is set, transmission is placed in the Running state, and the DMA checks the Transmit List at the current position for a frame to be transmitted. Descriptor acquisition is attempted either from the current position in the list, which is the Transmit List Base Address set by Register 4 (Transmit Descriptor List Address Register), or from the position retained when transmission was stopped previously. If the DMA does not own the current descriptor, transmission enters the Suspended state and Bit 2 (Transmit Buffer Unavailable) of Register 5 (Status Register) is set. The Start Transmission command is effective only when transmission is stopped. If the command is issued before setting Register 4 (Transmit Descriptor List Address Register), then the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current frame. The Next Descriptor position in the Transmit List is saved, and it becomes the current position when transmission is restarted. To change the list address, you need to program Register 4 (Transmit Descriptor List Address Register) with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current frame is complete or the transmission is in the Suspended state.
12:11	00b RW	<b>Threshold for Deactivating Flow Control (RFD)</b> : These bits control the threshold (Fill-level of Rx FIFO) at which the flow control is de-asserted after activation (in half-duplex and full-duplex). 00: Full minus 1 KB, that is, FULL - 1KB 01: Full minus 2 KB, that is, FULL - 2KB 10: Full minus 3 KB, that is, FULL - 3KB 11: Full minus 4 KB, that is, FULL - 4KB The de-assertion is effective only after flow control is asserted. If the Rx FIFO is 8 KB or more, an additional bit (RFD[2]) is used for more threshold levels as described in Bit 22.

Bit Range	Default & Access	Field Name (ID): Description
10:9	00b RW	<b>Threshold for Activating Flow Control (RFA):</b> These bits control the threshold (Fill level of Rx FIFO) at which the flow control is activated (in half-duplex and full-duplex). 00: Full minus 1 KB, that is, FULL - 1KB 01: Full minus 2 KB, that is, FULL - 2KB 10: Full minus 3 KB, that is, FULL - 3KB 11: Full minus 4 KB, that is, FULL - 4KB These values only apply to Rx FIFOs of 4 KB or more when the EFC bit is set high. If the Rx FIFO is 8 KB or more, an additional bit (RFA[2]) is used for more threshold levels as described in Bit 23.
8	0b RW	<b>Enable HW Flow Control (EFC):</b> When this bit is set, the flow control signal operation based on the fill-level of Rx FIFO is enabled. When reset, the flow control operation is disabled. This bit is not used (reserved and always reset) when the Rx FIFO is less than 4 KB.
7	0b RW	<b>Forward Error Frames (FEF):</b> When this bit is reset, the Rx FIFO drops frames with error status (CRC error, collision error, GMII_ER, giant frame, watchdog timeout, or overflow). However, if the start byte (write) pointer of a frame is already transferred to the read controller side (in Threshold mode), then the frame is not dropped. When the FEF bit is set, all frames except runt error frames are forwarded to the DMA. If the Bit 25 (RSF) is set and the Rx FIFO overflows when a partial frame is written, then the frame is dropped irrespective of the FEF bit setting. However, if the Bit 25 (RSF) is reset and the Rx FIFO overflows when a partial frame is written, then a partial frame may be forwarded to the DMA.
6	0b RW	<b>Forward Undersized Good Frames (FUF):</b> When set, the Rx FIFO forwards Undersized frames (frames with no Error and length less than 64 bytes) including pad-bytes and CRC. When reset, the Rx FIFO drops all frames of less than 64 bytes, unless a frame is already transferred because of the lower value of Receive Threshold, for example, RTC = 01.
5	0b RO	<b>Reserved (RSV1):</b> Reserved.
4:3	00b RW	<b>Receive Threshold Control (RTC):</b> These two bits control the threshold level of the MTL Receive FIFO. Transfer (request) to DMA starts when the frame size within the MTL Receive FIFO is larger than the threshold. In addition, full frames with length less than the threshold are transferred automatically. These bits are valid only when the RSF bit is zero, and are ignored when the RSF bit is set to 1. 00: 64 01: 32 10: 96 11: 128
2	0b RW	<b>Operate on Second Frame (OSF):</b> When this bit is set, it instructs the DMA to process the second frame of the Transmit data even before the status for the first frame is obtained.
1	0b RW	<b>Start or Stop Receive (SR):</b> When this bit is set, the Receive process is placed in the Running state. The DMA attempts to acquire the descriptor from the Receive list and processes the incoming frames. The descriptor acquisition is attempted from the current position in the list, which is the address set by Register 3 (Receive Descriptor List Address Register) or the position retained when the Receive process was previously stopped. If the DMA does not own the descriptor, reception is suspended and Bit 7 (Receive Buffer Unavailable) of Register 5 (Status Register) is set. The Start Receive command is effective only when the reception has stopped. If the command is issued before setting Register 3 (Receive Descriptor List Address Register), the DMA behavior is unpredictable. When this bit is cleared, the Rx DMA operation is stopped after the transfer of the current frame. The next descriptor position in the Receive list is saved and becomes the current position after the Receive process is restarted. The Stop Receive command is effective only when the Receive process is in either the Running (waiting for receive packet) or in the Suspended state.
0	0b RO	<b>Reserved (RSV0):</b> Reserved.

### 15.6.122 Interrupt Enable Register (Register 7) (DMA\_REG\_7)—Offset 101Ch

The Interrupt Enable register enables the interrupts reported by Register 5 (Status Register). Setting a bit to 1'b1 enables a corresponding interrupt. After a hardware or software reset, all interrupts are disabled.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 101Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0000h RO	<b>Reserved (RSV1):</b> Reserved.
16	0b RW	<b>Normal Interrupt Summary Enable (NIE):</b> When this bit is set, normal interrupt summary is enabled. When this bit is reset, normal interrupt summary is disabled. This bit enables the following interrupts in Register 5 (Status Register): Register 5[0]: Transmit Interrupt Register 5[2]: Transmit Buffer Unavailable Register 5[6]: Receive Interrupt Register 5[14]: Early Receive Interrupt
15	0b RW	<b>Abnormal Interrupt Summary Enable (AIE):</b> When this bit is set, abnormal interrupt summary is enabled. When this bit is reset, the abnormal interrupt summary is disabled. This bit enables the following interrupts in Register 5 (Status Register): Register 5[1]: Transmit Process Stopped Register 5[3]: Transmit Jabber Timeout Register 5[4]: Receive Overflow Register 5[5]: Transmit Underflow Register 5[7]: Receive Buffer Unavailable Register 5[8]: Receive Process Stopped Register 5[9]: Receive Watchdog Timeout Register 5[10]: Early Transmit Interrupt Register 5[13]: Fatal Bus Error
14	0b RW	<b>Early Receive Interrupt Enable (ERE):</b> When this bit is set with Normal Interrupt Summary Enable (Bit 16), the Early Receive Interrupt is enabled. When this bit is reset, the Early Receive Interrupt is disabled.
13	0b RW	<b>Fatal Bus Error Enable (FBE):</b> When this bit is set with Abnormal Interrupt Summary Enable (Bit 15), the Fatal Bus Error Interrupt is enabled. When this bit is reset, the Fatal Bus Error Enable Interrupt is disabled.
12:11	00b RO	<b>Reserved (RSV0):</b> Reserved.
10	0b RW	<b>Early Transmit Interrupt Enable (ETE):</b> When this bit is set with an Abnormal Interrupt Summary Enable (Bit 15), the Early Transmit Interrupt is enabled. When this bit is reset, the Early Transmit Interrupt is disabled.
9	0b RW	<b>Receive Watchdog Timeout Enable (RWE):</b> When this bit is set with Abnormal Interrupt Summary Enable (Bit 15), the Receive Watchdog Timeout Interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout Interrupt is disabled.
8	0b RW	<b>Receive Stopped Enable (RSE):</b> When this bit is set with Abnormal Interrupt Summary Enable (Bit 15), the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped Interrupt is disabled.

Bit Range	Default & Access	Field Name (ID): Description
27:17	000h RO	<b>FIFO Overflow Counter (OVFFRCNT)</b> : This field indicates the number of frames missed by the application due to buffer overflow conditions and runt frames (good frames of less than 64 bytes) dropped by the MTL. The counter is cleared when this register is read with the LS Byte enabled.
16	0b RO	<b>Missed Frame Counter Overflow (MISCNTOVF)</b> : Reserved.
15:0	0000h RO	<b>Missed Frame Counter (MISFRMCNT)</b> : This field indicates the number of frames missed by the controller because of the Host Receive Buffer being unavailable. This counter is incremented each time the DMA discards an incoming frame. The counter is cleared when this register is read with the LS Byte enabled.

### 15.6.124 Receive Interrupt Watchdog Timer Register (Register 9) (DMA\_REG\_9)—Offset 1024h

This register, when written with non-zero value, enables the watchdog timer for the Receive Interrupt (Bit 6) of Register 5 (Status Register).

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1024h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSV0							RIWT	

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	<b>Reserved (RSV0)</b> : Reserved.
7:0	00h RW	<b>RI Watchdog Timer Count (RIWT)</b> : This bit indicates the number of system clock cycles multiplied by 256 for which the watchdog timer is set. The watchdog timer gets triggered with the programmed value after the Rx DMA completes the transfer of a frame for which the RI status bit is not set because of the setting in the corresponding descriptor RDES1[31]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per RDES1[31] of any received frame.

### 15.6.125 AHB Status Register (Register 11) (DMA\_REG\_11)—Offset 102Ch

This register provides the active status of the AHB master interface interface's read and write channels. This register is useful for debugging purposes.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 102Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	00000000h RO	<b>Reserved (RSVO):</b> Reserved.
0	0b RO	<b>AHB Master Status (AXWHSTS):</b> This bit indicates that the AHB master interface FSMs are in the non-idle state.

### 15.6.126 Current Host Transmit Descriptor Register (Register 18) (DMA\_REG\_18)—Offset 1048h

The Current Host Transmit Descriptor register points to the start address of the current Transmit Descriptor read by the DMA.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1048h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>Host Transmit Descriptor Address Pointer (CURTDESAPTR):</b> Cleared on Reset. Pointer updated by the DMA during operation.

### 15.6.127 Current Host Receive Descriptor Register (Register 19) (DMA\_REG\_19)—Offset 104Ch

The Current Host Receive Descriptor register points to the start address of the current Receive Descriptor read by the DMA.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 104Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>Host Receive Descriptor Address Pointer (CURRDESAPTR):</b> Cleared on Reset. Pointer updated by the DMA during operation.

### 15.6.128 Current Host Transmit Buffer Address Register (Register 20) (DMA\_REG\_20)—Offset 1050h

The Current Host Transmit Buffer Address register points to the current Transmit Buffer Address being read by the DMA.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1050h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>Host Transmit Buffer Address Pointer (CURTBUFAPTR):</b> Cleared on Reset. Pointer updated by the DMA during operation.

### 15.6.129 Current Host Receive Buffer Address Register (Register 21) (DMA\_REG\_21)—Offset 1054h

The Current Host Receive Buffer Address register points to the current Receive Buffer address being read by the DMA.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1054h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:6] + 10h

## 15.7 MAC Descriptor Details

This section provides bit-field definitions of the current transmit and receive descriptor registers described in [Section 15.6](#), specifically:

- [Current Host Transmit Descriptor Register \(Register 18\) \(DMA\\_REG\\_18\)](#)—Offset 1048h
- [Current Host Receive Descriptor Register \(Register 19\) \(DMA\\_REG\\_19\)](#)—Offset 104Chh

### 15.7.1 Descriptor Overview

The descriptor structure has 8 DWORDS (32-bytes). The features of the descriptor structure are:

- The descriptor structure is implemented to support buffers of up to 8 KB (useful for Jumbo frames).
- There is a re-assignment of control and status bits in TDES0, TDES1, RDES0 (Advanced timestamp or IPC full offload configuration), and RDES1.
- The transmit descriptor stores the timestamp in TDES6 and TDES7.
- This receive descriptor structure is also used for storing the extended status (RDES4) and timestamp (RDES6 and RDES7).
- You can select one of the following options for descriptor structure:
  - If timestamping is enabled in Register 448 (Timestamp Control Register) or Checksum Offload is enabled in Register 0 (MAC Configuration Register), the software needs to allocate 32-bytes (8 DWORDS) of memory for every descriptor. For this, the software should set Bit 7 (Alternate Descriptor Size) of Register 0 (Bus Mode Register).
  - If timestamping or Checksum Offload is not enabled, the extended descriptors (DES4 to DES7) are not required. Therefore, the software can use alternate descriptors with the default size of 16 bytes.

### 15.7.2 Descriptor Endianness

The descriptor addresses must be aligned to the bus width (Word, DWord, or LWord for 32-bit bus). The data bus is configured for little-endian format.

The structure of the descriptor with respect to the data bus endianness is as follows:

- Data Bus Endianness: Little-endian
- Descriptor Endianness: Same-endian
- Data Bus: 32-bit data bus

### 15.7.3 Transmit Descriptor

The transmit descriptor structure is shown in [Figure 29](#). The application software must program the control bits TDES0[31:18] during descriptor initialization. When the DMA updates the descriptor, it writes back all the control bits except the OWN bit (which it

clears) and updates the status bits[7:0]. The contents of the transmitter descriptor word 0 (TDES0) through word 3 (TDES3) are given in [Table 89](#) through [Table 91](#), respectively.

The snapshot of the timestamp to be taken can be enabled for a given frame by setting Bit 25 (TTSE) of TDES0. When the descriptor is closed (that is, when the OWN bit is cleared), the timestamp is written into TDES6 and TDES7. This is indicated by the status Bit 17 (TTSS) of TDES0 shown in [Figure 29](#). The contents of TDES6 and TDES7 are mentioned in [Table 93](#) and [Table 94](#).

**Figure 29. Transmit Descriptor Fields**

The DMA always reads or fetches four DWORDS of the descriptor from system memory to obtain the buffer and control information as shown in [Figure 30](#). When the AV feature is enabled, TDES0 has additional control bits[6:3] for Channel 1 and Channel 2. For Channel 0, Bits [6:3] are ignored. Bits [6:3] are described in [Table 89](#).

Figure 30. Transmit Descriptor Fetch (Read)

Table 89. Transmit Descriptor Word 0 (TDES0) (Sheet 1 of 3)

Bit	Description
31	OWN: Own Bit When set, this bit indicates that the descriptor is owned by the DMA. When this bit is reset, it indicates that the descriptor is owned by the Host. The DMA clears this bit either when it completes the frame transmission or when the buffers allocated in the descriptor are read completely. The ownership bit of the frame's first descriptor must be set after all subsequent descriptors belonging to the same frame have been set. This avoids a possible race condition between fetching a descriptor and the driver setting an ownership bit.
30	IC: Interrupt on Completion When set, this bit sets the Transmit Interrupt (Register 5[0]) after the present frame has been transmitted.
29	LS: Last Segment When set, this bit indicates that the buffer contains the last segment of the frame. When this bit is set, the TBS1 or TBS2 field in TDES1 should have a non-zero value.
28	FS: First Segment When set, this bit indicates that the buffer contains the first segment of a frame.
27	DC: Disable CRC When this bit is set, the MAC does not append a cyclic redundancy check (CRC) to the end of the transmitted frame. This is valid only when the first segment (TDES0[28]) is set.
26	DP: Disable Pad When set, the MAC does not automatically add padding to a frame shorter than 64 bytes. When this bit is reset, the DMA automatically adds padding and CRC to a frame shorter than 64 bytes, and the CRC field is added despite the state of the DC (TDES0[27]) bit. This is valid only when the first segment (TDES0[28]) is set.
25	TTSE: Transmit Timestamp Enable When set, this bit enables IEEE1588 hardware timestamping for the transmit frame referenced by the descriptor. This field is valid only when the Enable IEEE1588 Timestamping option is selected during core configuration and the First Segment control bit (TDES0[28]) is set.
24	CRCR: CRC Replacement Control When set, the MAC replaces the last four bytes of the transmitted packet with recalculated CRC bytes. The host should ensure that the CRC bytes are present in the frame being transferred from the Transmit Buffer. This bit is valid when the Enable SA, VLAN, and CRC Insertion on TX option is selected during core configuration and the First Segment control bit (TDES0[28]) is set.

Table 89. Transmit Descriptor Word 0 (TDES0) (Sheet 2 of 3)

Bit	Description
23:22	<p>CIC: Checksum Insertion Control</p> <p>These bits control the checksum calculation and insertion. The following list describes the bit encoding:</p> <ul style="list-style-type: none"> <li>2'b00: Checksum Insertion Disabled.</li> <li>2'b01: Only IP header checksum calculation and insertion are enabled.</li> <li>2'b10: IP header checksum and payload checksum calculation and insertion are enabled, but pseudo-header checksum is not calculated in hardware.</li> <li>2'b11: IP Header checksum and payload checksum calculation and insertion are enabled, and pseudo-header checksum is calculated in hardware.</li> </ul> <p>This field is valid when the Enable Transmit Full TCP/IP Checksum (Type 2) option is selected during core configuration and the First Segment control bit (TDES0[28]) is set.</p>
21	<p>TER: Transmit End of Ring</p> <p>When set, this bit indicates that the descriptor list reached its final descriptor. The DMA returns to the base address of the list, creating a descriptor ring.</p>
20	<p>TCH: Second Address Chained</p> <p>When set, this bit indicates that the second address in the descriptor is the Next Descriptor address rather than the second buffer address. When TDES0[20] is set, TBS2 (TDES1[28:16]) is a "don't care" value. TDES0[21] takes precedence over TDES0[20].</p>
19:18	<p>VLIC: VLAN Insertion Control</p> <p>When set, these bits request the MAC to perform VLAN tagging or untagging before transmitting the frames. If the frame is modified for VLAN tags, the MAC automatically recalculates and replaces the CRC bytes.</p> <p>The following list describes the values of these bits:</p> <ul style="list-style-type: none"> <li>2'b00: Do not add a VLAN tag.</li> <li>2'b01: Remove the VLAN tag from the frames before transmission. This option should be used only with the VLAN frames.</li> <li>2'b10: Insert a VLAN tag with the tag value programmed in Register 353 (VLAN Tag Inclusion or Replacement Register).</li> <li>2'b11: Replace the VLAN tag in frames with the Tag value programmed in Register 353 (VLAN Tag Inclusion or Replacement Register). This option should be used only with the VLAN frames.</li> </ul> <p>These bits are valid when the Enable SA, VLAN, and CRC Insertion on TX option is selected during core configuration and the First Segment control bit (TDES0[28]) is set.</p>
17	<p>TTSS: Transmit Timestamp Status</p> <p>This field is used as a status bit to indicate that a timestamp was captured for the described transmit frame. When this bit is set, TDES2 and TDES3 have a timestamp value captured for the transmit frame. This field is only valid when the descriptor's Last Segment control bit (TDES0[29]) is set.</p>
16	<p>IHE: IP Header Error</p> <p>When set, this bit indicates that the MAC transmitter detected an error in the IP datagram header. The transmitter checks the header length in the IPv4 packet against the number of header bytes received from the application and indicates an error status if there is a mismatch. For IPv6 frames, a header error is reported if the main header length is not 40 bytes. Furthermore, the Ethernet Length/Type field value for an IPv4 or IPv6 frame must match the IP header version received with the packet. For IPv4 frames, an error status is also indicated if the Header Length field has a value less than 0x5.</p>
15	<p>ES: Error Summary</p> <p>Indicates the logical OR of the following bits:</p> <ul style="list-style-type: none"> <li>TDES0[14]: Jabber Timeout</li> <li>TDES0[13]: Frame Flush</li> <li>TDES0[11]: Loss of Carrier</li> <li>TDES0[10]: No Carrier</li> <li>TDES0[9]: Late Collision</li> <li>TDES0[8]: Excessive Collision</li> <li>TDES0[2]: Excessive Deferral</li> <li>TDES0[1]: Underflow Error</li> <li>TDES0[16]: IP Header Error</li> <li>TDES0[12]: IP Payload Error</li> </ul>
14	<p>JT: Jabber Timeout</p> <p>When set, this bit indicates the MAC transmitter has experienced a jabber time-out. This bit is only set when Bit 22 (Jabber Disable) of Register 0 (MAC Configuration Register) is not set.</p>

Table 89. Transmit Descriptor Word 0 (TDES0) (Sheet 3 of 3)

Bit	Description
13	<p>FF: Frame Flushed</p> <p>When set, this bit indicates that the DMA or MTL flushed the frame because of a software Flush command given by the CPU.</p>
12	<p>IPE: IP Payload Error</p> <p>When set, this bit indicates that MAC transmitter detected an error in the TCP, UDP, or ICMP IP datagram payload.</p> <p>The transmitter checks the payload length received in the IPv4 or IPv6 header against the actual number of TCP, UDP, or ICMP packet bytes received from the application and issues an error status in case of a mismatch.</p>
11	<p>LC: Loss of Carrier</p> <p>When set, this bit indicates that a loss of carrier occurred during frame transmission (that is, the gmii_crs_i signal was inactive for one or more transmit clock periods during frame transmission). This is valid only for the frames transmitted without collision when the MAC operates in the half-duplex mode.</p>
10	<p>NC: No Carrier</p> <p>When set, this bit indicates that the Carrier Sense signal from the PHY was not asserted during transmission.</p>
9	<p>LC: Late Collision</p> <p>When set, this bit indicates that frame transmission is aborted because of a collision occurring after the collision window (64 byte-times, including preamble, in MII mode and 512 byte-times, including preamble and carrier extension, in GMII mode). This bit is not valid if the Underflow Error bit is set.</p>
8	<p>EC: Excessive Collision</p> <p>When set, this bit indicates that the transmission was aborted after 16 successive collisions while attempting to transmit the current frame. If Bit 9 (Disable Retry) bit in the Register 0 (MAC Configuration Register) is set, this bit is set after the first collision, and the transmission of the frame is aborted.</p>
7	<p>VF: VLAN Frame</p> <p>When set, this bit indicates that the transmitted frame is a VLAN-type frame.</p>
6:3	<p>CC: Collision Count (Status field)</p> <p>These status bits indicate the number of collisions that occurred before the frame was transmitted. This count is not valid when the Excessive Collisions bit (TDES0[8]) is set. The core updates this status field only in the half-duplex mode.</p> <p>-or-</p> <p>SLOTNUM: Slot Number Control Bits in AV Mode</p> <p>These bits indicate the slot interval in which the data should be fetched from the corresponding buffers addressed by TDES2 or TDES3.</p> <p>When the transmit descriptor is fetched, the DMA compares the slot number value in this field with the slot interval maintained in the core (Register 11xx). It fetches the data from the buffers only if there is a match in values. These bits are valid only for AV channels (not Channel 0).</p>
2	<p>ED: Excessive Deferral</p> <p>When set, this bit indicates that the transmission has ended because of excessive deferral of over 24,288 bit times (155,680 bits times in 1,000-Mbps mode or if Jumbo Frame is enabled) if Bit 4 (Deferral Check) bit in Register 0 (MAC Configuration Register) is set high.</p>
1	<p>UF: Underflow Error</p> <p>When set, this bit indicates that the MAC aborted the frame because the data arrived late from the Host memory. Underflow Error indicates that the DMA encountered an empty transmit buffer while transmitting the frame. The transmission process enters the Suspended state and sets both Transmit Underflow (Register 5[5]) and Transmit Interrupt (Register 5[0]).</p>
0	<p>DB: Deferred Bit</p> <p>When set, this bit indicates that the MAC defers before transmission because of the presence of carrier. This bit is valid only in the half-duplex mode.</p>

**Table 90. Transmit Descriptor Word 1 (TDES1)**

Bit	Description
31:29	<p>SAIC: SA Insertion Control</p> <p>These bits request the MAC to add or replace the Source Address field in the Ethernet frame with the value given in the MAC Address 0 register. If the Source Address field is modified in a frame, the MAC automatically recalculates and replaces the CRC bytes.</p> <p>The Bit 31 specifies the MAC Address Register (1 or 0) value that is used for Source Address insertion or replacement. The following list describes the values of Bits[30:29]:</p> <ul style="list-style-type: none"> <li>2'b00: Do not include the source address.</li> <li>2'b01: Include or insert the source address. For reliable transmission, the application must provide frames without source addresses.</li> <li>2'b10: Replace the source address. For reliable transmission, the application must provide frames with source addresses.</li> <li>2'b11: Reserved</li> </ul> <p>These bits are valid in the GMAC-DMA, GMAC-AXI, and GMAC-AHB configurations when the Enable SA, VLAN, and CRC Insertion on TX is selected during core configuration and when the First Segment control bit (TDES0[28]) is set.</p>
28:16	<p>TBS2: Transmit Buffer 2 Size</p> <p>This field indicates the second data buffer size in bytes. This field is not valid if TDES0[20] is set.</p>
15:13	Reserved
12:0	<p>TBS1: Transmit Buffer 1 Size</p> <p>These bits indicate the first data buffer byte size, in bytes. If this field is 0, the DMA ignores this buffer and uses Buffer 2 or the next descriptor, depending on the value of TCH (TDES0[20]).</p>

**Table 91. Transmit Descriptor 2 (TDES2)**

Bit	Description
31:0	<p>Buffer 1 Address Pointer</p> <p>These bits indicate the physical address of Buffer 1. There is no limitation on the buffer address alignment.</p>

**Table 92. Transmit Descriptor 3 (TDES3)**

Bit	Description
31:0	<p>Buffer 2 Address Pointer (Next Descriptor Address)</p> <p>Indicates the physical address of Buffer 2 when a descriptor ring structure is used. If the Second Address Chained (TDES1[24]) bit is set, this address contains the pointer to the physical memory where the Next Descriptor is present. The buffer address pointer must be aligned to the bus width only when TDES1[24] is set. (LSBs are ignored internally.)</p>

**Table 93. Transmit Descriptor 6 (TDES6)**

Bit	Description
31:0	<p>TTSL: Transmit Frame Timestamp Low</p> <p>This field is updated by DMA with the least significant 32 bits of the timestamp captured for the corresponding transmit frame. This field has the timestamp only if the Last Segment bit (LS) in the descriptor is set and Timestamp status (TTSS) bit is set.</p>

**Table 94. Transmit Descriptor 7 (TDES7)**

Bit	Description
31:0	TTSH: Transmit Frame Timestamp High This field is updated by DMA with the most significant 32 bits of the timestamp captured for the corresponding receive frame. This field has the timestamp only if the Last Segment bit (LS) in the descriptor is set and Timestamp status (TTSS) bit is set.

### 15.7.4 Receive Descriptor

The structure of the received descriptor is shown in [Figure 31](#). It has 32 bytes of descriptor data (8 DWORDs).

**Figure 31. Receive Descriptor Fields**

The contents of RDES0 are identified in [Table 95](#). The contents of RDES1 through RDES3 are identified in [Table 96](#) through [Table 98](#), respectively.

*Note:* Some of the bit functions of RDES0 are not backward compatible to Release 3.41a and previous versions. These bits are Bit 7, Bit 0, and Bit 5. The function of Bit 5 is backward compatible to Release 3.30a and previous versions.

Table 95. Receive Descriptor Fields (RDES0) (Sheet 1 of 2)

Bit	Description
31	<p>OWN: Own Bit</p> <p>When set, this bit indicates that the descriptor is owned by the DMA of the DWC_gmac. When this bit is reset, this bit indicates that the descriptor is owned by the Host. The DMA clears this bit either when it completes the frame reception or when the buffers that are associated with this descriptor are full.</p>
30	<p>AFM: Destination Address Filter Fail</p> <p>When set, this bit indicates a frame that failed in the DA Filter in the MAC.</p>
29:16	<p>FL: Frame Length</p> <p>These bits indicate the byte length of the received frame that was transferred to host memory (including CRC). This field is valid when Last Descriptor (RDES0[8]) is set and either the Descriptor Error (RDES0[14]) or Overflow Error bits are reset. The frame length also includes the two bytes appended to the Ethernet frame when IP checksum calculation (Type 1) is enabled and the received frame is not a MAC control frame.</p> <p>This field is valid when Last Descriptor (RDES0[8]) is set. When the Last Descriptor and Error Summary bits are not set, this field indicates the accumulated number of bytes that have been transferred for the current frame.</p>
15	<p>ES: Error Summary</p> <p>Indicates the logical OR of the following bits:</p> <ul style="list-style-type: none"> <li>• RDES0[1]: CRC Error</li> <li>• RDES0[3]: Receive Error</li> <li>• RDES0[4]: Watchdog Timeout</li> <li>• RDES0[6]: Late Collision</li> <li>• RDES0[7]: Giant Frame</li> <li>• RDES4[4:3]: IP Header or Payload Error</li> <li>• RDES0[11]: Overflow Error</li> <li>• RDES0[14]: Descriptor Error</li> </ul> <p>This field is valid only when the Last Descriptor (RDES0[8]) is set.</p>
14	<p>DE: Descriptor Error</p> <p>When set, this bit indicates a frame truncation caused by a frame that does not fit within the current descriptor buffers, and that the DMA does not own the Next Descriptor. The frame is truncated. This field is valid only when the Last Descriptor (RDES0[8]) is set.</p>
13	<p>SAF: Source Address Filter Fail</p> <p>When set, this bit indicates that the SA field of frame failed the SA Filter in the MAC.</p>
12	<p>LE: Length Error</p> <p>When set, this bit indicates that the actual length of the frame received and that the Length/ Type field does not match. This bit is valid only when the Frame Type (RDES0[5]) bit is reset.</p>
11	<p>OE: Overflow Error</p> <p>When set, this bit indicates that the received frame was damaged because of buffer overflow in MTL.</p> <p><b>Note:</b> This bit is set only when the DMA transfers a partial frame to the application. This happens only when the Rx FIFO is operating in the threshold mode. In the store-and-forward mode, all partial frames are dropped completely in Rx FIFO.</p>
10	<p>VLAN: VLAN Tag</p> <p>When set, this bit indicates that the frame to which this descriptor is pointing is a VLAN frame tagged by the MAC. The VLAN tagging depends on checking the VLAN fields of received frame based on the VLAN Tag Register (Register 7) (GMAC_REG_7)—Offset 1Ch setting.</p>
9	<p>FS: First Descriptor</p> <p>When set, this bit indicates that this descriptor contains the first buffer of the frame. If the size of the first buffer is 0, the second buffer contains the beginning of the frame. If the size of the second buffer is also 0, the next Descriptor contains the beginning of the frame.</p>
8	<p>LS: Last Descriptor</p> <p>When set, this bit indicates that the buffers pointed to by this descriptor are the last buffers of the frame.</p>

Table 95. Receive Descriptor Fields (RDES0) (Sheet 2 of 2)

Bit	Description
7	<p>Timestamp Available, IP Checksum Error (Type1), or Giant Frame</p> <p>When Advanced Timestamp feature is present, when set, this bit indicates that a snapshot of the Timestamp is written in descriptor words 6 (RDES6) and 7 (RDES7). This is valid only when the Last Descriptor bit (RDES0[8]) is set.</p> <p>When IP Checksum Engine (Type 1) is selected, this bit, when set, indicates that the 16-bit IPv4 Header checksum calculated by the core did not match the received checksum bytes.</p> <p>Otherwise, this bit, when set, indicates the Giant Frame Status. Giant frames are larger than 1,518-byte (or 1,522-byte for VLAN or 2,000-byte when Bit 27 (2KPE) of MAC Configuration register is set) normal frames and larger than 9,018-byte (9,022-byte for VLAN) frame when Jumbo Frame processing is enabled.</p>
6	<p>LC: Late Collision</p> <p>When set, this bit indicates that a late collision has occurred while receiving the frame in the half-duplex mode.</p>
5	<p>FT: Frame Type</p> <p>When set, this bit indicates that the Receive Frame is an Ethernet-type frame (the LT field is greater than or equal to 16'h0600). When this bit is reset, it indicates that the received frame is an IEEE802.3 frame. This bit is not valid for Runt frames less than 14 bytes.</p>
4	<p>RWT: Receive Watchdog Timeout</p> <p>When set, this bit indicates that the Receive Watchdog Timer has expired while receiving the current frame and the current frame is truncated after the Watchdog Timeout.</p>
3	<p>RE: Receive Error</p> <p>When set, this bit indicates that the gmii_rxr_i signal is asserted while gmii_rxdv_i is asserted during frame reception. This error also includes carrier extension error in the GMII and half-duplex mode. Error can be of less or no extension, or error (rxd ≠ 0f) during extension.</p>
2	<p>DE: Dribble Bit Error</p> <p>When set, this bit indicates that the received frame has a non-integer multiple of bytes (odd nibbles). This bit is valid only in the MII Mode.</p>
1	<p>CE: CRC Error</p> <p>When set, this bit indicates that a Cyclic Redundancy Check (CRC) Error occurred on the received frame. This field is valid only when the Last Descriptor (RDES0[8]) is set.</p>
0	<p>Extended Status Available/Rx MAC Address</p> <p>When either Advanced Timestamp or IP Checksum Offload (Type 2) is present, this bit, when set, indicates that the extended status is available in descriptor word 4 (RDES4). This is valid only when the Last Descriptor bit (RDES0[8]) is set.</p> <p>When Advance Timestamp Feature or IPC Full Offload is not selected, this bit indicates Rx MAC Address status. When set, this bit indicates that the Rx MAC Address registers value (1 to 15) matched the frame's DA field. When reset, this bit indicates that the Rx MAC Address Register 0 value matched the DA field.</p>

Table 96. Receive Descriptor Fields 1 (RDES1) (Sheet 1 of 2)

Bit	Description
31	<p>DIC: Disable Interrupt on Completion</p> <p>When set, this bit prevents setting the Status Register's RI bit (CSR5[6]) for the received frame ending in the buffer indicated by this descriptor. This, in turn, disables the assertion of the interrupt to Host because of RI for that frame.</p>
30:29	Reserved
28:16	<p>RBS2: Receive Buffer 2 Size</p> <p>These bits indicate the second data buffer size, in bytes. The buffer size must be a multiple of 4, 8, or 16, depending on the bus widths (32, 64, or 128, respectively), even if the value of RDES3 (buffer2 address pointer) is not aligned to bus width. If the buffer size is not an appropriate multiple of 4, 8, or 16, the resulting behavior is undefined. This field is not valid if RDES1[14] is set.</p>
15	<p>RER: Receive End of Ring</p> <p>When set, this bit indicates that the descriptor list reached its final descriptor. The DMA returns to the base address of the list, creating a descriptor ring.</p>

Table 96. Receive Descriptor Fields 1 (RDES1) (Sheet 2 of 2)

Bit	Description
14	RCH: Second Address Chained When set, this bit indicates that the second address in the descriptor is the Next Descriptor address rather than the second buffer address. When this bit is set, RBS2 (RDES1[28:16]) is a "don't care" value. RDES1[15] takes precedence over RDES1[14].
13	Reserved
12:0	RBS1: Receive Buffer 1 Size Indicates the first data buffer size in bytes. The buffer size must be a multiple of 4, 8, or 16, depending upon the bus widths (32, 64, or 128), even if the value of RDES2 (buffer1 address pointer) is not aligned. When the buffer size is not a multiple of 4, 8, or 16, the resulting behavior is undefined. If this field is 0, the DMA ignores this buffer and uses Buffer 2 or next descriptor depending on the value of RCH (Bit 14).

Table 97. Receive Descriptor Fields 2 (RDES2)

Bit	Description
31:0	Buffer 1 Address Pointer These bits indicate the physical address of Buffer 1. There are no limitations on the buffer address alignment except for the following condition: The DMA uses the configured value for its address generation when the RDES2 value is used to store the start of frame. The DMA performs a write operation with the RDES2[3:0, 2:0, or 1:0] bits as 0 during the transfer of the start of frame but the frame data is shifted as per the actual Buffer address pointer. The DMA ignores RDES2[3:0, 2:0, or 1:0] (corresponding to bus width of 128, 64, or 32) if the address pointer is to a buffer where the middle or last part of the frame is stored.

Table 98. Receive Descriptor Fields 3 (RDES3)

Bit	Description
31:0	Buffer 2 Address Pointer (Next Descriptor Address) These bits indicate the physical address of Buffer 2 when a descriptor ring structure is used. If the Second Address Chained (RDES1[24]) bit is set, this address contains the pointer to the physical memory where the Next Descriptor is present. If RDES1[24] is set, the buffer (Next Descriptor) address pointer must be bus width-aligned (RDES3[3, 2, or 1:0] = 0, corresponding to a bus width of 128, 64, or 32. LSBs are ignored internally.) However, when RDES1[24] is reset, there are no limitations on the RDES3 value, except for the following condition: The DMA uses the configured value for its buffer address generation when the RDES3 value is used to store the start of frame. The DMA ignores RDES3 [3, 2, or 1:0] (corresponding to a bus width of 128, 64, or 32) if the address pointer is to a buffer where the middle or last part of the frame is stored.

The status written is as shown in Table 99. The status is written only when there is status related to IPC or timestamp available. The availability of extended status is indicated by Bit 0 of RDES0. This status is available only when the Advance Timestamp or IPC Full Offload feature is selected.

Table 99. Receive Descriptor Fields 4 (RDES4) (Sheet 1 of 2)

Bit	Description
31:28	Reserved
27:26	<p>Layer 3 and Layer 4 Filter Number Matched</p> <p>These bits indicate the number of the Layer 3 and Layer 4 Filter that matched the received frame.</p> <ul style="list-style-type: none"> <li>00: Filter 0</li> <li>01: Filter 1</li> <li>10: Filter 2</li> <li>11: Filter 3</li> </ul> <p>This field is valid only when Bit 24 or Bit 25 is set high. When more than one filter matches, these bits give only the lowest filter number.</p>
25	<p>Layer 4 Filter Match</p> <p>When set, this bit indicates that the received frame matches one of the enabled Layer 4 Port Number fields. This status is given only when one of the following conditions is true:</p> <ul style="list-style-type: none"> <li>Layer 3 fields are not enabled and all enabled Layer 4 fields match.</li> <li>All enabled Layer 3 and Layer 4 filter fields match.</li> </ul> <p>When more than one filter matches, this bit gives the layer 4 filter status of filter indicated by Bits [27:26].</p>
24	<p>Layer 3 Filter Match</p> <p>When set, this bit indicates that the received frame matches one of the enabled Layer 3 IP Address fields.</p> <p>This status is given only when one of the following conditions is true:</p> <ul style="list-style-type: none"> <li>All enabled Layer 3 fields match and all enabled Layer 4 fields are bypassed.</li> <li>All enabled filter fields match.</li> </ul> <p>When more than one filter matches, this bit gives the layer 3 filter status of filter indicated by Bits [27:26].</p>
23:21	Reserved
20:18	<p>VLAN Tag Priority Value</p> <p>These bits give the VLAN tag's user value in the received packet. These bits are valid only when the RDES4 Bits 16 and 17 are set.</p> <p>These bits are available only when you select the AV feature.</p>
17	<p>AV Tagged Packet Received</p> <p>When set, this bit indicates that an AV tagged packet is received. Otherwise, this bit indicates that an untagged AV packet is received. This bit is valid when Bit 16 is set.</p> <p>This bit is available only when you select the AV feature.</p>
16	<p>AV Packet Received</p> <p>When set, this bit indicates that an AV packet is received. This bit is available only when you select the AV feature.</p>
15	Reserved
14	<p>Timestamp Dropped</p> <p>When set, this bit indicates that the timestamp was captured for this frame but got dropped in the MTL Rx FIFO because of overflow. This bit is available only when you select the Advanced Timestamp feature. Otherwise, this bit is reserved.</p>
13	<p>PTP Version</p> <p>When set, this bit indicates that the received PTP message is having the IEEE 1588 version 2 format. When reset, it has the version 1 format. This bit is available only when you select the Advanced Timestamp feature. Otherwise, this bit is reserved.</p>
12	<p>PTP Frame Type</p> <p>When set, this bit indicates that the PTP message is sent directly over Ethernet. When this bit is not set and the message type is non-zero, it indicates that the PTP message is sent over UDP-IPv4 or UDP-IPv6. The information about IPv4 or IPv6 can be obtained from Bits 6 and 7.</p> <p>This bit is available only when you select the Advanced Timestamp feature.</p>

Table 99. Receive Descriptor Fields 4 (RDES4) (Sheet 2 of 2)

Bit	Description
11:8	<p>Message Type</p> <p>These bits are encoded to give the type of the message received.</p> <ul style="list-style-type: none"> <li>• 0000: No PTP message received</li> <li>• 0001: SYNC (all clock types)</li> <li>• 0010: Follow_Up (all clock types)</li> <li>• 0011: Delay_Req (all clock types)</li> <li>• 0100: Delay_Resp (all clock types)</li> <li>• 0101: Pdelay_Req (in peer-to-peer transparent clock)</li> <li>• 0110: Pdelay_Resp (in peer-to-peer transparent clock)</li> <li>• 0111: Pdelay_Resp_Follow_Up (in peer-to-peer transparent clock)</li> <li>• 1000: Announce • 1001: Management</li> <li>• 1010: Signaling • 1011-1110: Reserved</li> <li>• 1111: PTP packet with Reserved message type</li> </ul> <p>These bits are available only when you select the Advance Timestamp feature.</p> <p><b>Note:</b> Values 1000, 1001, and 1010 are not backward compatible with release 3.50a.</p>
7	<p>IPv6 Packet Received</p> <p>When set, this bit indicates that the received packet is an IPv6 packet. This bit is updated only when Bit 10 (IPC) of MAC Configuration Register (Register 0) (GMAC_REG_0)—Offset 0h) is set. This bit is available when you select the Enable Receive Full TCP/IP Checksum (Type 2) feature.</p>
6	<p>IPv4 Packet Received</p> <p>When set, this bit indicates that the received packet is an IPv4 packet. This bit is updated only when Bit 10 (IPC) of MAC Configuration Register (Register 0) (GMAC_REG_0)—Offset 0h) is set. This bit is available when you select the Enable Receive Full TCP/IP Checksum (Type 2) feature.</p>
5	<p>IP Checksum Bypassed</p> <p>When set, this bit indicates that the checksum offload engine is bypassed. This bit is available when you select the Enable Receive Full TCP/IP Checksum (Type 2) feature.</p>
4	<p>IP Payload Error</p> <p>When set, this bit indicates that the 16-bit IP payload checksum (that is, the TCP, UDP, or ICMP checksum) that the core calculated does not match the corresponding checksum field in the received segment. It is also set when the TCP, UDP, or ICMP segment length does not match the payload length value in the IP Header field. This bit is valid when either Bit 7 or Bit 6 is set. This bit is available when you select the Enable Receive Full TCP/IP Checksum (Type 2) feature.</p>
3	<p>IP Header Error</p> <p>When set, this bit indicates that either the 16-bit IPv4 header checksum calculated by the core does not match the received checksum bytes, or the IP datagram version is not consistent with the Ethernet Type value. This bit is valid when either Bit 7 or Bit 6 is set. This bit is available when you select the Enable Receive Full TCP/IP Checksum (Type 2) feature.</p>
2:0	<p>IP Payload Type</p> <p>These bits indicate the type of payload encapsulated in the IP datagram processed by the Receive Checksum Offload Engine (COE). The COE also sets these bits to 2'b00 if it does not process the IP datagram's payload due to an IP header error or fragmented IP.</p> <ul style="list-style-type: none"> <li>• 3'b000: Unknown or did not process IP payload</li> <li>• 3'b001: UDP</li> <li>• 3'b010: TCP</li> <li>• 3'b011: ICMP</li> <li>• 3'b1xx: Reserved</li> </ul> <p>This bit is valid when either Bit 7 or Bit 6 is set. This bit is available when you select the Enable Receive Full TCP/IP Checksum (Type 2) feature.</p>

RDES6 and RDES7 contain the snapshot of the timestamp. The availability of the snapshot of the timestamp in RDES6 and RDES7 is indicated by Bit 7 in the RDES0 descriptor. The contents of RDES6 and RDES7 are identified in [Table 100](#) and [Table 101](#), respectively.

**Table 100. Receive Descriptor Fields 6 (RDES6)**

Bit	Description
31:0	RTSL: Receive Frame Timestamp Low This field is updated by DMA with the least significant 32 bits of the timestamp captured for the corresponding receive frame. This field is updated by DMA only for the last descriptor of the receive frame which is indicated by Last Descriptor status bit (RDES0[8]).

**Table 101. Receive Descriptor Fields 7 (RDES7)**

Bit	Description
31:0	RTSH: Receive Frame Timestamp High This field is updated by DMA with the most significant 32 bits of the timestamp captured for the corresponding receive frame. This field is updated by DMA only for the last descriptor of the receive frame which is indicated by Last Descriptor status bit (RDES0[8]).

§ §

## 16.0 USB 2.0

The Intel® Quark™ SoC X1000 USB subsystem provides a two-port USB 2.0 Host Controller and one USB 2.0 Device port.

### 16.1 Signal Descriptions

See [Chapter 2.0, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Type:** The buffer type found in [Chapter 4.0, “Electrical Characteristics”](#)
- **Description:** A brief explanation of the signal’s function

**Table 102. Signals**

Signal Name	Direction/Type	Description
USBH[0/1]_DP USBH[0/1]_DN	I/O	Universal Serial Bus Host Port 0 and Port 1. Differentials: Bus Data/ Address/Command Bus
USBH0_OC_B USBH1_OC_B	I	Over current Indicators: These signals set corresponding bits in the USB controller to indicate that an over current condition has occurred. Overcurrent indicators are provided for both Host ports.
USBH0_PWR_EN USBH1_PWR_EN	O	Power Enable signal to the USB host port
USBD_DP USBD_DN	I/O	Universal Serial Bus Device Port. Differentials: Bus Data/ Address/ Command Bus
OUSBCOMP	O	RCOMP OUT. Note: Please check the Platform Design Guide for connection details for this COMP pin.
IUSBCOMP	I	RCOMP IN. Note: Please check the Platform Design Guide for connection details for this COMP pin.

### 16.2 Features

#### 16.2.1 USB2.0 Host Controller Features

- 2-Port USB 2.0 Host Controller compatible with the following standards:
  - Universal Serial Bus Specification (Revision 2.0, April 27, 2000)
  - Enhanced Host Controller Interface Specification for Universal Serial Bus (Revision 1.0, March 12, 2002)
  - EHCI 1.1 Addendum (Revision v0.6, October 2007)
  - OpenHCI: Open Host Controller Interface Specification for USB (Release 1.0a, September 14, 1999)

- EHCI features
  - Supported:
    - 512-byte Packet Buffer depth for in/out data buffering
    - Programmable Packet Buffer depth
    - Extended capability pointer (EECP = 8'hC0)
    - Programmable frame list flag
    - 32-bit only addressing capability
    - Per port power control
    - PCI Power Management
  - Not supported:
    - Descriptor/data prefetching
    - Asynchronous schedule park capability
    - HSIC functionality
    - Link Power Management (LPM) ECN
- OHCI features
  - Supported:
    - One OHCI companion controller
    - Per port power control
  - Not supported:
    - Keyboard/Mouse legacy interface

### 16.2.2 USB2.0 Device Features

- High-speed (480 Mbps) and full-speed (12 Mbps) operation
- 3 logical endpoints in addition to logical endpoint 0
- 1 configuration in addition to configuration 0
- Enables user-configurable endpoint information
- Multiple data packets for each OUT endpoint (Multiple Receive FIFO).
- Both DMA option and Slave-Only modes
- True scatter-gather DMA implementation
- Descriptor-based memory structures in application memory when in DMA mode

## 16.4 Register Map

Figure 32. USB Register Map

See Chapter 5.0, “Register Access Methods” for additional information.

## 16.5 PCI Configuration Registers

### 16.5.1 USB Device

Table 103. Summary of PCI Configuration Registers—0/20/2

Offset Start	Offset End	Register ID—Description	Default Value
0h	1h	“Vendor ID (VENDOR_ID)—Offset 0h” on page 438	8086h
2h	3h	“Device ID (DEVICE_ID)—Offset 2h” on page 439	0939h
4h	5h	“Command Register (COMMAND_REGISTER)—Offset 4h” on page 439	0000h
6h	7h	“Status Register (STATUS)—Offset 6h” on page 440	0010h

**Table 103. Summary of PCI Configuration Registers—0/20/2 (Continued)**

Offset Start	Offset End	Register ID—Description	Default Value
8h	Bh	"Revision ID and Class Code (REV_ID_CLASS_CODE)—Offset 8h" on page 440	0C03FE10h
Ch	Ch	"Cache Line Size (CACHE_LINE_SIZE)—Offset Ch" on page 441	00h
Dh	Dh	"Latency Timer (LATENCY_TIMER)—Offset Dh" on page 441	00h
Eh	Eh	"Header Type (HEADER_TYPE)—Offset Eh" on page 442	80h
Fh	Fh	"BIST (BIST)—Offset Fh" on page 442	00h
10h	13h	"Base Address Register (BAR0)—Offset 10h" on page 443	00000000h
28h	2Bh	"Cardbus CIS Pointer (CARDBUS_CIS_POINTER)—Offset 28h" on page 443	00000000h
2Ch	2Dh	"Subsystem Vendor ID (SUB_SYS_VENDOR_ID)—Offset 2Ch" on page 444	0000h
2Eh	2Fh	"Subsystem ID (SUB_SYS_ID)—Offset 2Eh" on page 444	0000h
30h	33h	"Expansion ROM Base Address (EXP_ROM_BASE_ADR)—Offset 30h" on page 444	00000000h
34h	37h	"Capabilities Pointer (CAP_POINTER)—Offset 34h" on page 445	00000080h
3Ch	3Ch	"Interrupt Line Register (INTR_LINE)—Offset 3Ch" on page 445	00h
3Dh	3Dh	"Interrupt Pin Register (INTR_PIN)—Offset 3Dh" on page 446	00h
3Eh	3Eh	"MIN_GNT (MIN_GNT)—Offset 3Eh" on page 446	00h
3Fh	3Fh	"MAX_LAT (MAX_LAT)—Offset 3Fh" on page 446	00h
80h	80h	"Capability ID (PM_CAP_ID)—Offset 80h" on page 447	01h
81h	81h	"Next Capability Pointer (PM_NXT_CAP_PTR)—Offset 81h" on page 447	A0h
82h	83h	"Power Management Capabilities (PMC)—Offset 82h" on page 447	4803h
84h	85h	"Power Management Control/Status Register (PMCSR)—Offset 84h" on page 448	0008h
86h	86h	"PM CSR PCI-to-PCI Bridge Support Extension (PMCSR_BSE)—Offset 86h" on page 449	00h
87h	87h	"Power Management Data Register (DATA_REGISTER)—Offset 87h" on page 449	00h
A0h	A0h	"Capability ID (MSI_CAP_ID)—Offset A0h" on page 450	05h
A1h	A1h	"Next Capability Pointer (MSI_NXT_CAP_PTR)—Offset A1h" on page 450	00h
A2h	A3h	"Message Control (MESSAGE_CTRL)—Offset A2h" on page 450	0100h
A4h	A7h	"Message Address (MESSAGE_ADDR)—Offset A4h" on page 451	00000000h
A8h	A9h	"Message Data (MESSAGE_DATA)—Offset A8h" on page 451	0000h
ACh	AFh	"Mask Bits for MSI (PER_VEC_MASK)—Offset ACh" on page 452	00000000h
B0h	B3h	"Pending Bits for MSI (PER_VEC_PEND)—Offset B0h" on page 452	00000000h

**16.5.1.1 Vendor ID (VENDOR\_ID)—Offset 0h**

**Access Method**

Type: PCI Configuration Register  
 (Size: 16 bits)

VENDOR\_ID: [B:0, D:20, F:2] + 0h

Default: 8086h

Bit Range	Default & Access	Description
15: 0	8086h RO	<b>Vendor ID (value):</b> PCI Vendor ID for Intel

### 16.5.1.2 Device ID (DEVICE\_ID)—Offset 2h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

DEVICE\_ID: [B:0, D:20, F:2] + 2h

Default: 0939h

15	12	8	4	0
0	0	0	0	1
0	0	0	1	0
0	0	0	1	1
1	0	0	0	1
value				

Bit Range	Default & Access	Description
15: 0	0939h RO	<b>Device ID (value):</b> PCI Device ID

### 16.5.1.3 Command Register (COMMAND\_REGISTER)—Offset 4h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

COMMAND\_REGISTER: [B:0, D:20, F:2] + 4h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
RSVD0	IntrDis	RSVD	SERREN	RSVD
				MasEn
				MEMen
				RSVD

Bit Range	Default & Access	Description
15: 11	0h RO	<b>RSVD0 (RSVD0):</b> Reserved
10	0b RW	<b>Interrupt Disable (IntrDis):</b> Interrupt disable. Disables generation of interrupt messages in the PCI Express function. 1 =) disabled, 0 =) not disabled
9	0h RO	<b>Reserved (RSVD):</b> Reserved.
8	0b RW	<b>SERR Enable (SERREN):</b> When set, this bit enables the non-fatal and fatal errors detected by the function to be reported to the root complex.
7: 3	00h RO	<b>Reserved (RSVD):</b> Reserved.
2	0b RW	<b>Bus Master Enable (MasEn):</b> 0=)disables upstream requests 1=)enables upstream requests.
1	0b RW	<b>Memory Space Enable (MEMen):</b> Device support for Memory transactions. 0 =) not supported. 1 =) supported.

Bit Range	Default & Access	Description
0	0h RO	<b>Reserved (RSVD):</b> Reserved.

### 16.5.1.4 Status Register (STATUS)—Offset 6h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**STATUS:** [B:0, D:20, F:2] + 6h

**Default:** 0010h

15	12	8	4	0
0	0	0	1	0
RSVD0	SigSysErr	RcdMasAb	RSVD	DEVSEL
			RSVD	FastB2B
			RSVD	capable_66Mhz
			hasCapList	IntrStatus
				RSVD1

Bit Range	Default & Access	Description
15	0h RO	<b>RSVD0 (RSVD0):</b> Reserved
14	0b RW	<b>Signaled System Error (SigSysErr):</b> Set when a function detects a system error and the SERR Enable bit is set
13	0b RW	<b>Received master abort (RcdMasAb):</b> Set when requester receives a completion with Unsupported Request completion status
12: 11	0h RO	<b>Reserved (RSVD):</b> Reserved.
10: 9	0b RO	<b>DEVSEL Timing (DEVSEL):</b> Deprecated: Hardwired to 0
8	0h RO	<b>Reserved (RSVD):</b> Reserved.
7	0b RO	<b>Fast Back-to-Back Capable (FastB2B):</b> Deprecated: Hardwired to 0
6	0h RO	<b>Reserved (RSVD):</b> Reserved.
5	0b RO	<b>66MHz-Capable (capable_66Mhz):</b> Deprecated: Hardwired to 0
4	1h RO	<b>Capabilities List (hasCapList):</b> Indicates the presence of one or more capability register sets.
3	0b RO	<b>Interrupt Status (IntrStatus):</b> Indicates that the function has a legacy interrupt request outstanding. This bit has no meaning if Message Signaled Interrupts are being used
2: 0	0h RO	<b>RSVD1 (RSVD1):</b> Reserved

### 16.5.1.5 Revision ID and Class Code (REV\_ID\_CLASS\_CODE)—Offset 8h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**REV\_ID\_CLASS\_CODE:** [B:0, D:20, F:2] + 8h

**Default:** 0C03FE10h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0			
0	0	0	0	0	1	1	1	0			
0	1	1	0	0	0	0	1	0			
classCode				subClassCode				progIntf		rev_id	

Bit Range	Default & Access	Description
31: 24	0Ch RO	<b>Class Code (classCode):</b> Broadly classifies the type of function that the device performs.
23: 16	03h RO	<b>Sub-Class Code (subClassCode):</b> Identifies more specifically (than the class_code byte) the function of the device.
15: 8	FEh RO	<b>Programming Interface (progIntf):</b> Used to define the register set variation within a particular sub-class.
7: 0	10h RO	<b>Revision ID (rev_id):</b> Assigned by the function manufacturer and identifies the revision number of the function.

### 16.5.1.6 Cache Line Size (CACHE\_LINE\_SIZE)—Offset Ch

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**CACHE\_LINE\_SIZE:** [B:0, D:20, F:2] + Ch

**Default:** 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RW	<b>Cache Line Size (value):</b> Implemented as a R/W register for legacy purposes but has no effect on device functionality.

### 16.5.1.7 Latency Timer (LATENCY\_TIMER)—Offset Dh

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**LATENCY\_TIMER:** [B:0, D:20, F:2] + Dh

**Default:** 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RO	<b>Latency Timer (value)</b> : Deprecated. Hardwire to 0.

### 16.5.1.8 Header Type (HEADER\_TYPE)—Offset Eh

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**HEADER\_TYPE:** [B:0, D:20, F:2] + Eh

**Default:** 80h

Bit Range	Default & Access	Description
7	1h RO	<b>Multi-Function Device (multiFnDev)</b> : Hard-wired to 1 to indicate that this is a multi-function device
6: 0	0h RO	<b>Configuration Header Format (cfgHdrFormat)</b> : Hard-wired to 0 to indicate that this configuration header is a Type 0 header, i.e. it is an endpoint rather than a bridge.

### 16.5.1.9 BIST (BIST)—Offset Fh

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**BIST:** [B:0, D:20, F:2] + Fh

**Default:** 00h

Bit Range	Default & Access	Description
7	0h RO	<b>BIST_capable (BIST_capable)</b> : Hard-wired to 0. (Returns 1 if the function implements a BIST)
6	0h RO	<b>Start (start_bist)</b> : Set to start the functions BIST if BIST is supported.
5: 4	0h RO	<b>Reserved (RSVD)</b> : Reserved.

Bit Range	Default & Access	Description
3: 0	0h RO	<b>Completion Code (comp_code)</b> : Completion code having run BIST if BIST is supported. 0=)success. non-zero=)failure

### 16.5.1.10 Base Address Register (BAR0)—Offset 10h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**BAR0:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0		
0	0	0	0	0	0	0	0	0	0	
address				RSVD				prefetchable	memType	isIO

Bit Range	Default & Access	Description
31: 12	0h RW	<b>address (address)</b> : Used to determine the size of memory required by the device and to assign a start address for this required amount of memory.
11: 4	00h RO	<b>Reserved (RSVD)</b> : Reserved.
3	0b RO	<b>Prefetchable (prefetchable)</b> : Defines the block of memory as prefetchable or not. A block of memory is prefetchable if it fulfils the following 3 conditions (1) no side effects on reads, (2) the device returns all bytes on reads regardless of the byte enables, and (3) host bridges can merge processor writes into this range without causing errors. Hardwired to 0
2: 1	00b RO	<b>Type (memType)</b> : Hardwired to 0 to indicate a 32-bit decoder
0	0b RO	<b>Memory Space Indicator (isIO)</b> : Hardwired to 0 to indicate the register is a memory address decoder

### 16.5.1.11 Cardbus CIS Pointer (CARDBUS\_CIS\_POINTER)—Offset 28h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**CARDBUS\_CIS\_POINTER:** [B:0, D:20, F:2] + 28h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
value									

Bit Range	Default & Access	Description
31: 0	0h RO	Cardbus CIS Pointer (value): Reserved. Hardwire to 0.

### 16.5.1.12 Subsystem Vendor ID (SUB\_SYS\_VENDOR\_ID)—Offset 2Ch

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

SUB\_SYS\_VENDOR\_ID: [B:0, D:20, F:2] + 2Ch

Default: 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
value				

Bit Range	Default & Access	Description
15: 0	0h RO	Subsystem Vendor ID (value): PCI Subsystem Vendor ID

### 16.5.1.13 Subsystem ID (SUB\_SYS\_ID)—Offset 2Eh

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

SUB\_SYS\_ID: [B:0, D:20, F:2] + 2Eh

Default: 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
value				

Bit Range	Default & Access	Description
15: 0	0h RO	Subsystem ID (value): PCI Subsystem ID

### 16.5.1.14 Expansion ROM Base Address (EXP\_ROM\_BASE\_ADR)—Offset 30h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

EXP\_ROM\_BASE\_ADR: [B:0, D:20, F:2] + 30h

Default: 00000000h

Bit Range	Default & Access	Description
31: 11	0h RW	<b>ROM Start Address (ROM_base_addr):</b> Used to determine the size of memory required by the ROM and to assign a start address for this required amount of memory.
10: 1	000h RO	<b>Reserved (RSVD):</b> Reserved.
0	0h RW	<b>Address Decode Enable (AddrDecodeEn):</b> A 1 in this field enables the function's ROM address decoder assuming that the Memory Space bit in the Command Register is also set to 1

### 16.5.1.15 Capabilities Pointer (CAP\_POINTER)—Offset 34h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

CAP\_POINTER: [B:0, D:20, F:2] + 34h

Default: 00000080h

Bit Range	Default & Access	Description
31: 8	0h RO	<b>RSVD0 (RSVD0):</b> Reserved
7: 0	80h RO	<b>Capabilities Pointer (value):</b> Pointer to memory location of first entry of linked list of configuration register sets each of which supports a feature. Points to PM (power management) register set at location 0x80

### 16.5.1.16 Interrupt Line Register (INTR\_LINE)—Offset 3Ch

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

INTR\_LINE: [B:0, D:20, F:2] + 3Ch

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RW	<b>Interrupt Line Register (value):</b> The value in this register tells which input of the system interrupt controller(s) the device's interrupt pin is connected to. The device itself does not use this value, rather it is used by device drivers and operating systems. Device drivers and operating systems can use this information to determine priority and vector information.

### 16.5.1.17 Interrupt Pin Register (INTR\_PIN)—Offset 3Dh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

INTR\_PIN: [B:0, D:20, F:2] + 3Dh

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	03h RO	<b>Interrupt Pin Register (value):</b> The Interrupt Pin register tells which interrupt pin the device (or device function) uses. A value of 1 corresponds to INTA#. A value of 2 corresponds to INTB#. A value of 3 corresponds to INTC#. A value of 4 corresponds to INTD#. Devices (or device functions) that do not use an interrupt pin must put a 0 in this register. The values 05h through FFh are reserved. For this system function 0 is connected to INTA, 1 to INTB, 2 to INTC 3 to INTD, 4 to INTA, 5 to INTB etc.

### 16.5.1.18 MIN\_GNT (MIN\_GNT)—Offset 3Eh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MIN\_GNT: [B:0, D:20, F:2] + 3Eh

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RO	<b>MIN_GNT (value):</b> Hardwired to 0

### 16.5.1.19 MAX\_LAT (MAX\_LAT)—Offset 3Fh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MAX\_LAT: [B:0, D:20, F:2] + 3Fh

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RO	<b>MAX_LAT (value):</b> Hardwired to 0

### 16.5.1.20 Capability ID (PM\_CAP\_ID)—Offset 80h

#### Access Method

**Type:** PCI Configuration Register (Size: 8 bits)      **PM\_CAP\_ID:** [B:0, D:20, F:2] + 80h

**Default:** 01h

7	4	0
0	0	1
value		

Bit Range	Default & Access	Description
7: 0	01h RO	<b>Capability ID (value):</b> Identifies the feature associated with this register set. Hardwired value as per PCI SIG assigned capability ID

### 16.5.1.21 Next Capability Pointer (PM\_NXT\_CAP\_PTR)—Offset 81h

#### Access Method

**Type:** PCI Configuration Register (Size: 8 bits)      **PM\_NXT\_CAP\_PTR:** [B:0, D:20, F:2] + 81h

**Default:** A0h

7	4	0
1	0	0
value		

Bit Range	Default & Access	Description
7: 0	a0h RO	<b>Next Capability Pointer (value):</b> Pointer to the next register set of feature specific configuration registers. Hardwired to 0xA0 to point to the MSI Capability Structure

### 16.5.1.22 Power Management Capabilities (PMC)—Offset 82h

#### Access Method

**Type:** PCI Configuration Register (Size: 16 bits)      **PMC:** [B:0, D:20, F:2] + 82h

Default: 4803h

15	12	8	4	0				
0	1	0	0	1				
0	0	1	0	0				
0	0	0	0	0				
0	0	0	0	0				
0	0	0	0	0				
0	0	1	1	1				
PME_support		D2_support	D1_support	aux_curr	DSI	RSVD	PME_clock	version

Bit Range	Default & Access	Description
15: 11	09h RO	<b>PME Support (PME_support)</b> : PME_Support field Indicates the PM states within which the function is capable of sending a PME (Power Management Event) message. 0 in a bit (=) PME is not supported in the corresponding PM state, where bit indexes 11,12,13,14,15 correspond to PM states D0, D1, D2, D3hot, D3cold respectively.
10	0h RO	<b>D2 Support (D2_support)</b> : Hardwired to 0 as the D2 state is not supported
9	0h RO	<b>D1 Support (D1_support)</b> : Hardwired to 0 as the D1 state is not supported
8: 6	0h RO	<b>Aux Current (aux_curr)</b> : Hardwired to 0 as the D3hot state is not supported
5	0h RO	<b>Device Specific Initialisation (DSI)</b> : Hardwired to 0 to indicate that the device does not require a device specific initialisation sequence following transition to the D0 uninitialised state
4	0h RO	<b>Reserved (RSVD)</b> : Reserved.
3	0h RO	<b>PME Clock (PME_clock)</b> : Deprecated. Hardwired to 0
2: 0	011b RO	<b>Version (version)</b> : This function complies with revision 1.2 of the PCI Power Management Interface Specification

### 16.5.1.23 Power Management Control/Status Register (PMCSR)—Offset 84h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

PMCSR: [B:0, D:20, F:2] + 84h

Default: 0008h

15	12	8	4	0			
0	0	0	0	0			
0	0	0	0	0			
0	0	0	0	0			
0	0	0	0	0			
0	0	0	0	0			
1	0	0	0	0			
0	0	0	0	0			
PME_status	Data_scale	Data_select	PME_en	RSVD	no_soft_reset	RSVD	power_state

Bit Range	Default & Access	Description
15	0h RW	<b>PME Status (PME_status)</b> : Set if function has experienced a PME (even if PME_en (bit 8 of PMCSR register) is not set).
14: 13	0h RO	<b>Data Scale (Data_scale)</b> : Hardwired to 0 as the data register is not supported

Bit Range	Default & Access	Description
12: 9	0h RO	<b>Data Select (Data_select)</b> : Hardwired to 0 as the data register is not supported
8	0b RW	<b>PME Enable (PME_en)</b> : Enable device function to send PME messages when an event occurs. 1=)enabled. 0=)disabled
7: 4	0h RO	<b>Reserved (RSVD)</b> : Reserved.
3	1b RO	<b>No Soft Reset (no_soft_reset)</b> : Devices do perform an internal reset when transitioning from D3hot to D0
2	0h RO	<b>Reserved (RSVD)</b> : Reserved.
1: 0	00b RW	<b>Power State (power_state)</b> : Allows software to read current PM state or transition device to a new PM state, where 2'b00 = D0, 2'b01=D1, 2'b10=D2, 2'b11=D3hot

### 16.5.1.24 PM CSR PCI-to-PCI Bridge Support Extension (PMCSR\_BSE)—Offset 86h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

PMCSR\_BSE: [B:0, D:20, F:2] + 86h

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RO	<b>PM CSR PCI-to-PCI Bridge Support Extension (value)</b> : Not Supported. Hardwired to 0.

### 16.5.1.25 Power Management Data Register (DATA\_REGISTER)—Offset 87h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

DATA\_REGISTER: [B:0, D:20, F:2] + 87h

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RO	<b>Power Management Data Register (value)</b> : Not Supported. Hardwired to 0

### 16.5.1.26 Capability ID (MSI\_CAP\_ID)—Offset A0h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MSI\_CAP\_ID: [B:0, D:20, F:2] + A0h

Default: 05h

7	4	0
0	0	1
value		

Bit Range	Default & Access	Description
7: 0	05h RO	<b>Capability ID (value):</b> Identifies the feature associated with this register set. Hardwired value as per PCI SIG assigned capability ID

### 16.5.1.27 Next Capability Pointer (MSI\_NXT\_CAP\_PTR)—Offset A1h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MSI\_NXT\_CAP\_PTR: [B:0, D:20, F:2] + A1h

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	00h RO	<b>Next Capability Pointer (value):</b> Hardwired to 0 as this is the last capability structure in the chain

### 16.5.1.28 Message Control (MESSAGE\_CTRL)—Offset A2h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

MESSAGE\_CTRL: [B:0, D:20, F:2] + A2h

Default: 0100h

15	12	8	4	0
0	0	0	1	0
RSVD0		perVecMskCap	bit64Cap	multiMsgEn
			multiMsgCap	MSIEnable

Bit Range	Default & Access	Description
15: 9	0h RO	<b>RSVDO (RSVDO)</b> : Reserved
8	1h RO	<b>Per Vector Masking Capable (perVecMskCap)</b> : Hardwired to 1 to indicate the function supports PVM
7	0h RO	<b>64 bit Address Capable (bit64Cap)</b> : This bit is hardwired to 0 to indicate that the function is not capable of sending a 64-bit message address.
6: 4	0h RW	<b>Multi-Message Enable (multiMsgEn)</b> : As only one vector is supported per function, software should only write a value of 0x0 to this field
3: 1	0h RO	<b>Multiple Message Enable (multiMsgCap)</b> : This field is hardwired to 0x0 to indicate that the function is requesting a single vector
0	0h RW	<b>MSI Enable (MSIEnable)</b> : Set to enable MSI to request service. If set then it's prohibited to use the INTx pin. System configuration software sets this bit to enable MSI.

### 16.5.1.29 Message Address (MESSAGE\_ADDR)—Offset A4h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

MESSAGE\_ADDR: [B:0, D:20, F:2] + A4h

Default: 00000000h

Bit Range	Default & Access	Description
31: 2	0h RW	<b>Message Address (address)</b> : If the Message Enable bit (bit 0 of the Message Control register) is set, the contents of this register specify the DWORD-aligned address (AD[31:2]) for the MSI memory write transaction. AD[1:0] are driven to zero during the address phase. This field is read/write
1: 0	0h RO	<b>RSVDO (RSVDO)</b> : Reserved

### 16.5.1.30 Message Data (MESSAGE\_DATA)—Offset A8h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

MESSAGE\_DATA: [B:0, D:20, F:2] + A8h

Default: 0000h

Bit Range	Default & Access	Description
15: 0	0h RW	<b>Data Field (MsgData):</b> System-specified message data. If the Message Enable bit (bit 0 of the Message Control register) is set, the message data is driven onto the lower word (AD[15:0]) of the memory write transactions data phase. AD[31:16] are driven to zero during the memory write transactions data phase. C/BE[3::0]# are asserted during the data phase of the memory write transaction. None of the message bits will be changed by hardware

### 16.5.1.31 Mask Bits for MSI (PER\_VEC\_MASK)—Offset ACh

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

PER\_VEC\_MASK: [B:0, D:20, F:2] + ACh

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVDO								MSIMask

Bit Range	Default & Access	Description
31: 1	0h RO	<b>RSVDO (RSVDO):</b> Reserved
0	0h RW	<b>Vector 0 Mask (MSIMask):</b> Mask Bit for Vector 0. If this bit is set, the function will not send MSI messages

### 16.5.1.32 Pending Bits for MSI (PER\_VEC\_PEND)—Offset B0h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

PER\_VEC\_PEND: [B:0, D:20, F:2] + B0h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVDO								value

Bit Range	Default & Access	Description
31: 1	0h RO	<b>RSVDO (RSVDO):</b> Reserved
0	0h RO	<b>Vector 0 Pending (value):</b> Pending Bit for Vector 0.

## 16.5.2 USB EHCI

**Table 104. Summary of PCI Configuration Registers—0/20/3**

Offset Start	Offset End	Register ID—Description	Default Value
0h	1h	"Vendor ID (VENDOR_ID)—Offset 0h" on page 438	8086h
2h	3h	"Device ID (DEVICE_ID)—Offset 2h" on page 439	0939h
4h	5h	"Command Register (COMMAND_REGISTER)—Offset 4h" on page 439	0000h
6h	7h	"Status Register (STATUS)—Offset 6h" on page 440	0010h
8h	Bh	"Revision ID and Class Code (REV_ID_CLASS_CODE)—Offset 8h" on page 440	0C032010h
Ch	Ch	"Cache Line Size (CACHE_LINE_SIZE)—Offset Ch" on page 441	00h
Dh	Dh	"Latency Timer (LATENCY_TIMER)—Offset Dh" on page 441	00h
Eh	Eh	"Header Type (HEADER_TYPE)—Offset Eh" on page 442	80h
Fh	Fh	"BIST (BIST)—Offset Fh" on page 457	00h
10h	13h	"Base Address Register (BAR0)—Offset 10h" on page 458	00000000h
28h	2Bh	"Cardbus CIS Pointer (CARDBUS_CIS_POINTER)—Offset 28h" on page 459	00000000h
2Ch	2Dh	"Subsystem Vendor ID (SUB_SYS_VENDOR_ID)—Offset 2Ch" on page 459	0000h
2Eh	2Fh	"Subsystem ID (SUB_SYS_ID)—Offset 2Eh" on page 459	0000h
30h	33h	"Expansion ROM Base Address (EXP_ROM_BASE_ADR)—Offset 30h" on page 460	00000000h
34h	37h	"Capabilities Pointer (CAP_POINTER)—Offset 34h" on page 460	00000080h
3Ch	3Ch	"Interrupt Line Register (INTR_LINE)—Offset 3Ch" on page 460	00h
3Dh	3Dh	"Interrupt Pin Register (INTR_PIN)—Offset 3Dh" on page 461	00h
3Eh	3Eh	"MIN_GNT (MIN_GNT)—Offset 3Eh" on page 461	00h
3Fh	3Fh	"MAX_LAT (MAX_LAT)—Offset 3Fh" on page 462	00h
60h	60h	"Serial Bus Release Number Register (SBRN)—Offset 60h" on page 462	20h
61h	61h	"Frame Length Adjustment Register (FLADJ)—Offset 61h" on page 462	20h
80h	80h	"Capability ID (PM_CAP_ID)—Offset 80h" on page 463	01h
81h	81h	"Next Capability Pointer (PM_NXT_CAP_PTR)—Offset 81h" on page 463	A0h
82h	83h	"Power Management Capabilities (PMC)—Offset 82h" on page 463	F803h
84h	85h	"Power Management Control/Status Register (PMCSR)—Offset 84h" on page 464	0008h
86h	86h	"PM CSR PCI-to-PCI Bridge Support Extension (PMCSR_BSE)—Offset 86h" on page 465	00h
87h	87h	"Power Management Data Register (DATA_REGISTER)—Offset 87h" on page 465	00h
A0h	A0h	"Capability ID (MSI_CAP_ID)—Offset A0h" on page 465	05h
A1h	A1h	"Next Capability Pointer (MSI_NXT_CAP_PTR)—Offset A1h" on page 466	C0h
A2h	A3h	"Message Control (MESSAGE_CTRL)—Offset A2h" on page 466	0100h
A4h	A7h	"Message Address (MESSAGE_ADDR)—Offset A4h" on page 467	00000000h
A8h	A9h	"Message Data (MESSAGE_DATA)—Offset A8h" on page 467	0000h
ACh	AFh	"Mask Bits for MSI (PER_VEC_MASK)—Offset ACh" on page 468	00000000h
B0h	B3h	"Pending Bits for MSI (PER_VEC_PEND)—Offset B0h" on page 468	00000000h
C0h	C3h	"USB Legacy Support Extended Capability (USBLEGSUP)—Offset C0h" on page 468	00000001h
C4h	C7h	"USB Legacy Support Control/Status (USBLEGCTLSTS)—Offset C4h" on page 469	00000000h

### 16.5.2.1 Vendor ID (VENDOR\_ID)—Offset 0h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

VENDOR\_ID: [B:0, D:20, F:3] + 0h

Default: 8086h

15	12	8	4	0
1	0	0	0	0
0	0	0	0	0
0	0	0	0	0
1	0	0	0	0
0	1	1	0	0
value				

Bit Range	Default & Access	Description
15: 0	8086h RO	Vendor ID (value): PCI Vendor ID for Intel

### 16.5.2.2 Device ID (DEVICE\_ID)—Offset 2h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

DEVICE\_ID: [B:0, D:20, F:3] + 2h

Default: 0939h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
1	0	0	1	1
0	0	1	1	1
1	0	0	0	1
value				

Bit Range	Default & Access	Description
15: 0	0939h RO	Device ID (value): PCI Device ID

### 16.5.2.3 Command Register (COMMAND\_REGISTER)—Offset 4h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

COMMAND\_REGISTER: [B:0, D:20, F:3] + 4h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
RSVD	RSVD	IntrDis	RSVD	SERREn
RSVD	RSVD	RSVD	RSVD	RSVD
MasEn	MEMen	RSVD	MasEn	MEMen
RSVD	RSVD	RSVD	RSVD	RSVD

Bit Range	Default & Access	Description
15: 11	0h RO	RSVDO (RSVDO): Reserved

Bit Range	Default & Access	Description
10	0b RW	<b>Interrupt Disable (IntrDis)</b> : Interrupt disable. Disables generation of interrupt messages in the PCI Express function. 1 =) disabled, 0 =) not disabled
9	0h RO	<b>Reserved (RSVD)</b> : Reserved.
8	0b RW	<b>SERR Enable (SERREn)</b> : When set, this bit enables the non-fatal and fatal errors detected by the function to be reported to the root complex.
7: 3	00h RO	<b>Reserved (RSVD)</b> : Reserved.
2	0b RW	<b>Bus Master Enable (MasEn)</b> : 0=)disables upstream requests 1=)enables upstream requests.
1	0b RW	<b>Memory Space Enable (MEMEn)</b> : Device support for Memory transactions. 0 =) not supported. 1 =) supported.
0	0h RO	<b>Reserved (RSVD)</b> : Reserved.

### 16.5.2.4 Status Register (STATUS)—Offset 6h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

STATUS: [B:0, D:20, F:3] + 6h

Default: 0010h

15	12	8	4	0
0	0	0	1	0
RSVD0	SigSysErr	RcdMasAb	RSVD	DEVSEL
			RSVD	FastB2B
			capable_66Mhz	hasCapList
			IntrStatus	RSVD1

Bit Range	Default & Access	Description
15	0h RO	<b>RSVD0 (RSVD0)</b> : Reserved
14	0b RW	<b>Signaled System Error (SigSysErr)</b> : Set when a function detects a system error and the SERR Enable bit is set
13	0b RW	<b>Received master abort (RcdMasAb)</b> : Set when requester receives a completion with Unsupported Request completion status
12: 11	0h RO	<b>Reserved (RSVD)</b> : Reserved.
10: 9	0b RO	<b>DEVSEL Timing (DEVSEL)</b> : Deprecated: Hardwired to 0
8	0h RO	<b>Reserved (RSVD)</b> : Reserved.
7	0b RO	<b>Fast Back-to-Back Capable (FastB2B)</b> : Deprecated: Hardwired to 0
6	0h RO	<b>Reserved (RSVD)</b> : Reserved.

Bit Range	Default & Access	Description
5	0b RO	<b>66MHz-Capable (capable_66Mhz)</b> : Deprecated: Hardwired to 0
4	1h RO	<b>Capabilities List (hasCapList)</b> : Indicates the presence of one or more capability register sets.
3	0b RO	<b>Interrupt Status (IntrStatus)</b> : Indicates that the function has a legacy interrupt request outstanding. This bit has no meaning if Message Signaled Interrupts are being used
2: 0	0h RO	<b>RSVD1 (RSVD1)</b> : Reserved

### 16.5.2.5 Revision ID and Class Code (REV\_ID\_CLASS\_CODE)—Offset 8h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**REV\_ID\_CLASS\_CODE:** [B:0, D:20, F:3] + 8h

**Default:** 0C032010h

31	28	24	20	16	12	8	4	0																							
0	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
classCode				subClassCode				progIntf				rev_id																			

Bit Range	Default & Access	Description
31: 24	0Ch RO	<b>Class Code (classCode)</b> : Broadly classifies the type of function that the device performs.
23: 16	03h RO	<b>Sub-Class Code (subClassCode)</b> : Identifies more specifically (than the class_code byte) the function of the device.
15: 8	20h RO	<b>Programming Interface (progIntf)</b> : Used to define the register set variation within a particular sub-class.
7: 0	10h RO	<b>Revision ID (rev_id)</b> : Assigned by the function manufacturer and identifies the revision number of the function.

### 16.5.2.6 Cache Line Size (CACHE\_LINE\_SIZE)—Offset Ch

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**CACHE\_LINE\_SIZE:** [B:0, D:20, F:3] + Ch

**Default:** 00h

7	4	0				
0	0	0	0	0	0	0
value						

Bit Range	Default & Access	Description
7: 0	0h RW	<b>Cache Line Size (value)</b> : Implemented as a R/W register for legacy purposes but has no effect on device functionality.

### 16.5.2.7 Latency Timer (LATENCY\_TIMER)—Offset Dh

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**LATENCY\_TIMER:** [B:0, D:20, F:3] + Dh

**Default:** 00h

7	4	0
0	0	0
value		0

Bit Range	Default & Access	Description
7: 0	0h RO	<b>Latency Timer (value)</b> : Deprecated. Hardwire to 0.

### 16.5.2.8 Header Type (HEADER\_TYPE)—Offset Eh

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**HEADER\_TYPE:** [B:0, D:20, F:3] + Eh

**Default:** 80h

7	4	0
1	0	0
multiFnDev	cfgHdrFormat	0

Bit Range	Default & Access	Description
7	1h RO	<b>Multi-Function Device (multiFnDev)</b> : Hard-wired to 1 to indicate that this is a multi-function device
6: 0	0h RO	<b>Configuration Header Format (cfgHdrFormat)</b> : Hard-wired to 0 to indicate that this configuration header is a Type 0 header, i.e. it is an endpoint rather than a bridge.

### 16.5.2.9 BIST (BIST)—Offset Fh

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**BIST:** [B:0, D:20, F:3] + Fh

**Default:** 00h

7	0	0	0	0	4	0	0	0	0
BIST_capable	start_bist	RSVD			comp_code				

Bit Range	Default & Access	Description
7	0h RO	<b>BIST_capable (BIST_capable):</b> Hard-wired to 0. (Returns 1 if the function implements a BIST)
6	0h RO	<b>Start (start_bist):</b> Set to start the functions BIST if BIST is supported.
5: 4	0h RO	<b>Reserved (RSVD):</b> Reserved.
3: 0	0h RO	<b>Completion Code (comp_code):</b> Completion code having run BIST if BIST is supported. 0=)success. non-zero=)failure

### 16.5.2.10 Base Address Register (BAR0)—Offset 10h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

BAR0: [B:0, D:20, F:3] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
address						RSVD	prefetchable	memType	isIO

Bit Range	Default & Access	Description
31: 12	0h RW	<b>address (address):</b> Used to determine the size of memory required by the device and to assign a start address for this required amount of memory.
11: 4	00h RO	<b>Reserved (RSVD):</b> Reserved.
3	0b RO	<b>Prefetchable (prefetchable):</b> Defines the block of memory as prefetchable or not. A block of memory is prefetchable if it fulfils the following 3 conditions (1) no side effects on reads, (2) the device returns all bytes on reads regardless of the byte enables, and (3) host bridges can merge processor writes into this range without causing errors. Hardwired to 0
2: 1	00b RO	<b>Type (memType):</b> Hardwired to 0 to indicate a 32-bit decoder
0	0b RO	<b>Memory Space Indicator (isIO):</b> Hardwired to 0 to indicate the register is a memory address decoder

### 16.5.2.11 Cardbus CIS Pointer (CARDBUS\_CIS\_POINTER)—Offset 28h

**Access Method**

Type: PCI Configuration Register  
(Size: 32 bits)

CARDBUS\_CIS\_POINTER: [B:0, D:20, F:3] + 28h

Default: 00000000h

Bit Range	Default & Access	Description
31: 0	0h RO	Cardbus CIS Pointer (value): Reserved. Hardwire to 0.

### 16.5.2.12 Subsystem Vendor ID (SUB\_SYS\_VENDOR\_ID)—Offset 2Ch

**Access Method**

Type: PCI Configuration Register  
(Size: 16 bits)

SUB\_SYS\_VENDOR\_ID: [B:0, D:20, F:3] + 2Ch

Default: 0000h

Bit Range	Default & Access	Description
15: 0	0h RO	Subsystem Vendor ID (value): PCI Subsystem Vendor ID

### 16.5.2.13 Subsystem ID (SUB\_SYS\_ID)—Offset 2Eh

**Access Method**

Type: PCI Configuration Register  
(Size: 16 bits)

SUB\_SYS\_ID: [B:0, D:20, F:3] + 2Eh

Default: 0000h

Bit Range	Default & Access	Description
15: 0	0h RO	Subsystem ID (value): PCI Subsystem ID

### 16.5.2.14 Expansion ROM Base Address (EXP\_ROM\_BASE\_ADR)—Offset 30h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

EXP\_ROM\_BASE\_ADR: [B:0, D:20, F:3] + 30h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
ROM_base_addr							RSVD	AddrDecodeEn

Bit Range	Default & Access	Description
31: 11	0h RW	<b>ROM Start Address (ROM_base_addr)</b> : Used to determine the size of memory required by the ROM and to assign a start address for this required amount of memory.
10: 1	000h RO	<b>Reserved (RSVD)</b> : Reserved.
0	0h RW	<b>Address Decode Enable (AddrDecodeEn)</b> : A 1 in this field enables the function's ROM address decoder assuming that the Memory Space bit in the Command Register is also set to 1

### 16.5.2.15 Capabilities Pointer (CAP\_POINTER)—Offset 34h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

CAP\_POINTER: [B:0, D:20, F:3] + 34h

Default: 00000080h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
RSVDO							value	0

Bit Range	Default & Access	Description
31: 8	0h RO	<b>RSVDO (RSVDO)</b> : Reserved
7: 0	80h RO	<b>Capabilities Pointer (value)</b> : Pointer to memory location of first entry of linked list of configuration register sets each of which supports a feature. Points to PM (power management) register set at location 0x80

### 16.5.2.16 Interrupt Line Register (INTR\_LINE)—Offset 3Ch

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

INTR\_LINE: [B:0, D:20, F:3] + 3Ch

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RW	<b>Interrupt Line Register (value):</b> The value in this register tells which input of the system interrupt controller(s) the device's interrupt pin is connected to. The device itself does not use this value, rather it is used by device drivers and operating systems. Device drivers and operating systems can use this information to determine priority and vector information.

### 16.5.2.17 Interrupt Pin Register (INTR\_PIN)—Offset 3Dh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

INTR\_PIN: [B:0, D:20, F:3] + 3Dh

Default: 00h

Bit Range	Default & Access	Description
7: 0	04h RO	<b>Interrupt Pin Register (value):</b> The Interrupt Pin register tells which interrupt pin the device (or device function) uses. A value of 1 corresponds to INTA#. A value of 2 corresponds to INTB#. A value of 3 corresponds to INTC#. A value of 4 corresponds to INTD#. Devices (or device functions) that do not use an interrupt pin must put a 0 in this register. The values 05h through FFh are reserved. For this system function 0 is connected to INTA, 1 to INTB, 2 to INTC 3 to INTD, 4 to INTA, 5 to INTB etc.

### 16.5.2.18 MIN\_GNT (MIN\_GNT)—Offset 3Eh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MIN\_GNT: [B:0, D:20, F:3] + 3Eh

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RO	<b>MIN_GNT (value):</b> Hardwired to 0

### 16.5.2.19 MAX\_LAT (MAX\_LAT)—Offset 3Fh

#### Access Method

Type: PCI Configuration Register (Size: 8 bits)      MAX\_LAT: [B:0, D:20, F:3] + 3Fh

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RO	MAX_LAT (value): Hardwired to 0

### 16.5.2.20 Serial Bus Release Number Register (SBRN)—Offset 60h

#### Access Method

Type: PCI Configuration Register (Size: 8 bits)      SBRN: [B:0, D:20, F:3] + 60h

Default: 20h

Bit Range	Default & Access	Description
7: 0	20h RO	Serial Bus Specification Release Number (SBRN): Serial Bus Specification Release Number.

### 16.5.2.21 Frame Length Adjustment Register (FLADJ)—Offset 61h

#### Access Method

Type: PCI Configuration Register (Size: 8 bits)      FLADJ: [B:0, D:20, F:3] + 61h

Default: 20h

Bit Range	Default & Access	Description
7: 6	0h RO	RSVDO (RSVDO): Reserved

Bit Range	Default & Access	Description
5: 0	20h RW	<b>Frame Length Timing Value (FLADJ)</b> : Each decimal value change to this register corresponds to 16 highspeed bit times. The SOF cycle time (number of SOF counter clock periods to generate a SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000.

### 16.5.2.22 Capability ID (PM\_CAP\_ID)—Offset 80h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

PM\_CAP\_ID: [B:0, D:20, F:3] + 80h

Default: 01h

7	4	0
0	0	1
value		

Bit Range	Default & Access	Description
7: 0	01h RO	<b>Capability ID (value)</b> : Identifies the feature associated with this register set. Hardwired value as per PCI SIG assigned capability ID

### 16.5.2.23 Next Capability Pointer (PM\_NXT\_CAP\_PTR)—Offset 81h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

PM\_NXT\_CAP\_PTR: [B:0, D:20, F:3] + 81h

Default: A0h

7	4	0
1	0	0
value		

Bit Range	Default & Access	Description
7: 0	a0h RO	<b>Next Capability Pointer (value)</b> : Pointer to the next register set of feature specific configuration registers. Hardwired to 0xA0 to point to the MSI Capability Structure

### 16.5.2.24 Power Management Capabilities (PMC)—Offset 82h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

PMC: [B:0, D:20, F:3] + 82h

Default: F803h

15	12	8	4	0
1	1	1	1	1
PME_support		D2_support	D1_support	aux_curr
			DSI	RSVD
			PME_clock	version

Bit Range	Default & Access	Description
15: 11	1Fh RO	<b>PME Support (PME_support):</b> PME_Support field Indicates the PM states within which the function is capable of sending a PME (Power Management Event) message. 0 in a bit (=) PME is not supported in the corresponding PM state, where bit indexes 11,12,13,14,15 correspond to PM states D0, D1, D2, D3hot, D3cold respectively.
10	0h RO	<b>D2 Support (D2_support):</b> Hardwired to 0 as the D2 state is not supported
9	0h RO	<b>D1 Support (D1_support):</b> Hardwired to 0 as the D1 state is not supported
8: 6	0h RO	<b>Aux Current (aux_curr):</b> Hardwired to 0 as the D3hot state is not supported
5	0h RO	<b>Device Specific Initialisation (DSI):</b> Hardwired to 0 to indicate that the device does not require a device specific initialisation sequence following transition to the D0 uninitialised state
4	0h RO	<b>Reserved (RSVD):</b> Reserved.
3	0h RO	<b>PME Clock (PME_clock):</b> Deprecated. Hardwired to 0
2: 0	011b RO	<b>Version (version):</b> This function complies with revision 1.2 of the PCI Power Management Interface Specification

### 16.5.2.25 Power Management Control/Status Register (PMCSR)—Offset 84h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

PMCSR: [B:0, D:20, F:3] + 84h

Default: 0008h

15	12	8	4	0
0	0	0	0	0
PME_status	Data_scale	Data_select	PME_en	RSVD
				no_soft_reset
				RSVD
				power_state

Bit Range	Default & Access	Description
15	0h RW	<b>PME Status (PME_status):</b> Set if function has experienced a PME (even if PME_en (bit 8 of PMCSR register) is not set).
14: 13	0h RO	<b>Data Scale (Data_scale):</b> Hardwired to 0 as the data register is not supported
12: 9	0h RO	<b>Data Select (Data_select):</b> Hardwired to 0 as the data register is not supported

Bit Range	Default & Access	Description
8	0b RW	<b>PME Enable (PME_en)</b> : Enable device function to send PME messages when an event occurs. 1=)enabled. 0=)disabled
7: 4	0h RO	<b>Reserved (RSVD)</b> : Reserved.
3	1b RO	<b>No Soft Reset (no_soft_reset)</b> : Devices do perform an internal reset when transitioning from D3hot to D0
2	0h RO	<b>Reserved (RSVD)</b> : Reserved.
1: 0	00b RW	<b>Power State (power_state)</b> : Allows software to read current PM state or transition device to a new PM state, where 2'b00 = D0, 2'b01=D1, 2'b10=D2, 2'b11=D3hot

### 16.5.2.26 PM CSR PCI-to-PCI Bridge Support Extension (PMCSR\_BSE)—Offset 86h

**Access Method**

Type: PCI Configuration Register  
(Size: 8 bits)

PMCSR\_BSE: [B:0, D:20, F:3] + 86h

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RO	<b>PM CSR PCI-to-PCI Bridge Support Extension (value)</b> : Not Supported. Hardwired to 0.

### 16.5.2.27 Power Management Data Register (DATA\_REGISTER)—Offset 87h

**Access Method**

Type: PCI Configuration Register  
(Size: 8 bits)

DATA\_REGISTER: [B:0, D:20, F:3] + 87h

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RO	<b>Power Management Data Register (value)</b> : Not Supported. Hardwired to 0

### 16.5.2.28 Capability ID (MSI\_CAP\_ID)—Offset A0h

**Access Method**

Type: PCI Configuration Register  
(Size: 8 bits)

MSI\_CAP\_ID: [B:0, D:20, F:3] + A0h

Default: 05h

7	4	0
0	0	1
value		

Bit Range	Default & Access	Description
7: 0	05h RO	<b>Capability ID (value):</b> Identifies the feature associated with this register set. Hardwired value as per PCI SIG assigned capability ID

### 16.5.2.29 Next Capability Pointer (MSI\_NXT\_CAP\_PTR)—Offset A1h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MSI\_NXT\_CAP\_PTR: [B:0, D:20, F:3] + A1h

Default: C0h

7	4	0
1	0	0
value		

Bit Range	Default & Access	Description
7: 0	C0h RO	<b>Next Capability Pointer (value):</b> Pointer to the next register set of feature specific configuration registers. Hardwired to 0xC0 to point to the USB Legacy Support Extended Capability Structure

### 16.5.2.30 Message Control (MESSAGE\_CTRL)—Offset A2h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

MESSAGE\_CTRL: [B:0, D:20, F:3] + A2h

Default: 0100h

15	12	8	4	0
0	0	0	0	0
RSVDO		perVecMskCap	bit64Cap	multiMsgEn
		multiMsgCap	MSIEnable	

Bit Range	Default & Access	Description
15: 9	0h RO	<b>RSVDO (RSVDO):</b> Reserved

Bit Range	Default & Access	Description
8	1h RO	<b>Per Vector Masking Capable (perVecMskCap)</b> : Hardwired to 1 to indicate the function supports PVM
7	0h RO	<b>64 bit Address Capable (bit64Cap)</b> : This bit is hardwired to 0 to indicate that the function is not capable of sending a 64-bit message address.
6: 4	0h RW	<b>Multi-Message Enable (multiMsgEn)</b> : As only one vector is supported per function, software should only write a value of 0x0 to this field
3: 1	0h RO	<b>Multiple Message Enable (multiMsgCap)</b> : This field is hardwired to 0x0 to indicate that the function is requesting a single vector
0	0h RW	<b>MSI Enable (MSI Enable)</b> : Set to enable MSI to request service. If set then it's prohibited to use the INTx pin. System configuration software sets this bit to enable MSI.

### 16.5.2.31 Message Address (MESSAGE\_ADDR)—Offset A4h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

MESSAGE\_ADDR: [B:0, D:20, F:3] + A4h

Default: 00000000h

Bit Range	Default & Access	Description
31: 2	0h RW	<b>Message Address (address)</b> : If the Message Enable bit (bit 0 of the Message Control register) is set, the contents of this register specify the DWORD-aligned address (AD[31:2]) for the MSI memory write transaction. AD[1:0] are driven to zero during the address phase. This field is read/write
1: 0	0h RO	<b>RSVD0 (RSVD0)</b> : Reserved

### 16.5.2.32 Message Data (MESSAGE\_DATA)—Offset A8h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

MESSAGE\_DATA: [B:0, D:20, F:3] + A8h

Default: 0000h

Bit Range	Default & Access	Description
15: 0	0h RW	<b>Data Field (MsgData):</b> System-specified message data. If the Message Enable bit (bit 0 of the Message Control register) is set, the message data is driven onto the lower word (AD[15:0]) of the memory write transactions data phase. AD[31:16] are driven to zero during the memory write transactions data phase. C/BE[3::0]# are asserted during the data phase of the memory write transaction. None of the message bits will be changed by hardware

16.5.2.33 Mask Bits for MSI (PER\_VEC\_MASK)—Offset ACh

Access Method

Type: PCI Configuration Register (Size: 32 bits)

PER\_VEC\_MASK: [B:0, D:20, F:3] + ACh

Default: 00000000h

31	28	24	20	16	12	8	4	0																											
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVDO															MSIMask																				

Bit Range	Default & Access	Description
31: 1	0h RO	<b>RSVDO (RSVDO):</b> Reserved
0	0h RW	<b>Vector 0 Mask (MSIMask):</b> Mask Bit for Vector 0. If this bit is set, the function will not send MSI messages

16.5.2.34 Pending Bits for MSI (PER\_VEC\_PEND)—Offset B0h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

PER\_VEC\_PEND: [B:0, D:20, F:3] + B0h

Default: 00000000h

31	28	24	20	16	12	8	4	0																											
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVDO															value																				

Bit Range	Default & Access	Description
31: 1	0h RO	<b>RSVDO (RSVDO):</b> Reserved
0	0h RO	<b>Vector 0 Pending (value):</b> Pending Bit for Vector 0.

16.5.2.35 USB Legacy Support Extended Capability (USBLEGSUP)—Offset C0h

Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

USBLEGSUP: [B:0, D:20, F:3] + C0h

Default: 0000001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
RSVD0		HC_OS_Owned_Semaphore	RSVD		HC_BIOS_Owned_Semaphore	NXT_CAP_PTR		CAP_ID

Bit Range	Default & Access	Description
31: 25	0h RO	<b>RSVD0 (RSVD0):</b> Reserved
24	0b RW	<b>HC OS Owned Semaphore (HC_OS_Owned_Semaphore):</b> System software sets this bit to request ownership of the EHCI controller. Ownership is obtained when this bit reads as one and the HC BIOS Owned Semaphore bit reads as zero.
23: 17	00h RO	<b>Reserved (RSVD):</b> Reserved.
16	0b RW	<b>HC BIOS Owned Semaphore (HC_BIOS_Owned_Semaphore):</b> The BIOS sets this bit to establish ownership of the EHCI controller. System BIOS will set this bit to a zero in response to a request for ownership of the EHCI controller by system software.
15: 8	0h RO	<b>Next EHCI Extended Capability Pointer (NXT_CAP_PTR):</b> This field points to the PCI configuration space offset of the next extended capability pointer. A value of 00h indicates the end of the extended capability list.
7: 0	01h RO	<b>Capability ID (CAP_ID):</b> This field identifies the extended capability. A value of 01h identifies the capability as Legacy Support. This extended capability requires one additional 32-bit register for control/status information, and this register is located at offset EECF+04h.

### 16.5.2.36 USB Legacy Support Control/Status (USBLEGCTLSTS)—Offset C4h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

USBLEGCTLSTS: [B:0, D:20, F:3] + C4h

Default: 0000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
SMI_BAR	RSVD			SMI_ASYNC_ADVANCE	RSVD			SMI_ASYNC_ADVANCE_EN
SMI_PCI_CMD				SMI_HOST_SYSTEM_ERROR				SMI_HOST_SYSTEM_ERROR_EN
SMI_OS_OWNR_CHANGE				SMI_FRAME_LIST_ROLLOVER				SMI_FRAME_LIST_ROLLOVER_EN
				SMI_PORT_CHANGE_DETECT				SMI_PORT_CHANGE_DETECT_EN
				SMI_USB_ERROR				SMI_USB_ERROR_EN
				SMI_USB_COMPLETE				SMI_USB_COMPLETE_EN
				SMI_BAR_EN				
				SMI_PCI_CMD_EN				
				SMI_OS_OWNR_CHANGE_EN				

Bit Range	Default & Access	Description
31	0b RW	<b>SMI on BAR (SMI_BAR)</b> : This bit is set to one whenever the Base Address Register (BAR) is written.
30	0b RW	<b>SMI on PCI Command (SMI_PCI_CMD)</b> : This bit is set to one whenever the PCI Command Register is written.
29	0b RW	<b>SMI on OS Ownership Change (SMI_OS_OWNR_CHANGE)</b> : This bit is set to one whenever the HC OS Owned Semaphore bit in the USBLEGSUP register transitions from 1 to a 0 or 0 to a 1.
28: 22	00h RO	<b>Reserved (RSVD)</b> : Reserved.
21	0b RO	<b>SMI on Async Advance (SMI_ASYNC_ADVANCE)</b> : Shadow bit of the Interrupt on Async Advance bit in the USBSTS register see Section 2.3.2 for definition. To set this bit to a zero, system software must write a one to the Interrupt on Async Advance bit in the USBSTS register.
20	0b RO	<b>SMI on Host System Error (SMI_HOST_SYSTEM_ERROR)</b> : Shadow bit of Host System Error bit in the USBSTS register, see Section 2.3.2 for definition and effects of the events associated with this bit being set to a one. To set this bit to a zero, system software must write a one to the Host System Error bit in the USBSTS register.
19	0b RO	<b>SMI on Frame List Rollover (SMI_FRAME_LIST_ROLLOVER)</b> : Shadow bit of Frame List Rollover bit in the USBSTS register see Section 2.3.2 for definition. To set this bit to a zero, system software must write a one to the Frame List Rollover bit in the USBSTS register.
18	0b RO	<b>SMI on Port Change Detect (SMI_PORT_CHANGE_DETECT)</b> : Shadow bit of Port Change Detect bit in the USBSTS register see Section 2.3.2 for definition. To set this bit to a zero, system software must write a one to the Port Change Detect bit in the USBSTS register.
17	0b RO	<b>SMI on USB Error (SMI_USB_ERROR)</b> : Shadow bit of USB Error Interrupt (USBERRINT) bit in the USBSTS register see Section 2.3.2 for definition. To set this bit to a zero, system software must write a one to the USB Error Interrupt bit in the USBSTS register.
16	0b RO	<b>SMI on USB Complete (SMI_USB_COMPLETE)</b> : Shadow bit of USB Interrupt (USBINT) bit in the USBSTS register see Section 2.3.2 for definition. To set this bit to a zero, system software must write a one to the USB Interrupt bit in the USBSTS register.
15	0b RW	<b>SMI on BAR Enable (SMI_BAR_EN)</b> : When this bit is one and SMI on BAR is one, then the host controller will issue an SMI.
14	0b RW	<b>SMI on PCI Command Enable (SMI_PCI_CMD_EN)</b> : When this bit is one and SMI on PCI Command is one, then the host controller will issue an SMI.
13	0b RW	<b>SMI on OS Ownership Enable (SMI_OS_OWNR_CHANGE_EN)</b> : When this bit is a one AND the OS Ownership Change bit is one, the host controller will issue an SMI.

Bit Range	Default & Access	Description
12: 6	00h RO	<b>Reserved (RSVD):</b> Reserved.
5	0b RW	<b>SMI on Async Advance Enable (SMI_ASYNC_ADVANCE_EN):</b> When this bit is a one, and the SMI on Async Advance bit (above) in this register is a one, the host controller will issue an SMI immediately
4	0b RW	<b>SMI on Host System Error Enable (SMI_HOST_SYSTEM_ERROR_EN):</b> When this bit is a one, and the SMI on Host System Error bit (above) in this register is a one, the host controller will issue an SMI immediately
3	0b RW	<b>SMI on Frame List Rollover Enable (SMI_FRAME_LIST_ROLLOVER_EN):</b> When this bit is a one, and the SMI on Frame List Rollover bit (above) in this register is a one, the host controller will issue an SMI immediately.
2	0b RW	<b>SMI on Port Change Enable (SMI_PORT_CHANGE_DETECT_EN):</b> When this bit is a one, and the SMI on Port Change Detect bit (above) in this register is a one, the host controller will issue an SMI immediately.
1	0b RW	<b>SMI on USB Error Enable (SMI_USB_ERROR_EN):</b> When this bit is a one, and the SMI on USB Error bit (above) in this register is a one, the host controller will issue an SMI immediately.
0	0b RW	<b>USB SMI Enable (SMI_USB_COMPLETE_EN):</b> When this bit is a one, and the SMI on USB Complete bit (above) in this register is a one, the host controller will issue an SMI immediately.

### 16.5.3 USB OHCI

Table 105. Summary of PCI Configuration Registers—0/20/4

B0h	B3h	"Pending Bits for MSI (PER_VEC_PEND)—Offset B0h" on page 468	00000000h

**16.5.3.1 Vendor ID (VENDOR\_ID)—Offset 0h**

**Access Method**

**Type:** PCI Configuration Register (Size: 16 bits)      **VENDOR\_ID:** [B:0, D:20, F:4] + 0h

**Default:** 8086h

Bit Range	Default & Access	Description
15: 0	8086h RO	<b>Vendor ID (value):</b> PCI Vendor ID for Intel

**16.5.3.2 Device ID (DEVICE\_ID)—Offset 2h**

**Access Method**

**Type:** PCI Configuration Register (Size: 16 bits)      **DEVICE\_ID:** [B:0, D:20, F:4] + 2h

**Default:** 093Ah

Bit Range	Default & Access	Description
15: 0	093Ah RO	<b>Device ID (value):</b> PCI Device ID

### 16.5.3.3 Command Register (COMMAND\_REGISTER)—Offset 4h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**COMMAND\_REGISTER:** [B:0, D:20, F:4] + 4h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
	RSVD0	IntrDis	RSVD	SERREN
			RSVD	MasEn
				MEMen
				RSVD

Bit Range	Default & Access	Description
15: 11	0h RO	<b>RSVDO (RSVDO):</b> Reserved
10	0b RW	<b>Interrupt Disable (IntrDis):</b> Interrupt disable. Disables generation of interrupt messages in the PCI Express function. 1 =) disabled, 0 =) not disabled
9	0h RO	<b>Reserved (RSVD):</b> Reserved.
8	0b RW	<b>SERR Enable (SERREN):</b> When set, this bit enables the non-fatal and fatal errors detected by the function to be reported to the root complex.
7: 3	00h RO	<b>Reserved (RSVD):</b> Reserved.
2	0b RW	<b>Bus Master Enable (MasEn):</b> 0=)disables upstream requests 1=)enables upstream requests.
1	0b RW	<b>Memory Space Enable (MEMen):</b> Device support for Memory transactions. 0 =) not supported. 1 =) supported.
0	0h RO	<b>Reserved (RSVD):</b> Reserved.

### 16.5.3.4 Status Register (STATUS)—Offset 6h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**STATUS:** [B:0, D:20, F:4] + 6h

**Default:** 0010h

15	12	8	4	0
0	0	0	1	0
RSVD0	SigSysErr	RcdMasAb	RSVD	DEVSEL
			RSVD	FastB2B
			RSVD	capable_66Mhz
			hasCapList	IntrStatus
				RSVD1

Bit Range	Default & Access	Description
15	0h RO	<b>RSVDO (RSVDO)</b> : Reserved
14	0b RW	<b>Signaled System Error (SigSysErr)</b> : Set when a function detects a system error and the SERR Enable bit is set
13	0b RW	<b>Received master abort (RcdMasAb)</b> : Set when requester receives a completion with Unsupported Request completion status
12: 11	0h RO	<b>Reserved (RSVD)</b> : Reserved.
10: 9	0b RO	<b>DEVSEL Timing (DEVSEL)</b> : Deprecated: Hardwired to 0
8	0h RO	<b>Reserved (RSVD)</b> : Reserved.
7	0b RO	<b>Fast Back-to-Back Capable (FastB2B)</b> : Deprecated: Hardwired to 0
6	0h RO	<b>Reserved (RSVD)</b> : Reserved.
5	0b RO	<b>66MHz-Capable (capable_66Mhz)</b> : Deprecated: Hardwired to 0
4	1h RO	<b>Capabilities List (hasCapList)</b> : Indicates the presence of one or more capability register sets.
3	0b RO	<b>Interrupt Status (IntrStatus)</b> : Indicates that the function has a legacy interrupt request outstanding. This bit has no meaning if Message Signaled Interrupts are being used
2: 0	0h RO	<b>RSVD1 (RSVD1)</b> : Reserved

### 16.5.3.5 Revision ID and Class Code (REV\_ID\_CLASS\_CODE)—Offset 8h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

REV\_ID\_CLASS\_CODE: [B:0, D:20, F:4] + 8h

Default: 0C031010h

31	28	24	20	16	12	8	4	0
0	0	0	0	1	1	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
	classCode		subClassCode		progIntf		rev_id	

Bit Range	Default & Access	Description
31: 24	0Ch RO	<b>Class Code (classCode)</b> : Broadly classifies the type of function that the device performs.
23: 16	03h RO	<b>Sub-Class Code (subClassCode)</b> : Identifies more specifically (than the class_code byte) the function of the device.
15: 8	10h RO	<b>Programming Interface (progIntf)</b> : Used to define the register set variation within a particular sub-class.
7: 0	10h RO	<b>Revision ID (rev_id)</b> : Assigned by the function manufacturer and identifies the revision number of the function.

### 16.5.3.6 Cache Line Size (CACHE\_LINE\_SIZE)—Offset Ch

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

CACHE\_LINE\_SIZE: [B:0, D:20, F:4] + Ch

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RW	<b>Cache Line Size (value)</b> : Implemented as a R/W register for legacy purposes but has no effect on device functionality.

### 16.5.3.7 Latency Timer (LATENCY\_TIMER)—Offset Dh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

LATENCY\_TIMER: [B:0, D:20, F:4] + Dh

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RO	<b>Latency Timer (value)</b> : Deprecated. Hardwire to 0.

### 16.5.3.8 Header Type (HEADER\_TYPE)—Offset Eh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

HEADER\_TYPE: [B:0, D:20, F:4] + Eh

Default: 80h

7	4	0
1	0 0 0 0	0 0 0 0
multiFnDev	cfgHdrFormat	

Bit Range	Default & Access	Description
7	1h RO	<b>Multi-Function Device (multiFnDev)</b> : Hard-wired to 1 to indicate that this is a multi-function device
6: 0	0h RO	<b>Configuration Header Format (cfgHdrFormat)</b> : Hard-wired to 0 to indicate that this configuration header is a Type 0 header, i.e. it is an endpoint rather than a bridge.

### 16.5.3.9 BIST (BIST)—Offset Fh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

BIST: [B:0, D:20, F:4] + Fh

Default: 00h

7	4	0
0	0 0 0 0	0 0 0 0
BIST_capable	start_bist	RSVD
		comp_code

Bit Range	Default & Access	Description
7	0h RO	<b>BIST_capable (BIST_capable)</b> : Hard-wired to 0. (Returns 1 if the function implements a BIST)
6	0h RO	<b>Start (start_bist)</b> : Set to start the functions BIST if BIST is supported.
5: 4	0h RO	<b>Reserved (RSVD)</b> : Reserved.
3: 0	0h RO	<b>Completion Code (comp_code)</b> : Completion code having run BIST if BIST is supported. 0=)success. non-zero=)failure

### 16.5.3.10 Base Address Register (BAR0)—Offset 10h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

BAR0: [B:0, D:20, F:4] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31: 12	0h RW	<b>address (address):</b> Used to determine the size of memory required by the device and to assign a start address for this required amount of memory.
11: 4	00h RO	<b>Reserved (RSVD):</b> Reserved.
3	0b RO	<b>Prefetchable (prefetchable):</b> Defines the block of memory as prefetchable or not. A block of memory is prefetchable if it fulfils the following 3 conditions (1) no side effects on reads, (2) the device returns all bytes on reads regardless of the byte enables, and (3) host bridges can merge processor writes into this range without causing errors. Hardwired to 0
2: 1	00b RO	<b>Type (memType):</b> Hardwired to 0 to indicate a 32-bit decoder
0	0b RO	<b>Memory Space Indicator (isIO):</b> Hardwired to 0 to indicate the register is a memory address decoder

### 16.5.3.11 Cardbus CIS Pointer (CARDBUS\_CIS\_POINTER)—Offset 28h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**CARDBUS\_CIS\_POINTER:** [B:0, D:20, F:4] + 28h

**Default:** 00000000h

Bit Range	Default & Access	Description
31: 0	0h RO	<b>Cardbus CIS Pointer (value):</b> Reserved. Hardwire to 0.

### 16.5.3.12 Subsystem Vendor ID (SUB\_SYS\_VENDOR\_ID)—Offset 2Ch

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**SUB\_SYS\_VENDOR\_ID:** [B:0, D:20, F:4] + 2Ch

**Default:** 0000h

Bit Range	Default & Access	Description
15: 0	0h RO	<b>Subsystem Vendor ID (value):</b> PCI Subsystem Vendor ID

### 16.5.3.13 Subsystem ID (SUB\_SYS\_ID)—Offset 2Eh

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

SUB\_SYS\_ID: [B:0, D:20, F:4] + 2Eh

Default: 0000h

Bit Range	Default & Access	Description
15: 0	0h RO	<b>Subsystem ID (value):</b> PCI Subsystem ID

### 16.5.3.14 Expansion ROM Base Address (EXP\_ROM\_BASE\_ADR)—Offset 30h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

EXP\_ROM\_BASE\_ADR: [B:0, D:20, F:4] + 30h

Default: 00000000h

Bit Range	Default & Access	Description
31: 11	0h RW	<b>ROM Start Address (ROM_base_addr):</b> Used to determine the size of memory required by the ROM and to assign a start address for this required amount of memory.
10: 1	000h RO	<b>Reserved (RSVD):</b> Reserved.
0	0h RW	<b>Address Decode Enable (AddrDecodeEn):</b> A 1 in this field enables the function's ROM address decoder assuming that the Memory Space bit in the Command Register is also set to 1

### 16.5.3.15 Capabilities Pointer (CAP\_POINTER)—Offset 34h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

CAP\_POINTER: [B:0, D:20, F:4] + 34h

Default: 00000080h

Bit Range	Default & Access	Description
31: 8	0h RO	RSVD0 (RSVD0): Reserved
7: 0	80h RO	Capabilities Pointer (value): Pointer to memory location of first entry of linked list of configuration register sets each of which supports a feature. Points to PM (power management) register set at location 0x80

### 16.5.3.16 Interrupt Line Register (INTR\_LINE)—Offset 3Ch

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

INTR\_LINE: [B:0, D:20, F:4] + 3Ch

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RW	Interrupt Line Register (value): The value in this register tells which input of the system interrupt controller(s) the device's interrupt pin is connected to. The device itself does not use this value, rather it is used by device drivers and operating systems. Device drivers and operating systems can use this information to determine priority and vector information.

### 16.5.3.17 Interrupt Pin Register (INTR\_PIN)—Offset 3Dh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

INTR\_PIN: [B:0, D:20, F:4] + 3Dh

Default: 00h

Bit Range	Default & Access	Description
7: 0	01h RO	<b>Interrupt Pin Register (value):</b> The Interrupt Pin register tells which interrupt pin the device (or device function) uses. A value of 1 corresponds to INTA#. A value of 2 corresponds to INTB#. A value of 3 corresponds to INTC#. A value of 4 corresponds to INTD#. Devices (or device functions) that do not use an interrupt pin must put a 0 in this register. The values 05h through FFh are reserved. For this system function 0 is connected to INTA, 1 to INTB, 2 to INTC 3 to INTD, 4 to INTA, 5 to INTB etc.

### 16.5.3.18 MIN\_GNT (MIN\_GNT)—Offset 3Eh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MIN\_GNT: [B:0, D:20, F:4] + 3Eh

Default: 00h

7				4				0
0	0	0	0	0	0	0	0	0
value								

Bit Range	Default & Access	Description
7: 0	0h RO	MIN_GNT (value): Hardwired to 0

### 16.5.3.19 MAX\_LAT (MAX\_LAT)—Offset 3Fh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MAX\_LAT: [B:0, D:20, F:4] + 3Fh

Default: 00h

7				4				0
0	0	0	0	0	0	0	0	0
value								

Bit Range	Default & Access	Description
7: 0	0h RO	MAX_LAT (value): Hardwired to 0

### 16.5.3.20 Capability ID (PM\_CAP\_ID)—Offset 80h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

PM\_CAP\_ID: [B:0, D:20, F:4] + 80h

Default: 01h

7				4					0
0	0	0	0	0	0	0	0	0	1
value									

Bit Range	Default & Access	Description
7: 0	01h RO	<b>Capability ID (value)</b> : Identifies the feature associated with this register set. Hardwired value as per PCI SIG assigned capability ID

### 16.5.3.21 Next Capability Pointer (PM\_NXT\_CAP\_PTR)—Offset 81h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

PM\_NXT\_CAP\_PTR: [B:0, D:20, F:4] + 81h

Default: A0h

7				4					0
1	0	1	0	0	0	0	0	0	0
value									

Bit Range	Default & Access	Description
7: 0	a0h RO	<b>Next Capability Pointer (value)</b> : Pointer to the next register set of feature specific configuration registers. Hardwired to 0xA0 to point to the MSI Capability Structure

### 16.5.3.22 Power Management Capabilities (PMC)—Offset 82h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

PMC: [B:0, D:20, F:4] + 82h

Default: 4803h

15			12				8			4				0	
0	1	0	0	1	0	0	0	0	0	0	0	0	0	1	1
PME_support				D2_support		D1_support		aux_curr			DSI	RSVD	PME_clock	version	

Bit Range	Default & Access	Description
15: 11	09h RO	<b>PME Support (PME_support)</b> : PME_Support field Indicates the PM states within which the function is capable of sending a PME (Power Management Event) message. 0 in a bit (=) PME is not supported in the corresponding PM state, where bit indexes 11,12,13,14,15 correspond to PM states D0, D1, D2, D3hot, D3cold respectively.
10	0h RO	<b>D2 Support (D2_support)</b> : Hardwired to 0 as the D2 state is not supported
9	0h RO	<b>D1 Support (D1_support)</b> : Hardwired to 0 as the D1 state is not supported

Bit Range	Default & Access	Description
8: 6	0h RO	<b>Aux Current (aux_curr)</b> : Hardwired to 0 as the D3hot state is not supported
5	0h RO	<b>Device Specific Initialisation (DSI)</b> : Hardwired to 0 to indicate that the device does not require a device specific initialisation sequence following transition to the D0 uninitialised state
4	0h RO	<b>Reserved (RSVD)</b> : Reserved.
3	0h RO	<b>PME Clock (PME_clock)</b> : Deprecated. Hardwired to 0
2: 0	011b RO	<b>Version (version)</b> : This function complies with revision 1.2 of the PCI Power Management Interface Specification

### 16.5.3.23 Power Management Control/Status Register (PMCSR)—Offset 84h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

PMCSR: [B:0, D:20, F:4] + 84h

Default: 0008h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
PME_status	Data_scale	Data_select	PME_en	RSVD
no_soft_reset	RSVD	power_state		

Bit Range	Default & Access	Description
15	0h RW	<b>PME Status (PME_status)</b> : Set if function has experienced a PME (even if PME_en (bit 8 of PMCSR register) is not set).
14: 13	0h RO	<b>Data Scale (Data_scale)</b> : Hardwired to 0 as the data register is not supported
12: 9	0h RO	<b>Data Select (Data_select)</b> : Hardwired to 0 as the data register is not supported
8	0b RW	<b>PME Enable (PME_en)</b> : Enable device function to send PME messages when an event occurs. 1=)enabled. 0=)disabled
7: 4	0h RO	<b>Reserved (RSVD)</b> : Reserved.
3	1b RO	<b>No Soft Reset (no_soft_reset)</b> : Devices do perform an internal reset when transitioning from D3hot to D0
2	0h RO	<b>Reserved (RSVD)</b> : Reserved.
1: 0	00b RW	<b>Power State (power_state)</b> : Allows software to read current PM state or transition device to a new PM state, where 2'b00 = D0, 2'b01=D1, 2'b10=D2, 2'b11=D3hot

### 16.5.3.24 PM CSR PCI-to-PCI Bridge Support Extension (PMCSR\_BSE)—Offset 86h

**Access Method**

Type: PCI Configuration Register  
(Size: 8 bits)

PMCSR\_BSE: [B:0, D:20, F:4] + 86h

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RO	PM CSR PCI-to-PCI Bridge Support Extension (value): Not Supported. Hardwired to 0.

### 16.5.3.25 Power Management Data Register (DATA\_REGISTER)—Offset 87h

**Access Method**

Type: PCI Configuration Register  
(Size: 8 bits)

DATA\_REGISTER: [B:0, D:20, F:4] + 87h

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RO	Power Management Data Register (value): Not Supported. Hardwired to 0

### 16.5.3.26 Capability ID (MSI\_CAP\_ID)—Offset A0h

**Access Method**

Type: PCI Configuration Register  
(Size: 8 bits)

MSI\_CAP\_ID: [B:0, D:20, F:4] + A0h

Default: 05h

Bit Range	Default & Access	Description
7: 0	05h RO	Capability ID (value): Identifies the feature associated with this register set. Hardwired value as per PCI SIG assigned capability ID

### 16.5.3.27 Next Capability Pointer (MSI\_NXT\_CAP\_PTR)—Offset A1h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MSI\_NXT\_CAP\_PTR: [B:0, D:20, F:4] + A1h

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	00h RO	<b>Next Capability Pointer (value)</b> : Hardwired to 0 as this is the last capability structure in the chain

### 16.5.3.28 Message Control (MESSAGE\_CTRL)—Offset A2h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

MESSAGE\_CTRL: [B:0, D:20, F:4] + A2h

Default: 0100h

15	12	8	4	0
0	0	0	0	0
RSVDO		perVecMskCap	bit64Cap	multiMsgEn
			multiMsgCap	MSIEnable

Bit Range	Default & Access	Description
15: 9	0h RO	<b>RSVDO (RSVDO)</b> : Reserved
8	1h RO	<b>Per Vector Masking Capable (perVecMskCap)</b> : Hardwired to 1 to indicate the function supports PVM
7	0h RO	<b>64 bit Address Capable (bit64Cap)</b> : This bit is hardwired to 0 to indicate that the function is not capable of sending a 64-bit message address.
6: 4	0h RW	<b>Multi-Message Enable (multiMsgEn)</b> : As only one vector is supported per function, software should only write a value of 0x0 to this field
3: 1	0h RO	<b>Multiple Message Enable (multiMsgCap)</b> : This field is hardwired to 0x0 to indicate that the function is requesting a single vector
0	0h RW	<b>MSI Enable (MSIEnable)</b> : Set to enable MSI to request service. If set then it's prohibited to use the INTx pin. System configuration software sets this bit to enable MSI.

### 16.5.3.29 Message Address (MESSAGE\_ADDR)—Offset A4h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

MESSAGE\_ADDR: [B:0, D:20, F:4] + A4h

Default: 00000000h

Bit Range	Default & Access	Description
31: 2	0h RW	<b>Message Address (address):</b> If the Message Enable bit (bit 0 of the Message Control register) is set, the contents of this register specify the DWORD-aligned address (AD[31:2]) for the MSI memory write transaction. AD[1:0] are driven to zero during the address phase. This field is read/write
1: 0	0h RO	<b>RSVD0 (RSVD0):</b> Reserved

### 16.5.3.30 Message Data (MESSAGE\_DATA)—Offset A8h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

MESSAGE\_DATA: [B:0, D:20, F:4] + A8h

Default: 0000h

Bit Range	Default & Access	Description
15: 0	0h RW	<b>Data Field (MsgData):</b> System-specified message data. If the Message Enable bit (bit 0 of the Message Control register) is set, the message data is driven onto the lower word (AD[15:0]) of the memory write transactions data phase. AD[31:16] are driven to zero during the memory write transactions data phase. C/BE[3:0]# are asserted during the data phase of the memory write transaction. None of the message bits will be changed by hardware

### 16.5.3.31 Mask Bits for MSI (PER\_VEC\_MASK)—Offset ACh

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

PER\_VEC\_MASK: [B:0, D:20, F:4] + ACh

Default: 00000000h

Bit Range	Default & Access	Description
31: 1	0h RO	<b>RSVDO (RSVDO)</b> : Reserved
0	0h RW	<b>Vector 0 Mask (MSIMask)</b> : Mask Bit for Vector 0. If this bit is set, the function will not send MSI messages

### 16.5.3.32 Pending Bits for MSI (PER\_VEC\_PEND)—Offset B0h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**PER\_VEC\_PEND:** [B:0, D:20, F:4] + B0h

**Default:** 00000000h

Bit Range	Default & Access	Description
31: 1	0h RO	<b>RSVDO (RSVDO)</b> : Reserved
0	0h RO	<b>Vector 0 Pending (value)</b> : Pending Bit for Vector 0.

## 16.6 Memory Mapped Registers

### 16.6.1 USB Device

**Table 106. Summary of Memory Mapped I/O Registers—BAR0**

Offset Start	Offset End	Register Name (Register Symbol)	Default Value
0h	3h	"IN Endpoint 0 Control Register (ep0_in_ctrl_udc_reg)—Offset 0h" on page 489	00000000h
4h	7h	"IN Endpoint 0 Status Register (ep0_in_sts_udc_reg)—Offset 4h" on page 490	00000000h
8h	Bh	"IN Endpoint 0 Buffer Size Register (ep0_in_bufsize_udc_reg)—Offset 8h" on page 492	00000000h
Ch	Fh	"IN Endpoint 0 Maximum Packet Size Register (ep0_in_mpkt_sz_reg)—Offset Ch" on page 493	00000000h
14h	17h	"IN Endpoint 0 Data Descriptor Pointer Register (ep0_in_desptr_udc_reg)—Offset 14h" on page 493	00000000h
1Ch	1Fh	"IN Endpoint 0 Write Confirmation register (for Slave-Only mode) (ep0_wr_cfrm_udc_reg)—Offset 1Ch" on page 494	00000000h
20h	23h	"IN Endpoint 1 Control Register (ep1_in_ctrl_udc_reg)—Offset 20h" on page 494	00000000h
24h	27h	"IN Endpoint 1 Status Register (ep1_in_sts_udc_reg)—Offset 24h" on page 495	00000000h
28h	2Bh	"IN Endpoint 1 Buffer Size Register (ep1_in_bufsize_udc_reg)—Offset 28h" on page 497	00000000h

Table 106. Summary of Memory Mapped I/O Registers—BAR0 (Continued)

Offset Start	Offset End	Register Name (Register Symbol)	Default Value
2Ch	2Fh	"IN Endpoint 1 Maximum Packet Size Register (ep1_in_mpkt_sz_reg)—Offset 2Ch" on page 498	00000000h
34h	37h	"IN Endpoint 1 Data Descriptor Pointer Register (ep1_in_desptr_udc_reg)—Offset 34h" on page 498	00000000h
3Ch	3Fh	"IN Endpoint 1 Write Confirmation register (for Slave-Only mode) (ep1_wr_cfrm_udc_reg)—Offset 3Ch" on page 499	00000000h
40h	43h	"IN Endpoint 2 Control Register (ep2_in_ctrl_udc_reg)—Offset 40h" on page 499	00000000h
44h	47h	"IN Endpoint 2 Status Register (ep2_in_sts_udc_reg)—Offset 44h" on page 500	00000000h
48h	4Bh	"IN Endpoint 2 Buffer Size Register (ep2_in_bufsize_udc_reg)—Offset 48h" on page 502	00000000h
4Ch	4Fh	"IN Endpoint 2 Maximum Packet Size Register (ep2_in_mpkt_sz_reg)—Offset 4Ch" on page 503	00000000h
54h	57h	"IN Endpoint 2 Data Descriptor Pointer Register (ep2_in_desptr_udc_reg)—Offset 54h" on page 503	00000000h
5Ch	5Fh	"IN Endpoint 2 Write Confirmation register (for Slave-Only mode) (ep2_wr_cfrm_udc_reg)—Offset 5Ch" on page 504	00000000h
60h	63h	"IN Endpoint 3 Control Register (ep3_in_ctrl_udc_reg)—Offset 60h" on page 504	00000000h

**16.6.1.1 IN Endpoint 0 Control Register (ep0\_in\_ctrl\_udc\_reg)—Offset 0h**

This register is used to program the endpoint as required by the application.

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 0h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0x0 RO	<b>reserved:</b> Reserved bits. These bits are reserved and should be set to zero.
12	0x0 RO	<b>Receive FIFO Flush for Multiple Receive FIFO (mrx_flush):</b> This is an OUT endpoint field only. These bits are reserved and should be set to zero.
11	0x0 RO	<b>Close Descriptor Channel (close_desc):</b> Close Descriptor Enhancement is not supported. These bits are reserved and should be set to zero.
10	0x0 RW	<b>Send Null Packet (null_bit):</b> This bit provides the application with a mechanism to instruct the USB Device Controller to send a NULL (zero length) packet when no data is available in the particular endpoint TxFIFO. If this bit is set, when no data is available in the endpoint TxFIFO, the USB Device Controller sends a NULL packet.
9	0x0 RO	<b>Receive Ready (rrdy):</b> This is an OUT endpoint field only. These bits are reserved and should be set to zero.

Bit Range	Default & Access	Field Name (ID): Description
8	0x0 WO	<b>Clear NAK (cnak):</b> Used by the application to clear the NAK bit (bit 6). After the subsystem sets bit 6 (NAK), the application must clear it with a write of 1 to the CNAK bit. (For example, after the application has decoded the SETUP packet and determined it is not an invalid command, the application must set the CNAK bit of the control endpoint to 1 to clear the NAK bit.)The application also must clear the NAK bit whenever the subsystem sets it. (The subsystem sets it due to the application setting the Stall bit.)The application can clear this bit only when the Rx FIFO is empty (for single Rx FIFO implementation) or when the Rx FIFO corresponding to the same logical endpoint is empty (Multiple Rx FIFO implementation). The application can write CNAK any time without waiting for a Rx FIFO empty condition. The NAK bit is cleared immediately upon write to CNAK bit. No polling is necessary.
7	0x0 WO	<b>Set NAK (snak):</b> Used by the application to set the NAK bit (bit 6 of this register). The application must not set the NAK bit for an IN endpoint until it has received an IN token interrupt indicating that the Tx FIFO is empty.
6	0x0 RO	<b>NAK Bit (nak):</b> After a SETUP packet, which is decoded by the application, is received by the core, the core sets the NAK bit for all control IN/OUT endpoints. NAK is also set after a STALL response for the endpoint (the STALL bit is set in Endpoint Control register bit 0). 1: The endpoint responds to the USB host with a NAK handshake. 0: The endpoint responds normally. Note 1: A SETUP packet is sent to the application regardless of whether the NAK bit is set. Note 2: A NAK set on ISOC OUT endpoint rejects the ISOC out data packet.
5:4	0x0 RW	<b>Endpoint Type (et):</b> The possible options are: 00: Control endpoint 01: Isochronous endpoint 10: Bulk endpoint 11: Interrupt endpoint
3	0x0 RW	<b>Poll Demand (p):</b> Poll demand from the application. The application can set this bit after an IN token is received from the endpoint. The application can also set this bit before an IN token is received for the endpoint, if it has the IN transfer data in advance. Note: After sending a zero-length or short packet, the application must wait for the next XFERDONE_TXEMPTY interrupt, before setting up the P bit for the next transfer.
2	0x0 RO	<b>Snoop Mode (sn):</b> This is an OUT endpoint field only. These bits are reserved and should be set to zero.
1	0x0 RW	<b>Flush Tx FIFO (f):</b> The application firmware sets this bit to 1 after it has detected a disconnect/connect on the USB cable, then waits for the IN token endpoint interrupt before resetting this bit to 0. This flushes the stale data out of the Tx FIFO. This bit is cleared by the core when TDC (Transmit DMA Complete) occurs on this endpoint.
0	0x0 RW	<b>Stall Handshake (s):</b> On successful reception of a SETUP packet (decoded by the application), the subsystem clears both IN and OUT Stall bits, and sets both the IN and OUT NAK bits. The application must check for Rx FIFO emptiness before setting the IN and OUT STALL bit. For non-SETUP packets, the subsystem clears either IN or out STALL bits only if a STALL handshake is returned to the USB host, then sets the corresponding NAK bit. The subsystem returns a STALL handshake for the subsequent transactions of the stalled endpoint until the USB host issues a Clear_Feature command to clear it. Once this bit is set, if the subsystem has already returned a STALL handshake to the USB host, the application firmware cannot clear the S bit to stop the subsystem from sending the STALL handshake on the endpoint. The host must instead send one of the following commands to clear the endpoint Halt status: - Clear Feature (Halt) - SetConfiguration - SetInterface.

### 16.6.1.2 IN Endpoint 0 Status Register (ep0\_in\_sts\_udc\_reg)—Offset 4h

The Endpoint Status register indicates the endpoint status.

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 4h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:2] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0						
0	0	0	0	0	0	0	0	0						
reserved_1	cdc	xfer_done_txf_empty	set_feature_halt	clr_feature_halt	tx_fifo_empty	isoc_xfer_done	rx_pkt_size	tdc	he	mrxfifo_empty	bna	in_tok	out_tok	reserved_3

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	<b>reserved_1</b> : Reserved bits. These bits are reserved and should be set to zero.
28	0x0 RO	<b>Close Descriptor Channel (cdc)</b> : Close Descriptor Enhancement is not supported. These bits are reserved and should be set to zero.
27	0x0 RW/1C	<b>Transfer Done/Transmit FIFO Empty (xfer_done_txf_empty)</b> : This bit indicates that the TXFIFO is empty after the DMA transfer has been completed. The application can use this bit to set the poll bit for the next transfer. The application must first clear this bit after servicing the interrupt.
26	0x0 RW/1C	<b>Received Set Halt (set_feature_halt)</b> : This bit indicates that the Set Feature (EP HALT) command is received for this endpoint. To stall this endpoint, the application can set the S bit in Endpoint Control Register. After this, the application clears this RSS bit to acknowledge the reception of Set Feature stall command. Once this RSS bit is cleared, core sends the zero-length packet for the Status IN phase of Set Feature command. Received Set Stall indication is applicable only for Bulk and Interrupt transactions.
25	0x0 RW/1C	<b>Received Clear Halt (clr_feature_halt)</b> : This bit indicates that the Clear Feature (EP HALT) command is received for this endpoint. To continue to stall the endpoint, the application must set the S bit Endpoint Control Register. After this, the application clears this RCS bit to acknowledge the reception of clear stall command. Once this bit is cleared, core sends the zero-length packet for the Status IN phase of clear stall command. Received Clear Stall indication is applicable only for Bulk and Interrupt transactions.
24	0x0 RW/1C	<b>Transmit FIFO Empty detected (tx_fifo_empty)</b> : This bit indicates that the Transmit FIFO Empty condition is triggered. Application can use this information to load the subsequent data into the Transmit FIFO. The application must clear this bit after writing the data into the Transmit FIFO. Note: This bit is not used for Isochronous endpoints.
23	0x0 RW/1C	<b>Isochronous IN transaction complete (isoc_xfer_done)</b> : This bit indicates that the isochronous IN transaction for this endpoint is complete. The application can use this information to program the isochronous IN data for the next microframe. This bit is used only in Slave-Only mode.
22:11	0x0 RO	<b>Receive Packet Size (rx_pkt_size)</b> : This is an OUT endpoint field only. These bits are reserved and should be set to zero.
10	0x0 RW/1C	<b>Transmit DMA Completion (tdc)</b> : Indicates the transmit DMA has completed transferring a descriptor chain data to the Tx FIFO. After servicing the interrupt, the application must clear this bit.
9	0x0 RW/1C	<b>Error response on the host bus (he)</b> : Error response on the host bus (AHB) when doing a data transfer, descriptor fetch, or descriptor update for this particular endpoint. After servicing the interrupt, the application must clear this bit.
8	0x0 RO	<b>Receive Address FIFO Empty Status (mrxfifo_empty)</b> : This is an OUT endpoint field only. These bits are reserved and should be set to zero.

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW/1C	<b>Buffer Not Available (bna)</b> : The subsystem sets this bit when the descriptor status is either Host Busy or DMA Done to indicate that the descriptor was not ready at the time the DMA tried to access it. After servicing the interrupt, the application must clear this bit.
6	0x0 RW/1C	<b>IN token (in_tok)</b> : An IN token has been received by this endpoint. After servicing the interrupt, application must clear this bit.
5:4	0x0 RO	<b>OUT token (out_tok)</b> : This is an OUT endpoint field only. These bits are reserved and should be set to zero.
3:0	0x0 RO	<b>reserved_3</b> : Reserved bits. These bits are reserved and should be set to zero.

### 16.6.1.3 IN Endpoint 0 Buffer Size Register (ep0\_in\_bufsize\_udc\_reg)—Offset 8h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 8h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RO	<b>reserved</b> : Reserved bits. These bits are reserved and should be set to zero.
17:16	0x0 RW	<b>Isochronous IN Transaction PID (isoc_data_pid)</b> : Initial data PID to be sent for a high-bandwidth isochronous IN transaction. This field is used only in Slave-Only mode. 00: DATA0 PID is sent 01: DATA0 PID is sent 10: DATA1 PID is sent 11: DATA2 PID is sent
15:10	0x0 RO	<b>Buffer Size (buff_size_frame_number)</b> : These bits are reserved and should be set to zero.
9:0	0x0 RW	<b>Buffer Size (buff_size_1)</b> : Buffer size required for this endpoint. The application can program this field to make each endpoints buffers adaptive, providing flexibility in buffer size when the interface or configuration is changed. This value is in 32-bit words, and indicates the number of 32-bit word entries in the Transmit FIFO. NOTE: the maximum size of the Tx FIFO is 1024 32-bit word entries.

### 16.6.1.4 IN Endpoint 0 Maximum Packet Size Register (ep0\_in\_mpkt\_sz\_reg)—Offset Ch

This register also specifies the maximum packet size an endpoint should support. This maximum size is used to calculate whether the Receive FIFO has sufficient space to accept a packet. When changing the maximum packet size for a specific endpoint, the user must also program the USB Device Controller register space.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	<b>Buffer Size (buff_size):</b> This is an OUT endpoint field only. These bits are reserved and should be set to zero.
15:0	0x0 RO	<b>Max Packet Size (mpkt_size):</b> Maximum packet size for the endpoint in bytes. This maximum size is used to calculate whether the Receive FIFO has sufficient space to accept a packet. When changing the maximum packet size for a specific endpoint, the user must also program the corresponding Physical Endpoint Register.

### 16.6.1.5 IN Endpoint 0 Data Descriptor Pointer Register (ep0\_in\_desptr\_udc\_reg)—Offset 14h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 14h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	<b>Descriptor Pointer (desptr):</b> This register contains the data descriptor pointers.

### 16.6.1.6 IN Endpoint 0 Write Confirmation register (for Slave-Only mode) (ep0\_wr\_cfrm\_udc\_reg)—Offset 1Ch

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 1Ch

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:2] + 10h

reserved					mrx_flush	close_desc	null_bit	rrdy	cnak	snak	nak	et	p	sn	f	s

Bit Range	Default & Access	Field Name (ID): Description
31:13	0x0 RO	<b>reserved</b> : Reserved bits. These bits are reserved and should be set to zero.
12	0x0 RO	<b>Receive FIFO Flush for Multiple Receive FIFO (mrx_flush)</b> : This is an OUT endpoint field only. These bits are reserved and should be set to zero.
11	0x0 RO	<b>Close Descriptor Channel (close_desc)</b> : Close Descriptor Enhancement is not supported. These bits are reserved and should be set to zero.
10	0x0 RW	<b>Send Null Packet (null_bit)</b> : This bit provides the application with a mechanism to instruct the USB Device Controller to send a NULL (zero length) packet when no data is available in the particular endpoint TxFIFO. If this bit is set, when no data is available in the endpoint TxFIFO, the USB Device Controller sends a NULL packet.
9	0x0 RO	<b>Receive Ready (rrdy)</b> : This is an OUT endpoint field only. These bits are reserved and should be set to zero.

Bit Range	Default & Access	Field Name (ID): Description
8	0x0 WO	<b>Clear NAK (cnak)</b> : Used by the application to clear the NAK bit (bit 6). After the subsystem sets bit 6 (NAK), the application must clear it with a write of 1 to the CNAK bit. (For example, after the application has decoded the SETUP packet and determined it is not an invalid command, the application must set the CNAK bit of the control endpoint to 1 to clear the NAK bit.)The application also must clear the NAK bit whenever the subsystem sets it. (The subsystem sets it due to the application setting the Stall bit.)The application can clear this bit only when the RxFIFO is empty (for single RxFIFO implementation) or when the RxFIFO corresponding to the same logical endpoint is empty (Multiple RxFIFO implementation). The application can write CNAK any time without waiting for a RxFIFO empty condition. The NAK bit is cleared immediately upon write to CNAK bit. No polling is necessary.
7	0x0 WO	<b>Set NAK (snak)</b> : Used by the application to set the NAK bit (bit 6 of this register). The application must not set the NAK bit for an IN endpoint until it has received an IN token interrupt indicating that the TxFIFO is empty.
6	0x0 RO	<b>NAK Bit (nak)</b> : After a SETUP packet, which is decoded by the application, is received by the core, the core sets the NAK bit for all control IN/OUT endpoints. NAK is also set after a STALL response for the endpoint (the STALL bit is set in Endpoint Control register bit 0). 1: The endpoint responds to the USB host with a NAK handshake. 0: The endpoint responds normally. Note 1: A SETUP packet is sent to the application regardless of whether the NAK bit is set. Note 2: A NAK set on ISOC OUT endpoint rejects the ISOC out data packet.
5:4	0x0 RW	<b>Endpoint Type (et)</b> : The possible options are: 00: Control endpoint 01: Isochronous endpoint 10: Bulk endpoint 11: Interrupt endpoint
3	0x0 RW	<b>Poll Demand (p)</b> : Poll demand from the application. The application can set this bit after an IN token is received from the endpoint. The application can also set this bit before an IN token is received for the endpoint, if it has the IN transfer data in advance. Note: After sending a zero-length or short packet, the application must wait for the next XFERDONE_TXEMPTY interrupt, before setting up the P bit for the next transfer.
2	0x0 RO	<b>Snoop Mode (sn)</b> : This is an OUT endpoint field only. These bits are reserved and should be set to zero.
1	0x0 RW	<b>Flush TxFIFO (f)</b> : The application firmware sets this bit to 1 after it has detected a disconnect/connect on the USB cable, then waits for the IN token endpoint interrupt before resetting this bit to 0. This flushes the stale data out of the TxFIFO. This bit is cleared by the core when TDC (Transmit DMA Complete) occurs on this endpoint.
0	0x0 RW	<b>Stall Handshake (s)</b> : On successful reception of a SETUP packet (decoded by the application), the subsystem clears both IN and OUT Stall bits, and sets both the IN and OUT NAK bits. The application must check for RxFIFO emptiness before setting the IN and OUT STALL bit. For non-SETUP packets, the subsystem clears either IN or out STALL bits only if a STALL handshake is returned to the USB host, then sets the corresponding NAK bit. The subsystem returns a STALL handshake for the subsequent transactions of the stalled endpoint until the USB host issues a Clear_Feature command to clear it. Once this bit is set, if the subsystem has already returned a STALL handshake to the USB host, the application firmware cannot clear the S bit to stop the subsystem from sending the STALL handshake on the endpoint. The host must instead send one of the following commands to clear the endpoint Halt status: - Clear Feature (Halt) - SetConfiguration - SetInterface.

### 16.6.1.8 IN Endpoint 1 Status Register (ep1\_in\_sts\_udc\_reg)—Offset 24h

The Endpoint Status register indicates the endpoint status.

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 24h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:2] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0						
0	0	0	0	0	0	0	0	0						
0	0	0	0	0	0	0	0	0						
reserved_1	cdc	xfer_done_txf_empty	set_feature_halt	clr_feature_halt	tx_fifo_empty	isoc_xfer_done	rx_pkt_size	tdc	he	mrxfifo_empty	bna	in_tok	out_tok	reserved_3

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	<b>reserved_1</b> : Reserved bits. These bits are reserved and should be set to zero.
28	0x0 RO	<b>Close Descriptor Channel (cdc)</b> : Close Descriptor Enhancement is not supported. These bits are reserved and should be set to zero.
27	0x0 RW/1C	<b>Transfer Done/Transmit FIFO Empty (xfer_done_txf_empty)</b> : This bit indicates that the TXFIFO is empty after the DMA transfer has been completed. The application can use this bit to set the poll bit for the next transfer. The application must first clear this bit after servicing the interrupt.
26	0x0 RW/1C	<b>Received Set Halt (set_feature_halt)</b> : This bit indicates that the Set Feature (EP HALT) command is received for this endpoint. To stall this endpoint, the application can set the S bit in Endpoint Control Register. After this, the application clears this RSS bit to acknowledge the reception of Set Feature stall command. Once this RSS bit is cleared, core sends the zero-length packet for the Status IN phase of Set Feature command. Received Set Stall indication is applicable only for Bulk and Interrupt transactions.
25	0x0 RW/1C	<b>Received Clear Halt (clr_feature_halt)</b> : This bit indicates that the Clear Feature (EP HALT) command is received for this endpoint. To continue to stall the endpoint, the application must set the S bit Endpoint Control Register. After this, the application clears this RCS bit to acknowledge the reception of clear stall command. Once this bit is cleared, core sends the zero-length packet for the Status IN phase of clear stall command. Received Clear Stall indication is applicable only for Bulk and Interrupt transactions.
24	0x0 RW/1C	<b>Transmit FIFO Empty detected (tx_fifo_empty)</b> : This bit indicates that the Transmit FIFO Empty condition is triggered. Application can use this information to load the subsequent data into the Transmit FIFO. The application must clear this bit after writing the data into the Transmit FIFO. Note: This bit is not used for Isochronous endpoints.
23	0x0 RW/1C	<b>Isochronous IN transaction complete (isoc_xfer_done)</b> : This bit indicates that the isochronous IN transaction for this endpoint is complete. The application can use this information to program the isochronous IN data for the next microframe. This bit is used only in Slave-Only mode.
22:11	0x0 RO	<b>Receive Packet Size (rx_pkt_size)</b> : This is an OUT endpoint field only. These bits are reserved and should be set to zero.
10	0x0 RW/1C	<b>Transmit DMA Completion (tdc)</b> : Indicates the transmit DMA has completed transferring a descriptor chain data to the Tx FIFO. After servicing the interrupt, the application must clear this bit.
9	0x0 RW/1C	<b>Error response on the host bus (he)</b> : Error response on the host bus (AHB) when doing a data transfer, descriptor fetch, or descriptor update for this particular endpoint. After servicing the interrupt, the application must clear this bit.
8	0x0 RO	<b>Receive Address FIFO Empty Status (mrxfifo_empty)</b> : This is an OUT endpoint field only. These bits are reserved and should be set to zero.

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW/1C	<b>Buffer Not Available (bna)</b> : The subsystem sets this bit when the descriptor status is either Host Busy or DMA Done to indicate that the descriptor was not ready at the time the DMA tried to access it. After servicing the interrupt, the application must clear this bit.
6	0x0 RW/1C	<b>IN token (in_tok)</b> : An IN token has been received by this endpoint. After servicing the interrupt, application must clear this bit.
5:4	0x0 RO	<b>OUT token (out_tok)</b> : This is an OUT endpoint field only. These bits are reserved and should be set to zero.
3:0	0x0 RO	<b>reserved_3</b> : Reserved bits. These bits are reserved and should be set to zero.

### 16.6.1.9 IN Endpoint 1 Buffer Size Register (ep1\_in\_bufsize\_udc\_reg)—Offset 28h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 28h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RO	<b>reserved</b> : Reserved bits. These bits are reserved and should be set to zero.
17:16	0x0 RW	<b>Isochronous IN Transaction PID (isoc_data_pid)</b> : Initial data PID to be sent for a high-bandwidth isochronous IN transaction. This field is used only in Slave-Only mode. 00: DATA0 PID is sent 01: DATA0 PID is sent 10: DATA1 PID is sent 11: DATA2 PID is sent
15:10	0x0 RO	<b>Buffer Size (buff_size_frame_number)</b> : These bits are reserved and should be set to zero.
9:0	0x0 RW	<b>Buffer Size (buff_size_1)</b> : Buffer size required for this endpoint. The application can program this field to make each endpoints buffers adaptive, providing flexibility in buffer size when the interface or configuration is changed. This value is in 32-bit words, and indicates the number of 32-bit word entries in the Transmit FIFO. NOTE: the maximum size of the Tx FIFO is 1024 32-bit word entries.

### 16.6.1.10 IN Endpoint 1 Maximum Packet Size Register (ep1\_in\_mpkt\_sz\_reg)—Offset 2Ch

This register also specifies the maximum packet size an endpoint should support. This maximum size is used to calculate whether the Receive FIFO has sufficient space to accept a packet. When changing the maximum packet size for a specific endpoint, the user must also program the USB Device Controller register space.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 2Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	<b>Buffer Size (buff_size):</b> This is an OUT endpoint field only. These bits are reserved and should be set to zero.
15:0	0x0 RO	<b>Max Packet Size (mpkt_size):</b> Maximum packet size for the endpoint in bytes. This maximum size is used to calculate whether the Receive FIFO has sufficient space to accept a packet. When changing the maximum packet size for a specific endpoint, the user must also program the corresponding Physical Endpoint Register.

### 16.6.1.11 IN Endpoint 1 Data Descriptor Pointer Register (ep1\_in\_desptr\_udc\_reg)—Offset 34h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 34h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	<b>Descriptor Pointer (desptr):</b> This register contains the data descriptor pointers.

### 16.6.1.12 IN Endpoint 1 Write Confirmation register (for Slave-Only mode) (ep1\_wr\_cfrm\_udc\_reg)—Offset 3Ch

**Access Method**

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 3Ch

BARO Type: PCI Configuration Register (Size: 32 bits)

BARO Reference: [B:0, D:20, F:2] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 WO	<b>Write Confirmation (for Slave-Only mode) (wr_cfrm):</b> Writing to this register confirms the IN data into the TxFIFO.

### 16.6.1.13 IN Endpoint 2 Control Register (ep2\_in\_ctrl\_udc\_reg)—Offset 40h

This register is used to program the endpoint as required by the application.

**Access Method**

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 40h

BARO Type: PCI Configuration Register (Size: 32 bits)

BARO Reference: [B:0, D:20, F:2] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0x0 RO	<b>reserved:</b> Reserved bits. These bits are reserved and should be set to zero.
12	0x0 RO	<b>Receive FIFO Flush for Multiple Receive FIFO (mrx_flush):</b> This is an OUT endpoint field only. These bits are reserved and should be set to zero.
11	0x0 RO	<b>Close Descriptor Channel (close_desc):</b> Close Descriptor Enhancement is not supported. These bits are reserved and should be set to zero.
10	0x0 RW	<b>Send Null Packet (null_bit):</b> This bit provides the application with a mechanism to instruct the USB Device Controller to send a NULL (zero length) packet when no data is available in the particular endpoint TxFIFO. If this bit is set, when no data is available in the endpoint TxFIFO, the USB Device Controller sends a NULL packet.
9	0x0 RO	<b>Receive Ready (rrdy):</b> This is an OUT endpoint field only. These bits are reserved and should be set to zero.

Bit Range	Default & Access	Field Name (ID): Description
8	0x0 WO	<b>Clear NAK (cnak):</b> Used by the application to clear the NAK bit (bit 6). After the subsystem sets bit 6 (NAK), the application must clear it with a write of 1 to the CNAK bit. (For example, after the application has decoded the SETUP packet and determined it is not an invalid command, the application must set the CNAK bit of the control endpoint to 1 to clear the NAK bit.)The application also must clear the NAK bit whenever the subsystem sets it. (The subsystem sets it due to the application setting the Stall bit.)The application can clear this bit only when the Rx FIFO is empty (for single Rx FIFO implementation) or when the Rx FIFO corresponding to the same logical endpoint is empty (Multiple Rx FIFO implementation). The application can write CNAK any time without waiting for a Rx FIFO empty condition. The NAK bit is cleared immediately upon write to CNAK bit. No polling is necessary.
7	0x0 WO	<b>Set NAK (snak):</b> Used by the application to set the NAK bit (bit 6 of this register). The application must not set the NAK bit for an IN endpoint until it has received an IN token interrupt indicating that the Tx FIFO is empty.
6	0x0 RO	<b>NAK Bit (nak):</b> After a SETUP packet, which is decoded by the application, is received by the core, the core sets the NAK bit for all control IN/OUT endpoints. NAK is also set after a STALL response for the endpoint (the STALL bit is set in Endpoint Control register bit 0). 1: The endpoint responds to the USB host with a NAK handshake. 0: The endpoint responds normally. Note 1: A SETUP packet is sent to the application regardless of whether the NAK bit is set. Note 2: A NAK set on ISOC OUT endpoint rejects the ISOC out data packet.
5:4	0x0 RW	<b>Endpoint Type (et):</b> The possible options are: 00: Control endpoint 01: Isochronous endpoint 10: Bulk endpoint 11: Interrupt endpoint
3	0x0 RW	<b>Poll Demand (p):</b> Poll demand from the application. The application can set this bit after an IN token is received from the endpoint. The application can also set this bit before an IN token is received for the endpoint, if it has the IN transfer data in advance. Note: After sending a zero-length or short packet, the application must wait for the next XFERDONE_TXEMPTY interrupt, before setting up the P bit for the next transfer.
2	0x0 RO	<b>Snoop Mode (sn):</b> This is an OUT endpoint field only. These bits are reserved and should be set to zero.
1	0x0 RW	<b>Flush Tx FIFO (f):</b> The application firmware sets this bit to 1 after it has detected a disconnect/connect on the USB cable, then waits for the IN token endpoint interrupt before resetting this bit to 0. This flushes the stale data out of the Tx FIFO. This bit is cleared by the core when TDC (Transmit DMA Complete) occurs on this endpoint.
0	0x0 RW	<b>Stall Handshake (s):</b> On successful reception of a SETUP packet (decoded by the application), the subsystem clears both IN and OUT Stall bits, and sets both the IN and OUT NAK bits. The application must check for Rx FIFO emptiness before setting the IN and OUT STALL bit. For non-SETUP packets, the subsystem clears either IN or out STALL bits only if a STALL handshake is returned to the USB host, then sets the corresponding NAK bit. The subsystem returns a STALL handshake for the subsequent transactions of the stalled endpoint until the USB host issues a Clear_Feature command to clear it. Once this bit is set, if the subsystem has already returned a STALL handshake to the USB host, the application firmware cannot clear the S bit to stop the subsystem from sending the STALL handshake on the endpoint. The host must instead send one of the following commands to clear the endpoint Halt status: - Clear Feature (Halt) - SetConfiguration - SetInterface.

### 16.6.1.14 IN Endpoint 2 Status Register (ep2\_in\_sts\_udc\_reg)—Offset 44h

The Endpoint Status register indicates the endpoint status.

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 44h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:2] + 10h

Default: 00000000h

9	0x0 RO	<b>Receive Ready (rrdy):</b> This is an OUT endpoint field only. These bits are reserved and should be set to zero.

Bit Range	Default & Access	Field Name (ID): Description
8	0x0 WO	<b>Clear NAK (cnak):</b> Used by the application to clear the NAK bit (bit 6). After the subsystem sets bit 6 (NAK), the application must clear it with a write of 1 to the CNAK bit. (For example, after the application has decoded the SETUP packet and determined it is not an invalid command, the application must set the CNAK bit of the control endpoint to 1 to clear the NAK bit.)The application also must clear the NAK bit whenever the subsystem sets it. (The subsystem sets it due to the application setting the Stall bit.)The application can clear this bit only when the RxFIFO is empty (for single RxFIFO implementation) or when the RxFIFO corresponding to the same logical endpoint is empty (Multiple RxFIFO implementation). The application can write CNAK any time without waiting for a RxFIFO empty condition. The NAK bit is cleared immediately upon write to CNAK bit. No polling is necessary.
7	0x0 WO	<b>Set NAK (snak):</b> Used by the application to set the NAK bit (bit 6 of this register). The application must not set the NAK bit for an IN endpoint until it has received an IN token interrupt indicating that the TxFIFO is empty.
6	0x0 RO	<b>NAK Bit (nak):</b> After a SETUP packet, which is decoded by the application, is received by the core, the core sets the NAK bit for all control IN/OUT endpoints. NAK is also set after a STALL response for the endpoint (the STALL bit is set in Endpoint Control register bit 0). 1: The endpoint responds to the USB host with a NAK handshake. 0: The endpoint responds normally. Note 1: A SETUP packet is sent to the application regardless of whether the NAK bit is set. Note 2: A NAK set on ISOC OUT endpoint rejects the ISOC out data packet.
5:4	0x0 RW	<b>Endpoint Type (et):</b> The possible options are: 00: Control endpoint 01: Isochronous endpoint 10: Bulk endpoint 11: Interrupt endpoint
3	0x0 RW	<b>Poll Demand (p):</b> Poll demand from the application. The application can set this bit after an IN token is received from the endpoint. The application can also set this bit before an IN token is received for the endpoint, if it has the IN transfer data in advance. Note: After sending a zero-length or short packet, the application must wait for the next XFERDONE_TXEMPTY interrupt, before setting up the P bit for the next transfer.
2	0x0 RO	<b>Snoop Mode (sn):</b> This is an OUT endpoint field only. These bits are reserved and should be set to zero.
1	0x0 RW	<b>Flush TxFIFO (f):</b> The application firmware sets this bit to 1 after it has detected a disconnect/connect on the USB cable, then waits for the IN token endpoint interrupt before resetting this bit to 0. This flushes the stale data out of the TxFIFO. This bit is cleared by the core when TDC (Transmit DMA Complete) occurs on this endpoint.
0	0x0 RW	<b>Stall Handshake (s):</b> On successful reception of a SETUP packet (decoded by the application), the subsystem clears both IN and OUT Stall bits, and sets both the IN and OUT NAK bits. The application must check for RxFIFO emptiness before setting the IN and OUT STALL bit. For non-SETUP packets, the subsystem clears either IN or out STALL bits only if a STALL handshake is returned to the USB host, then sets the corresponding NAK bit. The subsystem returns a STALL handshake for the subsequent transactions of the stalled endpoint until the USB host issues a Clear_Feature command to clear it. Once this bit is set, if the subsystem has already returned a STALL handshake to the USB host, the application firmware cannot clear the S bit to stop the subsystem from sending the STALL handshake on the endpoint. The host must instead send one of the following commands to clear the endpoint Halt status: - Clear Feature (Halt) - SetConfiguration - SetInterface.

### 16.6.1.20 IN Endpoint 3 Status Register (ep3\_in\_sts\_udc\_reg)—Offset 64h

The Endpoint Status register indicates the endpoint status.

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 64h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:2] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0						
0	0	0	0	0	0	0	0	0						
0	0	0	0	0	0	0	0	0						
reserved_1	cdc	xfer_done_txf_empty	set_feature_halt	clr_feature_halt	tx_fifo_empty	isoc_xfer_done	rx_pkt_size	tdc	he	mrxfifo_empty	bna	in_tok	out_tok	reserved_3

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	<b>reserved_1</b> : Reserved bits. These bits are reserved and should be set to zero.
28	0x0 RO	<b>Close Descriptor Channel (cdc)</b> : Close Descriptor Enhancement is not supported. These bits are reserved and should be set to zero.
27	0x0 RW/1C	<b>Transfer Done/Transmit FIFO Empty (xfer_done_txf_empty)</b> : This bit indicates that the TXFIFO is empty after the DMA transfer has been completed. The application can use this bit to set the poll bit for the next transfer. The application must first clear this bit after servicing the interrupt.
26	0x0 RW/1C	<b>Received Set Halt (set_feature_halt)</b> : This bit indicates that the Set Feature (EP HALT) command is received for this endpoint. To stall this endpoint, the application can set the S bit in Endpoint Control Register. After this, the application clears this RSS bit to acknowledge the reception of Set Feature stall command. Once this RSS bit is cleared, core sends the zero-length packet for the Status IN phase of Set Feature command. Received Set Stall indication is applicable only for Bulk and Interrupt transactions.
25	0x0 RW/1C	<b>Received Clear Halt (clr_feature_halt)</b> : This bit indicates that the Clear Feature (EP HALT) command is received for this endpoint. To continue to stall the endpoint, the application must set the S bit Endpoint Control Register. After this, the application clears this RCS bit to acknowledge the reception of clear stall command. Once this bit is cleared, core sends the zero-length packet for the Status IN phase of clear stall command. Received Clear Stall indication is applicable only for Bulk and Interrupt transactions.
24	0x0 RW/1C	<b>Transmit FIFO Empty detected (tx_fifo_empty)</b> : This bit indicates that the Transmit FIFO Empty condition is triggered. Application can use this information to load the subsequent data into the Transmit FIFO. The application must clear this bit after writing the data into the Transmit FIFO. Note: This bit is not used for Isochronous endpoints.
23	0x0 RW/1C	<b>Isochronous IN transaction complete (isoc_xfer_done)</b> : This bit indicates that the isochronous IN transaction for this endpoint is complete. The application can use this information to program the isochronous IN data for the next microframe. This bit is used only in Slave-Only mode.
22:11	0x0 RO	<b>Receive Packet Size (rx_pkt_size)</b> : This is an OUT endpoint field only. These bits are reserved and should be set to zero.
10	0x0 RW/1C	<b>Transmit DMA Completion (tdc)</b> : Indicates the transmit DMA has completed transferring a descriptor chain data to the Tx FIFO. After servicing the interrupt, the application must clear this bit.
9	0x0 RW/1C	<b>Error response on the host bus (he)</b> : Error response on the host bus (AHB) when doing a data transfer, descriptor fetch, or descriptor update for this particular endpoint. After servicing the interrupt, the application must clear this bit.
8	0x0 RO	<b>Receive Address FIFO Empty Status (mrxfifo_empty)</b> : This is an OUT endpoint field only. These bits are reserved and should be set to zero.

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW/1C	<b>Buffer Not Available (bna)</b> : The subsystem sets this bit when the descriptor status is either Host Busy or DMA Done to indicate that the descriptor was not ready at the time the DMA tried to access it. After servicing the interrupt, the application must clear this bit.
6	0x0 RW/1C	<b>IN token (in_tok)</b> : An IN token has been received by this endpoint. After servicing the interrupt, application must clear this bit.
5:4	0x0 RO	<b>OUT token (out_tok)</b> : This is an OUT endpoint field only. These bits are reserved and should be set to zero.
3:0	0x0 RO	<b>reserved_3</b> : Reserved bits. These bits are reserved and should be set to zero.

### 16.6.1.21 IN Endpoint 3 Buffer Size Register (ep3\_in\_bufsize\_udc\_reg)—Offset 68h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 68h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RO	<b>reserved</b> : Reserved bits. These bits are reserved and should be set to zero.
17:16	0x0 RW	<b>Isochronous IN Transaction PID (isoc_data_pid)</b> : Initial data PID to be sent for a high-bandwidth isochronous IN transaction. This field is used only in Slave-Only mode. 00: DATA0 PID is sent 01: DATA0 PID is sent 10: DATA1 PID is sent 11: DATA2 PID is sent
15:10	0x0 RO	<b>Buffer Size (buff_size_frame_number)</b> : These bits are reserved and should be set to zero.
9:0	0x0 RW	<b>Buffer Size (buff_size_1)</b> : Buffer size required for this endpoint. The application can program this field to make each endpoints buffers adaptive, providing flexibility in buffer size when the interface or configuration is changed. This value is in 32-bit words, and indicates the number of 32-bit word entries in the Transmit FIFO. NOTE: the maximum size of the Tx FIFO is 1024 32-bit word entries.

### 16.6.1.22 IN Endpoint 3 Maximum Packet Size Register (ep3\_in\_mpkt\_sz\_reg)—Offset 6Ch

This register also specifies the maximum packet size an endpoint should support. This maximum size is used to calculate whether the Receive FIFO has sufficient space to accept a packet. When changing the maximum packet size for a specific endpoint, the user must also program the USB Device Controller register space.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 6Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	<b>Buffer Size (buff_size):</b> This is an OUT endpoint field only. These bits are reserved and should be set to zero.
15:0	0x0 RO	<b>Max Packet Size (mpkt_size):</b> Maximum packet size for the endpoint in bytes. This maximum size is used to calculate whether the Receive FIFO has sufficient space to accept a packet. When changing the maximum packet size for a specific endpoint, the user must also program the corresponding Physical Endpoint Register.

### 16.6.1.23 IN Endpoint 3 Data Descriptor Pointer Register (ep3\_in\_desptr\_udc\_reg)—Offset 74h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 74h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	<b>Descriptor Pointer (desptr):</b> This register contains the data descriptor pointers.

### 16.6.1.24 IN Endpoint 3 Write Confirmation register (for Slave-Only mode) (ep3\_wr\_cfrm\_udc\_reg)—Offset 7Ch

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 7Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 WO	<b>Write Confirmation (for Slave-Only mode) (wr_cfrm):</b> Writing to this register confirms the IN data into the TxFIFO.

### 16.6.1.25 OUT Endpoint 0 Control Register (ep0\_out\_ctrl\_udc\_reg)—Offset 200h

This register is used to program the endpoint as required by the application.

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 200h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0x0 RO	<b>reserved:</b> Reserved bits. These bits are reserved and should be set to zero.
12	0x0 WO	<b>Receive FIFO Flush for Multiple Receive FIFO (mrx_flush):</b> When the application wants to flush the endpoint receive FIFO, it must first set the SNAK bit in the Endpoint Control register. If the receive DMA is in progress, then the core will finish the current descriptor, terminate the DMA, and flush the data in the endpoint receive FIFO and clear this bit. The application must clear this bit after the EP receive FIFO is empty, by checking the MRXFIFO EMPTY bit in the Endpoint Status register.
11	0x0 RO	<b>Close Descriptor Channel (close_desc):</b> Close Descriptor Enhancement is not supported. These bits are reserved and should be set to zero.
10	0x0 RO	<b>Send Null Packet (null_bit):</b> This is an IN endpoint field only. These bits are reserved and should be set to zero.

Bit Range	Default & Access	Field Name (ID): Description
9	0x0 RW	<b>Receive Ready (rrdy)</b> : If this bit is set by the application, on receiving an OUT packet, the DMA sends the packet to system memory. This bit is deasserted at the end of packet if the Descriptor Update bit is set in the Device Control register. This bit is deasserted at the end of payload if the Descriptor Update bit is deasserted. This bit can be set by the application at any time. The application cannot clear this bit if the DMA is busy transferring the data.
8	0x0 WO	<b>Clear NAK (cnak)</b> : Used by the application to clear the NAK bit (bit 6). After the subsystem sets bit 6 (NAK), the application must clear it with a write of 1 to the CNAK bit. (For example, after the application has decoded the SETUP packet and determined it is not an invalid command, the application must set the CNAK bit of the control endpoint to 1 to clear the NAK bit.)The application also must clear the NAK bit whenever the subsystem sets it. (The subsystem sets it due to the application setting the Stall bit.)The application can clear this bit only when the Rx FIFO is empty (for single Rx FIFO implementation) or when the Rx FIFO corresponding to the same logical endpoint is empty (Multiple Rx FIFO implementation). The application can write CNAK any time without waiting for a Rx FIFO empty condition. The NAK bit is cleared immediately upon write to CNAK bit. No polling is necessary.
7	0x0 WO	<b>Set NAK. (snak)</b> : Used by the application to set the NAK bit (bit 6 of this register). The application must not set the NAK bit for an IN endpoint until it has received an IN token interrupt indicating that the Tx FIFO is empty.
6	0x0 RO	<b>NAK Handshake Enable (nak)</b> : After a SETUP packet, which is decoded by the application, is received by the core, the core sets the NAK bit for all control IN/OUT endpoints. NAK is also set after a STALL response for the endpoint (the STALL bit is set in Endpoint Control register bit 0). 1: The endpoint responds to the USB host with a NAK handshake. 0: The endpoint responds normally. Note 1: A SETUP packet is sent to the application regardless of whether the NAK bit is set. Note 2: The NAK set on ISOC OUT endpoint rejects the ISOC out data packet.
5:4	0x0 RW	<b>Endpoint Type (et)</b> : Endpoint Type (2-bit). The possible options are: 00: Control endpoint 01: Isochronous endpoint 10: Bulk endpoint 11: Interrupt endpoint
3	0x0 RO	<b>Poll Demand (p)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
2	0x0 RW	<b>Snoop Mode (sn)</b> : Configures the endpoint for Snoop mode. In this mode, the subsystem does not check the correctness of OUT packets before transferring them to application memory.
1	0x0 RO	<b>Flush Tx FIFO (f)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
0	0x0 RW	<b>Stall Handshake (s)</b> : On successful reception of a SETUP packet (decoded by the application), the subsystem clears both IN and OUT Stall bits, and sets both the IN and OUT NAK bits. The application must check for Rx FIFO emptiness before setting the IN and OUT STALL bit. For non-SETUP packets, the subsystem clears either IN or out STALL bits only if a STALL handshake is returned to the USB host, then sets the corresponding NAK bit. The subsystem returns a STALL handshake for the subsequent transactions of the stalled endpoint until the USB host issues a Clear_Feature command to clear it. Once this bit is set, if the subsystem has already returned a STALL handshake to the USB host, the application firmware cannot clear the S bit to stop the subsystem from sending the STALL handshake on the endpoint. The host must instead send one of the following commands to clear the endpoint Halt status: - Clear Feature (Halt) - SetConfiguration - SetInterface.

### 16.6.1.26 OUT Endpoint 0 Status Register (ep0\_out\_sts\_udc\_reg)—Offset 204h

The Endpoint Status register indicates the endpoint status.

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 204h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:2] + 10h

Default: 00000100h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	1	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	<b>reserved_1</b> : Reserved bits. These bits are reserved and should be set to zero.
28	0x0 RO	<b>Close Descriptor Channel (cdc)</b> : Close Descriptor Enhancement is not supported. These bits are reserved and should be set to zero.
27	0x0 RO	<b>Transfer Done/Transmit FIFO Empty (xfer_done_txf_empty)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
26	0x0 RW/1C	<b>Received Set Halt (set_feature_halt)</b> : This bit indicates that the Set Feature (EP HALT) command is received for this endpoint. To stall this endpoint, the application can set the S bit in Endpoint Control Register. After this, the application clears this RSS bit to acknowledge the reception of Set Feature sta command. Once this RSS bit is cleared, core sends the zero-length packet for the Status IN phase of Set Feature command. Received Set Stall indication is applicable only for Bulk and Interrupt transactions.
25	0x0 RW/1C	<b>Received Clear Halt (clr_feature_halt)</b> : This bit indicates that the Clear Feature (EP HALT) command is received for this endpoint. To continue to stall the endpoint, the application must set the S bit Endpoint Control Register. After this, the application clears this RCS bit to acknowledge the reception of clear stall command. Once this bit is cleared, core sends the zero-length packet for the Status IN phase of clear stall command. Received Clear Stall indication is applicable only for Bulk and Interrupt transactions.
24	0x0 RO	<b>Transmit FIFO Empty detected (tx_fifo_empty)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
23	0x0 RO	<b>Isochronous IN transaction complete (isoc_xfer_done)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
22:11	0x0 RW	<b>Receive Packet Size (rx_pkt_size)</b> : Indicates the number of bytes in the current receive packet the Rx FIFO is receiving. Because the USB host always sends 8 bytes of SETUP data, these bits do not indicate the receipt of 8 bytes of SETUP data for a SETUP packet. Rather, these bits indicate the configuration status (Configuration number [22:19], Interface number [18:15], and Alternate Setting number [14:11]). This field is used in slave mode only. In DMA mode, the application must check the status from the endpoint data descriptor.
10	0x0 RO	<b>Transmit DMA Completion (tdc)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
9	0x0 RW/1C	<b>System Host Error (he)</b> : Error response on the host bus (AHB) when doing a data transfer, descriptor fetch, or descriptor update for this particular endpoint. After servicing the interrupt, the application must clear this bit.

Bit Range	Default & Access	Field Name (ID): Description
8	1h RO	<b>Receive Address FIFO Empty Status (mrxfifo_empty):</b> This bit indicates the empty status of the endpoint receive address FIFO. This bit is set by the core after the DMA transfers data to system memory, and there are no new packets received from the USB. This bit is cleared by the core after receiving a valid packet from the USB. 1: EP RXFIFO is empty 0: EP RXFIFO is not empty
7	0x0 RW/1C	<b>Buffer Not Available (bna):</b> The subsystem sets this bit when the descriptor status is either Host Busy or DMA Done to indicate that the descriptor was not ready at the time the DMA tried to access it. After servicing the interrupt, the application must clear this bit.
6	0x0 RO	<b>IN token (in_tok):</b> This is an IN endpoint field only. These bits are reserved and should be set to zero.
5:4	0x0 RW/1C	<b>OUT token. (out_tok):</b> An OUT packet has been received by this endpoint. The encoding of these two bits indicates the type of data received. The possible options are: 00: None 01: Received data 10: Received SETUP data (8 bytes) 11: Reserved (The application must write the same values to clear these bits.)
3:0	0x0 RO	<b>reserved_3:</b> Reserved bits. These bits are reserved and should be set to zero.

### 16.6.1.27 OUT Endpoint 0 Receive Packet Frame Number Register (ep0\_out\_rpf\_udc\_reg)—Offset 208h

This register contains the frame number in which the packet is received. This frame number information is useful when handling isochronous traffic.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 208h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RO	<b>reserved:</b> Reserved bits. These bits are reserved and should be set to zero.

Bit Range	Default & Access	Field Name (ID): Description
17:16	0x0 RO	<b>Isochronous OUT Transaction PID (isoc_data_pid):</b> Data PID received for a high-bandwidth isochronous OUT transaction. This field indicates that the data PID for the current packet is available in the Receive FIFO. This field is used only in Slave-Only mode. 00: DATA0 PID is received 01: DATA1 PID is received 10: DATA2 PID is received 11: MDATA PID is received
15:0	0x0 RO	<b>Buffer Size/Frame Number (buff_size_frame_number):</b> Frame number in which the packet is received. For high-speed operation: [15:14] Reserved [13:3] Millisecond frame number [2:0] Microframe number For full-speed operation: [15:11] Reserved [10:0] Millisecond frame number

### 16.6.1.28 OUT Endpoint 0 Buffer Size Register (ep0\_out\_bufsize\_udc\_reg)—Offset 20Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 20Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	<b>Packet Size (buff_size):</b> Buffer size required for this endpoint. The application can program this field to make each endpoint buffers adaptive, providing flexibility in buffer size when the interface or configuration is changed. This value is in 32-bit words, and indicates the number of 32-bit word entries in the Receive FIFO. This value cannot be changed dynamically during operation. NOTE: the maximum size of the Rx FIFO is 512 32-bit word entries.
15:0	0x0 RW	<b>Max Packet Size (max_pkt_size):</b> Maximum packet size for the endpoint. This is the value in bytes. This maximum size is used to calculate whether the Transmit FIFO has sufficient space to accept a packet. When changing the maximum packet size for a specific endpoint, the user must also program the corresponding Physical Endpoint Register.

### 16.6.1.29 OUT Endpoint 0 SETUP Buffer Pointer Register (ep0\_subptr\_udc\_reg)—Offset 210h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 210h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	<b>SETUP Buffer Pointer (subptr):</b> Endpoint SETUP buffer pointers are used for SETUP commands. The Endpoint SETUP Buffer Pointer register is used only in DMA mode. NOTE: This is applicable only to control endpoints. For all other endpoints this register is reserved.

### 16.6.1.30 OUT Endpoint 0 Data Descriptor Pointer Register (ep0\_out\_desptr\_udc\_reg)—Offset 214h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 214h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	<b>Descriptor Pointer (desptr):</b> This register contains the data descriptor pointer.

### 16.6.1.31 OUT Endpoint 0 Read Confirmation Register for zero-length OUT data (for Slave-Only mode) (ep0\_rd\_cfrm\_udc\_reg)—Offset 21Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 21Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 WO	<b>Read Confirmation for zero-length OUT data (for Slave-Only mode) (rd_cfrm):</b> For zero-length OUT data, the application must perform a dummy read from this register

### 16.6.1.32 OUT Endpoint 1 Control Register (ep1\_out\_ctrl\_udc\_reg)—Offset 220h

This register is used to program the endpoint as required by the application.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 220h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0x0 RO	<b>reserved:</b> Reserved bits. These bits are reserved and should be set to zero.
12	0x0 WO	<b>Receive FIFO Flush for Multiple Receive FIFO (mr_x_flush):</b> When the application wants to flush the endpoint receive FIFO, it must first set the SNAK bit in the Endpoint Control register. If the receive DMA is in progress, then the core will finish the current descriptor, terminate the DMA, and flush the data in the endpoint receive FIFO and clear this bit. The application must clear this bit after the EP receive FIFO is empty, by checking the MRXFIFO EMPTY bit in the Endpoint Status register.
11	0x0 RO	<b>Close Descriptor Channel (close_desc):</b> Close Descriptor Enhancement is not supported. These bits are reserved and should be set to zero.
10	0x0 RO	<b>Send Null Packet (null_bit):</b> This is an IN endpoint field only. These bits are reserved and should be set to zero.
9	0x0 RW	<b>Receive Ready (rrdy):</b> If this bit is set by the application, on receiving an OUT packet, the DMA sends the packet to system memory. This bit is deasserted at the end of packet if the Descriptor Update bit is set in the Device Control register. This bit is deasserted at the end of payload if the Descriptor Update bit is deasserted. This bit can be set by the application at any time. The application cannot clear this bit if the DMA is busy transferring the data.

Bit Range	Default & Access	Field Name (ID): Description
8	0x0 WO	<b>Clear NAK (cnak)</b> : Used by the application to clear the NAK bit (bit 6). After the subsystem sets bit 6 (NAK), the application must clear it with a write of 1 to the CNAK bit. (For example, after the application has decoded the SETUP packet and determined it is not an invalid command, the application must set the CNAK bit of the control endpoint to 1 to clear the NAK bit.)The application also must clear the NAK bit whenever the subsystem sets it. (The subsystem sets it due to the application setting the Stall bit.)The application can clear this bit only when the RxFIFO is empty (for single RxFIFO implementation) or when the RxFIFO corresponding to the same logical endpoint is empty (Multiple RxFIFO implementation). The application can write CNAK any time without waiting for a RxFIFO empty condition. The NAK bit is cleared immediately upon write to CNAK bit. No polling is necessary.
7	0x0 WO	<b>Set NAK. (snak)</b> : Used by the application to set the NAK bit (bit 6 of this register). The application must not set the NAK bit for an IN endpoint until it has received an IN token interrupt indicating that the TxFIFO is empty.
6	0x0 RO	<b>NAK Handshake Enable (nak)</b> : After a SETUP packet, which is decoded by the application, is received by the core, the core sets the NAK bit for all control IN/OUT endpoints. NAK is also set after a STALL response for the endpoint (the STALL bit is set in Endpoint Control register bit 0). 1: The endpoint responds to the USB host with a NAK handshake. 0: The endpoint responds normally. Note 1: A SETUP packet is sent to the application regardless of whether the NAK bit is set. Note 2: The NAK set on ISOC OUT endpoint rejects the ISOC out data packet.
5:4	0x0 RW	<b>Endpoint Type (et)</b> : Endpoint Type (2-bit). The possible options are: 00: Control endpoint 01: Isochronous endpoint 10: Bulk endpoint 11: Interrupt endpoint
3	0x0 RO	<b>Poll Demand (p)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
2	0x0 RW	<b>Snoop Mode (sn)</b> : Configures the endpoint for Snoop mode. In this mode, the subsystem does not check the correctness of OUT packets before transferring them to application memory.
1	0x0 RO	<b>Flush TxFIFO (f)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
0	0x0 RW	<b>Stall Handshake (s)</b> : On successful reception of a SETUP packet (decoded by the application), the subsystem clears both IN and OUT Stall bits, and sets both the IN and OUT NAK bits. The application must check for RxFIFO emptiness before setting the IN and OUT STALL bit. For non-SETUP packets, the subsystem clears either IN or out STALL bits only if a STALL handshake is returned to the USB host, then sets the corresponding NAK bit. The subsystem returns a STALL handshake for the subsequent transactions of the stalled endpoint until the USB host issues a Clear_Feature command to clear it. Once this bit is set, if the subsystem has already returned a STALL handshake to the USB host, the application firmware cannot clear the S bit to stop the subsystem from sending the STALL handshake on the endpoint. The host must instead send one of the following commands to clear the endpoint Halt status: - Clear Feature (Halt) - SetConfiguration - SetInterface.

### 16.6.1.33 OUT Endpoint 1 Status Register (ep1\_out\_sts\_udc\_reg)—Offset 224h

The Endpoint Status register indicates the endpoint status.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 224h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

Default: 00000100h

31	28	24	20	16	12	8	4	0						
0	0	0	0	0	0	0	1	0						
0	0	0	0	0	0	0	0	0						
0	0	0	0	0	0	0	0	0						
reserved_1	cdc	xfer_done_txf_empty	set_feature_halt	clr_feature_halt	tx_fifo_empty	isoc_xfer_done	rx_pkt_size	tdc	he	mrxfifo_empty	bna	in_tok	out_tok	reserved_3

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	<b>reserved_1</b> : Reserved bits. These bits are reserved and should be set to zero.
28	0x0 RO	<b>Close Descriptor Channel (cdc)</b> : Close Descriptor Enhancement is not supported. These bits are reserved and should be set to zero.
27	0x0 RO	<b>Transfer Done/Transmit FIFO Empty (xfer_done_txf_empty)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
26	0x0 RW/1C	<b>Received Set Halt (set_feature_halt)</b> : This bit indicates that the Set Feature (EP HALT) command is received for this endpoint. To stall this endpoint, the application can set the S bit in Endpoint Control Register. After this, the application clears this RSS bit to acknowledge the reception of Set Feature sta command. Once this RSS bit is cleared, core sends the zero-length packet for the Status IN phase of Set Feature command. Received Set Stall indication is applicable only for Bulk and Interrupt transactions.
25	0x0 RW/1C	<b>Received Clear Halt (clr_feature_halt)</b> : This bit indicates that the Clear Feature (EP HALT) command is received for this endpoint. To continue to stall the endpoint, the application must set the S bit Endpoint Control Register. After this, the application clears this RCS bit to acknowledge the reception of clear stall command. Once this bit is cleared, core sends the zero-length packet for the Status IN phase of clear stall command. Received Clear Stall indication is applicable only for Bulk and Interrupt transactions.
24	0x0 RO	<b>Transmit FIFO Empty detected (tx_fifo_empty)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
23	0x0 RO	<b>Isochronous IN transaction complete (isoc_xfer_done)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
22:11	0x0 RW	<b>Receive Packet Size (rx_pkt_size)</b> : Indicates the number of bytes in the current receive packet the Rx FIFO is receiving. Because the USB host always sends 8 bytes of SETUP data, these bits do not indicate the receipt of 8 bytes of SETUP data for a SETUP packet. Rather, these bits indicate the configuration status (Configuration number [22:19], Interface number [18:15], and Alternate Setting number [14:11]). This field is used in slave mode only. In DMA mode, the application must check the status from the endpoint data descriptor.
10	0x0 RO	<b>Transmit DMA Completion (tdc)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
9	0x0 RW/1C	<b>System Host Error (he)</b> : Error response on the host bus (AHB) when doing a data transfer, descriptor fetch, or descriptor update for this particular endpoint. After servicing the interrupt, the application must clear this bit.
8	1h RO	<b>Receive Address FIFO Empty Status (mrxfifo_empty)</b> : This bit indicates the empty status of the endpoint receive address FIFO. This bit is set by the core after the DMA transfers data to system memory, and there are no new packets received from the USB. This bit is cleared by the core after receiving a valid packet from the USB. 1: EP RXFIFO is empty 0: EP RXFIFO is not empty

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW/1C	<b>Buffer Not Available (bna)</b> : The subsystem sets this bit when the descriptor status is either Host Busy or DMA Done to indicate that the descriptor was not ready at the time the DMA tried to access it. After servicing the interrupt, the application must clear this bit.
6	0x0 RO	<b>IN token (in_tok)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
5:4	0x0 RW/1C	<b>OUT token. (out_tok)</b> : An OUT packet has been received by this endpoint. The encoding of these two bits indicates the type of data received. The possible options are: 00: None 01: Received data 10: Received SETUP data (8 bytes) 11: Reserved (The application must write the same values to clear these bits.)
3:0	0x0 RO	<b>reserved_3</b> : Reserved bits. These bits are reserved and should be set to zero.

### 16.6.1.34 OUT Endpoint 1 Receive Packet Frame Number Register (ep1\_out\_rpf\_udc\_reg)—Offset 228h

This register contains the frame number in which the packet is received. This frame number information is useful when handling isochronous traffic.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 228h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0

reserved				isoc_data_pid	buff_size_frame_number						

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RO	<b>reserved</b> : Reserved bits. These bits are reserved and should be set to zero.
17:16	0x0 RO	<b>Isochronous OUT Transaction PID (isoc_data_pid)</b> : Data PID received for a high-bandwidth isochronous OUT transaction. This field indicates that the data PID for the current packet is available in the Receive FIFO. This field is used only in Slave-Only mode. 00: DATA0 PID is received 01: DATA1 PID is received 10: DATA2 PID is received 11: MDATA PID is received

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RO	<b>Buffer Size/Frame Number (buff_size_frame_number):</b> Frame number in which the packet is received. For high-speed operation: [15:14] Reserved [13:3] Millisecond frame number [2:0] Microframe number For full-speed operation: [15:11] Reserved [10:0] Millisecond frame number

### 16.6.1.35 OUT Endpoint 1 Buffer Size Register (ep1\_out\_bufsize\_udc\_reg)—Offset 22Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 22Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	<b>Packet Size (buff_size):</b> Buffer size required for this endpoint. The application can program this field to make each endpoint buffers adaptive, providing flexibility in buffer size when the interface or configuration is changed. This value is in 32-bit words, and indicates the number of 32-bit word entries in the Receive FIFO. This value cannot be changed dynamically during operation. NOTE: the maximum size of the Rx FIFO is 512 32-bit word entries.
15:0	0x0 RW	<b>Max Packet Size (max_pkt_size):</b> Maximum packet size for the endpoint. This is the value in bytes. This maximum size is used to calculate whether the Transmit FIFO has sufficient space to accept a packet. When changing the maximum packet size for a specific endpoint, the user must also program the corresponding Physical Endpoint Register.

### 16.6.1.36 OUT Endpoint 1 SETUP Buffer Pointer Register (ep1\_subptr\_udc\_reg)—Offset 230h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 230h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0

0	0	0	0	0	0	0	0	0	0	0	0
rd_cfrm											

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 WO	<b>Read Confirmation for zero-length OUT data (for Slave-Only mode) (rd_cfrm):</b> For zero-length OUT data, the application must perform a dummy read from this register

### 16.6.1.39 OUT Endpoint 2 Control Register (ep2\_out\_ctrl\_udc\_reg)—Offset 240h

This register is used to program the endpoint as required by the application.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 240h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0									
0	0	0	0	0	0	0	0	0									
reserved						mrx_flush	close_desc	null_bit	rrdy	cnak	snak	nak	et	p	sn	f	s

Bit Range	Default & Access	Field Name (ID): Description
31:13	0x0 RO	<b>reserved:</b> Reserved bits. These bits are reserved and should be set to zero.
12	0x0 WO	<b>Receive FIFO Flush for Multiple Receive FIFO (mrx_flush):</b> When the application wants to flush the endpoint receive FIFO, it must first set the SNAK bit in the Endpoint Control register. If the receive DMA is in progress, then the core will finish the current descriptor, terminate the DMA, and flush the data in the endpoint receive FIFO and clear this bit. The application must clear this bit after the EP receive FIFO is empty, by checking the MRXFIFO EMPTY bit in the Endpoint Status register.
11	0x0 RO	<b>Close Descriptor Channel (close_desc):</b> Close Descriptor Enhancement is not supported. These bits are reserved and should be set to zero.
10	0x0 RO	<b>Send Null Packet (null_bit):</b> This is an IN endpoint field only. These bits are reserved and should be set to zero.
9	0x0 RW	<b>Receive Ready (rrdy):</b> If this bit is set by the application, on receiving an OUT packet, the DMA sends the packet to system memory. This bit is deasserted at the end of packet if the Descriptor Update bit is set in the Device Control register. This bit is deasserted at the end of payload if the Descriptor Update bit is deasserted. This bit can be set by the application at any time. The application cannot clear this bit if the DMA is busy transferring the data.
8	0x0 WO	<b>Clear NAK (cnak):</b> Used by the application to clear the NAK bit (bit 6). After the subsystem sets bit 6 (NAK), the application must clear it with a write of 1 to the CNAK bit. (For example, after the application has decoded the SETUP packet and determined it is not an invalid command, the application must set the CNAK bit of the control endpoint to 1 to clear the NAK bit.)The application also must clear the NAK bit whenever the subsystem sets it. (The subsystem sets it due to the application setting the Stall bit.)The application can clear this bit only when the Rx FIFO is empty (for single Rx FIFO implementation) or when the Rx FIFO corresponding to the same logical endpoint is empty (Multiple Rx FIFO implementation). The application can write CNAK any time without waiting for a Rx FIFO empty condition. The NAK bit is cleared immediately upon write to CNAK bit. No polling is necessary.

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 WO	<b>Set NAK. (snak)</b> : Used by the application to set the NAK bit (bit 6 of this register). The application must not set the NAK bit for an IN endpoint until it has received an IN token interrupt indicating that the TxFIFO is empty.
6	0x0 RO	<b>NAK Handshake Enable (nak)</b> : After a SETUP packet, which is decoded by the application, is received by the core, the core sets the NAK bit for all control IN/OUT endpoints. NAK is also set after a STALL response for the endpoint (the STALL bit is set in Endpoint Control register bit 0). 1: The endpoint responds to the USB host with a NAK handshake. 0: The endpoint responds normally. Note 1: A SETUP packet is sent to the application regardless of whether the NAK bit is set. Note 2: The NAK set on ISOC OUT endpoint rejects the ISOC out data packet.
5:4	0x0 RW	<b>Endpoint Type (et)</b> : Endpoint Type (2-bit). The possible options are: 00: Control endpoint 01: Isochronous endpoint 10: Bulk endpoint 11: Interrupt endpoint
3	0x0 RO	<b>Poll Demand (p)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
2	0x0 RW	<b>Snoop Mode (sn)</b> : Configures the endpoint for Snoop mode. In this mode, the subsystem does not check the correctness of OUT packets before transferring them to application memory.
1	0x0 RO	<b>Flush TxFIFO (f)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
0	0x0 RW	<b>Stall Handshake (s)</b> : On successful reception of a SETUP packet (decoded by the application), the subsystem clears both IN and OUT Stall bits, and sets both the IN and OUT NAK bits. The application must check for RxFIFO emptiness before setting the IN and OUT STALL bit. For non-SETUP packets, the subsystem clears either IN or out STALL bits only if a STALL handshake is returned to the USB host, then sets the corresponding NAK bit. The subsystem returns a STALL handshake for the subsequent transactions of the stalled endpoint until the USB host issues a Clear_Feature command to clear it. Once this bit is set, if the subsystem has already returned a STALL handshake to the USB host, the application firmware cannot clear the S bit to stop the subsystem from sending the STALL handshake on the endpoint. The host must instead send one of the following commands to clear the endpoint Halt status: - Clear Feature (Halt) - SetConfiguration - SetInterface.

#### 16.6.1.40 OUT Endpoint 2 Status Register (ep2\_out\_sts\_udc\_reg)—Offset 244h

The Endpoint Status register indicates the endpoint status.

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 244h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	<b>reserved_1</b> : Reserved bits. These bits are reserved and should be set to zero.
28	0x0 RO	<b>Close Descriptor Channel (cdc)</b> : Close Descriptor Enhancement is not supported. These bits are reserved and should be set to zero.
27	0x0 RO	<b>Transfer Done/Transmit FIFO Empty (xfer_done_txf_empty)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
26	0x0 RW/1C	<b>Received Set Halt (set_feature_halt)</b> : This bit indicates that the Set Feature (EP HALT) command is received for this endpoint. To stall this endpoint, the application can set the S bit in Endpoint Control Register. After this, the application clears this RSS bit to acknowledge the reception of Set Feature sta command. Once this RSS bit is cleared, core sends the zero-length packet for the Status IN phase of Set Feature command. Received Set Stall indication is applicable only for Bulk and Interrupt transactions.
25	0x0 RW/1C	<b>Received Clear Halt (clr_feature_halt)</b> : This bit indicates that the Clear Feature (EP HALT) command is received for this endpoint. To continue to stall the endpoint, the application must set the S bit Endpoint Control Register. After this, the application clears this RCS bit to acknowledge the reception of clear stall command. Once this bit is cleared, core sends the zero-length packet for the Status IN phase of clear stall command. Received Clear Stall indication is applicable only for Bulk and Interrupt transactions.
24	0x0 RO	<b>Transmit FIFO Empty detected (tx_fifo_empty)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
23	0x0 RO	<b>Isochronous IN transaction complete (isoc_xfer_done)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
22:11	0x0 RW	<b>Receive Packet Size (rx_pkt_size)</b> : Indicates the number of bytes in the current receive packet the Rx FIFO is receiving. Because the USB host always sends 8 bytes of SETUP data, these bits do not indicate the receipt of 8 bytes of SETUP data for a SETUP packet. Rather, these bits indicate the configuration status (Configuration number [22:19], Interface number [18:15], and Alternate Setting number [14:11]). This field is used in slave mode only. In DMA mode, the application must check the status from the endpoint data descriptor.
10	0x0 RO	<b>Transmit DMA Completion (tdc)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
9	0x0 RW/1C	<b>System Host Error (he)</b> : Error response on the host bus (AHB) when doing a data transfer, descriptor fetch, or descriptor update for this particular endpoint. After servicing the interrupt, the application must clear this bit.
8	1h RO	<b>Receive Address FIFO Empty Status (mrxfifo_empty)</b> : This bit indicates the empty status of the endpoint receive address FIFO. This bit is set by the core after the DMA transfers data to system memory, and there are no new packets received from the USB. This bit is cleared by the core after receiving a valid packet from the USB. 1: EP RXFIFO is empty 0: EP RXFIFO is not empty
7	0x0 RW/1C	<b>Buffer Not Available (bna)</b> : The subsystem sets this bit when the descriptor status is either Host Busy or DMA Done to indicate that the descriptor was not ready at the time the DMA tried to access it. After servicing the interrupt, the application must clear this bit.

Bit Range	Default & Access	Field Name (ID): Description
6	0x0 RO	<b>IN token (in_tok):</b> This is an IN endpoint field only. These bits are reserved and should be set to zero.
5:4	0x0 RW/1C	<b>OUT token. (out_tok):</b> An OUT packet has been received by this endpoint. The encoding of these two bits indicates the type of data received. The possible options are: 00: None 01: Received data 10: Received SETUP data (8 bytes) 11: Reserved (The application must write the same values to clear these bits.)
3:0	0x0 RO	<b>reserved_3:</b> Reserved bits. These bits are reserved and should be set to zero.

### 16.6.1.41 OUT Endpoint 2 Receive Packet Frame Number Register (ep2\_out\_rpf\_udc\_reg)—Offset 248h

This register contains the frame number in which the packet is received. This frame number information is useful when handling isochronous traffic.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 248h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RO	<b>reserved:</b> Reserved bits. These bits are reserved and should be set to zero.
17:16	0x0 RO	<b>Isochronous OUT Transaction PID (isoc_data_pid):</b> Data PID received for a high-bandwidth isochronous OUT transaction. This field indicates that the data PID for the current packet is available in the Receive FIFO. This field is used only in Slave-Only mode. 00: DATA0 PID is received 01: DATA1 PID is received 10: DATA2 PID is received 11: MDATA PID is received

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RO	<b>Buffer Size/Frame Number (buff_size_frame_number):</b> Frame number in which the packet is received. For high-speed operation: [15:14] Reserved [13:3] Millisecond frame number [2:0] Microframe number For full-speed operation: [15:11] Reserved [10:0] Millisecond frame number

### 16.6.1.42 OUT Endpoint 2 Buffer Size Register (ep2\_out\_bufsize\_udc\_reg)—Offset 24Ch

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 24Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	<b>Packet Size (buff_size):</b> Buffer size required for this endpoint. The application can program this field to make each endpoint buffers adaptive, providing flexibility in buffer size when the interface or configuration is changed. This value is in 32-bit words, and indicates the number of 32-bit word entries in the Receive FIFO. This value cannot be changed dynamically during operation. NOTE: the maximum size of the Rx FIFO is 512 32-bit word entries.
15:0	0x0 RW	<b>Max Packet Size (max_pkt_size):</b> Maximum packet size for the endpoint. This is the value in bytes. This maximum size is used to calculate whether the Transmit FIFO has sufficient space to accept a packet. When changing the maximum packet size for a specific endpoint, the user must also program the corresponding Physical Endpoint Register.

### 16.6.1.43 OUT Endpoint 2 SETUP Buffer Pointer Register (ep2\_subptr\_udc\_reg)—Offset 250h

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 250h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0x0 RO	<b>reserved:</b> Reserved bits. These bits are reserved and should be set to zero.
12	0x0 WO	<b>Receive FIFO Flush for Multiple Receive FIFO (mrx_flush):</b> When the application wants to flush the endpoint receive FIFO, it must first set the SNAK bit in the Endpoint Control register. If the receive DMA is in progress, then the core will finish the current descriptor, terminate the DMA, and flush the data in the endpoint receive FIFO and clear this bit. The application must clear this bit after the EP receive FIFO is empty, by checking the MRXFIFO EMPTY bit in the Endpoint Status register.
11	0x0 RO	<b>Close Descriptor Channel (close_desc):</b> Close Descriptor Enhancement is not supported. These bits are reserved and should be set to zero.
10	0x0 RO	<b>Send Null Packet (null_bit):</b> This is an IN endpoint field only. These bits are reserved and should be set to zero.
9	0x0 RW	<b>Receive Ready (rrdy):</b> If this bit is set by the application, on receiving an OUT packet, the DMA sends the packet to system memory. This bit is deasserted at the end of packet if the Descriptor Update bit is set in the Device Control register. This bit is deasserted at the end of payload if the Descriptor Update bit is deasserted. This bit can be set by the application at any time. The application cannot clear this bit if the DMA is busy transferring the data.
8	0x0 WO	<b>Clear NAK (cnak):</b> Used by the application to clear the NAK bit (bit 6). After the subsystem sets bit 6 (NAK), the application must clear it with a write of 1 to the CNAK bit. (For example, after the application has decoded the SETUP packet and determined it is not an invalid command, the application must set the CNAK bit of the control endpoint to 1 to clear the NAK bit.)The application also must clear the NAK bit whenever the subsystem sets it. (The subsystem sets it due to the application setting the Stall bit.)The application can clear this bit only when the RxFIFO is empty (for single RxFIFO implementation) or when the RxFIFO corresponding to the same logical endpoint is empty (Multiple RxFIFO implementation). The application can write CNAK any time without waiting for a RxFIFO empty condition. The NAK bit is cleared immediately upon write to CNAK bit. No polling is necessary.

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 WO	<b>Set NAK. (snak)</b> : Used by the application to set the NAK bit (bit 6 of this register). The application must not set the NAK bit for an IN endpoint until it has received an IN token interrupt indicating that the TxFIFO is empty.
6	0x0 RO	<b>NAK Handshake Enable (nak)</b> : After a SETUP packet, which is decoded by the application, is received by the core, the core sets the NAK bit for all control IN/OUT endpoints. NAK is also set after a STALL response for the endpoint (the STALL bit is set in Endpoint Control register bit 0). 1: The endpoint responds to the USB host with a NAK handshake. 0: The endpoint responds normally. Note 1: A SETUP packet is sent to the application regardless of whether the NAK bit is set. Note 2: The NAK set on ISOC OUT endpoint rejects the ISOC out data packet.
5:4	0x0 RW	<b>Endpoint Type (et)</b> : Endpoint Type (2-bit). The possible options are: 00: Control endpoint 01: Isochronous endpoint 10: Bulk endpoint 11: Interrupt endpoint
3	0x0 RO	<b>Poll Demand (p)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
2	0x0 RW	<b>Snoop Mode (sn)</b> : Configures the endpoint for Snoop mode. In this mode, the subsystem does not check the correctness of OUT packets before transferring them to application memory.
1	0x0 RO	<b>Flush TxFIFO (f)</b> : This is an IN endpoint field only. These bits are reserved and should be set to zero.
0	0x0 RW	<b>Stall Handshake (s)</b> : On successful reception of a SETUP packet (decoded by the application), the subsystem clears both IN and OUT Stall bits, and sets both the IN and OUT NAK bits. The application must check for RxFIFO emptiness before setting the IN and OUT STALL bit. For non-SETUP packets, the subsystem clears either IN or out STALL bits only if a STALL handshake is returned to the USB host, then sets the corresponding NAK bit. The subsystem returns a STALL handshake for the subsequent transactions of the stalled endpoint until the USB host issues a Clear_Feature command to clear it. Once this bit is set, if the subsystem has already returned a STALL handshake to the USB host, the application firmware cannot clear the S bit to stop the subsystem from sending the STALL handshake on the endpoint. The host must instead send one of the following commands to clear the endpoint Halt status: - Clear Feature (Halt) - SetConfiguration - SetInterface.

### 16.6.1.47 OUT Endpoint 3 Status Register (ep3\_out\_sts\_udc\_reg)—Offset 264h

The Endpoint Status register indicates the endpoint status.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 264h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	<b>reserved_1:</b> Reserved bits. These bits are reserved and should be set to zero.
28	0x0 RO	<b>Close Descriptor Channel (cdc):</b> Close Descriptor Enhancement is not supported. These bits are reserved and should be set to zero.
27	0x0 RO	<b>Transfer Done/Transmit FIFO Empty (xfer_done_txf_empty):</b> This is an IN endpoint field only. These bits are reserved and should be set to zero.
26	0x0 RW/1C	<b>Received Set Halt (set_feature_halt):</b> This bit indicates that the Set Feature (EP HALT) command is received for this endpoint. To stall this endpoint, the application can set the S bit in Endpoint Control Register. After this, the application clears this RSS bit to acknowledge the reception of Set Feature sta command. Once this RSS bit is cleared, core sends the zero-length packet for the Status IN phase of Set Feature command. Received Set Stall indication is applicable only for Bulk and Interrupt transactions.
25	0x0 RW/1C	<b>Received Clear Halt (clr_feature_halt):</b> This bit indicates that the Clear Feature (EP HALT) command is received for this endpoint. To continue to stall the endpoint, the application must set the S bit Endpoint Control Register. After this, the application clears this RCS bit to acknowledge the reception of clear stall command. Once this bit is cleared, core sends the zero-length packet for the Status IN phase of clear stall command. Received Clear Stall indication is applicable only for Bulk and Interrupt transactions.
24	0x0 RO	<b>Transmit FIFO Empty detected (tx_fifo_empty):</b> This is an IN endpoint field only. These bits are reserved and should be set to zero.
23	0x0 RO	<b>Isochronous IN transaction complete (isoc_xfer_done):</b> This is an IN endpoint field only. These bits are reserved and should be set to zero.
22:11	0x0 RW	<b>Receive Packet Size (rx_pkt_size):</b> Indicates the number of bytes in the current receive packet the RxFIFO is receiving. Because the USB host always sends 8 bytes of SETUP data, these bits do not indicate the receipt of 8 bytes of SETUP data for a SETUP packet. Rather, these bits indicate the configuration status (Configuration number [22:19], Interface number [18:15], and Alternate Setting number [14:11]). This field is used in slave mode only. In DMA mode, the application must check the status from the endpoint data descriptor.
10	0x0 RO	<b>Transmit DMA Completion (tdc):</b> This is an IN endpoint field only. These bits are reserved and should be set to zero.
9	0x0 RW/1C	<b>System Host Error (he):</b> Error response on the host bus (AHB) when doing a data transfer, descriptor fetch, or descriptor update for this particular endpoint. After servicing the interrupt, the application must clear this bit.
8	1h RO	<b>Receive Address FIFO Empty Status (mrxfifo_empty):</b> This bit indicates the empty status of the endpoint receive address FIFO. This bit is set by the core after the DMA transfers data to system memory, and there are no new packets received from the USB. This bit is cleared by the core after receiving a valid packet from the USB. 1: EP RXFIFO is empty 0: EP RXFIFO is not empty
7	0x0 RW/1C	<b>Buffer Not Available (bna):</b> The subsystem sets this bit when the descriptor status is either Host Busy or DMA Done to indicate that the descriptor was not ready at the time the DMA tried to access it. After servicing the interrupt, the application must clear this bit.

Bit Range	Default & Access	Field Name (ID): Description
6	0x0 RO	<b>IN token (in_tok):</b> This is an IN endpoint field only. These bits are reserved and should be set to zero.
5:4	0x0 RW/1C	<b>OUT token. (out_tok):</b> An OUT packet has been received by this endpoint. The encoding of these two bits indicates the type of data received. The possible options are: 00: None 01: Received data 10: Received SETUP data (8 bytes) 11: Reserved (The application must write the same values to clear these bits.)
3:0	0x0 RO	<b>reserved_3:</b> Reserved bits. These bits are reserved and should be set to zero.

### 16.6.1.48 OUT Endpoint 3 Receive Packet Frame Number Register (ep3\_out\_rpf\_udc\_reg)—Offset 268h

This register contains the frame number in which the packet is received. This frame number information is useful when handling isochronous traffic.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 268h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RO	<b>reserved:</b> Reserved bits. These bits are reserved and should be set to zero.
17:16	0x0 RO	<b>Isochronous OUT Transaction PID (isoc_data_pid):</b> Data PID received for a high-bandwidth isochronous OUT transaction. This field indicates that the data PID for the current packet is available in the Receive FIFO. This field is used only in Slave-Only mode. 00: DATA0 PID is received 01: DATA1 PID is received 10: DATA2 PID is received 11: MDATA PID is received

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RO	<b>Buffer Size/Frame Number (buff_size_frame_number):</b> Frame number in which the packet is received. For high-speed operation: [15:14] Reserved [13:3] Millisecond frame number [2:0] Microframe number For full-speed operation: [15:11] Reserved [10:0] Millisecond frame number

### 16.6.1.49 OUT Endpoint 3 Buffer Size Register (ep3\_out\_bufsize\_udc\_reg)—Offset 26Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 26Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	<b>Packet Size (buff_size):</b> Buffer size required for this endpoint. The application can program this field to make each endpoint buffers adaptive, providing flexibility in buffer size when the interface or configuration is changed. This value is in 32-bit words, and indicates the number of 32-bit word entries in the Receive FIFO. This value cannot be changed dynamically during operation. NOTE: the maximum size of the Rx FIFO is 512 32-bit word entries.
15:0	0x0 RW	<b>Max Packet Size (max_pkt_size):</b> Maximum packet size for the endpoint. This is the value in bytes. This maximum size is used to calculate whether the Transmit FIFO has sufficient space to accept a packet. When changing the maximum packet size for a specific endpoint, the user must also program the corresponding Physical Endpoint Register.

### 16.6.1.50 OUT Endpoint 3 SETUP Buffer Pointer Register (ep3\_subptr\_udc\_reg)—Offset 270h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 270h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
subptr											
Bit Range	Default & Access	Field Name (ID): Description									
31:0	0x0 RW	<b>SETUP Buffer Pointer (subptr):</b> Endpoint SETUP buffer pointers are used for SETUP commands. The Endpoint SETUP Buffer Pointer register is used only in DMA mode. NOTE: This is applicable only to control endpoints. For all other endpoints this register is reserved.									

### 16.6.1.51 OUT Endpoint 3 Data Descriptor Pointer Register (ep3\_out\_desptr\_udc\_reg)—Offset 274h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [BAR0] + 274h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
desptr											
Bit Range	Default & Access	Field Name (ID): Description									
31:0	0x0 RW	<b>Descriptor Pointer (desptr):</b> This register contains the data descriptor pointer.									

### 16.6.1.52 OUT Endpoint 3 Read Confirmation Register for zero-length OUT data (for Slave-Only mode) (ep3\_rd\_cfrm\_udc\_reg)—Offset 27Ch

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [BAR0] + 27Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
rd_cfrm											

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 WO	<b>Read Confirmation for zero-length OUT data (for Slave-Only mode) (rd_cfrm):</b> For zero-length OUT data, the application must perform a dummy read from this register

### 16.6.1.53 Device Configuration Register (d\_cfg\_udc\_reg)—Offset 400h

This register configures the device. It is only set during initial configuration or when there is a change in the configuration.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 400h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000020h

31	28	24	20	16	12	8	4	0												
0	0	0	0	0	0	0	0	0												
reserved				lpm_en	lpm_auto	ss_ddr	set_desc	csr_prg	halt_status	hs_timeout_calib	fs_timeout_calib	phy_error_detect	status_1	status	dir	pi	ss	sp	rwkp	spd

Bit Range	Default & Access	Field Name (ID): Description
31:22	0x0 RO	<b>reserved:</b> Reserved bits. These bits are reserved and should be set to zero.
21	0x0 RO	<b>Link Power Mode Enable (lpm_en):</b> Link Power Mode is not supported. These bits are reserved and should be set to zero.
20	0x0 RO	<b>Link Power Mode Automatic (lpm_auto):</b> Link Power Mode is not supported. These bits are reserved and should be set to zero.
19	0x0 RO	<b>Double Data Rate (ss_ddr):</b> ULPI PHY interface is not supported. These bits are reserved and should be set to zero.
18	0x0 RW	<b>Set Descriptor Request Enable (set_desc):</b> Indicates that the device supports Set Descriptor requests. 0: The USB Device Controller returns a STALL handshake to the USB host. 1: The SETUP packet for the Set Descriptor request passes to the application.
17	0x0 RW	<b>Dynamic Register Programming (csr_prg):</b> The application can program the USB Device Controller registers dynamically whenever it has received an interrupt for either a Set Configuration or a Set Interface request. If this bit is set to 1, the USB Device Controller returns a NAK handshake during the status IN stage of both the Set Configuration and Set Interface requests until the application has written 1 to the CSR_DONE bit 13 of the Device Control Register.
16	0x0 RW	<b>Halt Status (halt_status):</b> This bit indicates whether the USB Device Controller must respond with a STALL or an ACK handshake when the USB host has issued a Clear_Feature (ENDPOINT_HALT) request for Endpoint 0. Options are: 0: ACK 1: STALL
15:13	0x0 RW	<b>HS Timeout Counter (hs_timeout_calib):</b> Number of PHY Clocks to the USB Device Controller Timeout Counter(for HS).The application uses these bits to increase the timeout value (736 to 848 bit times in high-speed operation), which depends on the PHY delay in generating a line state condition. The default timeout value is 736 bit times.

Bit Range	Default & Access	Field Name (ID): Description
12:10	0x0 RW	<b>FS Timeout Counter (fs_timeout_calib):</b> Number of PHY Clocks to the USB Device Controller Timeout Counter(for FS).These three bits indicate the number of PHY clocks to the USB Device Controller timeout counter. The application uses these bits to increase the timeout value (16 to 18 bit times in full-speed operation), which depends on the PHY delay in generating line state condition. The default timeout value is 16 bit times.
9	0x0 RW	<b>PHY Error Detect (phy_error_detect):</b> If the application sets this bit, the device detects the phy_rxvalid or phy_rxactive input signal to be continuously asserted for 2 ms, indicating PHY error.
8	0x0 RW	<b>Non-zero Control Handshake 1 (status_1):</b> This bit, together with STATUS Bit 7, provides an option for the USB Device Controller to respond to the USB host with a STALL or ACK handshake if the USB host has issued a non-zero-length data packet during the STATUS-OUT stage of a CONTROL transfer.
7	0x0 RW	<b>Non-zero Control Handshake (status):</b> This bit, together with STATUS Bit 8, provides an option for the USB Device Controller to respond to the USB host with a STALL or ACK handshake if the USB host has issued a non-zero-length data packet during the STATUS-OUT stage of a CONTROL transfer.
6	0x0 RO	<b>UTMI Data Bus Direction (dir):</b> This bit indicates if the UTMI data bus interface has to support a unidirectional or bidirectional interface. 0: Unidirectional interface 1: Bidirectional interface
5	1h RW	<b>PHY Interface Width (pi):</b> Indicates if the UTMI PHY supports an 8-bit or 16-bit interface. 0: 16-bit 1: 8-bit. NOTE: even if this field is writable, only 8bit interface is supported. Writing 0 will lead to undefined behavior.
4	0x0 RW	<b>Sync Frame Support (ss):</b> Indicates that the Device Supports Sync Frame.
3	0x0 RW	<b>Self-Powered Device (sp):</b> Indicates that the Device is Self-Powered.
2	0x0 RW	<b>Remote Wake Up Capable (rwkp):</b> Indicates that the device is remote wake up capable.
1:0	0x0 RW	<b>Device Speed (spd):</b> This is the expected speed the application programs to the subsystem. The actual speed the subsystem operates depends on the enumeration speed (ENUM SPD) of the Device Status register. 00: HS (PHY clock = 60 MHz) 01: FS (PHY clock = 60 MHz) 10: Reserved 11: Reserved

#### 16.6.1.54 Device Control Register (d\_ctrl\_udc\_reg)—Offset 404h

This register is set at runtime and controls the device after device configuration.

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 404h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000400h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW	<b>Threshold Length (thlen)</b> : Indicates the number (THLEN + 1) of 32-bit entries in the RxFIFO before the DMA can start data transfer.
23:16	0x0 RW	<b>Burst Length (brlen)</b> : Indicates the length, in 32-bit transfers, of a single burst on the AHB. The subsystem sends number of 32-bit transfers equal to (BRLEN + 1).
15	0x0 RO	<b>reserved_1</b> : Reserved bits. These bits are reserved and should be set to zero.
14	0x0 RO	<b>Receive FIFO Flush for Single Receive FIFO (srx_flush)</b> : Multiple receive FIFOs are implemented. These bits are reserved and should be set to zero.
13	0x0 WO	<b>Dynamic Register Programming Done (csr_done)</b> : The application uses this bit to notify the USB Device Controller that the application has completed programming all required USB Device Controller registers, and the Subsystem can acknowledge the current Set Configuration or Set Interface command.
12	0x0 RW	<b>Device NAK (devnak)</b> : When the application sets this bit, the Subsystem core returns a NAK handshake to all OUT endpoints. By writing 1 to this bit, the application does not need to write 1 to the SNAK bit 7 of each Endpoint Control register.
11	0x0 RW	<b>Scale Down (scale)</b> : This bit reduces the timer values inside the USB Device Controller when running gate-level simulation only. When this bit is set to 1, timer values are scaled down to reduce simulation time. In Scale-Down mode, the USB Device Controller detects a USB reset within 150 PHY clock cycles (60-MHz PHY clock, 8-bit UTMI). Reset this bit to 0 for normal operation.
10	1h RW	<b>Soft Disconnect (sd)</b> : The application software uses this bit to signal the USB Device Controller to soft-disconnect. When set to 1, this bit causes the device to enter the disconnected state.
9	0x0 RW	<b>DMA/Slave-Only Mode (mode)</b> : Enables the application to dictate the subsystem operation in either DMA mode (1) or Slave-Only mode (0) operation.
8	0x0 RW	<b>Burst Enable (bren)</b> : When this bit is set, transfers on the AHB are split into bursts.
7	0x0 RW	<b>Threshold Enable (the)</b> : When this bit is set, a number of quadlets equivalent to the threshold value is transferred from the RxFIFO to the memory.
6	0x0 RW	<b>Buffer Fill Mode (bf)</b> : The DMA is in Buffer Fill mode and transfers data into contiguous locations pointed to by the buffer address.
5	0x0 RW	<b>System Endianness (be)</b> : A value of 1 indicates a big endian system.
4	0x0 RW	<b>Descriptor Update (du)</b> : When this bit is set, the DMA updates the descriptor at the end of each packet processed.
3	0x0 RW	<b>Transmit DMA Enable (tde)</b> : 0: disabled 1: enabled
2	0x0 RW	<b>Receive DMA Enable (rde)</b> : 0: disabled 1: enabled
1	0x0 RO	<b>reserved_2</b> : Reserved bits. These bits are reserved and should be set to zero.

Bit Range	Default & Access	Field Name (ID): Description
0	0x0 RW	<b>Remote Wakeup Resume (res):</b> To perform a remote wakeup resume the application sets this bit to 1, then resets it to 0 after 1 ms. The USB Device Controller signals the USB host to resume the USB bus. However: The application must first set RWKP bit 2 in the Device Configuration Register, indicating that the subsystem supports the Remote Wakeup feature. The host must already have issued a Set Feature request to enable the device Remote Wakeup feature.

### 16.6.1.55 Device Status Register (d\_sts\_udc\_reg)—Offset 408h

This register reflects status information needed to service some of the interrupts.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 408h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
ts		rmtwkup_feat_sts		phy_error	rxfifo_empty	enum_spd	susp	alt
intfr			cfg					

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RO	<b>Received SOF Frame Number (ts):</b> For high-speed operation: [31:21]: Millisecond frame number [20:18]: Microframe number For full-speed operation: [31:29]: Reserved [28:18]: Millisecond frame number
17	0x0 RO	<b>Remote Wakeup Status (rmtwkup_feat_sts):</b> Status of Remote wakeup feature due to Set/Clear Feature (Remotewakeup) command from the host. A value of 1 indicates a Set Feature (Remotewakeup) has been received. A value of 0 indicates Clear Feature (Remotewakeup) has been received. Any change to this bit sets an interrupt in bit 7 of Device Interrupt register, if not masked.
16	0x0 RO	<b>PHY Error (phy_error):</b> Either the phy_rxvalid or phy_rxactive input signal is detected to be continuously asserted for 2 ms, indicating PHY error. The USB Device Controller goes to the Suspend state as a result. When the application serves the early suspend interrupt (ES bit 2 of the Device Interrupt register) it also must check this bit to determine if the early suspend interrupt was generated due to PHY error detection.
15	0h RO	<b>Receive Address FIFO Empty Status (rxfifo_empty):</b> Multiple receive FIFOs are implemented. These bits are reserved and should be set to zero.

Bit Range	Default & Access	Field Name (ID): Description
14:13	0x0 RO	<b>Enumerated Speed (enum_spd)</b> : These bits hold the speed at which the subsystem comes up after the speed enumeration. Possible options are: 00 HS: If the SPD is high speed and the subsystem connects to a 2.0 host controller, then after Speed Enumeration, these bits indicate that the subsystem is operating in high speed mode. 01 FS: If the expected speed (SPD of the Device Configuration register) is high speed and the subsystem connects to a 1.1 host controller, then after Speed Enumeration, these bits indicate that the subsystem is operating in full speed mode. 10 : Reserved 110: Reserved
12	0x0 RO	<b>Suspend Status (susp)</b> : This bit is set as long as a Suspend condition is detected on the USB.
11:8	0x0 RO	<b>Alternate Setting (alt)</b> : This 4-bit field represents the alternate setting to which the above interface is switched.
7:4	0x0 RO	<b>SetInterface Command (intf)</b> : This 4-bit field reflects the interface set by the SetInterface command.
3:0	0x0 RO	<b>SetConfiguration Command (cfg)</b> : This 4-bit field reflects the configuration set by the SetConfiguration command.

### 16.6.1.56 Device Interrupt Register (d\_intr\_udc\_reg)—Offset 40Ch

Device interrupts are set when there are system-level events. Interrupts are used by the application to make system-level decisions. After checking the register, the application must clear the interrupt by writing a 1?b1 to the correct bit.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 40Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0								
0	0	0	0	0	0	0	0	0								
reserved						e_slpm	slpm	lpm_tkn	rmtwkup	enumc	sof	us	ur	es	si	sc

Bit Range	Default & Access	Field Name (ID): Description
31:11	0x0 RO	<b>reserved</b> : Reserved bits. These bits are reserved and should be set to zero.
10	0x0 RO	<b>LPM Early Sleep (e_slpm)</b> : Link Power Mode is not supported. These bits are reserved and should be set to zero.
9	0x0 RO	<b>LPM Sleep (slpm)</b> : Link Power Mode is not supported. These bits are reserved and should be set to zero.
8	0x0 RO	<b>LPM Transaction (lpm_tkn)</b> : Link Power Mode is not supported. These bits are reserved and should be set to zero.
7	0x0 RW/1C	<b>Remote Wakeup (rmtwkup)</b> : A Set/Clear Feature (Remote Wakeup) is received by the core. This bit is set by the core whenever bit 17 of the Device Status Register changes: HIGH to LOW or LOW to HIGH.

Bit Range	Default & Access	Field Name (ID): Description
6	0x0 RW/1C	<b>Speed Enumeration Completed (enumc)</b> : Speed enumeration is complete.
5	0x0 RW/1C	<b>SOF Token Detected (sof)</b> : An SOF token is detected on the USB.
4	0x0 RW/1C	<b>Suspend State (us)</b> : A suspend state is detected on the USB for a duration of 3 milliseconds, following the 3 ms Idle State interrupt activity due to an idle state.
3	0x0 RW/1C	<b>USB Reset Detected (ur)</b> : NOTE: If the application has not served this interrupt, the USB Device Controller returns a NAK handshake for all transactions except the 8 SETUP packet bytes from the USB host.
2	0x0 RW/1C	<b>Idle State Detected (es)</b> : An idle state is detected on the USB for a duration of 3 ms. This interrupt bit is used for the application firmware to finish its job before the subsystem generates a true suspend (US) interrupt (another 3 ms after the ES interrupt)
1	0x0 RW/1C	<b>Set_Interface Command Received (si)</b> : The device has received a Set_Interface command. NOTE: If the application has not served this interrupt, the USB Device Controller returns a NAK handshake for all transactions except the 8 SETUP packet bytes from the USB host.
0	0x0 RW/1C	<b>Set_Configuration Command Received (sc)</b> : NOTE: If the application has not served this interrupt, the USB Device Controller returns a NAK handshake for all transactions except the 8 SETUP packet bytes from the USB host.

### 16.6.1.57 Device Interrupt Mask Register (d\_intr\_msk\_udc\_reg)—Offset 410h

The device interrupt mask can be set for system-level interrupts using this register. Programming 1'b1 in the appropriate bit position in the Interrupt Mask register masks the designated interrupt. Once masked, an interrupt signal does not reach the application, nor does its interrupt bit get set.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 410h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
reserved								e_slpm	slpm	lpm_tkn	mask1

Bit Range	Default & Access	Field Name (ID): Description
31:11	0x0 RO	<b>reserved</b> : Reserved bits. These bits are reserved and should be set to zero.
10	0x0 RO	<b>LPM Early Sleep (e_slpm)</b> : Link Power Mode is not supported. These bits are reserved and should be set to zero.
9	0x0 RO	<b>LPM Sleep (slpm)</b> : Link Power Mode is not supported. These bits are reserved and should be set to zero.
8	0x0 RO	<b>LPM Transaction (lpm_tkn)</b> : Link Power Mode is not supported. These bits are reserved and should be set to zero.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	<b>Device Interrupt Mask (mask1)</b> : Masks equivalent device interrupt bit in the Device Interrupt Register.

### 16.6.1.58 Endpoints Interrupt Register (ep\_intr\_udc\_reg)—Offset 414h

The Endpoint Interrupt register is used to set endpoint-level interrupts. Since all 4 endpoints are bidirectional, each endpoint has two interrupt bits (one for each direction). The application needs to clear the interrupt by writing a 1'b1 to the correct bit after checking the register.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 414h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/1C	<b>OUT Endpoint Interrupt (out_ep)</b> : One bit is associated to one of the 4 supported OUT endpoint, set when there is an event on that endpoint. bit0: OUT ED0 bit1: OUT ED1 bit2: OUT ED2 bit3: OUT ED3 bit4-bit15: Reserved
15:0	0x0 RW/1C	<b>IN Endpoint Interrupt (in_ep)</b> : One bit is associated to one of the 4 supported IN endpoint, set when there is an event on that endpoint. bit0: IN ED0 bit1: IN ED1 bit2: IN ED2 bit3: IN ED3 bit4-bit15: Reserved

### 16.6.1.59 Endpoints Interrupt Mask Register (ep\_intr\_msk\_udc\_reg)—Offset 418h

This register is used to mask endpoint interrupts. A write of 1'b1 to any bit in this register masks the corresponding endpoint for any possible interrupts. Once masked, an interrupt signal does not reach the application, nor does its interrupt bit get set.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 418h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	<b>OUT Endpoint Interrupt Mask (out_ep_mask)</b> : Masks the OUT Endpoint Interrupt Register bits of the equivalent OUT endpoint. bit0: OUT ED0 bit1: OUT ED1 bit2: OUT ED2 bit3: OUT ED3 bit4-bit15: Reserved
15:0	0h RW	<b>IN Endpoint Interrupt Mask (in_ep_mask)</b> : Masks the IN Endpoint Interrupt Register bits of the equivalent IN endpoint. bit0: IN ED0 bit1: IN ED1 bit2: IN ED2 bit3: IN ED3 bit4-bit15: Reserved

**16.6.1.60 Test Mode Register (test\_mode\_udc\_reg)—Offset 41Ch**

In Test mode, the application can use the AHB to read from a Tx FIFO or write to an Rx FIFO using AHB read/write cycles. Test mode is supported only in the Slave-Only operational mode. In Test mode, only single- DWORD transactions are supported: byte and word transactions on the AHB are not supported. In non-Test modes, reading from a Tx FIFO or writing to an Rx FIFO results in an AHB error response. The application must never read an empty Tx FIFO or write a full Rx FIFO even though an AHB error response is not provided. NOTE: Writing to the Rx FIFO in Test mode and enabling the DMA to transfer the data are not supported.

**Access Method**

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [BAR0] + 41Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	<b>reserved:</b> Reserved bits. These bits are reserved and should be set to zero.
0	0x0 RW	<b>Test Mode indicator (tstmode):</b> 0: Normal mode 1: Test mode

### 16.6.1.61 Product Release Number Register (revision\_udc\_reg)—Offset 420h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 420h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 3234352Ah

31	28	24	20	16	12	8	4	0
0	0	1	1	0	0	1	0	0
0	0	1	0	0	0	1	1	0
0	1	0	0	0	0	1	1	0
0	0	1	0	1	0	1	0	0
0	0	1	0	0	1	0	1	0
1	0	1	0	1	0	1	0	0

Bit Range	Default & Access	Field Name (ID): Description
31:0	3234352Ah RO	<b>Product Release Number (release_id):</b> This field indicates the ASCII characters of the four-digit release number in hexadecimal format. For example, 32_34_35_2A represents 2.45* in ASCII character, where * is an alphabetic character (for example, a, b, or c) that represents an update to the release, which does not impact the RTL source.

### 16.6.1.62 SETUP command address pointer register (udc\_desc\_addr\_udc\_reg)—Offset 500h

**NOTE:** The SETUP command address pointer register is not writable and returns 0 when read because the SETUP command address pointer is hardcoded to xFFF0.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 500h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	<b>Device Descriptor Address Pointer (dev_desc_addr_ptr):</b> Device Descriptor Address Pointer
15:0	0x0 RO	<b>SETUP Command Address Pointer (su_cmd_addr_ptr):</b> SETUP Command Address Pointer

### 16.6.1.63 Physical Endpoint 0 Register (udc\_ep\_ne\_udc\_reg\_0)—Offset 504h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 504h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:2] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0

**Table 107. Summary of Memory Mapped I/O Registers—BAR0 (Continued)**

Offset Start	Offset End	Register Name (Register Symbol)	Default Value
28h	2Bh	"Asynchronous List Address (ASYNCLISTADDR)—Offset 28h" on page 560	00000000h
50h	53h	"Configure Flag (CONFIGFLAG)—Offset 50h" on page 560	00000000h
54h + [0-1]*4h	57h	"Port Status/Control[0-1] (PORTSC[0-1])—Offset 54h, Count 2, Stride 4h" on page 561	00002000h
90h	93h	"Programmable Microframe Base Value (INSNREG00)—Offset 90h" on page 564	00000000h
94h	97h	"Programmable Packet Buffer OUT/IN Thresholds (INSNREG01)—Offset 94h" on page 565	00200020h
98h	9Bh	"Programmable Packet Buffer Depth (INSNREG02)—Offset 98h" on page 565	00000080h
9Ch	9Fh	"Programmable Controller Settings (INSNREG03)—Offset 9Ch" on page 566	00002001h
A0h	A3h	"Programmable Controller Settings (INSNREG04)—Offset A0h" on page 567	00000000h
A4h	A7h	"UTMI Configuration (INSNREG05)—Offset A4h" on page 568	00001000h

**16.6.2.1 Host Controller Interface Version Number and Capability Registers Length (HCCAPBASE)—Offset 0h**

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 0h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:3] + 10h

**Default:** 01000010h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0100h RO	<b>Host Controller Interface Version Number (hcversion):</b> This is a two-byte register containing a BCD encoding of the EHCI revision number supported by this host controller. The most significant byte of this register represents a major revision and the least significant byte is the minor revision.
15:8	0h RO	<b>reserved_15_8:</b> Reserved bits. These bits are reserved and should be set to zero.
7:0	010h RO	<b>Capability Registers Length (caplength):</b> This register is used as an offset to add to register base to find the beginning of the Operational Register Space.

**16.6.2.2 Host Controller Structural Parameters (HCSPARAMS)—Offset 4h**

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 4h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:3] + 10h

Default: 00001212h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	1	0			
reserved_31_24		debug_port_number		reserved_19_17	p_indicator	n_cc	n_pcc	port_route_rules	reserved_6_5	ppc	n_ports

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>reserved_31_24:</b> Reserved bits. These bits are reserved and should be set to zero.
23:20	0h RO	<b>Debug Port Number (debug_port_number):</b> This register identifies which of the host controller ports is the debug port. The value is the port number (one-based) of the debug port. A non-zero value in this field indicates the presence of a debug port. The value in this register must not be greater than N_PORTS. NOTE: Debug Port is not supported
19:17	000b RO	<b>reserved_19_17:</b> Reserved bits. These bits are reserved and should be set to zero.
16	0b RO	<b>Port Indicator (p_indicator):</b> This bit indicates whether the ports support port indicator control. When this bit is a one, the port status and control registers include a read/writeable field for controlling the state of the port indicator. NOTE: Port Indicator is not supported
15:12	1h RO	<b>Number of Companion Controllers (n_cc):</b> This field indicates the number of companion controllers associated with this USB 2.0 host controller. A zero in this field indicates there are no companion host controllers. Port-ownership hand-off is not supported. Only high-speed devices are supported on the host controller root ports. A value larger than zero in this field indicates there are companion USB 1.1 host controller(s). Port-ownership hand-offs are supported. High, Full- and Low-speed devices are supported on the host controller root ports.
11:8	2h RO	<b>Number of Ports per Companion Controller (n_pcc):</b> This field indicates the number of ports supported per companion host controller. It is used to indicate the port routing configuration to system software. For example, if N_PORTS has a value of 6 and N_CC has a value of 2 then N_PCC could have a value of 3. The convention is that the first N_PCC ports are assumed to be routed to companion controller 1, the next N_PCC ports to companion controller 2, etc. In the previous example, the N_PCC could have been 4, where the first 4 are routed to companion controller 1 and the last two are routed to companion controller 2. The number in this field must be consistent with N_PORTS and N_CC.
7	0b RO	<b>Port Routing Rules (port_route_rules):</b> This field indicates the method used by this implementation for how all ports are mapped to companion controllers. The value of this field has the following interpretation: 0: The first N_PCC ports are routed to the lowest numbered function companion host controller, the next N_PCC port are routed to the next lowest function companion controller, and so on. 1: The port routing is explicitly enumerated by the first N_PORTS elements of the HCSP-PORTROUTE array.
6:5	00b RO	<b>reserved_6_5:</b> Reserved bits. These bits are reserved and should be set to zero.
4	1b RO	<b>Port Power Control (ppc):</b> This field indicates whether the host controller implementation includes port power control. A one in this bit indicates the ports have port power switches. A zero in this bit indicates the port do not have port power switches. The value of this field affects the functionality of the Port Power field in each port status and control register. NOTE: Port Power Control is supported.

Bit Range	Default & Access	Field Name (ID): Description
3:0	2h RO	<b>Number of Physical Downstream Ports (n_ports):</b> This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the Operational Register Space. Valid values are in the range of 1 to F. A zero in this field is undefined.

### 16.6.2.3 Host Controller Capability Parameters (HCCPARAMS)—Offset 8h

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 8h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:3] + 10h

Default: 0000C012h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	1	1	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	<b>reserved_31_18:</b> Reserved bits. These bits are reserved and should be set to zero.
17	0h RO	<b>Link Power Management Capability (link_power_mgmt_cap):</b> NOTE: Link Power Management is not supported.
16	0h RO	<b>reserved_16:</b> Reserved bits. These bits are reserved and should be set to zero.
15:8	C0h RO	<b>EHCI Extended Capabilities Pointer (eecp):</b> This optional field indicates the existence of a capabilities list. A value of 00h indicates no extended capabilities are implemented. A non-zero value in this register indicates the offset in PCI configuration space of the first EHCI extended capability. The pointer value must be 40 or greater if implemented to maintain the consistency of the PCI header defined for this class of device. NOTE: EHCI Extended Capabilities is supported.
7:4	1h RO	<b>Isochronous Scheduling Threshold (isoc_schedule_threshold):</b> This field indicates, relative to the current position of the executing host controller, where software can reliably update the isochronous schedule. When bit [7] is zero, the value of the least significant 3 bits indicates the number of micro-frames a host controller can hold a set of isochronous data structures (one or more) before flushing the state. When bit [7] is a one, then host software assumes the host controller may cache an isochronous data structure for an entire frame.
3	0h RO	<b>reserved_3:</b> Reserved bits. These bits are reserved and should be set to zero.

Bit Range	Default & Access	Field Name (ID): Description
27:24	0h RO	<b>Host Initiated Resume Duration (host_initiated_resume_duration):</b> If the Link Power Management Capability bit in the HCCPARAMS register is set to one then this bit is R/W; otherwise RO and not functional. NOTE: Link Power Management is not supported.
23:16	08h RW	<b>Interrupt Threshold Control (intr_threshold_ctrl):</b> This field is used by system software to select the maximum rate at which the host controller will issue interrupts. If software writes an invalid value to this register, the results are undefined. Allowed values are: 00: Reserved 01: 1 micro-frame 02: 2 micro-frames 04: 4 micro-frames 08: 8 micro-frames (default, equates to 1ms) 10: 16 micro-frames (2ms) 20: 32 micro-frames (4ms) 40: 64 micro-frames (8ms) Any other value in this register yields undefined results. Software modifications to this bit while HCHalted bit is equal to zero results in undefined behavior.
15:12	0h RO	<b>reserved_15_12:</b> Reserved bits. These bits are reserved and should be set to zero.
11	0h RO	<b>Asynchronous Schedule Park Mode Enable (async_schedule_park_mode_enable):</b> If the Asynchronous Park Capability bit in the HCCPARAMS register is a one, then this bit defaults to a 1 and is R/W. Otherwise the bit must be a zero and is RO. Software uses this bit to enable or disable Park mode. When this bit is one, Park mode is enabled. When this bit is a zero, Park mode is disabled. NOTE: Asynchronous Park Capability is not supported.
10	0h RO	<b>reserved_10:</b> Reserved bits. These bits are reserved and should be set to zero.
9:8	0h RO	<b>Asynchronous Schedule Park Mode Count (async_schedule_park_mode_cnt):</b> If the Asynchronous Park Capability bit in the HCCPARAMS register is a one, then this field defaults to 3 and is R/W. Otherwise it defaults to zero and is RO. It contains a count of the number of successive transactions the host controller is allowed to execute from a high-speed queue head on the Asynchronous schedule before continuing traversal of the Asynchronous schedule. Valid values are 1h to 3h. Software must not write a zero to this bit when Park Mode Enable is a one as this will result in undefined behavior. NOTE: Asynchronous Park Capability is not supported.
7	0h RW	<b>Light Host Controller Reset (light_hcreset):</b> This control bit allows the driver to reset the EHCI controller without affecting the state of the ports or the relationship to the companion host controllers. For example, the PORSTC registers should not be reset to their default values and the CF bit setting should not go to zero (retaining port ownership relationships). A host software read of this bit as zero indicates the Light Host Controller Reset has completed and it is safe for host software to re-initialize the host controller. A host software read of this bit as a one indicates the Light Host Controller Reset has not yet completed. If not implemented a read of this field will always return a zero. NOTE: this control bit is supported and resets the EHCI List Processor Master Controller Unit.
6	0h RW	<b>Interrupt on Async Advance Doorbell (intr_on_async_advance_drbell):</b> This bit is used as a doorbell by software to tell the host controller to issue an interrupt the next time it advances asynchronous schedule. Software must write a 1 to this bit to ring the doorbell. When the host controller has evicted all appropriate cached schedule state, it sets the Interrupt on Async Advance status bit in the USBSTS register. If the Interrupt on Async Advance Enable bit in the USBINTR register is a one then the host controller will assert an interrupt at the next interrupt threshold. The host controller sets this bit to a zero after it has set the Interrupt on Async Advance status bit in the USBSTS register to a one. Software should not write a one to this bit when the asynchronous schedule is disabled. Doing so will yield undefined results.
5	0h RW	<b>Asynchronous Schedule Enable (async_schedule_enable):</b> This bit controls whether the host controller skips processing the Asynchronous Schedule. Values mean: 0: Do not process the Asynchronous Schedule 1: Use the ASYNCLISTADDR register to access the Asynchronous Schedule

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	<b>Periodic Schedule Enable (periodic_schedule_enable):</b> This bit controls whether the host controller skips processing the Periodic Schedule. Values mean: 0: Do not process the Periodic Schedule 1: Use the PERIODICLISTBASE register to access the Periodic Schedule
3:2	0h RW	<b>Frame List Size (frame_list_size):</b> This field is RW only if Programmable Frame List Flag in the HCCPARAMS registers is set to a one. This field specifies the size of the frame list. The size the frame list controls which bits in the Frame Index Register should be used for the Frame List Current index. Values mean: 00: 1024 elements (4096) Default value 01: 512 elements (2048 ) 10: 256 elements (1024 ) for resource-constrained environments 11: Reserved
1	0h RW	<b>Host Controller Reset (hreset):</b> This control bit is used by software to reset host controller. The effects of this on Root Hub registers are similar to a Chip Hardware Reset. When software writes a one to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports. PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values. Port ownership reverts to the companion host controller(s). This bit is set to zero by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a zero to this register. Software should not set this bit to a one when the HCHalted bit in the USBSTS register is a zero. Attempting to reset an actively running host controller will result in undefined behavior.
0	0h RW	<b>Run/Stop bit (run_stop):</b> 1: Run 0: Stop When set to a 1, the Host Controller proceeds with execution of the schedule. The Host Controller continues execution as long as this bit is set to a 1. When this bit is set to 0, the Host Controller completes the current and any actively pipelined transactions on the USB and then halts. The Host Controller must halt within 16 micro-frames after software clears the Run bit. The HC Halted bit in the status register indicates when the Host Controller has finished its pending pipelined transactions and has entered the stopped state. Software must not write a one to this field unless the host controller is in the Halted state (i.e. HCHalted in the USBSTS register is a one). Doing so will yield undefined results.

### 16.6.2.5 USB Status (USBSTS)—Offset 14h

This register indicates pending interrupts and various states of the Host Controller. The status resulting from a transaction on the serial bus is not indicated in this register.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 14h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:3] + 10h

**Default:** 00001000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>reserved_31_16:</b> Reserved bits. These bits are reserved and should be set to zero.
15	0h RO	<b>Asynchronous Schedule Status (async_schedule_status):</b> The bit reports the current real status of the Asynchronous Schedule. If this bit is a zero then the status of the Asynchronous Schedule is disabled. If this bit is a one then the status of the Asynchronous Schedule is enabled. The Host Controller is not required to immediately disable or enable the Asynchronous Schedule when software transitions the Asynchronous Schedule Enable bit in the USBCMD register. When this bit and the Asynchronous Schedule Enable bit are the same value, the Asynchronous Schedule is either enabled (1) or disabled (0).
14	0h RO	<b>Periodic Schedule Status (periodic_schedule_status):</b> The bit reports the current real status of the Periodic Schedule. If this bit is a zero then the status of the Periodic Schedule is disabled. If this bit is a one then the status of the Periodic Schedule is enabled. The Host Controller is not required to immediately disable or enable the Periodic Schedule when software transitions the Periodic Schedule Enable bit in the USBCMD register. When this bit and the Periodic Schedule Enable bit are the same value, the Periodic Schedule is either enabled (1) or disabled (0).
13	0h RO	<b>Reclamation (reclamation):</b> This bit is used to detect an empty asynchronous schedule.
12	1h RO	<b>HcHalted (hchalted):</b> This bit is a zero whenever the Run/Stop bit is a one. The Host Controller sets this bit to one after it has stopped executing as a result of the Run/Stop bit being set to 0, either by software or by the Host Controller hardware (e.g. internal error).
11:6	0h RO	<b>reserved_11_6:</b> Reserved bits. These bits are reserved and should be set to zero.
5	0h RW/1C	<b>Interrupt on Async Advance (intr_on_async_advance):</b> System software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by writing a one to the Interrupt on Async Advance Doorbell bit in the USBCMD register. This status bit indicates the assertion of that interrupt source.
4	0h RW/1C	<b>Host System Error (host_system_error):</b> The Host Controller sets this bit to 1 when a serious error occurs during a host system access involving the Host Controller module. In a PCI system, conditions that set this bit to 1 include PCI Parity error, PCI Master Abort, and PCI Target Abort. When this error occurs, the Host Controller clears the Run/Stop bit in the Command register to prevent further execution of the scheduled TDs.
3	0h RW/1C	<b>Frame List Rollover (frame_list_rollover):</b> The Host Controller sets this bit to a one when the Frame List Index rolls over from its maximum value to zero. The exact value at which the rollover occurs depends on the frame list size. For example, if the frame list size (as programmed in the Frame List Size field of the USBCMD register) is 1024, the Frame Index Register rolls over every time FRINDEX[13] toggles. Similarly, if the size is 512, the Host Controller sets this bit to a one every time FRINDEX[12] toggles.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW/1C	<b>Port Change Detect (port_change_detect):</b> The Host Controller sets this bit to a one when any port for which the Port Owner bit is set to zero has a change bit transition from a zero to a one or a Force Port Resume bit transition from a zero to a one as a result of a J-K transition detected on a suspended port. This bit will also be set as a result of the Connect Status Change being set to a one after system software has relinquished ownership of a connected port by writing a one to a port's Port Owner bit. On a D3 to D0 transition of the EHCI HC device, this bit is loaded with the OR of all of the PORTSC change bits (including: Force port resume, over-current change, enable/disable change and connect status change).
1	0h RW/1C	<b>USB Error Interrupt (usberrint):</b> The Host Controller sets this bit to 1 when completion of a USB transaction results in an error condition (e.g., error counter underflow). If the TD on which the error interrupt occurred also had its IOC bit set, both this bit and USBINT bit are set. Refer to EHCI Specification for a list of the USB errors that will result in this bit being set to a one.
0	0h RW/1C	<b>USB Interrupt (usbint):</b> The Host Controller sets this bit to 1 on the completion of a USB transaction, which results in the retirement of a Transfer Descriptor that had its IOC bit set. The Host Controller also sets this bit to 1 when a short packet is detected (actual number of bytes received was less than the expected number of bytes).

### 16.6.2.6 USB Interrupt Enable (USBINTR)—Offset 18h

This register enables and disables reporting of the corresponding interrupt to the software. When a bit is set and the corresponding interrupt is active, an interrupt is generated to the host. Interrupt sources that are disabled in this register still appear in the USBSTS to allow the software to poll for events.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 18h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:3] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
							reserved_31_6 intr_on_async_advance_enable host_system_err_enable frame_list_rollover_enable port_change_intr_enable usberrint_enable usbint_enable	

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>reserved_31_6:</b> Reserved bits. These bits are reserved and should be set to zero.
5	0h RW	<b>Interrupt on Async Advance Enable (intr_on_async_advance_enable):</b> When this bit is a one, and the Interrupt on Async Advance bit in the USBSTS register is a one, the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by software clearing the Interrupt on Async Advance bit.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	<b>Host System Error Enable (host_system_err_enable):</b> When this bit is a one, and the Host System Error Status bit in the USBSTS register is a one, the host controller will issue an interrupt. The interrupt is acknowledged by software clearing the Host System Error bit.
3	0h RW	<b>Frame List Rollover Enable (frame_list_rollover_enable):</b> When this bit is a one, and the Frame List Rollover bit in the USBSTS register is a one, the host controller will issue an interrupt. The interrupt is acknowledged by software clearing the Frame List Rollover bit.
2	0h RW	<b>Port Change Interrupt Enable (port_change_intr_enable):</b> When this bit is a one, and the Port Change Detect bit in the USBSTS register is a one, the host controller will issue an interrupt. The interrupt is acknowledged by software clearing the Port Change Detect bit.
1	0h RW	<b>USB Error Interrupt Enable (usberrint_enable):</b> When this bit is a one, and the USBERRINT bit in the USBSTS register is a one, the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by software clearing the USBERRINT bit.
0	0h RW	<b>USB Interrupt Enable (usbint_enable):</b> When this bit is a one, and the USBINT bit in the USBSTS register is a one, the host controller will issue an interrupt at the next interrupt threshold. The interrupt is acknowledged by software clearing the USBINT bit.

### 16.6.2.7 USB Frame Index (FRINDEX)—Offset 1Ch

This register is used by the host controller to index into the periodic frame list.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:3] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	<b>reserved_31_14:</b> Reserved bits. These bits are reserved and should be set to zero.

Bit Range	Default & Access	Field Name (ID): Description
13:0	0h RW	<p><b>Frame Index (frame_index):</b> The value of this register increments at the end of each time frame (e.g. micro-frame). Bits [N:3] are used for the Frame List current index. This means that each location of the frame list is accessed 8 times (frames or micro-frames) before moving to the next index. The following illustrates values of N based on the value of the Frame List Size field in the USBCMD register: USBCMD[Frame List Size] Number Elements N</p> <p>USBCMD[Frame List Size] = 00 (1024), N = 12                      USBCMD[Frame List Size] = 01 (512), N = 11                      USBCMD[Frame List Size] = 10 (256), N = 10                      USBCMD[Frame List Size] = 11 (Reserved)</p> <p>This register must be written as a DWord. Byte writes produce undefined results. This register cannot be written unless the Host Controller is in the Halted state as indicated by the HCHalted bit in USBSTS register. A write to this register while the Run/Stop bit of USBCMD register is set to a one produces undefined results. Writes to this register also affect the SOF value.</p>

### 16.6.2.8 4 Gigabyte Memory Segment Selector (CTRLDSSEGMENT)—Offset 20h

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 20h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:3] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	<p><b>4 Gigabyte Memory Segment Selector (seg_4g_selector):</b> This 32-bit register corresponds to the most significant address bits [63:32] for all EHCI data structures. If the 64-bit Addressing Capability field in HCCPARAMS is a zero, then this register is not used. Software cannot write to it and a read from this register will return zeros. If the 64-bit Addressing Capability field in HCCPARAMS is a one, then this register is used with the link pointers to construct 64-bit addresses to EHCI control data structures. This register allows the host software to locate all control data structures within the same 4 Gigabyte memory segment.</p> <p>NOTE: 64-bit Addressing is not supported</p>

### 16.6.2.9 Periodic Frame List Base Address (PERIODICLISTBASE)—Offset 24h

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 24h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:3] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	<b>Base Address (base_address)</b> : This field contains bits [31:12] of the 32 bit address of the Periodic Frame List in the system memory. System software loads this register prior to starting the schedule execution by the Host Controller. The memory structure referenced by this physical memory pointer is assumed to be 4-Kbyte aligned. The contents of this register are combined with the Frame Index Register (FRINDEX) to enable the Host Controller to step through the Periodic Frame List in sequence. Writes must be DWord Writes.
11:0	0h RO	<b>reserved_11_0</b> : Reserved bits. Must be written as 0s. During runtime the value of these bits is undefined.

### 16.6.2.10 Asynchronous List Address (ASYNCLISTADDR)—Offset 28h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 28h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:3] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RW	<b>Link Pointer Low (lpl)</b> : This field contains bit [31:5] of the address of the next asynchronous queue head to be executed. The memory structure referenced by this physical memory pointer is assumed to be 4-Kbyte aligned. The contents of this register are combined with the Frame Index Register (FRINDEX) to enable the Host Controller to step through the Periodic Frame List in sequence. This field may only reference a Queue Head (QH).
4:0	0h RO	<b>reserved_4_0</b> : Reserved bits. These bits are reserved and their value has no effect on operation.

### 16.6.2.11 Configure Flag (CONFIGFLAG)—Offset 50h

This register is in the auxiliary power well. It is only reset by hardware when the auxiliary power is initially applied or in response to a host controller reset.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 50h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:3] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
reserved_31_1								cf

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>reserved_31_1:</b> Reserved bits. These bits are reserved and should be set to zero.
0	0h RW	<b>Configure Flag (cf):</b> Host software sets this bit as the last action in its process of configuring the Host Controller. This bit controls the default port-routing control logic. Bit values and side-effects are listed below. 0: Port routing control logic default-routes each port to an implementation dependent classic host controller. 1: Port routing control logic default-routes all ports to this host controller

### 16.6.2.12 Port Status/Control[0-1] (PORTSC[0-1])—Offset 54h, Count 2, Stride 4h

This register is in the auxiliary power well. It is only reset by hardware when the auxiliary power is initially applied or in response to a host controller reset.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset[0-1]:** [BAR0] + 54h + [0-1]\*4h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR0 Reference:** [B:0, D:20, F:3] + 10h

**Default:** 00002000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	1	0	0
device_address	suspend_status	wkoc_e	wkdscont_e	wkcnnt_e	port_test_ctrl	port_indicator_ctrl	port_owner	pp
					line_status	suspend_using_l1	port_reset	suspend
						force_port_resume	over_current_change	over_current_active
						port_en_dis_change	port_enable_disable	connect_status_change
						current_connect_status		

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	<b>Device Address (device_address):</b> The 7-bit USB device address for the device attached to and immediately downstream of the associated root port. A value of zero indicates no device is present or support for this feature is not present. NOTE: This field is not supported.

Bit Range	Default & Access	Field Name (ID): Description
24:23	0h RO	<b>Suspend Status (suspend_status):</b> These two bits are used by software to determine whether the most recent L1 suspend request was successful. NOTE: This field is not supported.
22	0h RW	<b>Wake on Over-current Enable (wkoc_e):</b> Writing this bit to a one enables the port to be sensitive to over-current conditions as wake-up events. This field is zero if Port Power is zero.
21	0h RW	<b>Wake on Disconnect Enable (wkdcnt_e):</b> Writing this bit to a one enables the port to be sensitive to device disconnects as wake-up events. This field is zero if Port Power is zero.
20	0h RW	<b>Wake on Connect Enable (wkcnt_e):</b> Writing this bit to a one enables the port to be sensitive to device connects as wake-up events. This field is zero if Port Power is zero.
19:16	0h RW	<b>Port Test Control (port_test_ctrl):</b> When this field is zero, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value. The encoding of the test mode bits are (0110 - 1111 are reserved): 0000: Test mode not enabled 0001: Test J_STATE 0010: Test K_STATE 0011: Test SE0_NAK 0100: Test Packet 0101: Test FORCE_ENABLE
15:14	00h RW	<b>Port Indicator Control (port_indicator_ctrl):</b> Writing to these bits has no effect if the Port Indicator (P_INDICATOR) bit in the HCSPARAMS register is a zero. If P_INDICATOR bit is a one, then the bit encodings are: 00: Port indicators are off 01: Amber 10: Green 11: Undefined This field is zero if Port Power is zero. NOTE: Port Indicator is not supported.
13	1h RW	<b>Port Owner (port_owner):</b> This bit unconditionally goes to a 0 when the Configured bit in the CONFIGFLAG register makes a 0b to 1b transition. This bit unconditionally goes to 1 whenever the Configured bit is zero. System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes a one to this bit when the attached device is not a high-speed device. A one in this bit means that a companion host controller owns and controls the port.
12	0h RW	<b>Port Power (pp):</b> The function of this bit depends on the value of the Port Power Control (PPC) field in the HCSPARAMS register. The behavior is as follows: If PPC=0, PP=1 and RO: Host controller does not have port power control switches. Each port is hard-wired to power. If PPC=0, PP=1 or 0 and R/W: Host controller has port power control switches. This bit represents the current setting of the switch (0 = off, 1 = on). When power is not available on port (i.e. PP equals a 0), the port is non-functional and will not report attaches, detaches, etc. When an over-current condition is detected on a powered port and PPC is a one, the PP bit in each affected port may be transitioned by the host controller from a 1 to 0 (removing power from the port). NOTE: Per Port Power control is supported (PPC=1)
11:10	0h RO	<b>Line Status (line_status):</b> These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is zero and the current connect status bit is set to a one. The encoding of the bits are: Bits[11:10] USB State Interpretation 00: USB State is SE0, Not Low-speed device, perform EHCI reset 10: USB State is J-state, Not Low-speed device, perform EHCI reset 01: USB State is K-state, Low-speed device, release ownership of port 11: USB State is Undefined, Not Low-speed device, perform EHCI reset The value of this field is undefined if Port Power is zero.
9	0h RO	<b>Suspend using I1 (suspend_using_I1):</b> NOTE: suspend using I1 is not supported as part of LPM.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	<p><b>Port Reset (port_reset):</b> 1: Port is in Reset 0: Port is not in Reset</p> <p>When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to ensure the reset sequence, as specified in the USB Specification Revision 2.0, completes.</p> <p>When software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2ms of software transitioning this bit from a one to a zero. For example: if the port detects that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero.</p> <p>The HCHalted bit in the USBSTS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHalted bit is a one. This field is zero if Port Power is zero.</p>
7	0h RW	<p><b>Suspend (suspend):</b> 1: Port in suspend state 0: Port not in suspend state</p> <p>Port Enabled Bit and Suspend bit of this register define the port states as follows: Bit [Port Enabled, Suspend]: Port State 0X: Disable 10: Enable 11: Suspend</p> <p>When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB.</p> <p>A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when: Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero).</p> <p>If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined. This field is zero if Port Power is zero.</p>
6	0h RW	<p><b>Force Port Resume (force_port_resume):</b> 1: Resume detected/driven on port 0: No resume (K-state) detected/driven on port</p> <p>This functionality defined for manipulating this bit depends on the value of the Suspend bit.</p> <p>For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined.</p> <p>Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero. This field is zero if Port Power is zero.</p>
5	0h RW/1C	<p><b>Over Current Change (over_current_change):</b> This bit gets set to a one when there is a change to Over-current Active. Software clears this bit by writing a one to this bit position.</p>
4	0h RO	<p><b>Over Current Active (over_current_active):</b> 1: This port currently has an over-current condition 0: This port does not have an over-current condition</p> <p>This bit will automatically transition from a one to a zero when the over current condition is removed.</p>

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C	<b>Port Enable/Disable Change (port_en_dis_change):</b> 1: Port enabled/disabled status has changed 0: No change For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point Software clears this bit by writing a 1 to it. This field is zero if Port Power is zero.
2	0h RW	<b>Port Enable/Disable (port_enable_disable):</b> 1: Enable 0: Disable Ports can only be enabled by the host controller as a part of the reset and enable. Software cannot enable a port by writing a one to this field. The host controller will only set this bit to a one when the reset sequence determines that the attached device is a high-speed device. Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by host software. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events. When the port is disabled (0) downstream propagation of data is blocked on this port, except for reset. This field is zero if Port Power is zero.
1	0h RW/1C	<b>Connect Status Change (connect_status_change):</b> 1: Change in Current Connect Status 0: No change Indicates a change has occurred in the ports Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be setting an already set bit. Software sets this bit to 0 by writing a 1 to it. This field is zero if Port Power is zero.
0	0h RO	<b>Current Connect Status (current_connect_status):</b> 1: Device is present on port 0: No device is present This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set. This field is zero if Port Power is zero.

### 16.6.2.13 Programmable Microframe Base Value (INSNREG00)—Offset 90h

This register allows changing the microframe length value (default is microframe SOF = 125ms) to reduce the simulation time.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 90h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:3] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	00000h RO	<b>reserved_31_14:</b> Reserved bits. These bits are reserved and should be set to zero.

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 98h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:3] + 10h

**Default:** 0000080h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
reserved_31_12				pkt_buffer_depth				

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	<b>reserved_31_12:</b> Reserved bits. These bits are reserved and should be set to zero.
11:0	80h RW	<b>Programmable Packet Buffer Depth (pkt_buffer_depth):</b> The value specified here is the number of DWORDs (32-bit entries).

### 16.6.2.16 Programmable Controller Settings (INSNREG03)—Offset 9Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 9Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:3] + 10h

**Default:** 00002001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	1	0	0
reserved_31_14				TestSEO	Tx_Tx_turnaround_dly	Periodic_Frame_List	Time_available_offset	Break_Memory

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	<b>reserved_31_14:</b> Reserved bits. These bits are reserved and should be set to zero.
13	1h RW	<b>TestSEO NAK (TestSEO):</b> When set to 1 (default), the core ignores the line state checking when transmitting SOF during the SE0_NAK test mode. When Set to 0, the port state machine disables the port if it does not find the line state to be in SE0 when transmitting SOF during the SE0_NAK testing. While doing impedance measurement during the SE0_NAK testing, the line state could go to non SE0 forcing the core to disable the port. This bit is used to control the port behavior during this.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	<b>Automatic Suspend Feature (automatic_feature):</b> 0: enables the automatic feature. The Suspend signal is deasserted (logic level 1) when run/stop is reset by software, but the hhalted bit is not yet set. 1: disables the automatic feature, which takes all ports out of suspend when software clears the run/stop bit. This is for backward compatibility. For systems where the host is halted without waking up all ports out of suspend, the port can become stuck because the PHYCLK is not running when the halt is programmed. To avoid this, the DWC H20AHB host core automatically pulls ports out of suspend when the host is halted by software. This bit is used to disable this automatic function. This is a functional bit.
4	0h RW	<b>NAK reload fix enabled (NAK):</b> When 1 NAK reload fix disabled. This is a functional bit for backward compatibility with Synopsys USB 2.0 Host-AHB core Release 2.40c.
3	0h RO	<b>reserved_3:</b> Reserved bits. These bits are reserved and should be set to zero.
2	0h RW	<b>Port Enumeration Time (port_enum):</b> Scales down port enumeration time. This is a debug bit.
1:0	0h RW	<b>System Reset (sys_res):</b> When sys_res[1]=1, HCCPARAMS bits 17,15:4 become writable. When sys_res[0]=1, HCCPARAMS register become writable Upon system reset, this field is 0. This is a debug bit.

### 16.6.2.18 UTMI Configuration (INSNREG05)—Offset A4h

This register gives access to implementation specific PHY vendor control and status registers. NOTE: Vendor control and status registers are not implemented. Read from Vendor Status will always return 0. Write to Vendor Control will have no effect.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + A4h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:3] + 10h

**Default:** 00001000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	1	0	0
0	0	0	0	0	0	0	0	0
reserved_31_18			Vbusy	Vport	VControlLoadM	Vcontrol	Vstatus	

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	<b>reserved_31_18:</b> Reserved bits. These bits are reserved and should be set to zero.
17	0h RO/V	<b>Vbusy:</b> Hardware indicator that a write to this register has occurred and the hardware is currently processing the operation defined by the data written. When processing is finished, this bit is cleared.

Bit Range	Default & Access	Field Name (ID): Description
16:13	0h RW	<b>Vport</b> : Port number from/to the PHY Vendor Status and Control value is read/written in Vstatus field. Vport meaningful values depend on the number of ports implemented. Allowed values are 4'h1 and 4'h2, any other value will return Vstatus=8'h0. Once software writes to VPort, from that write onwards, any writes to this register is ignored.
12	1h RW	<b>Vendor Control Load (VControlLoadM)</b> : 0: Load. 1: NOP.
11:8	0h RW	<b>Vendor control register (Vcontrol)</b> : Not implemented - write to Vendor Control will have no effect.
7:0	0h RO	<b>Vendor Status register (Vstatus)</b> : Not implemented - read from Vendor Status will always return 0.

### 16.6.3.1 OHCI Revision (HCREVISION)—Offset 0h

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

HCREVISION: [BAR0] + 0h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:4] + 10h

Default: 00000010h

Bit Range	Default & Access	Description
31: 8	000000h RO	<b>reserved_31_8 (reserved_31_8)</b> : Reserved bits. These bits are reserved and should be set to zero.
7: 0	10h RO	<b>Revision (revision)</b> : This read-only field contains the BCD representation of the version of the HCI specification that is implemented by this HC.

### 16.6.3.2 Host Controller Control (HCCONTROL)—Offset 4h

The HCCONTROL register defines the operating modes for the Host Controller (HC). Most of the fields in this register are modified only by the Host Controller Driver (HCD), except hc\_function\_state and rmtwkup\_connected.

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

HCCONTROL: [BAR0] + 4h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:4] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31: 11	0h RO	<b>reserved_31_11 (reserved_31_11)</b> : Reserved bits. These bits are reserved and should be set to zero.

Bit Range	Default & Access	Description
10	0h RW	<b>Remote Wakeup Enable (rmtwkup_enable)</b> : This bit is used by HCD to enable or disable the remote wakeup feature upon the detection of upstream resume signaling. When this bit is set and the resume_detected bit in HCINTRSTATUS is set, a remote wakeup is signaled to the host system. Setting this bit has no impact on the generation of hardware interrupts.
9	0h RW	<b>Remote Wakeup Connected (rmtwkup_connected)</b> : This bit indicates whether HC supports remote wakeup signaling. If remote wakeup is supported and used by the system it is the responsibility of system firmware to set this bit during POST. HC clears the bit upon a hardware reset but does not alter it upon a software reset.
8	0h RW	<b>Interrupt Routing (intr_routing)</b> : This bit determines the routing of interrupts generated by events registered in HCINTRSTATUS. If clear, all interrupts are routed to the normal host bus interrupt mechanism. If set, interrupts are routed to the System Management Interrupt. HCD clears this bit upon a hardware reset, but it does not alter this bit upon a software reset. HCD uses this bit as a tag to indicate the ownership of HC.
7: 6	0h RW	<b>Host Controller Functional State for USB (hc_function_state)</b> : 00: USBRESET 01: USBRESUME 10: USBOPERATIONAL 11: USBSUSPEND A transition to USBOPERATIONAL from another state causes SOF generation to begin 1ms later. HCD may determine whether HC has begun sending SOFs by reading the start_of_frame field of HCINTRSTATUS. This field may be changed by HC only when in the USBSUSPEND state. HC may move from the USBSUSPEND state to the USBRESUME state after detecting the resume signaling from a downstream port. HC enters USBSUSPEND after software reset, whereas it enters USBRESET after a hardware reset. The latter also resets the Root Hub and asserts subsequent reset signaling to downstream ports.
5	0h RW	<b>Bulk List Enable (bulklist_enable)</b> : This bit is set to enable the processing of the Bulk list in the next Frame. If cleared by HCD, processing of the Bulk list does not occur after the next SOF. HC checks this bit whenever it determines to process the list. When disabled, HCD may modify the list. If HCBULKCURED is pointing to an ED (Endpoint Descriptor) to be removed, HCD must advance the pointer by updating HCBULKCURED before re-enabling processing of the list.
4	0h RW	<b>Control List Enable (ctrllist_enable)</b> : This bit is set to enable the processing of the Control list in the next Frame. If cleared by HCD, processing of the Control list does not occur after the next SOF. HC must check this bit whenever it determines to process the list. When disabled, HCD may modify the list. If HCCTRLCURED is pointing to an ED to be removed, HCD must advance the pointer by updating HCCTRLCURED before re-enabling processing of the list.
3	0h RW	<b>Isochronous Enable (isoc_enable)</b> : This bit is used by HCD to enable/disable processing of isochronous ED's. While processing the periodic list in a Frame, HC checks the status of this bit when it finds an Isochronous ED (F=1). If set (enabled), HC continues processing the ED's. If cleared (disabled), HC halts processing of the periodic list (which now contains only isochronous ED's) and begins processing the Bulk/Control lists. Setting this bit is guaranteed to take effect in the next Frame (not the current Frame).
2	0h RW	<b>Periodic List Enable (periodiclist_enable)</b> : This bit is set to enable the processing of the periodic list in the next Frame. If cleared by HCD, processing of the periodic list does not occur after the next SOF. HC must check this bit before it starts processing the list.
1: 0	0h RW	<b>Control Bulk Service Ratio (ctrlbulk_serviceratio)</b> : This specifies the service ratio between Control and Bulk ED's. Before processing any of the nonperiodic lists, HC must compare the ratio specified with its internal count on how many nonempty Control ED's have been processed, in determining whether to continue serving another Control ED or switching to Bulk ED's. The internal count will be retained when crossing the frame boundary. In case of reset, HCD is responsible for restoring this value.

### 16.6.3.3 Host Controller Command Status (HCCMDSTATUS)—Offset 8h

The HCCMDSTATUS register is used by the Host Controller to receive commands issued by the Host Controller Driver, as well as reflecting the current status of the Host Controller. To the Host Controller Driver, it appears to be a 'write to set' register. The Host Controller must ensure that bits written as 1 become set in the register while bits

written as 0 remain unchanged in the register. The Host Controller Driver may issue multiple distinct commands to the Host Controller without concern for corrupting previously issued commands. The Host Controller Driver has normal read access to all bits. The sch\_overnun\_cnt field indicates the number of frames with which the Host Controller has detected the scheduling overrun error. This occurs when the Periodic list does not complete before EOF. When a scheduling overrun error is detected, the Host Controller increments the counter and sets the sch\_overnun field in the HCINTRSTATUS register.

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**HCCMDSTATUS:** [BAR0] + 8h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:4] + 10h

reserved_31_18			sch_overnun_cnt	reserved_15_4			ownerchange_req	bulklist_filled	ctrllist_filled	hccreset

Bit Range	Default & Access	Description
31: 18	0h RO	<b>reserved_31_18 (reserved_31_18):</b> Reserved bits. These bits are reserved and should be set to zero.
17: 16	0h RO	<b>Scheduling Overrun Count (sch_overnun_cnt):</b> These bits are incremented on each scheduling overrun error. It is initialized to 00b and wraps around at 11b. This will be incremented when a scheduling overrun is detected even if sch_overnun in HCINTRSTATUS has already been set. This is used by HCD to monitor any persistent scheduling problems
15: 4	0h RO	<b>reserved_15_4 (reserved_15_4):</b> Reserved bits. These bits are reserved and should be set to zero.
3	0h RW/1C	<b>Ownership Change Request (ownerchange_req):</b> This bit is set by an OS HCD to request a change of control of the HC. When set HC will set the ownerchange_req field in HCINTRSTATUS. After the changeover, this bit is cleared and remains so until the next request from OS HCD.
2	0h RW	<b>BulkListFilled (bulklist_filled):</b> This bit is used to indicate whether there are any TDs on the Bulk list. It is set by HCD whenever it adds a TD to an ED in the Bulk list. When HC begins to process the head of the Bulk list, it checks bulklist_filled. As long as bulklist_filled is 0, HC will not start processing the Bulk list. If bulklist_filled is 1, HC will start processing the Bulk list and will set bulklist_filled to 0. If HC finds a TD on the list, then HC will set bulklist_filled to 1 causing the Bulk list processing to continue. If no TD is found on the Bulk list, and if HCD does not set bulklist_filled, then bulklist_filled will still be 0 when HC completes processing the Bulk list and Bulk list processing will stop.
1	0h RW	<b>Control List Filled (ctrllist_filled):</b> This bit is used to indicate whether there are any TDs on the Control list. It is set by HCD whenever it adds a TD to an ED in the Control list. When HC begins to process the head of the Control list, it checks ctrllist_filled. As long as ctrllist_filled is 0, HC will not start processing the Control list. If CF is 1, HC will start processing the Control list and will set ctrllist_filled to 0. If HC finds a TD on the list, then HC will set ctrllist_filled to 1 causing the Control list processing to continue. If no TD is found on the Control list, and if the HCD does not set ctrllist_filled, then ctrllist_filled will still be 0 when HC completes processing the Control list and Control list processing will stop.

Bit Range	Default & Access	Description
0	0h RW	<b>Host Controller Reset (hreset):</b> This bit is set by HCD to initiate a software reset of HC. Regardless of the functional state of HC, it moves to the USBSUSPEND state in which most of the operational registers are reset except those stated otherwise; e.g., the intr_routing field of HCCONTROL, and no Host bus accesses are allowed. This bit is cleared by HC upon the completion of the reset operation. The reset operation must be completed within 10ms. This bit, when set, should not cause a reset to the Root Hub and no subsequent reset signaling should be asserted to its downstream ports.

### 16.6.3.4 Host Controller Interrupt Status (HCINTRSTATUS)—Offset Ch

This register provides status on various events that cause hardware interrupts. When an event occurs, Host Controller sets the corresponding bit in this register. When a bit becomes set, a hardware interrupt is generated if the interrupt is enabled in the HCINTRENABLE register and the mstr\_intr\_enable bit is set. The Host Controller Driver may clear specific bits in this register by writing 1 to bit positions to be cleared. The Host Controller Driver may not set any of these bits. The Host Controller will never clear the bit.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**HCINTRSTATUS:** [BAR0] + Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:4] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
reserved_31 owner_change			reserved_29_07				rhub_stschange fmnum_overflow unrecov_err resume_detected start_of_frame wrbck_donehead sch_overrun	

Bit Range	Default & Access	Description
31	0h RO	<b>reserved_31 (reserved_31):</b> Reserved bits. These bits are reserved and should be set to zero.
30	0h RW/1C	<b>Ownership Change (owner_change):</b> This bit is set by HC when HCD sets the ownerchange_req field in HCCMDSTATUS. This event, when unmasked, will always generate a System Management Interrupt (SMI) immediately. This bit is tied to 0 when the SMI pin is not implemented. NOTE: OHCI SMIs are ignored by the system.
29: 7	0h RO	<b>reserved_29_07 (reserved_29_07):</b> Reserved bits. These bits are reserved and should be set to zero.
6	0h RW/1C	<b>Root Hub Status Change (rhub_stschange):</b> This bit is set when the content of HCRHSTATUS or the content of any of HCRHPORTSTS[NumberOfDownstreamPort] has changed.
5	0h RW/1C	<b>Frame Number Overflow (fmnum_overflow):</b> This bit is set when the MSb of HCFMNUMBER (bit 15) changes value, from 0 to 1 or from 1 to 0, and after HccaFrameNumber has been updated.
4	0h RW/1C	<b>Unrecoverable Error (unrecov_err):</b> This bit is set when HC detects a system error not related to USB. HC should not proceed with any processing or signaling before the system error has been corrected. HCD clears this bit after HC has been reset.

Bit Range	Default & Access	Description
6	0h RW/1C	<b>Root Hub Status Change Disable (rhub_stschange_dbl):</b> 0: Ignore 1: Disable interrupt generation due to Root Hub Status Change
5	0h RW/1C	<b>Frame Number Overflow Disable (fmnum_overflow_dbl):</b> 0: Ignore 1: Disable interrupt generation due to Frame Number Overflow
4	0h RW/1C	<b>Unrecoverable Error Disable (unrecov_err_dbl):</b> 0: Ignore 1: Disable interrupt generation due to Unrecoverable Error
3	0h RW/1C	<b>Resume Detected Disable (resume_detected_dbl):</b> 0: Ignore 1: Disable interrupt generation due to Resume Detect
2	0h RW/1C	<b>Start of Frame Disable (start_of_frame_dbl):</b> 0: Ignore 1: Disable interrupt generation due to Start of Frame
1	0h RW/1C	<b>HCDONEHEAD Writeback Disable (wrback_donehead_dbl):</b> 0: Ignore 1: Disable interrupt generation due to HCDONEHEAD Writeback
0	0h RW/1C	<b>Scheduling Overrun Disable (sch_overrun_dbl):</b> 0: Ignore 1: Disable interrupt generation due to Scheduling Overrun

### 16.6.3.7 Host Controller Communication Area (HCHCCA)—Offset 18h

The HCHCCA register contains the physical address of the Host Controller Communication Area. The Host Controller Driver determines the alignment restrictions by writing all 1s to HCHCCA and reading the content of HCHCCA. The alignment is evaluated by examining the number of zeroes in the lower order bits. The minimum alignment is 256 bytes; therefore, bits 0 through 7 must always return '0' when read. Detailed description can be found in Chapter 4. This area is used to hold the control structures and the Interrupt table that are accessed by both the Host Controller and the Host Controller Driver.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**HCHCCA:** [BAR0] + 18h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:4] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31: 8	0h RW	<b>Host Controller Communication Area Base (hccabase):</b> This is the base address of the Host Controller Communication Area
7: 0	0h RO	<b>reserved_7_0 (reserved_7_0):</b> Reserved bits. These bits are reserved and should be set to zero.

### 16.6.3.8 Host Controller Current Isochronous or Interrupt Endpoint (HCPREDCURED)—Offset 1Ch

The HcPeriodCurrentED register contains the physical address of the current Isochronous or Interrupt Endpoint Descriptor.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**HCPREDCURED:** [BAR0] + 1Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:4] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
period_cur_ed								reserved_3_0	

Bit Range	Default & Access	Description
31: 4	0h RO	<b>Period Current ED (period_cur_ed):</b> This is used by HC to point to the head of one of the Periodic lists which will be processed in the current Frame. The content of this register is updated by HC after a periodic ED has been processed. HCD may read the content in determining which ED is currently being processed at the time of reading.
3: 0	0h RO	<b>reserved_3_0 (reserved_3_0):</b> Reserved bits. These bits are reserved and should be set to zero.

### 16.6.3.9 Host Controller Current First Control Endpoint (HCCTRLHEADED)—Offset 20h

The HCCTRLHEADED register contains the physical address of the first Endpoint Descriptor of the Control list.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**HCCTRLHEADED:** [BAR0] + 20h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:4] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
ctrl_head_ed								reserved_3_0	

Bit Range	Default & Access	Description
31: 4	0h RW	<b>Control Head ED (ctrl_head_ed)</b> : HC traverses the Control list starting with the HCCTRLHEADED pointer. The content is loaded from HCCA during the initialization of HC.
3: 0	0h RO	<b>reserved_3_0 (reserved_3_0)</b> : Reserved bits. These bits are reserved and should be set to zero.

### 16.6.3.10 Host Controller Current Control Endpoint (HCCTRLCURED)—Offset 24h

The HCCTRLCURED register contains the physical address of the current Endpoint Descriptor of the Control list.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**HCCTRLCURED:** [BAR0] + 24h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:4] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
ctrl_cur_ed								reserved_3_0

Bit Range	Default & Access	Description
31: 4	0h RW	<b>Control Current ED (ctrl_cur_ed)</b> : This pointer is advanced to the next ED after serving the present one. HC will continue processing the list from where it left off in the last Frame. When it reaches the end of the Control list, HC checks the ctrllist_filled of in HCCMDSTATUS. If set, it copies the content of HCCTRLHEADED to HCCTRLCURED and clears the bit. If not set, it does nothing. HCD is allowed to modify this register only when the ctrllist_enable of HCCONTROL is cleared. When set, HCD only reads the instantaneous value of this register. Initially, this is set to zero to indicate the end of the Control list.
3: 0	0h RO	<b>reserved_3_0 (reserved_3_0)</b> : Reserved bits. These bits are reserved and should be set to zero.

### 16.6.3.11 Host Controller First Bulk Endpoint (HCBULKHEADED)—Offset 28h

The HCBULKHEADED register contains the physical address of the first Endpoint Descriptor of the Bulk list.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**HCBULKHEADED:** [BAR0] + 28h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:4] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31: 4	0h RW	<b>Bulk Head ED (bulk_head_ed)</b> : HC traverses the Bulk list starting with the HCBULKHEADED pointer. The content is loaded from HCCA during the initialization of HC.
3: 0	0h RO	<b>reserved_3_0 (reserved_3_0)</b> : Reserved bits. These bits are reserved and should be set to zero.

### 16.6.3.12 Host Controller Current Bulk Endpoint (HCBULKCURED)—Offset 2Ch

The HCBULKCURED register contains the physical address of the current endpoint of the Bulk list. As the Bulk list will be served in a round-robin fashion, the endpoints will be ordered according to their insertion to the list.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**HCBULKCURED:** [BAR0] + 2Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:4] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31: 4	0h RW	<b>Bulk Current ED (bulk_cur_ed)</b> : This is advanced to the next ED after the HC has served the present one. HC continues processing the list from where it left off in the last Frame. When it reaches the end of the Bulk list, HC checks the ctrllist_filled of HCCONTROL. If set, it copies the content of HCBULKHEADED to HCBULKCURED and clears the bit. If it is not set, it does nothing. HCD is only allowed to modify this register when the bulklist_enable of HCCONTROL is cleared. When set, the HCD only reads the instantaneous value of this register. This is initially set to zero to indicate the end of the Bulk list.
3: 0	0h RO	<b>reserved_3_0 (reserved_3_0)</b> : Reserved bits. These bits are reserved and should be set to zero.

### 16.6.3.13 Host Controller Last Completed Descriptor (HCDONEHEAD)—Offset 30h

The HCDONEHEAD register contains the physical address of the last completed Transfer Descriptor that was added to the Done queue. In normal operation, the Host Controller Driver should not need to read this register as its content is periodically written to the HCCA.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**HCDONEHEAD:** [BAR0] + 30h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:4] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
donehead								reserved_3_0

Bit Range	Default & Access	Description
31: 4	0h RO	<b>Done Head (donehead):</b> When a TD is completed, HC writes the content of HCDONEHEAD to the NextTD field of the TD. HC then overwrites the content of HCDONEHEAD with the address of this TD. This is set to zero whenever HC writes the content of this register to HCCA. It also sets the wrback_donehead of HCINTRSTATUS.
3: 0	0h RO	<b>reserved_3_0 (reserved_3_0):</b> Reserved bits. These bits are reserved and should be set to zero.

### 16.6.3.14 Host Controller Frame Interval (HCFMINTERVAL)—Offset 34h

The HCFMINTERVAL register contains a 14-bit value which indicates the bit time interval in a Frame, (i.e., between two consecutive SOFs), and a 15-bit value indicating the Full Speed maximum packet size that the Host Controller may transmit or receive without causing scheduling overrun. The Host Controller Driver may carry out minor adjustment on the fm\_interval by writing a new value over the present one at each SOF. This provides the programmability necessary for the Host Controller to synchronize with an external clocking resource and to adjust any unknown local clock offset.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**HCFMINTERVAL:** [BAR0] + 34h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:4] + 10h

**Default:** 00002EDFh

Bit Range	Default & Access	Description
31	0h RW	<b>Frame Remaining Toggle (fm_remaining_tgl):</b> This bit is loaded from the fm_interval_tgl field of fm_interval whenever fm_remaining reaches 0. This bit is used by HCD for the synchronization between fm_interval and fm_remaining. NOTE: Though these bits are writable, the Host Controller Driver must not write into these bits. Doing so yields undefined results.
30: 14	0h RO	<b>reserved_30_14 (reserved_30_14):</b> Reserved bits. These bits are reserved and should be set to zero.
13: 0	0h RW	<b>Frame Remaining (fm_remaining):</b> This counter is decremented at each bit time. When it reaches zero, it is reset by loading the fm_interval value specified in fm_interval at the next bit time boundary. When entering the USBOPERATIONAL state, HC re-loads the content with the fm_interval of HCFMINTERVAL and uses the updated value from the next SOF. NOTE: Though these bits are writable, the Host Controller Driver must not write into these bits. Doing so yields undefined results.

### 16.6.3.16 Host Controller Frame Number (HCFMNUMBER)—Offset 3Ch

The HCFMNUMBER register is a 16-bit counter. It provides a timing reference among events happening in the Host Controller and the Host Controller Driver. The Host Controller Driver may use the 16-bit value specified in this register and generate a 32-bit frame number without requiring frequent access to the register. NOTE: In OpenHCI 1.0a, the Frame Number bits in the HCFMNUMBER register are read-only to the Host Controller Driver. However, it is allowed to write to these bits for debugging purposes. Though these bits are writable, the Host Controller Driver must not write into these bits. Doing so yields undefined results.

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

HCFMNUMBER: [BAR0] + 3Ch

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:4] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0											
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
reserved_31_16								fmnumber											

Bit Range	Default & Access	Description
31: 16	0h RO	<b>reserved_31_16 (reserved_31_16):</b> Reserved bits. These bits are reserved and should be set to zero.
15: 0	0h RW	<b>Frame Number (fmnumber):</b> This is incremented when fm_remaining is re-loaded. It will be rolled over to 0 after FFFF. When entering the USBOPERATIONAL state, this will be incremented automatically. The content will be written to HCCA after HC has incremented the FrameNumber at each frame boundary and sent a SOF but before HC reads the first ED in that Frame. After writing to HCCA, HC will set the start_of_frame in HCINTRSTATUS. NOTE: Though these bits are writable, the Host Controller Driver must not write into these bits. Doing so yields undefined results.

### 16.6.3.17 Host Controller Periodic List Start (HCPERIODICSTART)—Offset 40h

The HcPeriodicStart register has a 14-bit programmable value which determines when is the earliest time HC should start processing the periodic list.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**HCPERIODICSTART:** [BAR0] + 40h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:4] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31: 14	0h RO	<b>reserved_31_14 (reserved_31_14):</b> Reserved bits. These bits are reserved and should be set to zero.
13: 0	0h RW	<b>Periodic Start (periodic_start):</b> After hardware reset, this field is cleared. This is then set by HCD during the HC initialization. The value is calculated roughly as 10% off from fm_interval. A typical value will be h3E67. When fm_remaining reaches the value specified, processing of the periodic lists will have priority over Control/Bulk processing. HC will therefore start processing the Interrupt list after completing the current Control or Bulk transaction that is in progress.

### 16.6.3.18 Host Controller LS Threshold (HCLSTHRESHOLD)—Offset 44h

The HclSThreshold register contains an 11-bit value used by the Host Controller to determine whether to commit to the transfer of a maximum of 8-byte LS packet before EOF. Neither the Host Controller nor the Host Controller Driver is allowed to change this value.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**HCLSTHRESHOLD:** [BAR0] + 44h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:4] + 10h

**Default:** 00000628h

Bit Range	Default & Access	Description
31: 12	0h RO	<b>reserved_31_12 (reserved_31_12)</b> : Reserved bits. These bits are reserved and should be set to zero.
11: 0	0628h RW	<b>LS Threshold (ls_threshold)</b> : This field contains a value which is compared to the fm_remaining field prior to initiating a Low Speed transaction. The transaction is started only if fm_remaining this field. The value is calculated by HCD with the consideration of transmission and setup overhead. NOTE: Neither the Host Controller nor the Host Controller Driver are allowed to change this value.

### 16.6.3.19 Host Controller Root Hub Descriptor A (HCRHDESPA)—Offset 48h

The HCRHDESPA register is the first register of two describing the characteristics of the Root Hub.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**HCRHDESPA:** [BAR0] + 48h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:4] + 10h

**Default:** 02000902h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0			
0	0	1	0	0	0	0	0	0			
0	0	0	0	0	0	1	0	0			
0	0	0	0	0	0	0	1	0			
pwrn_to_pwrgood_time		reserved_23_13				no_overcur_prot	overcur_prot_mode	device_type	no_pwr_switching	pwr_switch_mode	ndp

Bit Range	Default & Access	Description
31: 24	02h RW	<b>Power On To Power Good Time (pwrn_to_pwrgood_time)</b> : This byte specifies the duration HCD has to wait before accessing a powered-on port of the Root Hub. It is implementation-specific. The unit of time is 2ms. The duration is calculated as pwrn_to_pwrgood_time*2ms.
23: 13	0h RO	<b>reserved_23_13 (reserved_23_13)</b> : Reserved bits. These bits are reserved and should be set to zero.
12	0h RW	<b>No Over Current Protection (no_overcur_prot)</b> : This bit describes how the overcurrent status for the Root Hub ports is reported. When this bit is cleared, the overcur_prot_mode field specifies global or per-port reporting. 0: Over-current status is reported collectively for all downstream ports 1: No overcurrent protection supported
11	1h RW	<b>Over Current Protection Mode (overcur_prot_mode)</b> : This bit describes how the overcurrent status for the Root Hub ports is reported. At reset, this field should reflect the same mode as pwr_switch_mode. This field is valid only if the no_overcur_prot field is cleared. 0: over-current status is reported collectively for all downstream ports 1: over-current status is reported on a per-port basis
10	0h RO	<b>Device Type (device_type)</b> : This bit specifies that the Root Hub is not a compound device. The Root Hub is not permitted to be a compound device. This field should always read/write 0.

Bit Range	Default & Access	Description
9	0h RW	<b>No Power Switching (no_pwr_switching)</b> : These bits are used to specify whether power switching is supported or port are always powered. It is implementation-specific. When this bit is cleared, the pwr_switch_mode specifies global or per-port switching. 0: Ports are power switched 1: Ports are always powered on when the HC is powered on
8	1h RW	<b>Power Switching Mode (pwr_switch_mode)</b> : This bit is used to specify how the power switching of the Root Hub ports is controlled. It is implementation-specific. This field is only valid if the no_pwr_switching field is cleared. 0: all ports are powered at the same time. 1: each port is powered individually. This mode allows port power to be controlled by either the global switch or per-port switching. If the port_pwr_ctrlmask bit is set, the port responds only to port power commands (Set/ClearPortPower). If the port mask is cleared, then the port is controlled only by the global power switch (Set/ClearGlobalPower).
7: 0	02h RO	<b>Number Downstream Ports (ndp)</b> : These bits specify the number of downstream ports (ndp) supported by the Root Hub. It is implementation-specific. The minimum number of ports is 1.

### 16.6.3.20 Host Controller Root Hub Descriptor B (HCRHDESPB)—Offset 4Ch

The HCRHDESPB register is the second register of two describing the characteristics of the Root Hub. These fields are written during initialization to correspond with the system implementation.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**HCRHDESPB:** [BAR0] + 4Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:4] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31: 19	0h RO	<b>reserved_31_18 (reserved_31_18)</b> : Reserved bits. These bits are reserved and should be set to zero.
18: 17	0h RW	<b>Port Power Control Mask (port_pwr_ctrlmask)</b> : Each bit indicates if a port is affected by a global power control command when pwr_switch_mode is set. When set, the port's power state is only affected by per-port power control (Set/ClearPortPower). When cleared, the port is controlled by the global power switch (Set/ClearGlobalPower). If the device is configured to global switching mode (pwr_switch_mode=0), this field is not valid. bit 0: Reserved bit 1: Ganged-power mask on Port #1 bit 2: Ganged-power mask on Port #2 NOTE: Per Port Power Control is supported
16: 3	0h RO	<b>reserved_16_3 (reserved_16_3)</b> : Reserved bits. These bits are reserved and should be set to zero.

Bit Range	Default & Access	Description
15	0h RW/1S	<b>Device Remote Wakeup Enable / SetRemoteWakeupEnable (dev_rmtwkup_enb):</b> (read) Device Remote Wakeup Enable. This bit enables a csc bit as a resume event, causing a USBRESUME state transition and setting the resume_detected interrupt. 0: csc is not a remote wakeup event. 1: csc is a remote wakeup event. (write) SetRemoteWakeupEnable. Writing a '1' sets dev_rmtwkup_enb. Writing a '0' has no effect.
14: 2	0h RO	<b>reserved_14_2 (reserved_14_2):</b> Reserved bits. These bits are reserved and should be set to zero.
1	0h RO	<b>Over Current Indicator (overcur_ind):</b> This bit reports overcurrent conditions when the global reporting is implemented. When set, an overcurrent condition exists. When cleared, all power operations are normal. If per-port overcurrent protection is implemented this bit is always 0
0	0h RW/1S	<b>Local Power Status / ClearGlobalPower (local_pwrsts):</b> (read)Local Power Status. The Root Hub does not support the local power status feature; thus, this bit is always read as 0. (write) ClearGlobalPower. In global power mode (pwr_switch_mode=0), this bit is written to 1 to turn off power to all ports (clear pps). In per-port power mode, it clears pps only on ports whose port_pwr_ctrlmask bit is not set. Writing a 0 has no effect.

### 16.6.3.22 Host Controller Root Hub Port Status (HCRHPORTSTS)—Offset 54h

The HCRHPORTSTS[1:ndp] register is used to control and report port events on a per-port basis. ndp represents the number of HCRHPORTSTS registers that are implemented in hardware. The lower word is used to reflect the port status, whereas the upper word reflects the status change bits. Some status bits are implemented with special write behavior (see below). If a transaction (token through handshake) is in progress when a write to change port status occurs, the resulting port status change must be postponed until the transaction completes. Reserved bits should always be written '0'.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**HCRHPORTSTS:** [BAR0] + 54h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:4] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0			
reserved_31_21				prsc	ocic	pssc	pesc	csc			
reserved_15_10						lsda	pps	reserved_7_5			
							prs	poci	pss	pes	ccs

Bit Range	Default & Access	Description
31: 21	0h RO	<b>reserved_31_21 (reserved_31_21):</b> Reserved bits. These bits are reserved and should be set to zero.

Bit Range	Default & Access	Description
20	0b RW/1C	<b>Port Reset Status Change (prsc):</b> This bit is set at the end of the 10-ms port reset signal. The HCD writes a 1 to clear this bit. Writing a 0 has no effect. 0: port reset is not complete 1: port reset is complete
19	0b RW/1C	<b>Port Over Current Indicator Change (ocic):</b> This bit is valid only if overcurrent conditions are reported on a per-port basis. This bit is set when Root Hub changes the poci bit. The HCD writes a 1 to clear this bit. Writing a 0 has no effect. 0: no change in poci 1: poci has changed
18	0b RW/1C	<b>Port Suspend Status Change (pssc):</b> This bit is set when the full resume sequence has been completed. This sequence includes the 20-s resume pulse, LS EOP, and 3-ms resynchronization delay. The HCD writes a 1 to clear this bit. Writing a 0 has no effect. This bit is also cleared when prsc is set. 0: resume is not completed 1: resume completed
17	0b RW/1C	<b>Port Enable Status Change (pesc):</b> This bit is set when hardware events cause the pes bit to be cleared. Changes from HCD writes do not set this bit. The HCD writes a 1 to clear this bit. Writing a 0 has no effect. 0: no change in pes 1: change in pes
16	0b RW/1C	<b>Connect Status Change (csc):</b> This bit is set whenever a connect or disconnect event occurs. The HCD writes a 1 to clear this bit. Writing a 0 has no effect. If ccs is cleared when a SetPortReset, SetPortEnable, or SetPortSuspend write occurs, this bit is set to force the driver to re-evaluate the connection status since these writes should not occur if the port is disconnected. 0: no change in ccs 1 = change in ccs Note: If the device_removable[ndp] bit is set, this bit is set only after a Root Hub reset to inform the system that the device is attached.
15: 10	0h RO	<b>reserved_15_10 (reserved_15_10):</b> Reserved bits. These bits are reserved and should be set to zero.
9	0b RW/1C	<b>Speed Device Attached / Clear Port Power (Isda):</b> (read) Low or Full Speed Device Attached. This bit indicates the speed of the device attached to this port. When set, a Low Speed device is attached to this port. When clear, a Full Speed device is attached to this port. This field is valid only when the ccs is set. 0: full speed device attached 1: low speed device attached (write) ClearPortPower. The HCD clears the pps bit by writing a 1 to this bit. Writing a 0 has no effect.
8	0b RW/1C	<b>Port Power Status / Set Port Power (pps):</b> (read) Port Power Status. This bit reflects the port power status, regardless of the type of power switching implemented. This bit is cleared if an overcurrent condition is detected. HCD sets this bit by writing SetPortPower or SetGlobalPower. HCD clears this bit by writing ClearPortPower or ClearGlobalPower. Which power control switches are enabled is determined by pwr_switch_mode and PortPortControlMask[ndp]. In global switching mode, only Set/ClearGlobalPower controls this bit. In per-port power switching (pwr_switch_mode=1), if the port_pwr_ctrlmask[ndp] bit for the port is set, only Set/ClearPortPower commands are enabled. If the mask is not set, only Set/ClearGlobalPower commands are enabled. When port power is disabled, ccs, pes, pss, and prs should be reset. 0: port power is off 1: port power is on (write) SetPortPower. The HCD writes a 1 to set the pps bit. Writing a 0 has no effect.
7: 5	0h RO	<b>reserved_7_5 (reserved_7_5):</b> Reserved bits. These bits are reserved and should be set to zero.

Bit Range	Default & Access	Description
4	0b RW/1C	<p><b>Port Reset Status / Set Port Reset (prs):</b> (read) Port Reset Status. When this bit is set by a write to SetPortReset, port reset signaling is asserted. When reset is completed, this bit is cleared when prsc is set. This bit cannot be set if ccs is cleared.</p> <p>0: port reset signal is not active 1: port reset signal is active (write) SetPortReset.</p> <p>The HCD sets the port reset signaling by writing a 1 to this bit. Writing a 0 has no effect. If ccs is cleared, this write does not set prs, but instead sets csc. This informs the driver that it attempted to reset a disconnected port.</p>
3	0b RW/1C	<p><b>Port Over Current Indicator / Clear Suspend Status (poci):</b> (read) Port Over Current Indicator. This bit is only valid when the Root Hub is configured in such a way that overcurrent conditions are reported on a per-port basis. If per-port overcurrent reporting is not supported, this bit is set to 0. If cleared, all power operations are normal for this port. If set an overcurrent condition exists on this port. This bit always reflects the overcurrent input signal</p> <p>0: no overcurrent condition. 1: overcurrent condition detected. (write) ClearSuspendStatus.</p> <p>The HCD writes a 1 to initiate a resume. Writing a 0 has no effect. A resume is initiated only if pss is set.</p>
2	0b RW/1C	<p><b>Port Suspend Status / Set Port Suspend (pss):</b> Port Suspend Status. This bit indicates the port is suspended or in the resume sequence. It is set by a SetSuspendState write and cleared when pssc is set at the end of the resume interval. This bit cannot be set if ccs is cleared. This bit is also cleared when prsc is set at the end of the port reset or when the HC is placed in the USBRESUME state. If an upstream resume is in progress, it should propagate to the HC.</p> <p>0: port is not suspended 1: port is suspended (write) SetPortSuspend.</p> <p>The HCD sets the pss bit by writing a 1 to this bit. Writing a 0 has no effect. If ccs is cleared, this write does not set pss; instead it sets csc. This informs the driver that it attempted to suspend a disconnected port.</p>
1	0b RW/1C	<p><b>Port Enable Status / Set Port Enable (pes):</b> (read) Port Enable Status. This bit indicates whether the port is enabled or disabled. The Root Hub may clear this bit when an overcurrent condition, disconnect event, switched-off power, or operational bus error such as babble is detected. This change also causes pesc to be set. HCD sets this bit by writing SetPortEnable and clears it by writing ClearPortEnable. This bit cannot be set when ccs is cleared. This bit is also set, if not already, at the completion of a port reset when prsc is set or port suspend when pssc is set.</p> <p>0: port is disabled 1: port is enabled (write) SetPortEnable.</p> <p>The HCD sets pes by writing a 1. Writing a 0 has no effect. If ccs is cleared, this write does not set pes, but instead sets csc. This informs the driver that it attempted to enable a disconnected port.</p>
0	0b RW/1C	<p><b>Current Connect Status / Clear Port Enable (ccs):</b> (read) Current Connect Status. This bit reflects the current state of the downstream port.</p> <p>0: no device connected 1: device connected (write) ClearPortEnable</p> <p>The HCD writes a 1 to this bit to clear the pes bit. Writing a 0 has no effect. The ccs is not affected by any write.</p> <p>Note: This bit is always read 1 when the attached device is non-removable (device_removable[ndp]).</p>

§ §

## 17.0 SDIO/SD/eMMC

The Intel® Quark™ SoC X1000 provides an SDIO/SD/eMMC controller that supports a single port configurable as:

- One SDIO 3.0 interface
- One SD 3.0 interface
- One eMMC 4.41 interface

### 17.1 Signal Descriptions

See [Chapter 2.0, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Type:** The buffer type found in [Chapter 4.0, “Electrical Characteristics”](#)
- **Description:** A brief explanation of the signal’s function

**Table 109. SDIO/SD/eMMC Interface Signals**

Signal Name	Direction/ Type	Description
SD_CLK	O 3.3V	<b>SD Card Clock</b> Clock frequency up to 50 MHz.
SD_DATA[7:0]	I/O 3.3V	<b>SD Card Data</b> Bidirectional port used to transfer data to and from SD/eMMC card. By default, after power up or reset, only D[0] is used for data transfer. A wider data bus can be configured for data transfer, using D[0]-D[7].
SD_CD_B	I 3.3V	<b>SD Card Detect</b> Active low when a card is present. Floating (pulled high with internal PU) when a card is not present.
SD_CMD	I/O MG	<b>SD Card Command</b> This signal is used for card initialization and transfer of commands. It has two modes—open-drain for initialization, and push-pull for fast command transfer.
SD_WP	I MG	<b>SD Card Write Protect</b> Active high to protect from write.
SD_LED	O MG	<b>SD Card Access LED Control</b> Controls the LED to indicate that the card is being accessed
SD_PWR	O MG	<b>SD Card Power Supply Control</b>

## 17.2 Features

### 17.2.1 SDIO/SD/eMMC Features

Table 110 summarizes the SDIO/SD/eMMC supported/non-supported features.

Table 110. SDIO/SD/eMMC Features

Features	Supported
Meets SD Memory Card Specification version 3.0	Yes
Meets SD Host Controller Standard Specification Version 3.0	Yes
Meets SDIO card specification version 3.0	Yes
Meets eMMC Specification version 4.41	Yes
Supports both DMA and Non-DMA mode of operation	Yes
Supports SDMA	Yes
Supports ADMA1 and ADMA2	Yes
eMMC supports 1 bit, 4 bit and 8 bit bus modes	Yes
SD/SDIO supports 1 bit and 4 bit bus modes	Yes
SDXC Capacity up to 2TB	Yes
High Speed (SD Clock up to 50 MHz - 25 MByte/s for SDIO/SD and 50 MByte/s for eMMC)	Yes
Integrated ADMA Controller	Yes
SD SPI mode	Yes
Multi SD/SDIO card Slots	No
Boot OS from SD/eMMC device (see Note)	Yes
SDIO Dual Voltage support 1.8V/3.3V	No
SDIO/SD UHS-I Support	No
Wakeup On Card Insertion	No

Note:

1. Must pair together with SPI chip.
2. Refer to the *Intel® X1000 – Board Support Package (BSP) UEFI EMMC Patch* on eMMC enabling for software portion.

### 17.2.2 SD 3.0/ SDIO 3.0 / eMMC 4.41 Interfaces

This section provides a very high level overview of the SD, SDIO, eMMC 4.41 specification. Refer to the SD and eMMC specification for complete details.

#### 17.2.2.1 SD 3.0 Bus Topology

The SD Memory Card bus has a single master, single slave (card), synchronous topology (refer to [Figure 33](#)). During the initialization process, commands are sent to the card allowing the application to detect the card and assign logical addresses to the physical slot. All data communication in the Card Identification Mode uses the command line (CMD) only.

The SD bus allows dynamic configuration of the number of data lines. After power up, by default, the SD Memory Card uses only D[0] for data transfer. After initialization the host can change the bus width (number of active data lines). This feature allows easy trade off between hardware cost and system performance. Note that while D[1:3] are not in use, the related host's data lines should be in tri-state (input mode).

**Figure 33. SD Memory Card Bus Topology**

**17.2.2.2 SDIO 3.0 Interface**

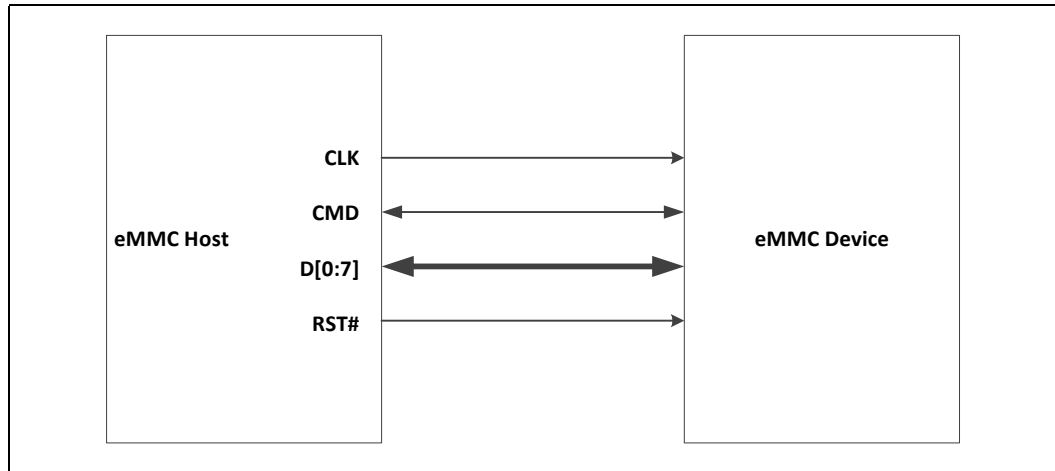

The SDIO card interface is very much like the SD Memory Card interface. The SoC supports one SDIO card slot.

**Figure 34. SDIO Card Bus Topology**

### 17.2.2.3 eMMC Interface

Figure 35. eMMC Interface

### 17.2.3 SDIO/SD/eMMC Host Controller

The Secure Digital Host Controller 3.0 specification defines a standardized host controller for interfacing to eMMC devices, as well as Secure Digital memory and I/O cards. The specification encompasses the following:

- A register map and register set
- Data buffer model
- Data movement model, including both Programmed I/O (PIO) and Direct Memory Access (DMA)
- Three different DMA modes:
  - Single DMA (SDMA)
  - Advanced DMA Mode 1; this is linked list DMA with the restriction that data buffers must reside at 4k boundaries.
  - Advanced DMA Mode 2; this is linked list DMA with the restriction of 4k aligned data buffers removed; data buffers may reside at any arbitrary alignment. 64-bit addressing is also supported.
- Interrupt model
- Suspend and resume mechanism
- Power state definition
- Method for automatic generation of STOP\_TRANSMISSION commands (Auto CMD12)
- Test registers

In short, the SD Host Controller specification defines a standard software model for accessing SD/SDIO/eMMC devices, and makes it possible for standards-compliant host controllers to work with off-the-shelf device drivers.

### 17.2.3.1 SD DMA

A new DMA transfer algorithm, called ADMA (Advanced DMA), is defined in the SD Host Controller Standard Specification Version 2.00. The DMA algorithm defined in the SD Host Controller Standard Specification Version 1.00 is called SDMA (Single Operation DMA). SDMA had the disadvantage that a DMA Interrupt generated at every page boundary disturbs the CPU to reprogram the new system address. This SDMA algorithm forms a performance bottleneck by interruption at every page boundary. Only one SD command transaction can be executed per a SDMA operation.

ADMA adopts a scatter-gather DMA algorithm, so that higher data transfer speed is available. The Host Driver can program a list of data transfers between system memory and SD card to the Descriptor Table before executing ADMA. It enables ADMA to operate without interrupting the Host Driver.

There are two types of ADMA; ADMA1 and ADMA2. ADMA1 can support data transfer of only 4 KByte aligned data in system memory. ADMA2 improves the restriction so that data of any location and any size can be transferred in system memory. The format of Descriptor Table is different between them. The Host Controller Specification Ver2.00 defines ADMA2 as standard ADMA and recommends supporting ADMA2 rather than ADMA1.

The SDIO/SD/eMMC controller supports all three flavors of DMA described in the SD Host Controller 2.0 specification - SDMA, ADMA1, and ADMA2.

*Note:* Although the SD Host Controller Standard Specification Version 3.00 states that ADMA1 is not supported in Standard Host Controller versions 3.0 and latter, the SoC SDIO/SD/eMMC controller supports both ADMA1 and ADMA2.

## 17.3 References

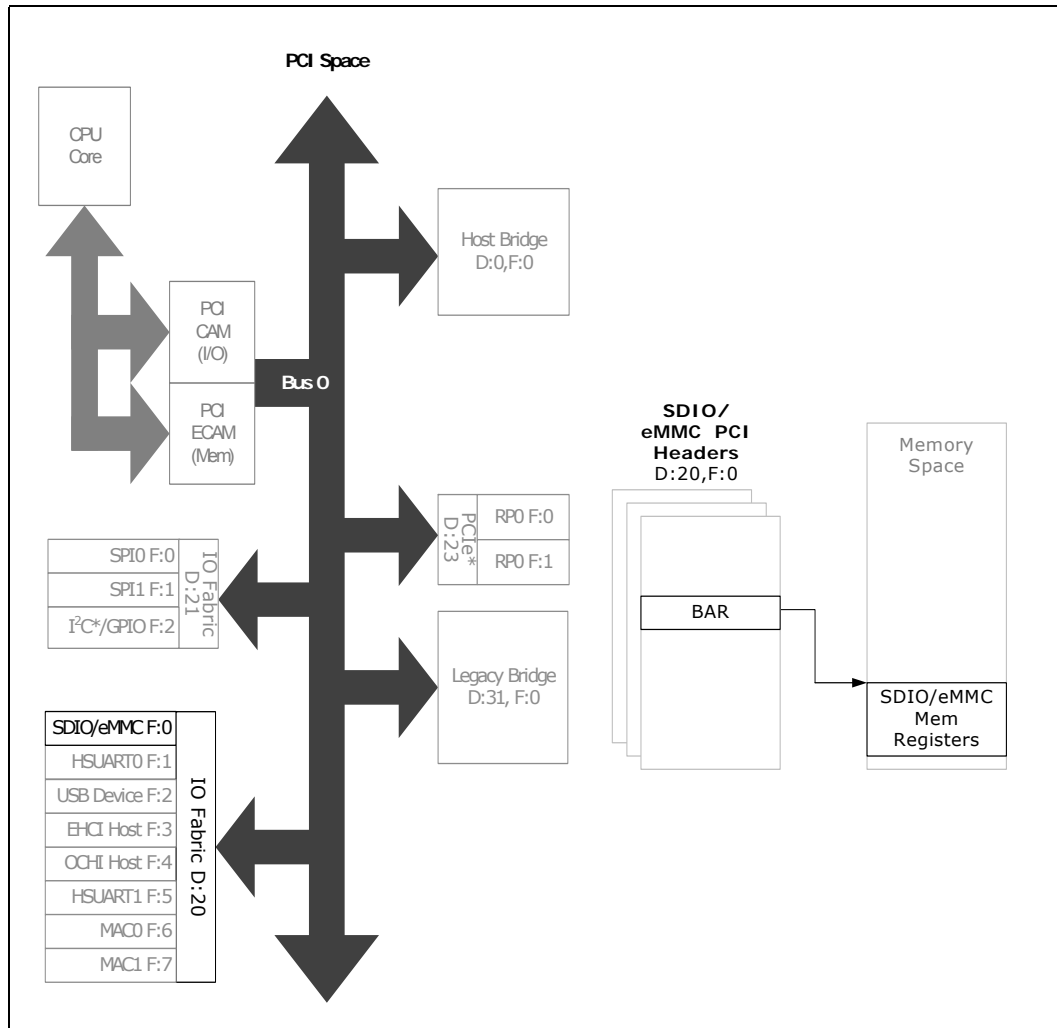

The SDIO/SD/eMMC controller is a Secure Digital I/O (SDIO), Secure Digital (SD), MultiMediaCard (eMMC) host controller that is configured to comply with:

- SD Specification Part 1 Physical Layer Specification version 3.00, April 16, 2009 <https://www.sdcard.org>
- SD Specification Part E1 SDIO Specification version 3.00, December 16, 2010 <https://www.sdcard.org>
- SD Specification Part A2 SD Host Controller Standard Specification version 3.00, February 18, 2010 <https://www.sdcard.org>
- Embedded MultiMediaCard (eMMC) Product Standard v4.41, JESD84-A441 <http://www.jedec.org/>.

## 17.4 Register Map

See [Chapter 5.0, "Register Access Methods"](#) for additional information.

Figure 36. SDIO/SD/eMMC Register Map

## 17.5 PCI Configuration Registers

Table 111. Summary of PCI Configuration Registers—0/20/0

Offset Start	Offset End	Register ID—Description	Default Value
0h	1h	"Vendor ID (VENDOR_ID)—Offset 0h" on page 597	8086h
2h	3h	"Device ID (DEVICE_ID)—Offset 2h" on page 598	08A7h

### 17.5.1 Vendor ID (VENDOR\_ID)—Offset 0h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

VENDOR\_ID: [B:0, D:20, F:0] + 0h

Default: 8086h

15	12	8	4	0
1	0	0	0	0
0	0	0	0	0
1	0	0	0	0
0	1	1	0	0
value				

Bit Range	Default & Access	Description
15: 0	8086h RO	Vendor ID (value): PCI Vendor ID for Intel

### 17.5.2 Device ID (DEVICE\_ID)—Offset 2h

**Access Method**

Type: PCI Configuration Register (Size: 16 bits) **DEVICE\_ID:** [B:0, D:20, F:0] + 2h

**Default:** 08A7h

15	12	8	4	0
0	0	0	0	1
1	0	0	0	1
0	1	1	1	1
value				

Bit Range	Default & Access	Description
15: 0	08A7h RO	<b>Device ID (value):</b> PCI Device ID

### 17.5.3 Command Register (COMMAND\_REGISTER)—Offset 4h

**Access Method**

Type: PCI Configuration Register (Size: 16 bits) **COMMAND\_REGISTER:** [B:0, D:20, F:0] + 4h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
RSVD0	IntrDis	RSVD	SERREN	RSVD
		MasEn	MEMen	RSVD

Bit Range	Default & Access	Description
15: 11	0h RO	<b>RSVDO (RSVDO):</b> Reserved
10	0b RW	<b>Interrupt Disable (IntrDis):</b> Interrupt disable. Disables generation of interrupt messages in the PCI Express function. 1 =) disabled, 0 =) not disabled
9	0h RO	<b>Reserved (RSVD):</b> Reserved.
8	0b RW	<b>SERR Enable (SERREN):</b> When set, this bit enables the non-fatal and fatal errors detected by the function to be reported to the root complex.
7: 3	00h RO	<b>Reserved (RSVD):</b> Reserved.
2	0b RW	<b>Bus Master Enable (MasEn):</b> 0=)disables upstream requests 1=)enables upstream requests.
1	0b RW	<b>Memory Space Enable (MEMen):</b> Device support for Memory transactions. 0 =) not supported. 1 =) supported.
0	0h RO	<b>Reserved (RSVD):</b> Reserved.

## 17.5.4 Status Register (STATUS)—Offset 6h

### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

STATUS: [B:0, D:20, F:0] + 6h

Default: 0010h

15	12	8	4	0
0	0	0	1	0
RSVD0	SigSysErr	RcdMasAb	RSVD	DEVSEL
			RSVD	FastB2B
			capable_66Mhz	hasCapList
			IntrStatus	RSVD1

Bit Range	Default & Access	Description
15	0h RO	<b>RSVD0 (RSVD0)</b> : Reserved
14	0b RW	<b>Signaled System Error (SigSysErr)</b> : Set when a function detects a system error and the SERR Enable bit is set
13	0b RW	<b>Received master abort (RcdMasAb)</b> : Set when requester receives a completion with Unsupported Request completion status
12: 11	0h RO	<b>Reserved (RSVD)</b> : Reserved.
10: 9	0b RO	<b>DEVSEL Timing (DEVSEL)</b> : Deprecated: Hardwired to 0
8	0h RO	<b>Reserved (RSVD)</b> : Reserved.
7	0b RO	<b>Fast Back-to-Back Capable (FastB2B)</b> : Deprecated: Hardwired to 0
6	0h RO	<b>Reserved (RSVD)</b> : Reserved.
5	0b RO	<b>66MHz-Capable (capable_66Mhz)</b> : Deprecated: Hardwired to 0
4	1h RO	<b>Capabilities List (hasCapList)</b> : Indicates the presence of one or more capability register sets.
3	0b RO	<b>Interrupt Status (IntrStatus)</b> : Indicates that the function has a legacy interrupt request outstanding. This bit has no meaning if Message Signaled Interrupts are being used
2: 0	0h RO	<b>RSVD1 (RSVD1)</b> : Reserved

## 17.5.5 Revision ID and Class Code (REV\_ID\_CLASS\_CODE)—Offset 8h

### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

REV\_ID\_CLASS\_CODE: [B:0, D:20, F:0] + 8h

Default: 08050110h

Bit Range	Default & Access	Description
7: 0	0h RO	<b>Latency Timer (value)</b> : Deprecated. Hardwire to 0.

## 17.5.8 Header Type (HEADER\_TYPE)—Offset Eh

### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**HEADER\_TYPE:** [B:0, D:20, F:0] + Eh

**Default:** 80h

7	0	0	0	0	0	0	0	0
1								
multiFnDev								cfgHdrFormat

Bit Range	Default & Access	Description
7	1h RO	<b>Multi-Function Device (multiFnDev)</b> : Hard-wired to 1 to indicate that this is a multi-function device
6: 0	0h RO	<b>Configuration Header Format (cfgHdrFormat)</b> : Hard-wired to 0 to indicate that this configuration header is a Type 0 header, i.e. it is an endpoint rather than a bridge.

## 17.5.9 BIST (BIST)—Offset Fh

### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**BIST:** [B:0, D:20, F:0] + Fh

**Default:** 00h

7	0	0	0	0	0	0	0	0
0								
BIST_capable	start_bist	RSVD			comp_code			

Bit Range	Default & Access	Description
7	0h RO	<b>BIST_capable (BIST_capable)</b> : Hard-wired to 0. (Returns 1 if the function implements a BIST)
6	0h RO	<b>Start (start_bist)</b> : Set to start the functions BIST if BIST is supported.
5: 4	0h RO	<b>Reserved (RSVD)</b> : Reserved.

Bit Range	Default & Access	Description
3: 0	0h RO	<b>Completion Code (comp_code):</b> Completion code having run BIST if BIST is supported. 0=)success. non-zero=)failure

### 17.5.10 Base Address Register (BAR0)—Offset 10h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**BAR0:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0		
0	0	0	0	0	0	0	0	0	0	
address				RSVD				prefetchable	memType	isIO

Bit Range	Default & Access	Description
31: 12	0h RW	<b>address (address):</b> Used to determine the size of memory required by the device and to assign a start address for this required amount of memory.
11: 4	00h RO	<b>Reserved (RSVD):</b> Reserved.
3	0b RO	<b>Prefetchable (prefetchable):</b> Defines the block of memory as prefetchable or not. A block of memory is prefetchable if it fulfils the following 3 conditions (1) no side effects on reads, (2) the device returns all bytes on reads regardless of the byte enables, and (3) host bridges can merge processor writes into this range without causing errors. Hardwired to 0
2: 1	00b RO	<b>Type (memType):</b> Hardwired to 0 to indicate a 32-bit decoder
0	0b RO	<b>Memory Space Indicator (isIO):</b> Hardwired to 0 to indicate the register is a memory address decoder

### 17.5.11 Cardbus CIS Pointer (CARDBUS\_CIS\_POINTER)—Offset 28h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**CARDBUS\_CIS\_POINTER:** [B:0, D:20, F:0] + 28h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
value									

Bit Range	Default & Access	Description
31: 0	0h RO	Cardbus CIS Pointer (value): Reserved. Hardwire to 0.

### 17.5.12 Subsystem Vendor ID (SUB\_SYS\_VENDOR\_ID)—Offset 2Ch

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

SUB\_SYS\_VENDOR\_ID: [B:0, D:20, F:0] + 2Ch

Default: 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
value				

Bit Range	Default & Access	Description
15: 0	0h RO	Subsystem Vendor ID (value): PCI Subsystem Vendor ID

### 17.5.13 Subsystem ID (SUB\_SYS\_ID)—Offset 2Eh

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

SUB\_SYS\_ID: [B:0, D:20, F:0] + 2Eh

Default: 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
value				

Bit Range	Default & Access	Description
15: 0	0h RO	Subsystem ID (value): PCI Subsystem ID

### 17.5.14 Expansion ROM Base Address (EXP\_ROM\_BASE\_ADR)—Offset 30h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

EXP\_ROM\_BASE\_ADR: [B:0, D:20, F:0] + 30h

Default: 00000000h

Bit Range	Default & Access	Description
31: 11	0h RW	<b>ROM Start Address (ROM_base_addr)</b> : Used to determine the size of memory required by the ROM and to assign a start address for this required amount of memory.
10: 1	000h RO	<b>Reserved (RSVD)</b> : Reserved.
0	0h RW	<b>Address Decode Enable (AddrDecodeEn)</b> : A 1 in this field enables the function's ROM address decoder assuming that the Memory Space bit in the Command Register is also set to 1

### 17.5.15 Capabilities Pointer (CAP\_POINTER)—Offset 34h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

CAP\_POINTER: [B:0, D:20, F:0] + 34h

Default: 00000080h

Bit Range	Default & Access	Description
31: 8	0h RO	<b>RSVD0 (RSVD0)</b> : Reserved
7: 0	80h RO	<b>Capabilities Pointer (value)</b> : Pointer to memory location of first entry of linked list of configuration register sets each of which supports a feature. Points to PM (power management) register set at location 0x80

### 17.5.16 Interrupt Line Register (INTR\_LINE)—Offset 3Ch

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

INTR\_LINE: [B:0, D:20, F:0] + 3Ch

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RW	<b>Interrupt Line Register (value):</b> The value in this register tells which input of the system interrupt controller(s) the device's interrupt pin is connected to. The device itself does not use this value, rather it is used by device drivers and operating systems. Device drivers and operating systems can use this information to determine priority and vector information.

### 17.5.17 Interrupt Pin Register (INTR\_PIN)—Offset 3Dh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

INTR\_PIN: [B:0, D:20, F:0] + 3Dh

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	01h RO	<b>Interrupt Pin Register (value):</b> The Interrupt Pin register tells which interrupt pin the device (or device function) uses. A value of 1 corresponds to INTA#. A value of 2 corresponds to INTB#. A value of 3 corresponds to INTC#. A value of 4 corresponds to INTD#. Devices (or device functions) that do not use an interrupt pin must put a 0 in this register. The values 05h through FFh are reserved. For this system function 0 is connected to INTA, 1 to INTB, 2 to INTC 3 to INTD, 4 to INTA, 5 to INTB etc.

### 17.5.18 MIN\_GNT (MIN\_GNT)—Offset 3Eh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MIN\_GNT: [B:0, D:20, F:0] + 3Eh

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RO	<b>MIN_GNT (value):</b> Hardwired to 0

### 17.5.19 MAX\_LAT (MAX\_LAT)—Offset 3Fh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MAX\_LAT: [B:0, D:20, F:0] + 3Fh

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RO	<b>MAX_LAT (value):</b> Hardwired to 0

### 17.5.20 Capability ID (PM\_CAP\_ID)—Offset 80h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

PM\_CAP\_ID: [B:0, D:20, F:0] + 80h

Default: 01h

7	4	0
0	0	1
value		

Bit Range	Default & Access	Description
7: 0	01h RO	<b>Capability ID (value):</b> Identifies the feature associated with this register set. Hardwired value as per PCI SIG assigned capability ID

### 17.5.21 Next Capability Pointer (PM\_NXT\_CAP\_PTR)—Offset 81h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

PM\_NXT\_CAP\_PTR: [B:0, D:20, F:0] + 81h

Default: A0h

7	4	0
1	0	0
value		

Bit Range	Default & Access	Description
7: 0	a0h RO	<b>Next Capability Pointer (value):</b> Pointer to the next register set of feature specific configuration registers. Hardwired to 0xA0 to point to the MSI Capability Structure

### 17.5.22 Power Management Capabilities (PMC)—Offset 82h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

PMC: [B:0, D:20, F:0] + 82h

Bit Range	Default & Access	Description
12: 9	0h RO	<b>Data Select (Data_select)</b> : Hardwired to 0 as the data register is not supported
8	0b RW	<b>PME Enable (PME_en)</b> : Enable device function to send PME messages when an event occurs. 1=)enabled. 0=)disabled
7: 4	0h RO	<b>Reserved (RSVD)</b> : Reserved.
3	1b RO	<b>No Soft Reset (no_soft_reset)</b> : Devices do perform an internal reset when transitioning from D3hot to D0
2	0h RO	<b>Reserved (RSVD)</b> : Reserved.
1: 0	00b RW	<b>Power State (power_state)</b> : Allows software to read current PM state or transition device to a new PM state, where 2'b00 = D0, 2'b01=D1, 2'b10=D2, 2'b11=D3hot

### 17.5.24 PM CSR PCI-to-PCI Bridge Support Extension (PMCSR\_BSE)—Offset 86h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

PMCSR\_BSE: [B:0, D:20, F:0] + 86h

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RO	<b>PM CSR PCI-to-PCI Bridge Support Extension (value)</b> : Not Supported. Hardwired to 0.

### 17.5.25 Power Management Data Register (DATA\_REGISTER)—Offset 87h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

DATA\_REGISTER: [B:0, D:20, F:0] + 87h

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RO	<b>Power Management Data Register (value)</b> : Not Supported. Hardwired to 0

### 17.5.26 Capability ID (MSI\_CAP\_ID)—Offset A0h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MSI\_CAP\_ID: [B:0, D:20, F:0] + A0h

Default: 05h

7	4	0
0	0	1
value		

Bit Range	Default & Access	Description
7: 0	05h RO	<b>Capability ID (value)</b> : Identifies the feature associated with this register set. Hardwired value as per PCI SIG assigned capability ID

### 17.5.27 Next Capability Pointer (MSI\_NXT\_CAP\_PTR)—Offset A1h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MSI\_NXT\_CAP\_PTR: [B:0, D:20, F:0] + A1h

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	00h RO	<b>Next Capability Pointer (value)</b> : Hardwired to 0 as this is the last capability structure in the chain

### 17.5.28 Message Control (MESSAGE\_CTRL)—Offset A2h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

MESSAGE\_CTRL: [B:0, D:20, F:0] + A2h

Default: 0100h

15	12	8	4	0
0	0	0	0	0
RSVD0				MSIEnable
		perVecMskCap	bit64Cap	multiMsgEn
		multiMsgCap		

Bit Range	Default & Access	Description
15: 9	0h RO	<b>RSVDO (RSVDO)</b> : Reserved
8	1h RO	<b>Per Vector Masking Capable (perVecMskCap)</b> : Hardwired to 1 to indicate the function supports PVM
7	0h RO	<b>64 bit Address Capable (bit64Cap)</b> : This bit is hardwired to 0 to indicate that the function is not capable of sending a 64-bit message address.
6: 4	0h RW	<b>Multi-Message Enable (multiMsgEn)</b> : As only one vector is supported per function, software should only write a value of 0x0 to this field
3: 1	0h RO	<b>Multiple Message Enable (multiMsgCap)</b> : This field is hardwired to 0x0 to indicate that the function is requesting a single vector
0	0h RW	<b>MSI Enable (MSIEnable)</b> : Set to enable MSI to request service. If set then it's prohibited to use the INTx pin. System configuration software sets this bit to enable MSI.

### 17.5.29 Message Address (MESSAGE\_ADDR)—Offset A4h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

MESSAGE\_ADDR: [B:0, D:20, F:0] + A4h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
address								RSVDO

Bit Range	Default & Access	Description
31: 2	0h RW	<b>Message Address (address)</b> : If the Message Enable bit (bit 0 of the Message Control register) is set, the contents of this register specify the DWORD-aligned address (AD[31:2]) for the MSI memory write transaction. AD[1:0] are driven to zero during the address phase. This field is read/write
1: 0	0h RO	<b>RSVDO (RSVDO)</b> : Reserved

### 17.5.30 Message Data (MESSAGE\_DATA)—Offset A8h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

MESSAGE\_DATA: [B:0, D:20, F:0] + A8h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
MsgData				

## 17.6 Memory Mapped Registers

**Table 112. Summary of Memory Mapped I/O Registers—BAR0**

Offset Start	Offset End	Register ID—Description	Default Value
0h	3h	"SDMA System Address Register (SYS_ADR)—Offset 0h" on page 613	00000000h
4h	5h	"Block Size Register (BLK_SIZE)—Offset 4h" on page 614	0000h
6h	7h	"Block Count Register (BLK_COUNT)—Offset 6h" on page 615	0000h
8h	Bh	"Argument Register (ARGUMENT)—Offset 8h" on page 616	00000000h
Ch	Dh	"Transfer Mode Register (TX_MODE)—Offset Ch" on page 616	0000h
Eh	Fh	"Command Register (CMD)—Offset Eh" on page 618	0000h
10h	13h	"Response Register 0 (RESPONSE0)—Offset 10h" on page 619	00000000h
14h	17h	"Response Register 2 (RESPONSE2)—Offset 14h" on page 620	00000000h
18h	1Bh	"Response Register 4 (RESPONSE4)—Offset 18h" on page 620	00000000h
1Ch	1Fh	"Response Register 6 (RESPONSE6)—Offset 1Ch" on page 621	00000000h
20h	23h	"Buffer Data Port Register (BUF_DATA_PORT)—Offset 20h" on page 621	00000000h
24h	27h	"Present State Register (PRE_STATE)—Offset 24h" on page 622	1FF00000h
28h	28h	"Host Control Register (HOST_CTL)—Offset 28h" on page 627	00h
29h	29h	"Power Control Register (PWR_CTL)—Offset 29h" on page 628	00h
2Ah	2Ah	"Block Gap Control Register (BLK_GAP_CTL)—Offset 2Ah" on page 628	00h
2Ch	2Dh	"Clock Control Register (CLK_CTL)—Offset 2Ch" on page 630	0000h
2Eh	2Eh	"Timeout Control Register (TIMEOUT_CTL)—Offset 2Eh" on page 632	00h
2Fh	2Fh	"Software Reset Register (SW_RST)—Offset 2Fh" on page 633	00h
30h	31h	"Normal Interrupt Status Register (NML_INT_STATUS)—Offset 30h" on page 634	0000h
32h	33h	"Error Interrupt Status Register (ERR_INT_STATUS)—Offset 32h" on page 636	0000h
34h	35h	"Normal Interrupt Status Enable (NRM_INT_STATUS_EN)—Offset 34h" on page 638	0000h
36h	37h	"Error Interrupt Status Enable Register (ERR_INT_STAT_EN)—Offset 36h" on page 639	0000h
38h	39h	"Normal Interrupt Signal Enable Register (NRM_INT_SIG_EN)—Offset 38h" on page 640	0000h
3Ah	3Bh	"Error Interrupt Signal Enable Register (ERR_INT_SIG_EN)—Offset 3Ah" on page 642	0000h
3Ch	3Dh	"Auto CMD12 Error Status Register (CMD12_ERR_STAT)—Offset 3Ch" on page 643	0000h
3Eh	3Fh	"Host Control 2 Register (HOST_CTRL_2)—Offset 3Eh" on page 644	0000h
40h	43h	"Capabilities Register (CAPABILITIES)—Offset 40h" on page 645	01EC32B2h
44h	47h	"Capabilities Register 2 (CAPABILITIES_2)—Offset 44h" on page 647	03000000h
48h	4Bh	"Maximum Current Capabilities Register (MAX_CUR_CAP)—Offset 48h" on page 648	00000001h
50h	51h	"Force Event Register for Auto CMD12 Error Status (FORCE_EVENT_CMD12_ERR_STAT)—Offset 50h" on page 649	0000h
52h	53h	"Force Event Register for Error Interrupt Status (FORCE_EVENT_ERR_INT_STAT)—Offset 52h" on page 650	0000h
54h	54h	"ADMA Error Status Register (ADMA_ERR_STAT)—Offset 54h" on page 651	00h
58h	5Bh	"ADMA System Address Register (ADMA_SYS_ADDR)—Offset 58h" on page 652	00000000h

Bit Range	Default & Access	Description
31: 0	0h RW	<p><b>SDMA System Address / Auto CMD23 Argument 2 (sys_adr):</b> This register contains the physical system memory address used for DMA transfers (1) or the second argument for the Auto CMD23 (2).</p> <p>(1) SDMA System Address This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value. The Host Driver shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register. The SDMA transfer waits at the every boundary specified by the Host SDMA Buffer Boundary in the Block Size register. The Host Controller generates DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register. When the most upper byte of this register (003h) is written, the Host Controller restarts the SDMA transfer. When restarting SDMA by the Resume command or by setting Continue Request in the Block Gap Control register, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register. ADMA does not use this register</p> <p>(2) Argument 2 This register is used with the Auto CMD23 to set a 32-bit block count value to the argument of the CMD23 while executing Auto CMD23. If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without ADMA, the available block count value is limited by the Block Count register. 65535 blocks is the maximum value in this case.</p>

### 17.6.2 Block Size Register (BLK\_SIZE)—Offset 4h

This register is used to configure the number of bytes in a data block.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**BLK\_SIZE:** [BAR0] + 4h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
tx_blk_size_12	boundary	tr_blk_size		

Bit Range	Default & Access	Description
15	0h RW	<b>Transfer Block Size [12] (tx_blk_size_12):</b> Transfer Block Size 12th bit. This bit is added to support 4Kb Data block transfer.

Bit Range	Default & Access	Description
14: 12	000b RW	<p><b>Host SDMA Buffer Boundary (boundary):</b> The large contiguous memory space may not be available in the virtual memory system. To perform long SDMA transfer, SDMA System Address register shall be updated at every system memory boundary during SDMA transfer. These bits specify the size of contiguous buffer in the system memory. The SDMA transfer shall wait at the every boundary specified by these fields and the Host Controller generates the DMA Interrupt to request the Host Driver to update the SDMA System Address register. At the end of transfer, the Host Controller may issue or may not issue DMA Interrupt. In particular, DMA Interrupt shall not be issued after Transfer Complete Interrupt is issued. In case of this register is set to 0 (buffer size = 4K bytes), lower 12-bit of byte address points data in the contiguous buffer and the upper 20-bit points the location of the buffer in the system memory. The SDMA transfer stops when the Host Controller detects carry out of the address from bit 11 to 12. These bits shall be supported when the SDMA Support in the Capabilities register is set to 1 and this function is active when the DMA Enable in the Transfer Mode register is set to 1. ADMA does not use this register.</p> <p>000b 4K bytes (Detects A11 carry out)                      001b 8K bytes (Detects A12 carry out)                      010b 16K Bytes (Detects A13 carry out)                      011b 32K Bytes (Detects A14 carry out)                      100b 64K bytes (Detects A15 carry out)                      101b 128K Bytes (Detects A16 carry out)                      110b 256K Bytes (Detects A17 carry out)                      111b 512K Bytes (Detects A18 carry out)</p>
11: 0	000h RW	<p><b>Transfer Block Size (tr_blk_size):</b> This register specifies the block size of data transfers for CMD17, CMD18, CMD24, CMD25, and CMD53. Values ranging from 1 up to the maximum buffer size can be set. In case of memory, it shall be set up to 512 bytes (Refer to SD Host Controller Simplified Specification Version 3.00 - Implementation Note in Section 1.7.2). It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations shall be ignored.</p> <p>0800h 2048 Bytes                      ... ..                      0200h 512 Bytes                      01FFh 511 Bytes                      ... ..                      0004h 4 Bytes                      0003h 3 Bytes                      0002h 2 Bytes                      0001h 1 Byte                      0000h No data transfer</p>

### 17.6.3 Block Count Register (BLK\_COUNT)—Offset 6h

This register is enabled when Block Count Enable in the Transfer Mode register is set to 1 and is valid only for multiple block transfers.

#### Access Method

**Type:** Memory Mapped I/O Register  
 (Size: 16 bits)

**BLK\_COUNT:** [BAR0] + 6h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0000h

Bit Range	Default & Access	Description
15: 0	0000h RW	<b>Blocks Count For Current Transfer (blk_count):</b> The Host Driver shall set this register to a value between 1 and the maximum block count. The Host Controller decrements the block count after each block transfer and stops when the count reaches zero. Setting the block count to 0 results in no data blocks is transferred. This register should be accessed only when no transaction is executing (i.e., after transactions are stopped). During data transfer, read operations on this register may return an invalid value and write operations are ignored. When a suspend command is completed, the number of blocks yet to be transferred can be determined by reading this register. Before issuing a resume command, the Host Driver shall restore the previously saved block count. FFFFh 65535 blocks ... .. 0002h 2 blocks 0001h 1 block 0000h Stop Count

### 17.6.4 Argument Register (ARGUMENT)—Offset 8h

This register contains the SD Command Argument.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ARGUMENT:** [BAR0] + 8h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31: 0	0h RW	<b>Command Argument 1 (argument):</b> The SD Command Argument is specified as bit39-8 of Command-Format in the SD Physical Layer Specification.

### 17.6.5 Transfer Mode Register (TX\_MODE)—Offset Ch

This register is used to control the operation of data transfers. The Host Driver shall set this register before issuing a command which transfers data (Refer to Data Present Select in the Command register), or before issuing a Resume command. The Host Driver shall save the value of this register when the data transfer is suspended (as a result of a Suspend command) and restore it before issuing a Resume command. To prevent data loss, the Host Controller shall implement write protection for this register during data transactions. Writes to this register shall be ignored when the Command Inhibit (DAT) in the Present State register is 1.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**TX\_MODE:** [BAR0] + Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:0] + 10h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
rsvd		cmd_comp_ata	blk_sel	data_tr_dir
		cmd12_en	blk_count_en	dma_en

Bit Range	Default & Access	Description
15: 7	000h RO	<b>RSVD (rsvd):</b> Reserved
6	0b RW	<b>Command Completion Signal Enable for CE-ATA Device (cmd_comp_ata):</b> 1 - Device will send command completion Signal 0 - Device will not send command completion Signal  NOTE: This field is not part of the SD Host Controller Specification v3.00.
5	0h RW	<b>Multi / Single Block Select (blk_sel):</b> This bit is set when issuing multiple-block transfer commands using DAT line. For any other commands, this bit shall be set to 0. If this bit is 0, it is not necessary to set the Block Count register. (Refer to Table 2-8 on SD Host Controller Simplified Specification Version 3.00) 1 Multiple Block 0 Single Block
4	0h RW	<b>Data Transfer Direction Select (data_tr_dir):</b> This bit defines the direction of DAT line data transfers. The bit is set to 1 by the Host Driver to transfer data from the SD card to the SD Host Controller and it is set to 0 for all other commands. 1 Read (Card to Host) 0 Write (Host to Card)
3: 2	00b RW	<b>Auto CMD Enable (cmd12_en):</b> This field determines use of auto command functions. 00b Auto Command Disabled 01b Auto CMD12 Enable 10b Auto CMD23 Enable 11b Reserved There are two methods to stop Multiple-block read and write operation. (1) Auto CMD12 Enable The Host Controller issues CMD12 automatically when last block transfer is completed. Auto CMD12 error is indicated to the Auto CMD Error Status register. The Host Driver shall not set this bit if the command does not require CMD12. In particular, secure commands defined in the Part 3 File Security specification do not require CMD12. (2) Auto CMD23 Enable The Host Controller issues a CMD23 automatically before issuing a command specified in the Command Register. The following conditions are required to use the Auto CMD23: - Auto CMD23 Supported - A memory card that supports CMD23 (SCR[33]=1) - If DMA is used, it shall be ADMA. - Only when CMD18 or CMD25 is issued (Note, the Host Controller does not check command index.) Auto CMD23 can be used with or without ADMA. By writing the Command register, the Host Controller issues a CMD23 first and then issues a command specified by the Command Index in Command register. If response errors of CMD23 are detected, the second command is not issued. A CMD23 error is indicated in the Auto CMD Error Status register. 32-bit block count value for CMD23 is set to SDMA System Address / Argument 2 register
1	0b RW	<b>Block Count Enable (blk_count_en):</b> This bit is used to enable the Block Count register, which is only relevant for multiple block transfers. When this bit is 0, the Block Count register is disabled, which is useful in executing an infinite transfer. (Refer to Table 2-8 on SD Host Controller Simplified Specification Version 3.00) If ADMA2 data transfer is more than 65535 blocks, this bit shall be set to 0. In this case, data transfer length is designated by Descriptor Table. 1 Enable 0 Disable

Bit Range	Default & Access	Description
0	0b RW	<b>DMA Enable (dma_en):</b> DMA can be enabled only if it is supported as indicated in the Capabilities register. One of the DMA modes can be selected by DMA Select in the Host Control 1 register. If DMA is not supported, this bit is meaningless and shall always read 0. If this bit is set to 1, a DMA operation shall begin when the Host Driver writes to the upper byte of Command register (00Fh). 1 DMA Data transfer 0 No data transfer or Non DMA data transfer

### 17.6.6 Command Register (CMD)—Offset Eh

The Host Driver shall check the Command Inhibit (DAT) bit and Command Inhibit (CMD) bit in the Present State register before writing to this register. Writing to the upper byte of this register triggers SD command generation. The Host Driver has the responsibility to write this register because the Host Controller does not protect for writing when Command Inhibit (CMD) is set.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**CMD:** [BAR0] + Eh

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0000h

Bit Range	Default & Access	Description
15: 14	0h RO	<b>RSVD (rsvd):</b> Reserved
13: 8	0h RW	<b>Command Index (cmd_index):</b> These bits shall be set to the command number (CMD0-63, ACMD0-63) that is specified in bits 45-40 of the Command-Format in the Physical Layer Specification and SDIO Card Specification

Bit Range	Default & Access	Description
7: 6	00b RW	<p><b>Command Type (cmd_type):</b> There are three types of special commands: Suspend, Resume and Abort. These bits shall be set to 00b for all other commands.</p> <p>(1) Suspend Command If the Suspend command succeeds, the Host Controller shall assume the SD Bus has been released and that it is possible to issue the next command, which uses the DAT line. The Host Controller shall de-assert Read Wait for read transactions and stop checking busy for write transactions. The interrupt cycle shall start, in 4-bit mode. If the Suspend command fails, the Host Controller shall maintain its current state, and the Host Driver shall restart the transfer by setting Continue Request in the Block Gap Control register.</p> <p>(2) Resume Command The Host Driver re-starts the data transfer by restoring the registers in the range of 000-00Dh. The Host Controller shall check for busy before starting write transfers.</p> <p>(3) Abort Command If this command is set when executing a read transfer, the Host Controller shall stop reads to the buffer. If this command is set when executing a write transfer, the Host Controller shall stop driving the DAT line. After issuing the Abort command, the Host Driver should issue a software reset.</p> <p>11b Abort CMD12, CMD52 for writing I/O Abort in CCCR  10b Resume CMD52 for writing Function Select in CCCR  01b Suspend CMD52 for writing Bus Suspend in CCCR  00b Normal Other commands</p>
5	0b RW	<p><b>Data Present Select (data_pr_sel):</b> This bit is set to 1 to indicate that data is present and shall be transferred using the DAT line. It is set to 0 for the following:</p> <p>(1) Commands using only CMD line (ex. CMD52).  (2) Commands with no data transfer but using busy signal on DAT[0] line (R1b or R5b ex. CMD38)  (3) Resume command</p> <p>1 Data Present  0 No Data Present</p>
4	0b RW	<p><b>Command Index Check Enable (cmd_index_chk_en):</b> If this bit is set to 1, the Host Controller shall check the Index field in the response to see if it has the same value as the command index. If it is not, it is reported as a Command Index Error. If this bit is set to 0, the Index field is not checked.</p> <p>1 Enable  0 Disable</p>
3	0b RW	<p><b>Command CRC Check Enable (cmd_crc_chk_en):</b> If this bit is set to 1, the Host Controller shall check the CRC field in the response. If an error is detected, it is reported as a Command CRC Error. If this bit is set to 0, the CRC field is not checked. The position of CRC field is determined according to the length of the response. (Refer to definition in D01-00 and Table 2-10 in the SD Host Controller Simplified Specification Version 3.00).</p> <p>1 Enable  0 Disable</p>
2	0h RO	<b>Reserved (reserved):</b> Reserved
1: 0	0h RW	<p><b>Response Type Select (resp_type_sel):</b> 00 No Response  01 Response Length 136  10 Response Length 48  11 Response Length 48 check Busy after response</p>

### 17.6.7 Response Register 0 (RESPONSE0)—Offset 10h

This register is used to store responses from SD cards

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**RESPONSE0:** [BAR0] + 10h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:0] + 10h

Bit Range	Default & Access	Description
31: 0	0h RO	<b>Command Response (cmd_resp)</b> : Section 2.2.7 and Table 2-12 in the SD Host Controller Simplified Specification Version 3.00 describe the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register

### 17.6.11 Buffer Data Port Register (BUF\_DATA\_PORT)—Offset 20h

32-bit data port register to access internal buffer

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**BUF\_DATA\_PORT:** [BAR0] + 20h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
buf_data								

Bit Range	Default & Access	Description
31: 0	0h RW	<b>Buffer Data (buf_data):</b> The Host Controller buffer can be accessed through this 32-bit Data Port register. Refer to section 1.7 in the SD Host Controller Simplified Specification Version 3.00

### 17.6.12 Present State Register (PRE\_STATE)—Offset 24h

This bit indicates whether one of the DAT line on SD bus is in use. The Host Driver can get status of the Host Controller from this 32-bit read only register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PRE\_STATE:** [BAR0] + 24h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:0] + 10h

**Default:** 1FF0000h

31	28	24	20	16	12	8	4	0
0	0	0	1	1	1	1	1	1
reserved2	dat_sig_lvl	cmd_in_sig_lvl	data_in_sig_lvl	wr_prot_sw_pin_lvl crd_det_pin_lvl crd_st_stable crd_ins	reserved1	buf_rd_en buf_wr_en rd_tx_active wr_tx_active	reserved	re_tune_req dat_in_active cmd_inhibit_dat cmd_inhibit_cmd

Bit Range	Default & Access	Description
31: 29	0h RO	<b>Reserved2 (reserved2):</b> Reserved
28: 25	Fh RO	<b>DAT[7:4] Line Signal Level (dat_sig_lvl):</b> This status is used to check DAT line level to recover from errors, and for debugging. D28 - DAT[7] D27 - DAT[6] D26 - DAT[5] D25 - DAT[4] NOTE: This field is not part of the SD Host Controller Specification v3.00.
24	1b RO	<b>CMD Line Signal Level (cmd_in_sig_lvl):</b> This status is used to check the CMD line level to recover from errors, and for debugging.
23: 20	Fh RO	<b>DAT[3:0] Line Signal Level (data_in_sig_lvl):</b> This status is used to check the DAT line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from DAT[0]. D23 - DAT[3] D22 - DAT[2] D21 - DAT[1] D20 - DAT[0]

Bit Range	Default & Access	Description
19	0b RO	<b>Write Protect Switch Pin Level (wr_prot_sw_pin_lvl)</b> : The Write Protect Switch is supported for memory and combo cards. This bit reflects the inverse value of the SD_WP pin. 1 Write enabled (SD_WP=0) 0 Write protected (SD_WP=1)
18	0b RO	<b>Card Detect Pin Level (crd_det_pin_lvl)</b> : This bit reflects the inverse value of the SD_CD_B pin. Debouncing is not performed on this bit. This bit may be valid when Card State Stable is set to 1, but it is not guaranteed because of propagation delay. Use of this bit is limited to testing since it must be debounced by software. 1 Card present (SD_CD_B=0) 0 No card present (SD_CD_B=1)
17	0b RO	<b>Card State Stable (crd_st_stable)</b> : This bit is used for testing. If it is 0, the Card Detect Pin Level is not stable. If this bit is set to 1, it means the Card Detect Pin Level is stable. No Card state can be detected by this bit is set to 1 and Card Inserted is set to 0. The Software Reset For All in the Software Reset register shall not affect this bit. 1 No Card or Inserted (stable) 0 Reset or Debouncing (unstable)
16	0b RO	<b>Card Inserted (crd_ins)</b> : This bit indicates whether a card has been inserted. The Host Controller shall debounce this signal so that the Host Driver will not need to wait for it to stabilize. Changing from 0 to 1 generates a Card Insertion interrupt in the Normal Interrupt Status register and changing from 1 to 0 generates a Card Removal interrupt in the Normal Interrupt Status register. The Software Reset For All in the Software Reset register shall not affect this bit. If a card is removed while its power is on and its clock is oscillating, the Host Controller shall clear SD Bus Power in the Power Control register and SD Clock Enable in the Clock Control register. When this bit is changed from 1 to 0, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state). In addition, the Host Driver should clear the Host Controller by the Software Reset For All in Software Reset register. The card detect is active regardless of the SD Bus Power. 1 Card Inserted 0 Reset or Debouncing or No Card
15: 12	0h RO	<b>Reserved1 (reserved1)</b> : Reserved
11	0b RO	<b>Buffer Read Enable (buf_rd_en)</b> : This status is used for non-DMA read transfers. The Host Controller may implement multiple buffers to transfer data efficiently. This read only flag indicates that valid data exists in the host side buffer. If this bit is 1, readable data exists in the buffer. A change of this bit from 1 to 0 occurs when all the block data is read from the buffer. A change of this bit from 0 to 1 occurs when block data is ready in the buffer and generates the Buffer Read Ready interrupt. 1 Read enable 0 Read disable
10	0b RO	<b>Buffer Write Enable (buf_wr_en)</b> : This status is used for non-DMA write transfers. The Host Controller can implement multiple buffers to transfer data efficiently. This read only flag indicates if space is available for write data. If this bit is 1, data can be written to the buffer. A change of this bit from 1 to 0 occurs when all the block data is written to the buffer. A change of this bit from 0 to 1 occurs when top of block data can be written to the buffer and generates the Buffer Write Ready interrupt. The Host Controller should neither set Buffer Write Enable nor generate Buffer Write Ready Interrupt after the last block data is written to the Buffer Data Port Register. 1 Write enable 0 Write disable
9	0b RO	<b>Read Transfer Active (rd_tx_active)</b> : This status is used for detecting completion of a read transfer. (Refer to Section 3.12.3 in the SD Host Controller Simplified Specification Version 3.00) This bit is set to 1 for either of the following conditions: (1) After the end bit of the read command. (2) When read operation is restarted by writing a 1 to Continue Request in the Block Gap Control register. This bit is cleared to 0 for either of the following conditions: (1) When the last data block as specified by block length is transferred to the System. (2) In case of ADMA2, end of read operation is designated by Descriptor Table. (3) When all valid data blocks in the Host Controller have been transferred to the System and no current block transfers are being sent as a result of the Stop At Block Gap Request being set to 1. A Transfer Complete interrupt is generated when this bit changes to 0. 1 Transferring data 0 No valid data

Bit Range	Default & Access	Description
8	0b RO	<p><b>Write Transfer Active (wr_tx_active):</b> This status indicates a write transfer is active. If this bit is 0, it means no valid write data exists in the Host Controller. (Refer to Section 3.12.4 in the SD Host Controller Simplified Specification Version 3.00) This bit is set in either of the following cases:</p> <ul style="list-style-type: none"> <li>(1) After the end bit of the write command.</li> <li>(2) When write operation is restarted by writing a 1 to Continue Request in the Block Gap Control register.</li> </ul> <p>This bit is cleared in either of the following cases:</p> <ul style="list-style-type: none"> <li>(1) After getting the CRC status of the last data block as specified by the transfer count (Single and Multiple) In case of ADMA2, transfer count is designated by Descriptor Table.</li> <li>(2) After getting the CRC status of any block where data transmission is about to be stopped by a Stop At Block Gap Request.</li> </ul> <p>During a write transaction, a Block Gap Event interrupt is generated when this bit is changed to 0, as the result of the Stop At Block Gap Request being set. This status is useful for the Host Driver in determining non DAT line commands can be issued during write busy.</p> <p>1 Transferring data 0 No valid data</p>
7: 4	0h RO	<b>Reserved (reserved):</b> Reserved
3	0b RO	<p><b>Re-Tuning Request (re_tune_req):</b> Host Controller may request Host Driver to execute re-tuning sequence by setting this bit when the data window is shifted by temperature drift and a tuned sampling point does not have a good margin to receive correct data. This bit is cleared when a command is issued with setting Execute Tuning in the Host Control 2 register. Changing of this bit from 0 to 1 generates Re-Tuning Event. Refer to Normal Interrupt Status registers for more detail. This bit isn't set to 1 if Sampling Clock Select in the Host Control 2 register is set to 0 (using fixed sampling clock). Refer to Re-Tuning Modes in the Capabilities register for more detail.</p>

Bit Range	Default & Access	Description
2	0b RO	<p><b>DAT Line Active (dat_in_active):</b> This bit indicates whether one of the DAT line on SD Bus is in use.</p> <p>(a) In the case of read transactions This status indicates whether a read transfer is executing on the SD Bus. Changing this value from 1 to 0 generates a Block Gap Event interrupt in the Normal Interrupt Status register, as the result of the Stop At Block Gap Request being set. Refer to Section 3.12.3 for details on timing. This bit shall be set in either of the following cases: (1) After the end bit of the read command. (2) When writing a 1 to Continue Request in the Block Gap Control register to restart a read transfer. This bit shall be cleared in either of the following cases: (1) When the end bit of the last data block is sent from the SD Bus to the Host Controller. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table. (2) When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request. The Host Controller shall stop read operation at the start of the interrupt cycle of the next block gap by driving Read Wait or stopping SD clock. If the Read Wait signal is already driven (due to data buffer cannot receive data), the Host Controller can continue to stop read operation by driving the Read Wait signal. It is necessary to support Read Wait in order to use suspend / resume function.</p> <p>(b) In the case of write transactions This status indicates that a write transfer is executing on the SD Bus. Changing this value from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer to Section 3.12.4 for sequence details. This bit shall be set in either of the following cases: (1) After the end bit of the write command. (2) When writing to 1 to Continue Request in the Block Gap Control register to continue a write transfer. This bit shall be cleared in either of the following cases: (1) When the SD card releases write busy of the last data block. If SD card does not drive busy signal for 8 SD Clocks, the Host Controller shall consider the card drive -Not Busy-. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table. (2) When the SD card releases write busy prior to waiting for write transfer as a result of a Stop At Block Gap Request.</p> <p>(c) Command with busy This status indicates whether a command indicates busy (ex. erase command for memory) is executing on the SD Bus. This bit is set after the end bit of the command with busy and cleared when busy is de-asserted. Changing this bit from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer Figure 2-11 to Figure 2-13 on SD Host Controller Simplified Specification Version 3.00. 1 DAT Line Active 0 DAT Line Inactive</p>
1	0b RO	<p><b>Command Inhibit (DAT) (cmd_inhibit_dat):</b> This status bit is generated if either the DAT Line Active or the Read Transfer Active is set to 1. If this bit is 0, it indicates the Host Controller can issue the next SD Command. Commands with busy signal belong to Command Inhibit (DAT) (ex. R1b, R5b type). Changing from 1 to 0 generates a Transfer Complete interrupt in the Normal Interrupt Status register. Note: The SD Host Driver can save registers in the range of 000-00Dh for a suspend transaction after this bit has changed from 1 to 0. 1 Cannot issue command which uses the DAT line 0 Can issue command which uses the DAT line</p>
0	0b RO	<p><b>Command Inhibit (CMD) (cmd_inhibit_cmd):</b> If this bit is 0, it indicates the CMD line is not in use and the Host Controller can issue a SD Command using the CMD line. This bit is set immediately after the Command register (00Fh) is written. This bit is cleared when the command response is received. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the response of CMD12 or CMD23 but cleared by the response of a read/write command. Status issuing Auto CMD12 is not read from this bit. So if a command is issued during Auto CMD12 operation, Host Controller shall manage to issue two commands: CMD12 and a command set by Command register. Even if the Command Inhibit (DAT) is set to 1, commands using only the CMD line can be issued if this bit is 0. Changing from 1 to 0 generates a Command Complete Interrupt in the Normal Interrupt Status register. If the Host Controller cannot issue the command because of a command conflict error or because of Command Not Issued By Auto CMD12 Error (Refer to Section (Refer to Section 2.2.18 and 2.2.23 SD Host Controller Simplified Specification Version 3.00), this bit shall remain 1 and the Command Complete is not set. 1 Cannot issue command 0 Can issue command using only CMD line</p>

### 17.6.13 Host Control Register (HOST\_CTL)—Offset 28h

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 8 bits)

HOST\_CTL: [BAR0] + 28h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:0] + 10h

Default: 00h

7	0	0	0	0	4	0	0	0	0
crd_det_sig_sel	crd_det_tst_lvl	sd8_bit_mode	dma_sel	hi_spd_en	data_tx_wid	led_ctl			

Bit Range	Default & Access	Description
7	0b RW	<b>Card Detect Signal Selection (crd_det_sig_sel):</b> This bit selects source for the card detection. When the source for the card detection is switched, the interrupt should be disabled during the switching period by clearing the Interrupt Status/Signal Enable register in order to mask unexpected interrupt being caused by the glitch. The Interrupt Status/Signal Enable should be disabled during over the period of debouncing. 1 The Card Detect Test Level is selected (for test purpose) 0 SD_CD_B is selected (for normal use)
6	0h RW	<b>Card Detect Test Level (crd_det_tst_lvl):</b> This bit is enabled while the Card Detect Signal Selection is set to 1 and it indicates card inserted or not. Generates (card ins or card removal) interrupt when the normal int sts enable bit is set. 1 - Card Inserted 0 - No Card
5	0h RW	<b>Extended Data Transfer Width (sd8_bit_mode):</b> This bit controls 8-bit bus width mode for embedded device. Support of this function is indicated in 8-bit Support for Embedded Device in the Capabilities register. If a device supports 8-bit bus mode, this bit may be set to 1. If this bit is 0, bus width is controlled by Data Transfer Width in the Host Control 1 register. This bit is not effective when multiple devices are installed on a bus slot (Slot Type is set to 10b in the Capabilities register). In this case, each device bus width is controlled by Bus Width Preset field in the Shared Bus Control register. 1 8-bit Bus Width 0 Bus Width is Selected by Data Transfer Width
4: 3	00b RW	<b>DMA Select (dma_sel):</b> One of supported DMA modes can be selected. The host driver shall check support of DMA modes by referring the Capabilities register. 00 - SDMA is selected 01 - 32-bit Address ADMA1 is selected 10 - 32-bit Address ADMA2 is selected 11 - 64-bit Address ADMA2 is selected NOTE: Codes 01 and 11 are not part of the SD Host Controller Simplified Specification Version 3.00
2	0b RW	<b>High Speed Enable (hi_spd_en):</b> This bit is optional. Before setting this bit, the HD shall check the High Speed Support in the capabilities register. If this bit is set to 0 (default), the HC outputs CMD line and DAT lines at the falling edge of the SD clock (up to 25 MHz/ 20MHz for MMC). If this bit is set to 1, the HC outputs CMD line and DAT lines at the rising edge of the SD clock (up to 50 MHz for SD/52MHz for MMC)/ 208Mhz (for SD3.0) If Preset Value Enable in the Host Control 2 register is set to 1, Host Driver needs to reset SD Clock Enable before changing this field to avoid generating clock glitches. After setting this field, the Host Driver sets SD Clock Enable again 1 - High Speed Mode 0 - Normal Speed Mode
1	0h RW	<b>Data Transfer Width (SD1 or SD4) (data_tx_wid):</b> This bit selects the data width of the Host Controller. The Host Driver shall set it to match the data width of the SD card. 1 4-bit mode 0 1-bit mode

Bit Range	Default & Access	Description
0	0h RW	<b>LED Control (led_ctl)</b> : This bit is used to caution the user not to remove the card while the SD card is being accessed. If the software is going to issue multiple SD commands, this bit can be set during all these transactions. It is not necessary to change for each transaction. 1 LED on 0 LED off

### 17.6.14 Power Control Register (PWR\_CTL)—Offset 29h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**PWR\_CTL:** [BAR0] + 29h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:0] + 10h

4	0b RW	<b>HW reset (hw_rst)</b> : Hardware reset signal is generated for eMMC4.4 card when this bit is set. NOTE: Not part of the SD Host Controller Simplified Specification Version 3.00
3: 1	0h RW	<b>SD Bus Voltage Select (sd_bus_volt_sel)</b> : By setting these bits, the Host Driver selects the voltage level for the SD card. Before setting this register, the Host Driver shall check the Voltage Support bits in the Capabilities register. If an unsupported voltage is selected, the Host System shall not supply SD Bus voltage. 111 3.3V (Typ.) 110 Reserved 101 Reserved
0	0b RW	<b>SD Bus Power (sd_bus_pwr)</b> : Before setting this bit, the SD Host Driver shall set SD Bus Voltage Select. If the Host Controller detects the No Card state, this bit shall be cleared. If this bit is cleared, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state) and drive SDCLK to low level (Refer to Section 2.2.14 of SD Host Controller Simplified Specification Version 3.00). 1 Power on 0 Power off

### 17.6.15 Block Gap Control Register (BLK\_GAP\_CTL)—Offset 2Ah

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**BLK\_GAP\_CTL:** [BAR0] + 2Ah

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:0] + 10h

Default: 00h

7	0	0	0	0	4	0	0	0	0					
rsvd		alt_boot_en		boot_en		spi_mode		int_blk_gap		rd_wait_ctl		cont_req		stp_blk_gap_req

Bit Range	Default & Access	Description
7	0b RO	<b>RSVD (rsvd):</b> Reserved
6	0b RW	<b>Alternate Boot Mode Enable (alt_boot_en):</b> To start boot code access in alternative mode. 1 - To start alternate boot mode access 0 - To stop alternate boot mode access NOTE: Not part of the SD Host Controller Simplified Specification Version 3.00
5	0b RW	<b>Boot Enable (boot_en):</b> To start boot code access 1 - To start boot code access 0 - To stop boot code access NOTE: Not part of the SD Host Controller Simplified Specification Version 3.00
4	0b RW	<b>SPI mode enable (spi_mode):</b> SPI mode enable bit. 1 - SPI mode 0 - SD mode NOTE: Not part of the SD Host Controller Simplified Specification Version 3.00
3	0b RW	<b>Interrupt At Block Gap (int_blk_gap):</b> This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. Setting to 0 disables interrupt detection during a multiple block transfer. If the SD card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. 1 Enabled 0 Disabled
2	0b RW	<b>Read Wait Control (rd_wait_ctl):</b> The read wait function is optional for SDIO cards. If the card supports read wait, set this bit to enable use of the read wait protocol to stop read data using the DAT[2] line. Otherwise, the Host Controller has to stop the SD Clock to hold read data, which restricts commands generation. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. If the card does not support read wait, this bit shall never be set to 1 otherwise DAT line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported. 1 Enable Read Wait Control 0 Disable Read Wait Control
1	0b RW	<b>Continue Request (cont_req):</b> This bit is used to restart a transaction, which was stopped using the Stop At Block Gap Request. To cancel stop at the block gap, set Stop At Block Gap Request to 0 and set this bit 1 to restart the transfer. The Host Controller automatically clears this bit in either of the following cases: (1) In the case of a read transaction, the DAT Line Active changes from 0 to 1 as a read transaction restarts. (2) In the case of a write transaction, the Write Transfer Active changes from 0 to 1 as the write transaction restarts. Therefore, it is not necessary for Host Driver to set this bit to 0. If Stop At Block Gap Request is set to 1, any write to this bit is ignored. 1 Restart 0 Not affect

Bit Range	Default & Access	Description
0	0b RW	<p><b>Stop At Block Gap Request (stp_blk_gap_req):</b> This bit is used to stop executing read and write transaction at the next block gap for non-DMA, SDMA and ADMA transfers. The Host Driver shall leave this bit set to 1 until the Transfer Complete is set to 1. Clearing both Stop At Block Gap Request and Continue Request shall not cause the transaction to restart. When Host Controller version is 1.00, the Host Driver can set this bit if the card supports Read Wait Control. When Host Controller version is 2.00 or later, the Host Driver can set this bit regardless of the card supports Read Wait Control. The Host Controller shall stop read transfer by using Read Wait or stopping SD clock. In case of write transfers in which the Host Driver writes data to the Buffer Data Port register, the Host Driver shall set this bit after all block data is written. If this bit is set to 1, the Host Driver shall not write data to Buffer Data Port register. This bit affects Read Transfer Active, Write Transfer Active, DAT Line Active and Command Inhibit (DAT) in the Present State register.</p> <p>1 Stop 0 Transfer</p>

### 17.6.16 Clock Control Register (CLK\_CTL)—Offset 2Ch

This register is used configure the frequency of the SDIO controller, and enable the clock.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**CLK\_CTL:** [BAR0] + 2Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
sdclk_freq_sel				upr_sdclk_freq_sel
				clk_gen_sel
				rsvd
				sd_clk_en
				int_clk_stable
				int_clk_en

Bit Range	Default & Access	Description
15: 8	00h RW	<p><b>SDCLK Frequency Select (sdclk_freq_sel):</b> This register is used to select the frequency of the SDCLK pin. The frequency is not programmed directly; rather this register holds the divisor of the Base Clock Frequency For SD clock in the capabilities register. Only the following settings are allowed.</p> <p>(1) 8-bit Divided Clock Mode            80h - base clock divided by 256            40h - base clock divided by 128            20h - base clock divided by 64            10h - base clock divided by 32            08h - base clock divided by 16            04h - base clock divided by 8            02h - base clock divided by 4            01h - base clock divided by 2            00h - base clock(10MHz-63MHz)</p> <p>Setting 00h specifies the highest frequency of the SD Clock. When setting multiple bits, the most significant bit is used as the divisor. But multiple bits should not be set. The two default divider values can be calculated by the frequency that is defined by the Base Clock Frequency For SD Clock in the Capabilities register.</p> <ul style="list-style-type: none"> <li>- 400KHz divider value</li> <li>- 25MHz divider value</li> <li>- 50MHz divider value</li> </ul> <p>The frequency of the SDCLK is set by the following formula: Clock Frequency = (Base clock) / divisor. Thus choose the smallest possible divisor which results in a clock frequency that is less than or equal to the target frequency. Maximum Frequency for SD = 50Mhz (base clock) Maximum Frequency for MMC = 52Mhz (base clock) Minimum Frequency = 195.3125Khz (50Mhz / 256), same clock for MMC also.</p> <p>For example, if the Base Clock Frequency For SD Clock in the Capabilities register has the value 33MHz, and the target frequency is 25MHz, then choosing the divisor value of 01h will yield 16.5MHz, which is the nearest frequency less than or equal to the target. Similarly, to approach a clock value of 400KHz, the divisor value of 40h yields the optimal clock value of 258KHz.</p> <p>(2) 10-bit Divided Clock Mode            Host Controller Version 3.00 supports this mandatory mode instead of the 8-bit Divided Clock Mode. The length of divider is extended to 10 bits and all divider values shall be supported.</p> <p>3FFh 1/2046 Divided Clock            ...            N 1/2N Divided Clock (Duty 50%)            ...            002h 1/4 Divided Clock            001h 1/2 Divided Clock            000h Base Clock (10MHz-255MHz)</p> <p>(3) Programmable Clock Mode            Host Controller Version 3.00 supports this mode as optional. A non-zero value set to Clock Multiplier in the Capabilities register indicates support of this clock mode. The multiplier enables the Host System to select a finer grain SD clock frequency. It is not necessary to support all frequency generation specified by this field because programmable clock generator is vendor specific and dependent on the implementation. Therefore, this mode is used with Preset Value registers. The Host Controller vendor provides possible settings and the Host System vendor sets appropriate values to the Preset Value registers.</p> <p>3FFh Base Clock * M / 1024            ...            N - 1 Base Clock * M / N            ...            002h Base Clock * M / 3            001h Base Clock * M / 2            000h Base Clock * M</p> <p>This field depends on setting of Preset Value Enable in the Host Control 2 register. If Preset Value Enable = 0, this field is set by Host Driver. If the Preset Value Enable = 1, this field is automatically set to a value specified in one of Preset Value registers.</p>
7: 6	00b RW	<p><b>Upper Bits of SDCLK Frequency Select (upr_sdclk_freq_sel):</b> Host Controller Version 1.00 and 2.00 do not support these bits and they are treated as 00b fixed value (ROC). Host Controller Version 3.00 shall support these bits to expand SDCLK Frequency Select to 10-bit. Bit 07-06 is assigned to bit 09-08 of clock divider in SDCLK Frequency Select.</p>

Bit Range	Default & Access	Description
5	0b RW	<b>Clock Generator Select (clk_gen_sel):</b> This bit is used to select the clock generator mode in SDCLK Frequency Select. If the Programmable Clock Mode is supported (non-zero value is set to Clock Multiplier in the Capabilities register), this bit attribute is RW, and if not supported, this bit attribute is RO and zero is read. This bit depends on the setting of Preset Value Enable in the Host Control 2 register. If the Preset Value Enable = 0, this bit is set by Host Driver. If the Preset Value Enable = 1, this bit is automatically set to a value specified in one of Preset Value registers. 1 Programmable Clock Mode 0 Divided Clock Mode
4: 3	00b RO	<b>RSVD (rsvd):</b> Reserved
2	0b RW	<b>SD Clock Enable (sd_clk_en):</b> The Host Controller shall stop SDCLK when writing this bit to 0. SDCLK Frequency Select can be changed when this bit is 0. Then, the Host Controller shall maintain the same clock frequency until SDCLK is stopped (Stop at SDCLK=0). If the Card Inserted in the Present State register is cleared, this bit shall be cleared. 1 Enable 0 Disable
1	0b RO	<b>Internal Clock Stable (int_clk_stable):</b> This bit is set to 1 when SD Clock is stable after writing to Internal Clock Enable in this register to 1. The SD Host Driver shall wait to set SD Clock Enable until this bit is set to 1. Note: This is useful when using PLL for a clock oscillator that requires setup time. 1 Ready 0 Not Ready
0	0b RW	<b>Internal Clock Enable (int_clk_en):</b> This bit is set to 0 when the Host Driver is not using the Host Controller or the Host Controller awaits a wakeup interrupt. The Host Controller should stop its internal clock to go very low power state. Still, registers shall be able to be read and written. Clock starts to oscillate when this bit is set to 1. When clock oscillation is stable, the Host Controller shall set Internal Clock Stable in this register to 1. This bit shall not affect card detection. 1 Oscillate 0 Stop

### 17.6.17 Timeout Control Register (TIMEOUT\_CTL)—Offset 2Eh

At the initialization of the Host Controller, the Host Driver shall set the Data Timeout Counter Value according to the Capabilities register.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**TIMEOUT\_CTL:** [BAR0] + 2Eh

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:0] + 10h

0	0b RW	<b>Software Reset For All (sw_rst_all):</b> This reset affects the entire Host Controller except for the card detection circuit. Register bits of type ROC, RW, RW1C, RWAC are cleared to 0. During its initialization, the Host Driver shall set this bit to 1 to reset the Host Controller. The Host Controller shall reset this bit to 0 when Capabilities registers are valid and the Host Driver can read them. Additional use of Software Reset For All may not affect the value of the Capabilities registers. If this bit is set to 1, the host driver should issue reset command and reinitialize the SD card. 1 Reset 0 Work

### 17.6.19 Normal Interrupt Status Register (NML\_INT\_STATUS)—Offset 30h

The Normal Interrupt Status Enable affects reads of this register, but Normal Interrupt Signal Enable does not affect these reads. An interrupt is generated when the Normal Interrupt Signal Enable is enabled and at least one of the status bits is set to 1. Writing 1 to a bit of RW1C attribute clears it; writing 0 keeps the bit unchanged. Writing 1 to a bit of ROC attribute keeps the bit unchanged. More than one status can be cleared with a single register write. The Card Interrupt is cleared when the card stops asserting the interrupt; that is, when the Card Driver services the interrupt condition.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**NML\_INT\_STATUS:** [BAR0] + 30h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0000h

15	0	0	0	0	12	0	0	0	0	8	0	0	0	0	4	0	0	0	0

Bit Range	Default & Access	Description
15	0b RO	<b>Error Interrupt (err_int):</b> If any of the bits in the Error Interrupt Status Register are set, then this bit is set. Therefore the HD can test for an error by checking this bit first. 0 - No Error. 1 - Error.
14	0h RW/1C	<b>Boot Terminate Interrupt (boot_ter_int):</b> This status is set if the boot operation get terminated. 0 - Boot operation is not terminated. 1 - Boot operation is terminated NOTE: Not part of the SD Host Controller Simplified Specification Version 3.00
13	0h RW/1C	<b>Boot Acknowledge Received (boot_ck_rcv):</b> This status is set if the boot acknowledge is received from device. 0 - Boot ack is not received. 1 - Boot ack is received. NOTE: Not part of the SD Host Controller Simplified Specification Version 3.00
12	0h RO	<b>Re-Tuning Event (re_tune):</b> This status is set if Re-Tuning Request in the Present State register changes from 0 to 1. Host Controller requests Host Driver to perform re-tuning for next data transfer. Current data transfer (not large block count) can be completed without re-tuning. 1 - Re-Tuning should be performed, 0 - Re-Tuning is not required
11	0h RO	<b>INT_C (int_c):</b> This status is set if INT_C is enabled and INT_C# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_C interrupt factor
10	0h RO	<b>INT_B (int_b):</b> This status is set if INT_B is enabled and INT_B# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_B interrupt factor
9	0h RO	<b>INT_A (int_a):</b> This status is set if INT_A is enabled and INT_A# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_A interrupt factor
8	0b RO	<b>Card Interrupt (crd_int):</b> Writing this bit to 1 does not clear this bit. It is cleared by resetting the SD card interrupt factor. In 1-bit mode, the HC shall detect the Card Interrupt without SD Clock to support wakeup. In 4-bit mode, the card interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the card and the interrupt to the Host system. when this status has been set and the HD needs to start this interrupt service, Card Interrupt Status Enable in the Normal Interrupt Status register shall be set to 0 in order to clear the card interrupt statuses latched in the HC and stop driving the Host System. After completion of the card interrupt service (the reset factor in the SD card and the interrupt signal may not be asserted), set Card Interrupt Status Enable to 1 and start sampling the interrupt signal again. Interrupt detected by DAT[1] is supported when there is a card per slot. In case of shared bus, interrupt pins are used to detect interrupts. If 000b is set to Interrupt Pin Select in the Shared Bus Control register, this status is effective. Non-zero value is set to Interrupt Pin Select, INT_A, INT_B or INT_C is then used to device interrupts. 0 - No Card Interrupt, 1 - Generate Card Interrupt
7	0b RW/1C	<b>Card Removal (crd_rm):</b> This status is set if the Card Inserted in the Present State register changes from 1 to 0. When the HD writes this bit to 1 to clear this status the status of the Card Inserted in the Present State register should be confirmed. Because the card detect may possibly be changed when the HD clear this bit an Interrupt event may not be generated. 0 - Card State Stable or Debouncing, 1 - Card Removed
6	0b RW/1C	<b>Card Insertion (crd_ins):</b> This status is set if the Card Inserted in the Present State register changes from 0 to 1. When the HD writes this bit to 1 to clear this status the status of the Card Inserted in the Present State register should be confirmed. Because the card detect may possibly be changed when the HD clear this bit an Interrupt event may not be generated. 0 - Card State Stable or Debouncing, 1 - Card Inserted
5	0b RW/1C	<b>Buffer Read Ready (buf_rd_rdy):</b> This status is set if the Buffer Read Enable changes from 0 to 1. Buffer Read Ready is set to 1 for every CMD19 execution in tuning procedure. 0 - Not Ready to read Buffer. 1 - Ready to read Buffer.

Bit Range	Default & Access	Description
4	0b RW/1C	<b>Buffer Write Ready (buf_wr_rdy):</b> This status is set if the Buffer Write Enable changes from 0 to 1. 0 - Not Ready to Write Buffer. 1 - Ready to Write Buffer.
3	0b RW/1C	<b>DMA Interrupt (dma_int):</b> This status is set if the HC detects the Host DMA Buffer Boundary in the Block Size register. 0 - No DMA Interrupt, 1 - DMA Interrupt is Generated
2	0b RW/1C	<b>Block Gap Event (blk_gap_event):</b> If the Stop At Block Gap Request in the Block Gap Control Register is set, this bit is set. Read Transaction: This bit is set at the falling edge of the DAT Line Active Status (When the transaction is stopped at SD Bus timing. The Read Wait must be supported in order to use this function). Write Transaction: This bit is set at the falling edge of Write Transfer Active Status (After getting CRC status at SD Bus timing). 0 - No Block Gap Event, 1 - Transaction stopped at Block Gap
1	0b RW/1C	<b>Transfer Complete (tx_comp):</b> This bit is set when a read / write transfer and a command with busy is completed. (1) In the case of a Read Transaction This bit is set at the falling edge of Read Transfer Active Status. This interrupt is generated in two cases. The first is when a data transfer is completed as specified by data length (After the last data has been read to the Host System). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request in the Block Gap Control register (After valid data has been read to the Host System). Refer to Section 3.12.3 of SD Host Controller Simplified Specification Version 3.00 for more details on the sequence of events. (2) In the case of a Write Transaction This bit is set at the falling edge of the DAT Line Active Status. This interrupt is generated in two cases. The first is when the last data is written to the SD card as specified by data length and the busy signal released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request in the Block Gap Control register and data transfers completed. (After valid data is written to the SD card and the busy signal released). Refer to Section 3.12.4 for more details on the sequence of events. (3) In the case of a command with busy This bit is set when busy is de-asserted. Refer to DAT Line Active and Command Inhibit (DAT) in the Present State register. Table on page 66 of SD Host Controller Simplified Specification Version 3.00, Relation between Transfer Complete and Data Timeout Error, shows that Transfer Complete has higher priority than Data Timeout Error. If both bits are set to 1, execution of a command can be considered to be completed. 1 Command execution is completed 0 Not complete While performing tuning procedure (Execute Tuning is set to 1), Transfer Complete is not set to 1.
0	0b RW/1C	<b>Command Complete (cmd_comp):</b> This bit is set when get the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23 but generated by the response of a read/write command. Refer to Command Inhibit (CMD) in the Present State register for how to control this bit. Table on page 67 of SD Host Controller Simplified Specification Version 3.00, Relation between command complete and command time-out error, shows that Command Timeout Error has higher priority than Command Complete. If both bits are set to 1, it can be considered that the response was not received correctly. 1 Command complete 0 No command complete

### 17.6.20 Error Interrupt Status Register (ERR\_INT\_STATUS)—Offset 32h

Signals defined in this register can be enabled by the Error Interrupt Status Enable register, but not by the Error Interrupt Signal Enable register. The interrupt is generated when the Error Interrupt Signal Enable is enabled and at least one of the statuses is set to 1. Writing to 1 clears the bit and writing to 0 keeps the bit unchanged. More than one status can be cleared at the one register write.

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 16 bits)

ERR\_INT\_STATUS: [BAR0] + 32h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:0] + 10h

Default: 0000h

15: 14	00b RW	<b>Vendor Specific Error Status (vend_spec_err_status):</b> Reserved
13	0b RW	<b>CEATA Error Status (ceata_err):</b> Occurs when ATA command termination has occurred due to an error condition the device has encountered. 0 - no error, 1 - error NOTE: Not part of the SD Host Controller Simplified Specification Version 3.00
12	0b RW	<b>Target Response Error (tgt_rsp_err):</b> Occurs when detecting ERROR in m_hresp (dma transaction) 0 - no error, 1 - error NOTE: Not part of the SD Host Controller Simplified Specification Version 3.00
11	0b RO	<b>RSVD (rsvd):</b> Reserved
10	0b RW	<b>Tuning Error (tune_err):</b> This bit is set when an unrecoverable error is detected in a tuning circuit except during tuning procedure (Occurrence of an error during tuning procedure is indicated by Sampling Select). By detecting Tuning Error, Host Driver needs to abort a command executing and perform tuning. To reset tuning circuit, Sampling Clock shall be set to 0 before executing tuning procedure. The Tuning Error is higher priority than the other error interrupts generated during data transfer. By detecting Turning Error, the Host Driver should discard data transferred by a current read/write command and retry data transfer after the Host Controller retrieved from tuning circuit error. 1 - Error, 0 - No Error
9	0b RW	<b>ADMA Error (adma_err):</b> This bit is set when the Host Controller detects errors during ADMA based data transfer. The state of the ADMA at an error occurrence is saved in the ADMA Error Status Register. 1 - Error, 0 - No Error
8	0b RW	<b>Auto CMD Error (cmd12_err):</b> Auto CMD12 and Auto CMD23 use this error status. This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1. In case of Auto CMD12, this bit is set to 1, not only when the errors in Auto CMD12 occur but also when Auto CMD12 is not executed due to the previous command error. 0 - No Error, 1 - Error
7	0b RW	<b>Current Limit Error (cur_limit_err):</b> By setting the SD Bus Power bit in the Power Control Register, the HC is requested to supply power for the SD Bus. If the HC supports the Current Limit Function, it can be protected from an Illegal card by stopping power supply to the card in which case this bit indicates a failure status. Reading 1 means the HC is not supplying power to SD card due to some failure. Reading 0 means that the HC is supplying power and no error has occurred. This bit shall always set to be 0, if the HC does not support this function. 0 - No Error, 1 - Power Fail
6	0b RW	<b>Data End Bit Error (data_end_bit_err):</b> Occurs when detecting 0 at the end bit position of read data which uses the DAT line or the end bit position of the CRC status. 0 - No Error, 1 - Error
5	0b RW	<b>Data CRC Error (data_crc_err):</b> Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC Status having a value of other than 010. 0 - No Error, 1 - Error

Bit Range	Default & Access	Description
4	0b RW	<b>Data Timeout Error (data_timeout_err)</b> : Occurs when detecting one of following timeout conditions. 1. Busy Time-out for R1b, R5b type. 2. Busy Time-out after Write CRC status 3. Write CRC status Time-out 4. Read Data Time-out 0 - No Error, 1 - Timeout
3	0b RW	<b>Command Index Error (cmd_index_err)</b> : Occurs if a Command Index error occurs in the Command Response. 0 - No Error, 1 - Error
2	0b RW	<b>Command End Bit Error (cmd_end_bit_err)</b> : Occurs when detecting that the end bit of a command response is 0. 0 - No Error, 1 - End Bit Error Generated
1	0b RW	<b>Command CRC Error (cmd_crc_err)</b> : Command CRC Error is generated in two cases. 1. If a response is returned and the Command Time-out Error is set to 0, this bit is set to 1 when detecting a CRT error in the command response 2. The HC detects a CMD line conflict by monitoring the CMD line when a command is issued. If the HC drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SDCLK edge, then the HC shall abort the command (Stop driving CMD line) and set this bit to 1. The Command Time-out Error shall also be set to 1 to distinguish CMD line conflict. 0 - No Error, 1 - CRC Error Generated
0	0b RW	<b>Command Timeout Error (cmd_timeout_err)</b> : Occurs only if the no response is returned within 64 SDCLK cycles from the end bit of the command. If the HC detects a CMD line conflict, in which case Command CRC Error shall also be set. This bit shall be set without waiting for 64 SDCLK cycles because the command will be aborted by the HC. 0 - No Error, 1 - Timeout

### 17.6.21 Normal Interrupt Status Enable (NRM\_INT\_STATUS\_EN)—Offset 34h

Setting to 1 enables Interrupt Status.

#### Access Method

### 17.6.25 Auto CMD12 Error Status Register (CMD12\_ERR\_STAT)—Offset 3Ch

This register is used to indicate CMD12 response error of Auto CMD12 and CMD23 response error of Auto CMD23. The Host driver can determine what kind of Auto CMD12 / CMD23 errors occur by this register. Auto CMD23 errors are indicated in bit 04-01. This register is valid only when the Auto CMD Error is set.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**CMD12\_ERR\_STAT:** [BAR0] + 3Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
rsvd1		cmd_not_iss_cmd12_err	rsvd2	cmd12_ind_err
			cmd12_end_bit_err	cmd12_crc_err
			cmd12_timeout_err	cmd12_not_exe

Bit Range	Default & Access	Description
15: 8	0h RO	<b>RSVD1 (rsvd1):</b> Reserved
7	0b RO	<b>Command Not Issued By Auto CMD12 Error (cmd_not_iss_cmd12_err):</b> CMD_wo_DAT is not executed due to an Auto CMD12 error (D04 - D01) in this register. This bit is set to 0 when Auto CMD Error is generated by Auto CMD23. 0 - No Error, 1 - Not Issued
6: 5	0h RO	<b>RSVD2 (rsvd2):</b> Reserved

Bit Range	Default & Access	Description
4	0b RO	<b>Auto CMD Index Error (cmd12_ind_err)</b> : Occurs if the Command Index error occurs in response to a command. 0 - No Error, 1 - Error
3	0b RO	<b>Auto CMD End Bit Error (cmd12_end_bit_err)</b> : Occurs when detecting that the end bit of command response is 0. 0 - No Error, 1 - End Bit Error Generated
2	0b RO	<b>Auto CMD CRC Error (cmd12_crc_err)</b> : Occurs when detecting a CRC error in the command response. 0 - No Error, 1 - CRC Error Generated
1	0b RO	<b>Auto CMD Timeout Error (cmd12_timeout_err)</b> : Occurs if the no response is returned within 64 SDCLK cycles from the end bit of the command. If this bit is set to 1, the other error status bits (D04 - D02) are meaningless. 0 - No Error, 1 - Timeout
0	0b RO	<b>Auto CMD12 Not Executed (cmd12_not_exe)</b> : If memory multiple block data transfer is not started due to command error, this bit is not set because it is not necessary to issue Auto CMD12. Setting this bit to 1 means the HC cannot issue Auto CMD12 to stop memory multiple block transfer due to some error. If this bit is set to 1, other error status bits (D04 - D01) are meaningless. This bit is set to 0 when Auto CMD Error is generated by Auto CMD23. 0 - Executed, 1 - Not Executed

## 17.6.26 Host Control 2 Register (HOST\_CTRL\_2)—Offset 3Eh

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**HOST\_CTRL\_2:** [BAR0] + 3Eh

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
preset_value	async_int	rsvd0	sampling_clock	execute_tuning
			driver_strength	vi
				uhs_mode

Bit Range	Default & Access	Description
15	0b RW	<b>Preset Value Enable (preset_value)</b> : Host Controller Version 3.00 supports this bit. As the operating SDCLK frequency and I/O driver strength depend on the Host System implementation, it is difficult to determine these parameters in the Standard Host Driver. When Preset Value Enable is set to automatic This bit enables the functions defined in the Preset Value registers. 1 Automatic Selection by Preset Value are Enabled 0 SDCLK and Driver Strength are controlled by Host Driver If this bit is set to 0, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Driver. If this bit is set to 1, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Controller as specified in the Preset Value registers.
14	0b RW	<b>Asynchronous Interrupt Enable (async_int)</b> : This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode (and zero is set to Interrupt Pin Select in the Shared Bus Control register). If this bit is set to 1, the Host Driver can stop the SDCLK during asynchronous interrupt period to save power. During this period, the Host Controller continues to deliver Card Interrupt to the host when it is asserted by the Card. 1 Enabled, 0 Disabled
13: 8	00h RO	<b>RSVD0 (rsvd0)</b> : Reserved

Bit Range	Default & Access	Description
7	0b RW	<b>Sampling Clock Select (sampling_clock):</b> This bit is set by tuning procedure when Execute Tuning is cleared. Writing 1 to this bit is meaningless and ignored. Setting 1 means that tuning is completed successfully and setting 0 means that tuning is failed. Host Controller uses this bit to select sampling clock to receive CMD and DAT. This bit is cleared by writing 0. Change of this bit is not allowed while the Host Controller is receiving response or a read data block. 1 Tuned clock is used to sample data, 0 Fixed clock is used to sample data
6	0b RW/AC	<b>Execute Tuning (execute_tuning):</b> This bit is set to 1 to start tuning procedure and automatically cleared when tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select. Tuning procedure is aborted by writing 0 for more detail about tuning procedure. 1 Execute Tuning, 0 Not Tuned or Tuning Completed
5: 4	0b RW	<b>Driver Strength Select (driver_strength):</b> Host Controller output driver in 1.8V signaling is selected by this bit. In 3.3V signaling, this field is not effective. This field can be set depends on Driver Type A, C and D support bits in the Capabilities register. This bit depends on setting of Preset Value Enable. If Preset Value Enable = 0, this field is set by Host Driver. If Preset Value Enable = 1, this field is automatically set by a value specified in the one of Preset Value registers. 00b Driver Type B is Selected (Default), 01b Driver Type A is Selected, 10b Driver Type C is Selected, 11b Driver Type D is Selected
3	0b RO	<b>Reserved (v1):</b> Reserved
2: 0	0b RW	<b>UHS Mode Select (uhs_mode):</b> This field is used to select one of UHS-I modes and effective when 1.8V Signaling Enable is set to 1. If Preset Value Enable in the Host Control 2 register is set to 1, Host Controller sets SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select according to Preset Value registers. In this case, one of preset value registers is selected by this field. Host Driver needs to reset SD Clock Enable before changing this field to avoid generating clock glitch. After setting this field, Host Driver sets SD Clock Enable again. 000b - SDR12, 001b - SDR25, 010b - SDR50, 011b - SDR104, 100b - DDR50, 101b - 111 Reserved. When SDR50, SDR104 or DDR50 is selected for SDIO card, interrupt detection at the block gap shall not be used. Read Wait timing is changed for these modes. Refer to the SDIO Specification Version 3.00 for more detail.

### 17.6.27 Capabilities Register (CAPABILITIES)—Offset 40h

This register provides the Host Driver with information specific to the Host Controller implementation. The Host Controller may implement these values as fixed or loaded from flash memory during power on initialization. Refer to Software Reset For All in the Software Reset register for loading from flash memory and completion timing control.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CAPABILITIES:** [BAR0] + 40h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:0] + 10h

**Default:** 01EC32B2h

Bit Range	Default & Access	Description
17: 16	00b RO	<b>Max Block Length (max_block_length):</b> This value indicates the maximum block size that the HD can read and write to the buffer in the HC. The buffer shall transfer this block size without wait cycles. Three sizes can be defined as indicated below. 00 - 512 byte, 01 - 1024 byte, 10 - 2048 byte, 11 - 4096 byte
15: 8	32h RO	<b>Base Clock Frequency for SD Clock (base_clock_frequency_sd_clk):</b> (1) 6-bit Base Clock Frequency This mode is supported by the Host Controller Version 1.00 and 2.00. Upper 2-bit is not effective and always 0. Unit values are 1MHz. The supported clock range is 10MHz to 63MHz. 11xx xxxxb - Not supported, 0011 1111b - 63MHz, 0000 0010b - 2MHz, 0000 0001b - 1MHz, 0000 0000b - Get information via another method. (2) 8-bit Base Clock Frequency This mode is supported by the Host Controller Version 3.00. Unit values are 1MHz. The supported clock range is 10MHz to 255MHz. FFh - 255MHz, 02h - 2MHz, 01h - 1MHz, 00h - Get information via another method. If the real frequency is 16.5MHz, the larger value shall be set 0001 0001b (17MHz) because the Host Driver use this value to calculate the clock divider value (Refer to the SDCLK Frequency Select in the Clock Control register.) and it shall not exceed upper limit of the SD Clock frequency. If these bits are all 0, the Host System has to get information via another method.
7	1b RO	<b>Timeout Clock Unit (timeout_clock_unit):</b> This bit shows the unit of base clock frequency used to detect Data Timeout Error. 0 - KHz, 1 - MHz
6	0b RO	<b>RSVD6 (rsvd6):</b> Reserved
5: 0	32h RO	<b>Timeout Clock Frequency (timeout_clock_frequency):</b> This bit shows the base clock frequency used to detect Data Timeout Error. Not 0 - 1KHz to 63KHz or 1MHz to 63MHz, 000000b - Get Information via another method.

### 17.6.28 Capabilities Register 2 (CAPABILITIES\_2)—Offset 44h

This register provides the host driver with information specific to the host controller implementation.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CAPABILITIES\_2:** [BAR0] + 44h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:0] + 10h

### 17.6.31 Force Event Register for Error Interrupt Status (FORCE\_EVENT\_ERR\_INT\_STAT)—Offset 52h

The Force Event Register is not a physically implemented register. Rather, it is an address at which the Error Interrupt Status register can be written. The effect of a write to this address will be reflected in the Error Interrupt Status Register if the corresponding bit of the Error Interrupt Status Enable Register is set. Writing 1 : set each bit of the Error Interrupt Status Register Writing 0 : no effect Note: By setting this register, the Error Interrupt can be set in the Error Interrupt Status register. In order to generate interrupt signal, both the Error Interrupt Status Enable and Error Interrupt Signal Enable shall be set.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**FORCE\_EVENT\_ERR\_INT\_STAT:** [BAR0] + 52h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

### 17.6.32 ADMA Error Status Register (ADMA\_ERR\_STAT)—Offset 54h

When ADMA Error Interrupt is occurred, the ADMA Error States field in this register holds the ADMA state and the ADMA System Address Register holds the address around the error descriptor. For recovering the error, the Host Driver requires the ADMA state to identify the error descriptor address as follows: ST\_STOP: Previous location set in the ADMA System Address register is the error descriptor address ST\_FDS: Current location set in the ADMA System Address register is the error descriptor address ST\_CADR: This state is never set because do not generate ADMA error in this state. ST\_TFR: Previous location set in the ADMA System Address register is the error descriptor address In case of write operation, the Host Driver should use ACMD22 to get the number of written block rather than using this information, since unwritten data may exist in the Host Controller. The Host Controller generates the ADMA Error Interrupt when it detects invalid descriptor data (Valid=0) at the ST\_FDS state. In this case, ADMA Error State indicates that an error occurs at ST\_FDS state. The Host Driver may find that the Valid bit is not set in the error descriptor.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**ADMA\_ERR\_STAT:** [BAR0] + 54h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:0] + 10h

The upper and lower 4- bits indicate the version. 00 - SD Host Specification version 1.0, 01 - SD Host Specification version 2.00 including only the feature of the Test Register, 02 - SD Host Specification Version 3.00, others - Reserved

§ §

## 18.0 High Speed UART

The Intel® Quark™ SoC X1000 implements two instances of a 16550 compliant UART controller that supports baud rates between 300 and 2764800. Hardware flow control is also supported.

*Note:* Only one UART controller (UART0) provides MODEM pins.

### 18.1 Signal Descriptions

See [Chapter 2.0, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Type:** The buffer type found in [Chapter 4.0, “Electrical Characteristics”](#)
- **Description:** A brief explanation of the signal’s function

**Table 113. UART 0 Interface Signals**

Signal Name	Direction/ Type	Description
SIU0_RXD	I	UART 0 - Serial Input
SIU0_TXD	O	UART 0 - Serial Output
SIU0_RTS_B	O	UART 0 - MODEM Request to Send
SIU0_CTS_B	I	UART 0 - MODEM Clear to Send
SIU0_DCD_B	I	UART 0 - MODEM Data Carrier Detect
SIU0_DSR_B	I	UART 0 - MODEM Data Set Ready
SIU0_DTR_B	O	UART 0 - MODEM Data Terminal Ready
SIU0_RI_B	I	UART 0 - MODEM Ring Indicator

**Table 114. UART 1 Interface Signals**

Signal Name	Direction/ Type	Description
SIU1_RXD	I	UART 1 - Serial Input
SIU1_TXD	O	UART 1 -Serial Output
SIU1_RTS_B	O	UART 1 - MODEM Request to Send
SIU1_CTS_B	I	UART 1 - MODEM Clear to Send

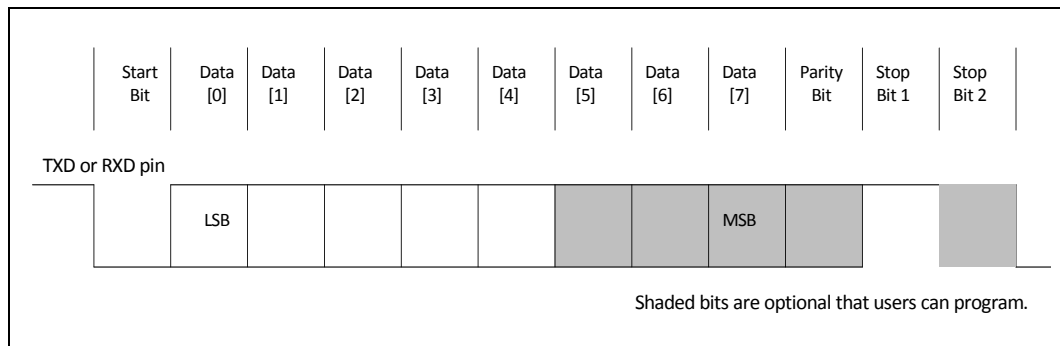

## 18.2 Features

### 18.2.1 UART Function

The UART transmits and receives data in bit frames as shown in [Figure 37](#).

- Each data frame is between 7 and 12 bits long, depending on the size of data programmed and if parity and stop bits are enabled.
- The frame begins with a start bit that is represented by a high-to-low transition.
- Next, 5 to 8 bits of data are transmitted, beginning with the Least Significant Bit (LSB). An optional parity bit follows, which is set if even parity is enabled and an odd number of ones exist within the data byte; or, if odd parity is enabled and the data byte contains an even number of ones.
- The data frame ends with one, one and a half, or two stop bits (as programmed by users), which is represented by one or two successive bit periods of a logic one.

**Figure 37. UART Data Transfer Flow**

### 18.2.2 Baud Rate Generator

The baud rates for the UARTs are generated from the base frequency (Fbase) indicated in [Table 115](#) by programming the DLH and DLL registers as divisor. The hexadecimal value of the divisor is (IER\_DLH[7:0] < 8) | RBR\_THR\_DLL[7:0].

The output baud rate is equal to the base frequency divided by sixteen times the value of the divisor, as follows:  $\text{baud rate} = (\text{Fbase}) / (16 * \text{divisor})$ .

**Table 115. Baud Rates Achievable with Different DLAB Settings**

DLH,DLL Divisor	DLH,DLL Divisor Hexadecimal	Baud Rate
Fbase: 44236800 Hz		
1	0001	2764800
3	0003	921600
6	0006	460800
9	0009	307200
12	000C	230400
15	000F	184320
18	0012	153600
24	0018	115200
48	0030	57600
72	0048	38400

**Table 115. Baud Rates Achievable with Different DLAB Settings**

DLH,DLL Divisor	DLH,DLL Divisor Hexadecimal	Baud Rate
144	0090	19200
288	0120	9600
384	0180	7200
576	0240	4800
768	0300	3600
1152	0480	2400
1536	0600	1800
2304	0900	1200
4608	1200	600
9216	2400	300

## 18.3 Usage

Each UART has a Transmit FIFO and a Receive FIFO and each FIFO holds 16 bytes of data. There are three separate methods for moving data into and out of the FIFOs: DMA, Interrupts, and Polling.

### 18.3.1 DMA Mode Operation

Each UART has an associated DMA Controller (DMAC) that is enabled by setting DMA\_CFG\_REG.DMA\_EN to 1. Two DMA channels are used — one for transmit data and one for receive data.

A hardware interface between the UART and the DMA is used to signal when data can be read from the Receive FIFO and to signal when the Transmit FIFO is either empty or has reached a programmed threshold level. This interface gives the DMA all responsibility for the transfer of data and it must be programmed accordingly. Using the UART to set the DMA mode via IIR\_FCR[3] has no effect. An interrupt is generated upon the completion of a DMA transfer.

NOTE: RX data can overrun or be corrupted when operating the UART DMA with baud rate > 115200. It is recommended to disable the DMA for high baud rate or high UART bandwidth operations.

#### 18.3.1.1 Receiver DMA

The DMA Controller uses Channel 0 to transfer data from the UART to Host Memory. The UART requests a DMA transfer to memory under the following condition:

- When the Receiver FIFO is at or above programmed trigger level in FIFO mode

To transfer data from the UART, the source transfer width (CTL0\_L.SRC\_TR\_WIDTH) is set to 8-bits to match the size of the FIFO entries and the destination transfer width (CTL0\_L.DST\_TR\_WIDTH) is set to 32-bits.

The receive watermark level (IIR\_FCR[7:6]) should be set such that DMA requests to transfer data to memory are made often enough for the Receiver FIFO to accept serial transfers continuously. This will prevent the Receiver FIFO from overflowing.

To prevent Receiver FIFO underflow, the source burst length must be set such that the FIFO can be emptied, but not underflowed, at the completion of the burst transaction. For optimal operation, CTL0\_L.SRC\_MSIZ should be set at the receive watermark level; that is:

- CTL0\_L.SRC\_MSIZ = decoded level of IIR\_FCR[7:6]

### 18.3.1.2 Transmitter DMA

The DMA Controller uses Channel 1 to transfer data from Host Memory to the UART. The UART requests a DMA transfer from memory under the following conditions:

- When the transmitter FIFO is empty in FIFO mode with Programmable THRE interrupt mode disabled
- When the transmitter FIFO is at, or below the programmed threshold with FIFO and Programmable THRE interrupt mode enabled

To transfer data to the UART, the destination transfer width (CTL1\_L.DST\_TR\_WIDTH) is set to 8-bits to match the size of the FIFO entries and the source transfer width (CTL1\_L.SRC\_TR\_WIDTH) is set to 32-bits.

The transmit watermark level (IIR\_FCR[5:4]) should be set such that DMA requests to transfer data from memory are made often enough for the Transmitter FIFO to be able to perform serial transfers continuously. This will prevent the Transmitter FIFO from underflowing.

The Transmitter FIFO can overflow if CTL1\_L.DEST\_MSIZ is programmed to a value greater than the transmit watermark level as there may not be not enough space in the Transmitter FIFO to service the destination burst request. To avoid overflow, CTL1\_L.DEST\_MSIZ should be programmed as follows:

- CTL1\_L.DEST\_MSIZ ≤ UART FIFO DEPTH – decoded level of IIR\_FCR[5:4]

For optimal operation, CTL1\_L.DEST\_MSIZ should be set at the FIFO level that triggers a transmit DMA request; that is:

- CTL1\_L.DEST\_MSIZ = UART FIFO DEPTH – decoded level of IIR\_FCR[5:4]

## 18.3.2 FIFO Interrupt-Mode Operation

### 18.3.2.1 Receiver Interrupt

When the Receive FIFO and receiver interrupts are enabled (IIR\_FCR[0]=1 and IER\_DLH[0]=1), receiver interrupts occur as follows:

- The Receive Data Available Interrupt is asserted when the FIFO has reached its programmed trigger level. The interrupt is cleared when the FIFO drops below the programmed trigger level.
- The IIR Receive Data Available indication also occurs when the FIFO trigger level is reached, and like the interrupt, the bits are cleared when the FIFO drops below the trigger level.
- The Data Ready bit (LSR.DR) is set to 1 as soon as a character is transferred from the shift register to the Receive FIFO. This bit is reset to 0 when the FIFO is empty.

### 18.3.2.2 Transmitter Interrupt

When the transmitter FIFO and transmitter interrupt are enabled (IIR\_FCR[0]=1, IER\_DLH[1]=1), transmit interrupts occur as follows:

- When Programmable THRE Interrupt Mode is disabled (IER\_DLH[7] set to 0), the transmitter interrupt occurs when the transmitter FIFO is empty. It is cleared when the transmitter FIFO is no longer empty or the interrupt identification register (IIR) is read.
- When Programmable THRE Interrupt Mode is enabled (IER\_DLH[7] set to 1), the transmitter interrupt occurs when the number of entries in the transmitter FIFO is

at or below a programmed transmitter FIFO empty threshold level (IIR\_FCR[5:4]). It is cleared when the number of entries in the transmitter FIFO is greater than the programmed transmitter FIFO empty threshold.

Users could cause the UART Transmit FIFO to overflow when too many characters are written. FIFO underflow does not cause an error as the UART waits for the Transmit FIFO to be serviced.

### 18.3.3 FIFO Polled-Mode Operation

With the FIFOs enabled (IIR\_FCR[0] set to 1), clearing IER\_DLH[7] and IER\_DLH[3:0] puts the serial port in the FIFO Polled Operation mode. Because the receiver and the transmitter are controlled separately, either one or both can be in Polled Operation mode. In this mode, software checks Receiver and Transmitter status using the Line Status Register (LSR). The processor polls the following bits for Receive and Transmit Data Service.

#### 18.3.3.1 Receive Data Service

The processor checks the Data Ready bit (LSR.DR) which is set when 1 or more bytes remains in the Receive FIFO or Receive Buffer Register (RBR\_THR\_DLL).

#### 18.3.3.2 Transmit Data Service

The processor checks transmit data request LSR.THRE bit, which is set when the transmitter needs data.

The processor can also check transmitter empty LSR.TEMT, which is set when the Transmit FIFO or Holding register is empty.

### 18.3.4 Autoflow Control

Autoflow Control uses Clear-to-Send (nCTS) and Request-to-Send (nRTS) signals to automatically control the flow of data between the UART and external modem. When autoflow is enabled, the remote device is not allowed to send data unless the UART asserts nRTS low. If the UART de-asserts nRTS while the remote device is sending data, the remote device is allowed to send one additional byte after nRTS is de-asserted. An overflow could occur if the remote device violates this rule. Likewise, the UART is not allowed to transmit data unless the remote device asserts nCTS low. This feature increases system efficiency and eliminates the possibility of a Receive FIFO Overflow error due to long interrupt latency.

Autoflow mode can be used in two ways: Full autoflow, automating both nCTS and nRTS, and half autoflow, automating only nCTS. Full Autoflow is enabled by writing a 1 to bits 1 and 5 of the Modem Control Register (MCR). Auto-nCTS-Only mode is enabled by writing a 1 to bit 5 and a 0 to bit 1 of the MCR register.

NOTE: It is recommended to turn on the autoflow control at all times to prevent data corruption or overrun issue.

#### 18.3.4.1 RTS (UART Output)

When in Full-autoflow mode, nRTS is asserted when the UART FIFO is ready to receive data from the remote transmitter. This occurs when the amount of data in the Receive FIFO is below the programmable threshold value. When the amount of data in the Receive FIFO reaches the programmable threshold, nRTS is de-asserted. It will be asserted once again when enough bytes are removed from the FIFO to lower the data level below the threshold.

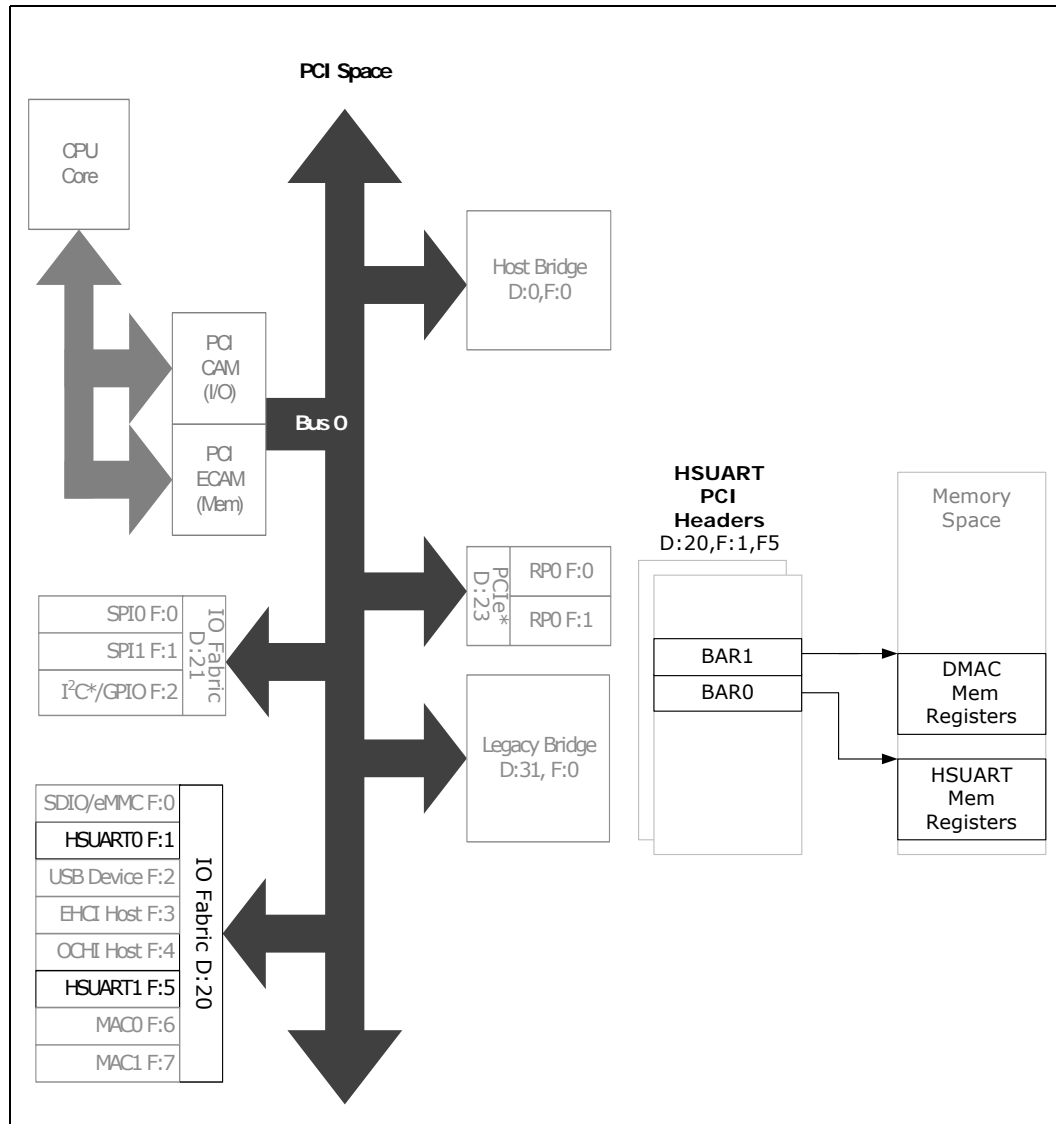

### 18.3.4.2 CTS (UART Input)

When in Full or Half-autoflow mode, nCTS is asserted by the remote receiver when the receiver is ready to receive data from the UART. The UART checks nCTS before sending the next byte of data and will not transmit the byte until nCTS is low. If nCTS goes high while the transfer of a byte is in progress, the transmitter completes this byte.

## 18.4 Register Map

See Chapter 5.0, “Register Access Methods” for additional information.

Figure 38. HSUART Register Map

## 18.5 PCI Configuration Registers

Registers listed are for Function 1 (HS-UART0). Function 5 (HS-UART1) contains the same registers. Differences between the HS-UARTs are noted in individual registers.

**Table 116. Summary of PCI Configuration Registers—0/20/1**

Offset Start	Offset End	Register ID—Description	Default Value
0h	1h	"Vendor ID (VENDOR_ID)—Offset 0h" on page 669	8086h
2h	3h	"Device ID (DEVICE_ID)—Offset 2h" on page 670	0936h
4h	5h	"Command Register (COMMAND_REGISTER)—Offset 4h" on page 670	0000h

### 18.5.1 Vendor ID (VENDOR\_ID)—Offset 0h

#### Access Method

Bit Range	Default & Access	Description
8	0b RW	<b>SERR Enable (SERREn)</b> : When set, this bit enables the non-fatal and fatal errors detected by the function to be reported to the root complex.
7: 3	00h RO	<b>Reserved (RSVD)</b> : Reserved.
2	0b RW	<b>Bus Master Enable (MasEn)</b> : 0=)disables upstream requests 1=)enables upstream requests.
1	0b RW	<b>Memory Space Enable (MEMEn)</b> : Device support for Memory transactions. 0 =) not supported. 1 =) supported.
0	0h RO	<b>Reserved (RSVD)</b> : Reserved.

### 18.5.4 Status Register (STATUS)—Offset 6h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

STATUS: [B:0, D:20, F:1] + 6h

Default: 0010h

15	12	8	4	0
0	0	0	1	0
RSVD0	SigSysErr	RcdMasAb	RSVD	DEVSEL
RSVD	FastB2B	RSVD	capable_66Mhz	hasCapList
IntrStatus	RSVD1			

Bit Range	Default & Access	Description
15	0h RO	<b>RSVD0 (RSVD0)</b> : Reserved
14	0b RW	<b>Signaled System Error (SigSysErr)</b> : Set when a function detects a system error and the SERR Enable bit is set
13	0b RW	<b>Received master abort (RcdMasAb)</b> : Set when requester receives a completion with Unsupported Request completion status
12: 11	0h RO	<b>Reserved (RSVD)</b> : Reserved.
10: 9	0b RO	<b>DEVSEL Timing (DEVSEL)</b> : Deprecated: Hardwired to 0
8	0h RO	<b>Reserved (RSVD)</b> : Reserved.
7	0b RO	<b>Fast Back-to-Back Capable (FastB2B)</b> : Deprecated: Hardwired to 0
6	0h RO	<b>Reserved (RSVD)</b> : Reserved.
5	0b RO	<b>66MHz-Capable (capable_66Mhz)</b> : Deprecated: Hardwired to 0
4	1h RO	<b>Capabilities List (hasCapList)</b> : Indicates the presence of one or more capability register sets.

Bit Range	Default & Access	Description
3	0b RO	<b>Interrupt Status (IntrStatus)</b> : Indicates that the function has a legacy interrupt request outstanding. This bit has no meaning if Message Signaled Interrupts are being used
2: 0	0h RO	<b>RSVD1 (RSVD1)</b> : Reserved

### 18.5.5 Revision ID and Class Code (REV\_ID\_CLASS\_CODE)—Offset 8h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**REV\_ID\_CLASS\_CODE:** [B:0, D:20, F:1] + 8h

**Default:** 07000210h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	1	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	1	0	0	
0	1	1	1	0	0	0	0	0	
classCode			subClassCode			progIntf		rev_id	

Bit Range	Default & Access	Description
31: 24	07h RO	<b>Class Code (classCode)</b> : Broadly classifies the type of function that the device performs.
23: 16	00h RO	<b>Sub-Class Code (subClassCode)</b> : Identifies more specifically (than the class_code byte) the function of the device.
15: 8	02h RO	<b>Programming Interface (progIntf)</b> : Used to define the register set variation within a particular sub-class.
7: 0	10h RO	<b>Revision ID (rev_id)</b> : Assigned by the function manufacturer and identifies the revision number of the function.

### 18.5.6 Cache Line Size (CACHE\_LINE\_SIZE)—Offset Ch

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**CACHE\_LINE\_SIZE:** [B:0, D:20, F:1] + Ch

**Default:** 00h

7	4	0
0	0	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RW	<b>Cache Line Size (value)</b> : Implemented as a R/W register for legacy purposes but has no effect on device functionality.

### 18.5.7 Latency Timer (LATENCY\_TIMER)—Offset Dh

**Access Method**

Type: PCI Configuration Register (Size: 8 bits)      **LATENCY\_TIMER**: [B:0, D:20, F:1] + Dh

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RO	<b>Latency Timer (value)</b> : Deprecated. Hardwire to 0.

### 18.5.8 Header Type (HEADER\_TYPE)—Offset Eh

**Access Method**

Type: PCI Configuration Register (Size: 8 bits)      **HEADER\_TYPE**: [B:0, D:20, F:1] + Eh

Default: 80h

7	4	0
1	0	0
multiFnDev	cfgHdrFormat	0

Bit Range	Default & Access	Description
7	1h RO	<b>Multi-Function Device (multiFnDev)</b> : Hard-wired to 1 to indicate that this is a multi-function device
6: 0	0h RO	<b>Configuration Header Format (cfgHdrFormat)</b> : Hard-wired to 0 to indicate that this configuration header is a Type 0 header, i.e. it is an endpoint rather than a bridge.

### 18.5.9 BIST (BIST)—Offset Fh

**Access Method**

Type: PCI Configuration Register (Size: 8 bits)      **BIST**: [B:0, D:20, F:1] + Fh

Default: 00h

7	4	0
0	0	0
BIST_capable	start_bist	RSVD
		comp_code

Bit Range	Default & Access	Description
7	0h RO	<b>BIST_capable (BIST_capable)</b> : Hard-wired to 0. (Returns 1 if the function implements a BIST)
6	0h RO	<b>Start (start_bist)</b> : Set to start the functions BIST if BIST is supported.
5: 4	0h RO	<b>Reserved (RSVD)</b> : Reserved.
3: 0	0h RO	<b>Completion Code (comp_code)</b> : Completion code having run BIST if BIST is supported. 0=)success. non-zero=)failure

### 18.5.10 Base Address Register (BAR0)—Offset 10h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**BAR0:** [B:0, D:20, F:1] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
address						RSVD	prefetchable	memType	isIO

Bit Range	Default & Access	Description
31: 12	0h RW	<b>address (address)</b> : Used to determine the size of memory required by the device and to assign a start address for this required amount of memory.
11: 4	00h RO	<b>Reserved (RSVD)</b> : Reserved.
3	0b RO	<b>Prefetchable (prefetchable)</b> : Defines the block of memory as prefetchable or not. A block of memory is prefetchable if it fulfils the following 3 conditions (1) no side effects on reads, (2) the device returns all bytes on reads regardless of the byte enables, and (3) host bridges can merge processor writes into this range without causing errors. Hardwired to 0
2: 1	00b RO	<b>Type (memType)</b> : Hardwired to 0 to indicate a 32-bit decoder
0	0b RO	<b>Memory Space Indicator (isIO)</b> : Hardwired to 0 to indicate the register is a memory address decoder

### 18.5.11 Base Address Register (BAR1)—Offset 14h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**BAR1:** [B:0, D:20, F:1] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Description
31: 12	0h RW	<b>address (address):</b> Used to determine the size of memory required by the device and to assign a start address for this required amount of memory.
11: 4	00h RO	<b>Reserved (RSVD):</b> Reserved.
3	0b RO	<b>Prefetchable (prefetchable):</b> Defines the block of memory as prefetchable or not. A block of memory is prefetchable if it fulfills the following 3 conditions (1) no side effects on reads, (2) the device returns all bytes on reads regardless of the byte enables, and (3) host bridges can merge processor writes into this range without causing errors. Hardwired to 0
2: 1	00b RO	<b>Type (memType):</b> Hardwired to 0 to indicate a 32-bit decoder
0	0b RO	<b>Memory Space Indicator (isIO):</b> Hardwired to 0 to indicate the register is a memory address decoder

### 18.5.12 Cardbus CIS Pointer (CARDBUS\_CIS\_POINTER)—Offset 28h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

CARDBUS\_CIS\_POINTER: [B:0, D:20, F:1] + 28h

Default: 00000000h

Bit Range	Default & Access	Description
31: 0	0h RO	<b>Cardbus CIS Pointer (value):</b> Reserved. Hardwire to 0.

### 18.5.13 Subsystem Vendor ID (SUB\_SYS\_VENDOR\_ID)—Offset 2Ch

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

SUB\_SYS\_VENDOR\_ID: [B:0, D:20, F:1] + 2Ch

Default: 0000h

Type: PCI Configuration Register  
(Size: 32 bits)

CAP\_POINTER: [B:0, D:20, F:1] + 34h

Default: 00000080h

Bit Range	Default & Access	Description
31: 8	0h RO	RSVD0 (RSVD0): Reserved
7: 0	80h RO	Capabilities Pointer (value): Pointer to memory location of first entry of linked list of configuration register sets each of which supports a feature. Points to PM (power management) register set at location 0x80

### 18.5.17 Interrupt Line Register (INTR\_LINE)—Offset 3Ch

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

INTR\_LINE: [B:0, D:20, F:1] + 3Ch

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RW	Interrupt Line Register (value): The value in this register tells which input of the system interrupt controller(s) the device's interrupt pin is connected to. The device itself does not use this value, rather it is used by device drivers and operating systems. Device drivers and operating systems can use this information to determine priority and vector information.

### 18.5.18 Interrupt Pin Register (INTR\_PIN)—Offset 3Dh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

INTR\_PIN: [B:0, D:20, F:1] + 3Dh

Default: 00h

Bit Range	Default & Access	Description
7: 0	02h RO	<b>Interrupt Pin Register (value):</b> The Interrupt Pin register tells which interrupt pin the device (or device function) uses. A value of 1 corresponds to INTA#. A value of 2 corresponds to INTB#. A value of 3 corresponds to INTC#. A value of 4 corresponds to INTD#. Devices (or device functions) that do not use an interrupt pin must put a 0 in this register. The values 05h through FFh are reserved. For this system function 0 is connected to INTA, 1 to INTB, 2 to INTC 3 to INTD, 4 to INTA, 5 to INTB etc.

### 18.5.19 MIN\_GNT (MIN\_GNT)—Offset 3Eh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MIN\_GNT: [B:0, D:20, F:1] + 3Eh

Default: 00h

7		4		0
0	0	0	0	0
value				

Bit Range	Default & Access	Description
7: 0	0h RO	<b>MIN_GNT (value):</b> Hardwired to 0

### 18.5.20 MAX\_LAT (MAX\_LAT)—Offset 3Fh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MAX\_LAT: [B:0, D:20, F:1] + 3Fh

Default: 00h

7		4		0
0	0	0	0	0
value				

Bit Range	Default & Access	Description
7: 0	0h RO	<b>MAX_LAT (value):</b> Hardwired to 0

### 18.5.21 Capability ID (PM\_CAP\_ID)—Offset 80h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

PM\_CAP\_ID: [B:0, D:20, F:1] + 80h

Default: 01h

7	4	0
0	0	1
value		

Bit Range	Default & Access	Description
7: 0	01h RO	<b>Capability ID (value)</b> : Identifies the feature associated with this register set. Hardwired value as per PCI SIG assigned capability ID

### 18.5.22 Next Capability Pointer (PM\_NXT\_CAP\_PTR)—Offset 81h

**Access Method**

**Type:** PCI Configuration Register (Size: 8 bits) **PM\_NXT\_CAP\_PTR:** [B:0, D:20, F:1] + 81h

**Default:** A0h

7	4	0
1	0	0
value		

Bit Range	Default & Access	Description
7: 0	a0h RO	<b>Next Capability Pointer (value)</b> : Pointer to the next register set of feature specific configuration registers. Hardwired to 0xA0 to point to the MSI Capability Structure

### 18.5.23 Power Management Capabilities (PMC)—Offset 82h

**Access Method**

**Type:** PCI Configuration Register (Size: 16 bits) **PMC:** [B:0, D:20, F:1] + 82h

**Default:** 4803h

15	12	8	4	0
0	1	0	0	1
0	0	1	0	0
0	0	0	0	0
0	0	0	0	1
0	0	0	0	1
PME_support	D2_support	D1_support	aux_curr	DSI
RSVD	PME_clock	version		

Bit Range	Default & Access	Description
15: 11	09h RO	<b>PME Support (PME_support)</b> : PME_Support field Indicates the PM states within which the function is capable of sending a PME (Power Management Event) message. 0 in a bit (=) PME is not supported in the corresponding PM state, where bit indexes 11,12,13,14,15 correspond to PM states D0, D1, D2, D3hot, D3cold respectively.
10	0h RO	<b>D2 Support (D2_support)</b> : Hardwired to 0 as the D2 state is not supported
9	0h RO	<b>D1 Support (D1_support)</b> : Hardwired to 0 as the D1 state is not supported

Bit Range	Default & Access	Description
8: 6	0h RO	<b>Aux Current (aux_curr)</b> : Hardwired to 0 as the D3hot state is not supported
5	0h RO	<b>Device Specific Initialisation (DSI)</b> : Hardwired to 0 to indicate that the device does not require a device specific initialisation sequence following transition to the D0 uninitialised state
4	0h RO	<b>Reserved (RSVD)</b> : Reserved.
3	0h RO	<b>PME Clock (PME_clock)</b> : Deprecated. Hardwired to 0
2: 0	011b RO	<b>Version (version)</b> : This function complies with revision 1.2 of the PCI Power Management Interface Specification

### 18.5.24 Power Management Control/Status Register (PMCSR)—Offset 84h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

PMCSR: [B:0, D:20, F:1] + 84h

Default: 0008h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	1
0	0	0	0	0
PME_status	Data_scale	Data_select	PME_en	RSVD
				no_soft_reset
				RSVD
				power_state

Bit Range	Default & Access	Description
15	0h RW	<b>PME Status (PME_status)</b> : Set if function has experienced a PME (even if PME_en (bit 8 of PMCSR register) is not set).
14: 13	0h RO	<b>Data Scale (Data_scale)</b> : Hardwired to 0 as the data register is not supported
12: 9	0h RO	<b>Data Select (Data_select)</b> : Hardwired to 0 as the data register is not supported
8	0b RW	<b>PME Enable (PME_en)</b> : Enable device function to send PME messages when an event occurs. 1=)enabled. 0=)disabled
7: 4	0h RO	<b>Reserved (RSVD)</b> : Reserved.
3	1b RO	<b>No Soft Reset (no_soft_reset)</b> : Devices do perform an internal reset when transitioning from D3hot to D0
2	0h RO	<b>Reserved (RSVD)</b> : Reserved.
1: 0	00b RW	<b>Power State (power_state)</b> : Allows software to read current PM state or transition device to a new PM state, where 2'b00 = D0, 2'b01=D1, 2'b10=D2, 2'b11=D3hot

### 18.5.25 PM CSR PCI-to-PCI Bridge Support Extension (PMCSR\_BSE)—Offset 86h

**Access Method**

Type: PCI Configuration Register  
(Size: 8 bits)

PMCSR\_BSE: [B:0, D:20, F:1] + 86h

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RO	PM CSR PCI-to-PCI Bridge Support Extension (value): Not Supported. Hardwired to 0.

### 18.5.26 Power Management Data Register (DATA\_REGISTER)—Offset 87h

**Access Method**

Type: PCI Configuration Register  
(Size: 8 bits)

DATA\_REGISTER: [B:0, D:20, F:1] + 87h

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RO	Power Management Data Register (value): Not Supported. Hardwired to 0

### 18.5.27 Capability ID (MSI\_CAP\_ID)—Offset A0h

**Access Method**

Type: PCI Configuration Register  
(Size: 8 bits)

MSI\_CAP\_ID: [B:0, D:20, F:1] + A0h

Default: 05h

Bit Range	Default & Access	Description
7: 0	05h RO	Capability ID (value): Identifies the feature associated with this register set. Hardwired value as per PCI SIG assigned capability ID

### 18.5.28 Next Capability Pointer (MSI\_NXT\_CAP\_PTR)—Offset A1h

**Access Method**

Type: PCI Configuration Register  
(Size: 8 bits)

MSI\_NXT\_CAP\_PTR: [B:0, D:20, F:1] + A1h

Default: 00h

Bit Range	Default & Access	Description
7: 0	00h RO	<b>Next Capability Pointer (value)</b> : Hardwired to 0 as this is the last capability structure in the chain

### 18.5.29 Message Control (MESSAGE\_CTRL)—Offset A2h

**Access Method**

Type: PCI Configuration Register  
(Size: 16 bits)

MESSAGE\_CTRL: [B:0, D:20, F:1] + A2h

Default: 0100h

Bit Range	Default & Access	Description
15: 9	0h RO	<b>RSVDO (RSVDO)</b> : Reserved
8	1h RO	<b>Per Vector Masking Capable (perVecMskCap)</b> : Hardwired to 1 to indicate the function supports PVM
7	0h RO	<b>64 bit Address Capable (bit64Cap)</b> : This bit is hardwired to 0 to indicate that the function is not capable of sending a 64-bit message address.
6: 4	0h RW	<b>Multi-Message Enable (multiMsgEn)</b> : As only one vector is supported per function, software should only write a value of 0x0 to this field
3: 1	0h RO	<b>Multiple Message Enable (multiMsgCap)</b> : This field is hardwired to 0x0 to indicate that the function is requesting a single vector
0	0h RW	<b>MSI Enable (MSIEnable)</b> : Set to enable MSI to request service. If set then it's prohibited to use the INTx pin. System configuration software sets this bit to enable MSI.

### 18.5.30 Message Address (MESSAGE\_ADDR)—Offset A4h

**Access Method**

Type: PCI Configuration Register  
(Size: 32 bits)

MESSAGE\_ADDR: [B:0, D:20, F:1] + A4h

Default: 00000000h

Bit Range	Default & Access	Description
31: 2	0h RW	<b>Message Address (address):</b> If the Message Enable bit (bit 0 of the Message Control register) is set, the contents of this register specify the DWORD-aligned address (AD[31:2]) for the MSI memory write transaction. AD[1:0] are driven to zero during the address phase. This field is read/write
1: 0	0h RO	<b>RSVD0 (RSVD0):</b> Reserved

### 18.5.31 Message Data (MESSAGE\_DATA)—Offset A8h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

MESSAGE\_DATA: [B:0, D:20, F:1] + A8h

Default: 0000h

Bit Range	Default & Access	Description
15: 0	0h RW	<b>Data Field (MsgData):</b> System-specified message data. If the Message Enable bit (bit 0 of the Message Control register) is set, the message data is driven onto the lower word (AD[15:0]) of the memory write transactions data phase. AD[31:16] are driven to zero during the memory write transactions data phase. C/BE[3:0]# are asserted during the data phase of the memory write transaction. None of the message bits will be changed by hardware

### 18.5.32 Mask Bits for MSI (PER\_VEC\_MASK)—Offset ACh

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

PER\_VEC\_MASK: [B:0, D:20, F:1] + ACh

Default: 00000000h

Bit Range	Default & Access	Description
31: 1	0h RO	<b>RSVDO (RSVDO)</b> : Reserved
0	0h RW	<b>Vector 0 Mask (MSIMask)</b> : Mask Bit for Vector 0. If this bit is set, the function will not send MSI messages

### 18.5.33 Pending Bits for MSI (PER\_VEC\_PEND)—Offset B0h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

PER\_VEC\_PEND: [B:0, D:20, F:1] + B0h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVDO								value

Bit Range	Default & Access	Description
31: 1	0h RO	<b>RSVDO (RSVDO)</b> : Reserved
0	0h RO	<b>Vector 0 Pending (value)</b> : Pending Bit for Vector 0.

## 18.6 Memory Mapped Registers

### 18.6.1 UART Registers

Table 117. Summary of Memory Mapped I/O Registers—BAR0

Offset Start	Offset End	Register Name (Register Symbol)	Default Value
0h	3h	"Receive Buffer / Transmit Holding / Divisor Latch Low (RBR_THR_DLL)—Offset 0h" on page 685	00000000h
4h	7h	"Interrupt Enable / Divisor Latch High (IER_DLH)—Offset 4h" on page 685	00000000h
8h	Bh	"Interrupt Identification / FIFO Control (IIR_FCR)—Offset 8h" on page 686	00000001h
Ch	Fh	"Line Control (LCR)—Offset Ch" on page 688	00000000h
10h	13h	"MODEM Control (MCR)—Offset 10h" on page 688	00000000h
14h	17h	"Line Status (LSR)—Offset 14h" on page 689	00000060h
18h	1Bh	"MODEM Status (MSR)—Offset 18h" on page 691	00000000h
1Ch	1Fh	"Scratchpad (SCR)—Offset 1Ch" on page 692	00000000h
7Ch	7Fh	"UART Status (USR)—Offset 7Ch" on page 693	00000000h
A4h	A7h	"Halt Transmission (HTX)—Offset A4h" on page 693	00000000h
A8h	ABh	"DMA Software Acknowledge (DMASA)—Offset A8h" on page 694	00000000h

### 18.6.1.1 Receive Buffer / Transmit Holding / Divisor Latch Low (RBR\_THR\_DLL)—Offset 0h

Receive Buffer Register(RBR), reading this register when the DLAB bit (LCR[7]) is zero; Transmit Holding Register (THR), writing to this register when the DLAB is zero; Divisor Latch Low (DLL), when DLAB bit is one

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 0h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:1] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
RSV								FIELD			

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	<b>Reserved (RSV):</b> Reserved.
7:0	00h RW	<p><b>Receive Buffer / Transmit Holding / Divisor Latch Low (FIELD):</b> Different UART registers are accessed depending on read/write transfer type and Line control Register (LCR) DLAB bit value.</p> <p>RBR, Receive Buffer Register                      - Access - Read AND DLAB (LCR[7]) =0                      Data byte received on the serial input port. Valid only if the Data Ready (DR) bit in the LSR is set. If FIFOs are disabled (FCR[0] set to zero), the data must be read before the next data arrives, otherwise it is overwritten, resulting in an over-run error. If FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO is preserved, but any incoming data are lost and an over-run error occurs.</p> <p>THR, Transmit Holding Register.                      - Access - Write AND DLAB (LCR[7]) =0                      Data to be transmitted on the serial output port. Data should only be written to the THR when the THR Empty (THRE) bit (LSR[5]) is set. If FIFOs are disabled (FCR[0] = 0) and THRE is set, writing a single character to the THR clears the THRE. Any additional writes to the THR before the THRE is set again causes the THR data to be overwritten. If FIFOs are enabled (FCR[0] = 1) and THRE is set, a total of 16 characters (FIFO Depth) can be written to the THR before the FIFO is full. Any attempt to write data when the FIFO is full results in the write data being lost.</p> <p>DLL, Lower part of the Divisor Latch.                      - Access - Read/Write AND DLAB (LCR[7]) =1                      Lower 8 bits of a 16-bit, read/write, Divisor Latch register that contains the baud rate divisor for the UART. This register may be accessed only when the DLAB bit (LCR[7]) is set. Note that with the Divisor Latch Registers (DLL and DLH) set to zero, the baud clock is disabled and no serial communications occur. Also, once the DLL is set, at least 8 clock cycles of sclk should be allowed to pass before transmitting or receiving data.</p>

### 18.6.1.2 Interrupt Enable / Divisor Latch High (IER\_DLH)—Offset 4h

Interrupt Enable Register (IER), when the DLAB bit is zero; Divisor Latch High (DLH), when the DLAB bit is one

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 4h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:1] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSV							FIELD	

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	<b>Reserved (RSV):</b> Reserved.
7:0	00h RW	<p><b>Interrupt Enable / Divisor Latch High (FIELD):</b> Different UART registers are accessed depending on the Line control Register (LCR) DLAB bit value. IER, Interrupt Enable Register Access - Read/write AND DLAB (LCR[7]) =0 Interrupt Enable Register: Each of the bits used has a different function ( 0 = disabled 1 = enabled):</p> <ul style="list-style-type: none"> <li>0 - ERBFI, Enable Received Data Available Interrupt</li> <li>1 - ETBEI, Enable Transmit Holding Register Empty Interrupt</li> <li>2 - ELSI, Enable Receiver Line Status Interrupt</li> <li>3 - EDSSI, Enable Modem Status Interrupt</li> <li>4 - RESERVED</li> <li>5 - RESERVED</li> <li>6 - RESERVED</li> <li>7 - PTIME, Programmable THRE Interrupt Mode Enable</li> </ul> <p>DLH, Divisor Latch (High) Access - Read/write AND DLAB (LCR[7]) =1 This register makes up the upper 8-bits of a 16-bit, read/write, Divisor Latch register that contains the baud rate divisor for the UART. This register can be accessed only when the DLAB bit (LCR[7]) is set.</p> <p>NOTE: if the Divisor Latch Registers (DLL and DLH) are set to zero, the baud clock is disabled and no serial communications occur. Also, once the Divisor Latch Registers (DLL and DLH) are set, a minimum of 50ns should be awaited before transmitting or receiving data as this time is required in order for changes to take effect due to internal synchronization processes.</p>

### 18.6.1.3 Interrupt Identification / FIFO Control (IIR\_FCR)—Offset 8h

Interrupt Identification Register (IIR) if reading; FIFO Control Register (FCR) if writing

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 8h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:1] + 10h

**Default:** 00000001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSV							FIELD	

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	<b>Reserved (RSV):</b> Reserved.
7:0	01h RW	<p><b>Interrupt Identification / FIFO Control (FIELD):</b> Different UART registers are accessed depending on read/write transfer type.</p> <p>IIR, Interrupt Identification Register                      - Access - Read only                      - Reset - 0x01                      Each of the bits used has a different function:</p> <p>[3:0] - IID, Interrupt ID. This indicates the highest priority pending interrupt which can be one of the following types:                      0000 = modem status.                      0001 = no interrupt pending.                      0010 = THR empty.                      0100 = received data available.                      0110 = receiver line status.                      0111 = busy detect. NEVER INDICATED                      1100 = character timeout.</p> <p>[5:3] - RESERVED read as zero</p> <p>[7:6] - FIFOSE, FIFOs Enabled.                      This is used to indicate whether the FIFO's are enabled or disabled:                      00 = disabled                      11 = enabled</p> <p>FCR, FIFO Control Register                      Access - Write only                      Used to control the FIFOs. Different functions:</p> <p>[0] - FIFOE, FIFO Enable.                      Enables/disables the transmit (XMIT) and receive (RCVR) FIFO's. Whenever the value of this bit is changed both the XMIT and RCVR controller portion of FIFO's will be reset.</p> <p>[1] - RFIFOR, RCVR FIFO Reset                      Resets the control portion of the receive FIFO and treats the FIFO as empty. This will also de-assert the DMA RX request and single signals. NOTE that this bit is 'self-clearing' and it is not necessary to clear this bit.</p> <p>[2] - XFIFOR, XMIT FIFO Reset                      Resets the control portion of the transmit FIFO and treats the FIFO as empty. This will also de-assert the DMA TX request and single signals. NOTE that this bit is 'self-clearing' and it is not necessary to clear this bit.</p> <p>[3] - DMAM, DMA Mode                      Not used in UART due to the use of extra DMA handshake interface signals</p> <p>[5:4] - TET, TX Empty Trigger                      Used to select the empty threshold level at which the THRE Interrupts will be generated when the mode is active. It also determines when the DMA support is requested if the DMA is enabled.                      The following trigger levels are supported:                      00 = FIFO empty                      01 = 2 characters in the FIFO                      10 = FIFO 1/4 full                      11 = FIFO 1/2 full</p> <p>[7:6] - RT, RCVR Trigger                      Used to select the trigger level in the receiver FIFO at which the Received Data Available Interrupt will be generated. In auto flow control mode it is used to determine when the rts_n signal will be de-asserted. It also determines when the DMA support is requested if the DMA is enabled.                      The following trigger levels are supported:                      00 = 1 character in the FIFO                      01 = FIFO 1/4 full                      10 = FIFO 1/2 full                      11 = FIFO 2 less than full</p>

### 18.6.1.4 Line Control (LCR)—Offset Ch

Used to specify the format of the asynchronous data communication exchange.

#### Access Method

Type: Memory Mapped I/O Register  
 (Size: 32 bits)

Offset: [BAR0] + Ch

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:1] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0					
0	0	0	0	0	0	0	0	0					
RSV							DLAB	BC	STICK_PAR	EPS	PEN	STOP	DLS

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	<b>Reserved (RSV):</b> Reserved.
7	0h RW	<b>Divisor Latch Access Bit (DLAB):</b> Used to enable reading and writing of the Divisor Latch register (DLL and DLH) to set the baud rate of the UART. This bit must be cleared after initial baud rate setup in order to access other registers.
6	0h RW	<b>Break Control Bit (BC):</b> Used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the serial output line is forced low until the Break bit is cleared.
5	0h RW	<b>Reserved for future use (STICK_PAR):</b> Reserved.
4	0h RW	<b>Even Parity Select (EPS):</b> Used to select between even and odd parity, when parity is enabled (PEN set to one). If set to one, an even number of logic '1's is transmitted or checked. If set to zero, an odd number of logic '1's is transmitted or checked.
3	0h RW	<b>Parity Enable (PEN):</b> Used to enable and disable parity generation and detection in transmitted and received serial character respectively. 0 = parity disabled 1 = parity enabled
2	0h RW	<b>Number of stop bits (STOP):</b> Used to select the number of stop bits per character that the peripheral will transmit and receive. If set to zero, one stop bit is transmitted in the serial data. If set to one and the data bits are set to 5 (LCR[1:0] set to zero) one and a half stop bits are transmitted. Otherwise, two stop bits are transmitted. NOTE: regardless of the number of stop bits selected the receiver will only check the first stop bit. 0 = 1 stop bit 1 = 1.5 stop bits when DLS (LCR[1:0]) == 00 1 = 2 stop bits when DLS (LCR[1:0]) different from 00
1:0	0h RW	<b>Data Length Select (DLS):</b> Used to select the number of data bits per character that the peripheral will transmit and receive. The number of bit that may be selected are as follows: 00 = 5 bits 01 = 6 bits 10 = 7 bits 11 = 8 bits

### 18.6.1.5 MODEM Control (MCR)—Offset 10h

Controls the interface with the MODEM or data set (or a peripheral device emulating a MODEM)

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 10h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:1] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0			
RSV							AFCE	LOOPBACK	RSVD	RTS	DTR

Bit Range	Default & Access	Field Name (ID): Description
31:6	0b RO	<b>Reserved (RSV):</b> Reserved.
5	0h RW	<b>Auto Flow Control Enable (AFCE):</b> When FIFOs are enabled and the Auto Flow Control Enable (AFCE) bit is set, Auto Flow Control features are enabled 0 = Auto Flow Control Mode disabled 1 = Auto Flow Control Mode enabled
4	0h RW	<b>LoopBack Bit (LOOPBACK):</b> Used to put the UART into a diagnostic mode for test purposes. Data on the serial out line is held high, while serial data output is looped back to the serial in line, internally. In this mode all the interrupts are fully functional. Also, in loopback mode, the modem control inputs (dsr_n, cts_n, ri_n, dcd_n) are disconnected and the modem control outputs (dtr_n, rts_n, out1_n, out2_n) are looped back to the inputs, internally.
3:2	0h RO	<b>Reserved (RSVD):</b> Reserved.
1	0h RW	<b>Request to Send (RTS):</b> Used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the UART is ready to exchange data. When Auto RTS Flow Control is not enabled (MCR[5] set to zero), the rts_n signal is set low by programming MCR[1] (RTS) to a high. In Auto Flow Control, MCR[5] set to one and FIFO's enable (FCR[0] set to one, the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). The rts_n signal will be de-asserted when MCR[1] is set low. Note that in Loopback mode (MCR[4] set to one), the rts_n output is held inactive high while the value of this location is internally looped back to an input.
0	0h RW	<b>Data Terminal Ready (DTR):</b> Used to directly control the Data Terminal Ready (dtr_n) output. The value written to this location is inverted and driven out on dtr_n, that is: 0 = dtr_n de-asserted (logic 1) 1 = dtr_n asserted (logic 0)  The Data Terminal Ready output is used to inform the modem or data set that the UART is ready to establish communications. Note that in Loopback mode (MCR[4] set to one), the dtr_n output is held inactive high while the value of this location is internally looped back to an input.

### 18.6.1.6 Line Status (LSR)—Offset 14h

Provides status information concerning the data transfer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 14h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:1] + 10h

Default: 00000060h

31	28	24	20	16	12	8	4	0						
0	0	0	0	0	0	0	0	0						
0	0	0	0	0	0	0	0	0						
0	0	0	0	0	0	0	0	0						
RSV							RFE	TEMT	THRE	BI	FE	PE	OE	DR

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	<b>Reserved (RSV):</b> Reserved.
7	0h RO	<b>Receiver FIFO Error bit (RFE):</b> This bit is only relevant when FIFO are enabled (FCR[0] set to one). This is used to indicate if there is at least one parity error, framing error, or break indication in the FIFO. That is: 0 = no error in RX FIFO 1 = error in RX FIFO This bit is cleared when the LSR is read and the character with the error is at the top of the receiver FIFO and there are no subsequent errors in the FIFO.
6	1h RO	<b>Transmitter Empty bit (TEMT):</b> If FIFO are enabled (FCR[0] set to one), this bit is set whenever the Transmitter Shift Register and the FIFO are both empty. If FIFO are disabled, this bit is set whenever the Transmitter Holding Register and the Transmitter Shift Register are both empty.
5	1h RO	<b>Transmit Holding Register Empty bit (THRE):</b> If THRE mode is disabled (IER[7] set to zero) and regardless of FIFO's being enabled or not, this bit indicates that the THR or TX FIFO is empty. This bit is set whenever data is transferred from the THR or TX FIFO to the transmitter shift register and no new data has been written to the THR or TX FIFO. This also causes a THRE Interrupt to occur, if the THRE Interrupt is enabled. If the THRE mode and FIFO are enabled (IER[7] and FCR[0] set to one), the functionality is switched to indicate the transmitter FIFO is full, and no longer controls THRE interrupts, which are then controlled by the FCR[5:4] threshold setting.
4	0h RO	<b>Break Interrupt bit (BI):</b> Used to indicate the detection of a break sequence on the serial input data. If in UART mode it is set whenever the serial input is held in a logic '0' state for longer than the sum of start time + data bits + parity + stop bits. A break condition on serial input causes one and only one character, consisting of all zeros, to be received by the UART. In the FIFO mode, the character associated with the break condition is carried through the FIFO and is revealed when the character is at the top of the FIFO. Reading the LSR clears the BI bit. In the non-FIFO mode, the BI indication occurs immediately and persists until the LSR is read.
3	0h RO	<b>Framing Error bit (FE):</b> Used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data. In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO. When a framing error occurs the UART will try resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (LSR[3]) will be set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). 0 = no framing error, 1 = framing error Reading the LSR clears the FE bit.
2	0h RO	<b>Parity Error bit (PE):</b> Used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (LCR[3]) is set. In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO. It should be noted that the Parity Error (PE) bit (LSR[2]) will be set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). 0 = no parity error, 1 = parity error Reading the LSR clears the PE bit.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RO	<b>Overrun error bit (OE):</b> Used to indicate the occurrence of an overrun error. This occurs if a new data character was received before the previous data was read. In the non-FIFO mode, the OE bit is set when a new character arrives in the receiver before the previous character was read from the RBR. When this happens, the data in the RBR is overwritten. In the FIFO mode, an overrun error occurs when the FIFO is full and a new character arrives at the receiver. The data in the FIFO is retained and the data in the receive shift register is lost. 0 = no overrun error, 1 = overrun error  Reading the LSR clears the OE bit.
0	0h RO	<b>Data Ready bit (DR):</b> Used to indicate that the receiver contains at least one character in the RBR or the receiver FIFO. 0 = no data ready, 1 = data ready  This bit is cleared when the RBR is read in the non-FIFO mode, or when the receiver FIFO is empty, in the FIFO mode.

### 18.6.1.7 MODEM Status (MSR)—Offset 18h

Provides the current state of the control lines from the MODEM (or peripheral device)

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 18h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:1] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0						
0	0	0	0	0	0	0	0	0						
RSV							DCD	RI	DSR	CTS	DDCD	TERI	DDSR	DCTS

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	<b>Reserved (RSV):</b> Reserved.
7	0h RO	<b>Data Carrier Detect (DCD):</b> Used to indicate the current state of the modem control line dcd_n. That is this bit is the complement dcd_n. When the Data Carrier Detect input (dcd_n) is asserted it is an indication that the carrier has been detected by the modem or data set. 0 = dcd_n input is de-asserted (logic 1) 1 = dcd_n input is asserted (logic 0) In Loopback Mode (MCR[4] set to one), DCD is the same as MCR[3] (Out2).
6	0h RO	<b>Ring Indicator (RI):</b> Used to indicate the current state of the modem control line ri_n. That is this bit is the complement ri_n. When the Ring Indicator input (ri_n) is asserted it is an indication that a telephone ringing signal has been received by the modem or data set. 0 = ri_n input is de-asserted (logic 1) 1 = ri_n input is asserted (logic 0) In Loopback Mode (MCR[4] set to one), RI is the same as MCR[2] (Out1).
5	0h RO	<b>Data Set Ready (DSR):</b> Used to indicate the current state of the modem control line dsr_n. That is this bit is the complement dsr_n. When the Data Set Ready input (dsr_n) is asserted it is an indication that the modem or data set is ready to establish communications with the UART. 0 = dsr_n input is de-asserted (logic 1) 1 = dsr_n input is asserted (logic 0) In Loopback Mode (MCR[4] set to one), DSR is the same as MCR[0] (DTR).

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	<b>Clear to Send (CTS)</b> : Used to indicate the current state of the modem control line cts_n. That is, this bit is the complement cts_n. When the Clear to Send input (cts_n) is asserted it is an indication that the modem or data set is ready to exchange data with the UART 0 = cts_n input is de-asserted (logic 1) 1 = cts_n input is asserted (logic 0) In Loopback Mode (MCR[4] set to one), CTS is the same as MCR[1] (RTS).
3	0h RO	<b>Delta Data Carrier Detect (DDCD)</b> : Used to indicate that the modem control line dcd_n has changed since the last time the MSR was read. That is: 0 = no change on dcd_n since last read of MSR 1 = change on dcd_n since last read of MSR Reading the MSR clears the DDCD bit. In Loopback Mode (MCR[4] set to one), DDCD reflects changes on MCR[3] (Out2). Note, if the DDCD bit is not set and the dcd_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDCD bit will get set when the reset is removed if the dcd_n signal remains asserted.
2	0h RO	<b>Trailing Edge of Ring Indicator (TERI)</b> : Used to indicate that a change on the input ri_n (from an active low, to an inactive high state) has occurred since the last time the MSR was read. That is: 0 = no change on ri_n since last read of MSR 1 = change on ri_n since last read of MSR Reading the MSR clears the TERI bit. In Loopback Mode (MCR[4] set to one), TERI reflects when MCR[2] (Out1) has changed state from a high to a low.
1	0h RO	<b>Delta Data Set Ready (DDSR)</b> : Used to indicate that the modem control line dsr_n has changed since the last time the MSR was read. That is: 0 = no change on dsr_n since last read of MSR 1 = change on dsr_n since last read of MSR Reading the MSR clears the DDSR bit. In Loopback Mode (MCR[4] set to one), DDSR reflects changes on MCR[0] (DTR). Note, if the DDSR bit is not set and the dsr_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDSR bit will get set when the reset is removed if the dsr_n signal remains asserted.
0	0h RO	<b>Delta Clear to Send (DCTS)</b> : used to indicate that the modem control line cts_n has changed since the last time the MSR was read. That is: 0 = no change on cts_n since last read of MSR 1 = change on cts_n since last read of MSR Reading the MSR clears the DCTS bit. In Loopback Mode (MCR[4] set to one), DCTS reflects changes on MCR[1] (RTS). Note, if the DCTS bit is not set and the cts_n signal is asserted (low) and a reset occurs (software or otherwise), then the DCTS bit will get set when the reset is removed if the cts_n signal remains asserted.

### 18.6.1.8 Scratchpad (SCR)—Offset 1Ch

Used by the programmer to hold data temporarily

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:1] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0																											
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSV																SCR																			

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	<b>Reserved (RSV)</b> : Reserved.
7:0	0h RW	<b>Scratchpad Register (SCR)</b> : This register is for programmers to use as a temporary storage space. It has no defined purpose in the UART.

### 18.6.1.9 UART Status (USR)—Offset 7Ch

Provides internal status information

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 7Ch

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:1] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0			
0	0	0	0	0	0	0	0	0			
RSV1							RFF	RFNE	TFE	TFNF	RSV0

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved (RSV1):</b> Reserved.
4	0h RO	<b>Receive FIFO Full (RFF):</b> Used to indicate that the receive FIFO is completely full. That is: 0 = Receive FIFO not full 1 = Receive FIFO Full This bit is cleared when the RX FIFO is no longer full.
3	0h RO	<b>Receive FIFO Not Empty (RFNE):</b> Used to indicate that the receive FIFO contains one or more entries. 0 = Receive FIFO is empty 1 = Receive FIFO is not empty This bit is cleared when the RX FIFO is empty.
2	0h RO	<b>Transmit FIFO Empty (TFE):</b> Used to indicate that the transmit FIFO is completely empty. 0 = Transmit FIFO is not empty 1 = Transmit FIFO is empty This bit is cleared when the TX FIFO is no longer empty.
1	0h RO	<b>Transmit FIFO Not Full (TFNF):</b> Used to indicate that the transmit FIFO is not full. 0 = Transmit FIFO is full 1 = Transmit FIFO is not full This bit is cleared when the TX FIFO is full.
0	0h RO	<b>Reserved (RSV0):</b> Reserved.

### 18.6.1.10 Halt Transmission (HTX)—Offset A4h

Halt Transmission

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + A4h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:20, F:1] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSV								HTX

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RO	<b>Reserved (RSV):</b> Reserved.
0	0h RW	<b>Halt Transmission (HTX):</b> Used to halt transmissions for testing, so that the transmit FIFO can be filled by the master when FIFO's are enabled. Note, if FIFO's are not enabled the setting of the halt TX register will have no effect on operation. 0 = Halt TX disabled 1 = Halt TX enabled

### 18.6.1.11 DMA Software Acknowledge (DMASA)—Offset A8h

DMA software acknowledge if a transfer needs to be terminated due to an error condition.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + A8h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:20, F:1] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSV								DMASA

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RO	<b>Reserved (RSV):</b> Reserved.
0	0h RW	<b>DMA Software Acknowledge (DMASA):</b> Used to perform DMA software acknowledge if a transfer needs to be terminated due to an error condition. For example, if the DMA disables the channel, then the UART should clear its request. This will cause the DMA operation to be concluded. NOTE: this bit is 'self-clearing'. It is not necessary to clear it.

## 18.6.2 DMA Controller Registers

**Table 118. Summary of Memory Mapped I/O Registers—BAR1**

Offset Start	Offset End	Register Name (Register Symbol)	Default Value

390h	393h	"Destination Single Transaction Request (LST_DST_REG)—Offset 390h" on page 729	00000000h
398h	39Bh	"DMA Configuration (DMA_CFG_REG)—Offset 398h" on page 729	00000000h
3A0h	3A3h	"Channel Enable (CH_EN_REG)—Offset 3A0h" on page 730	00000000h

**18.6.2.1 Channel 0 Source Address (SAR0)—Offset 0h**

Source Address of DMA transfer The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 0h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0b RW	<p><b>Current Source Address of DMA transfer (SAR):</b> Updated after each source transfer. The SINC field in the CTLO_L register determines whether the address increments, decrements, or is left unchanged on every source transfer throughout the block transfer.</p> <p>NOTE: Channel 0 is dedicated to the UART controller Received data. Source Address is the UART controller RBR_THR_DLL register address: 0xFFFF_F000</p>

**18.6.2.2 Channel 0 Destination Address (DAR0)—Offset 8h**

Destination address of DMA transfer The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 8h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0b RW	<b>Current Destination address of DMA transfer (DAR):</b> Updated after each destination transfer. The DINC field in the CTL0_L register determines whether the address increments, decrements, or is left unchanged on every destination transfer throughout the block transfer.  NOTE: Channel 0 is dedicated to the UART controller Received data. Destination Address is a memory address

### 18.6.2.3 Channel 0 Linked List Pointer (LLP0)—Offset 10h

Program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 10h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0b RW	<b>Starting Address In Memory (LOC):</b> Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses (Hsize = 2) aligned to 32-bit boundaries and cannot be changed or programmed to anything other than 32-bit.
1:0	0b RO	<b>Reserved (RSV):</b> Reserved.

### 18.6.2.4 Channel 0 Control LOWER (CTL0\_L)—Offset 18h

Contains fields that control the DMA transfer. Part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 18h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

0	1b RW	<b>Interrupt enable (INT_EN):</b> If set, then all interrupt-generating sources are enabled. Functions as a global mask bit for all interrupts for the channel. RAW interrupt registers still assert if INT_EN = 0.

### 18.6.2.5 Channel 0 Control UPPER (CTLO\_U)—Offset 1Ch

Contains fields that control the DMA transfer. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, the content is written to the control register location of the LLI in system memory at the end of the block transfer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 1Ch

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000002h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0b RO	<b>Reserved (RSV):</b> Reserved.
11:0	002h RW	<b>Block length (BLOCK_TS):</b> When the DMAC is the flow controller, the user writes this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of single transactions to perform for every block transfer. A single transaction is mapped to a single AMBA beat. Width: The width of the single transaction is determined by CTL0_L.SRC_TR_WIDTHH.

### 18.6.2.6 Channel 0 Source Status (SSTAT0)—Offset 20h

This register is a temporary placeholder for the source status information on its way to the SSTAT0 register location of the LLI. The source status information should be retrieved by software from the SSTAT0 register location of the LLI, and not by a read of this register over the DMAC slave interface.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 20h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0b RW	<b>Channel Source Status (SSTAT):</b> Source status information retrieved by hardware from the address pointed to by the contents of the SSTATAR0 register.

### 18.6.2.7 Channel 0 Destination Status (DSTAT0)—Offset 28h

This register is a temporary placeholder for the destination status information on its way to the DSTAT0 register location of the LLI. The destination status information should be retrieved by software from the DSTAT0 register location of the LLI and not by a read of this register over the DMAC slave interface

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 28h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0b RW	<b>Channel Destination Status (DSTAT):</b> Destination status information retrieved by hardware from the address pointed to by the contents of the DSTATAR0 register

### 18.6.2.8 Channel 0 Source Status Address (SSTATAR0)—Offset 30h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of this register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 30h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0b RW	<b>Channel Source Status Address (SSTATAR):</b> Pointer from where hardware can fetch the source status information, which is registered in the SSTAT0 register and written out to the SSTAT0 register location of the LLI before the start of the next block.

### 18.6.2.9 Channel 0 Destination Status Address (DSTATAR0)—Offset 38h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of this register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 38h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)  
**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0b RW	<b>Channel Destination Status Address (DSTATAR):</b> Pointer from where hardware can fetch the destination status information, which is registered in the DSTAT0 register and written out to the DSTAT0 register location of the LLI before the start of the next block.

### 18.6.2.10 Channel 0 Configuration LOWER (CFG0\_L)—Offset 40h

Contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This register need to be programmed before enable the channel.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 40h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000E00h

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	<b>Reload destination enable (RELOAD_DST):</b> The DARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0b RW	<b>Reload source enable (RELOAD_SRC):</b> The SAR register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:20	0b RO	<b>Reserved (RSV2):</b> Reserved.
19	0b RW	<b>Source handshake polarity (SRC_HS_POL):</b> 0 = Active high 1 = Active low
18	0b RW	<b>Destination handshake polarity (DST_HS_POL):</b> 0 = Active high 1 = Active low
17:12	0b RW	<b>Reserved (RSV1):</b> Reserved.
11	1b RW	<b>Source Handshake select (HS_SEL_SRC):</b> Used to select which handshake interface is active for source requests on this channel 0 = HW handshake. SW ones are ignored 1 = SW handshake. HW ones are ignored If source peripheral is memory this bit is ignored

Bit Range	Default & Access	Field Name (ID): Description
7	0b RW	<b>Source hardware interface (SRC_PER)</b> : Assigns a hardware handshaking interface (0-1) to the channel source if the CFG0_L_HS_SEL_SRC field is 0; otherwise, this field is ignored. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.
6	0b RW	<b>Source Status Update Enable (SS_UPD_EN)</b> : Source status information is fetched only from the location pointed to by the SSTATAR0 register, stored in the SSTAT0 register and written out to the SSTAT0 location of the LLI if this field is high
5	0b RW	<b>Destination Status Update Enable (DS_UPD_EN)</b> : Destination status information is fetched only from the location pointed to by the DSTATAR0 register, stored in the DSTAT0 register and written out to the DSTAT0 location of the LLI if this field is high
4:2	001b RW	<b>AHB bus protocol bus control (PROTCTL)</b> : Protection Control bits used to drive the AHB HPROT[3:1] bus. The AMBA Specification recommends that the default value of HPROT indicates a non-cached, non-buffered, privileged data access. The reset value is used to indicate such an access. HPROT[0] is tied high because all transfers are data accesses, as there are no opcode fetches. There is a one-to-one mapping of these register bits to the HPROT[3:1] master interface signals.
1	0b RW	<b>Channel FIFO mode control (FIFO_MODE)</b> : Determines how much space or data needs to be available in the FIFO before a burst transaction request is serviced. 0 = Space/data available for single AHB transfer of the specified transfer width. 1 = Data available is greater than or equal to half the FIFO depth for destination transfers and space available is greater than half the fifo depth for source transfers. The exceptions are at the end of a burst transaction request or at the end of a block transfer.
0	0b RW	<b>Channel flow control mode (FCMODE)</b> : Determines when source transaction requests are serviced when the Destination Peripheral is the flow controller. 0 = Source transaction requests are serviced when they occur. Data pre-fetching is enabled. 1 = Source transaction requests are not serviced until a destination transaction request occurs. In this mode, the amount of data transferred from the source is limited so that it is guaranteed to be transferred to the destination prior to block termination by the destination. Data pre-fetching is disabled.

### 18.6.2.12 Channel 0 Source Gather (SGR0)—Offset 48h

The CTLO\_L.SINC field controls whether the address increments or decrements. For a fixed-address control, then the address remains constant throughout the transfer and this register is ignored.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 48h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000000h

RSV								SGC				SGT																			

Bit Range	Default & Access	Field Name (ID): Description
31:25	0b RO	<b>Reserved (RSV)</b> : Reserved.

Bit Range	Default & Access	Field Name (ID): Description
24:20	0b RW	<b>Source Gather Count (SGC)</b> : Source contiguous transfer count between successive gather boundaries. Specifies the number of contiguous source transfers of CTL0_L.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary
19:0	0b RW	<b>Source Gather Interval (SGI)</b> : Specifies the source address increment/decrement in multiples of CTL0_L.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer.

### 18.6.2.13 Channel 0 Destination Scatter (DSR0)—Offset 50h

The CTL0\_L.DINC field controls whether the address increments or decrements. For a fixed-address control, then the address remains constant throughout the transfer and this register is ignored.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 50h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

RSV			DSC		DSI			

Bit Range	Default & Access	Field Name (ID): Description
31:25	0b RO	<b>Reserved (RSV)</b> : Reserved.
24:20	0b RW	<b>Destination Scatter Count (DSC)</b> : Source contiguous transfer count between successive scatter boundaries. Specifies the number of contiguous destination transfers of CTL0_L.DST_TR_WIDTH between successive scatter intervals. This is defined as a scatter boundary
19:0	0b RW	<b>Destination Scatter Interval (DSI)</b> : Specifies the destination address increment/decrement in multiples of CTL0_L.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer.

### 18.6.2.14 Channel 1 Source Address (SAR1)—Offset 58h

Source Address of DMA transfer The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 58h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0b RW	<b>Current Source Address of DMA transfer (SAR):</b> Updated after each source transfer. The SINC field in the CTL1_L register determines whether the address increments, decrements, or is left unchanged on every source transfer throughout the block transfer.  NOTE: Channel 1 is dedicated to the UART controller Transmitted data. Source Address is a memory address

### 18.6.2.15 Channel 1 Destination Address (DAR1)—Offset 60h

Destination address of DMA transfer The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 60h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0b RW	<b>Current Destination address of DMA transfer (DAR):</b> Updated after each destination transfer. The DINC field in the CTL1_L register determines whether the address increments, decrements, or is left unchanged on every destination transfer throughout the block transfer.  NOTE: Channel 0 is dedicated to the UART controller Transmitted data. Destination Address is the UART controller RBR_THR_DLL register address: 0xFFFF_F000

### 18.6.2.16 Channel 1 Linked List Pointer (LLP1)—Offset 68h

Program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 68h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0b RW	<b>Starting Address In Memory (LOC):</b> Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses (Hsize = 2) aligned to 32-bit boundaries and cannot be changed or programmed to anything other than 32-bit.
1:0	0b RO	<b>Reserved (RSV):</b> Reserved.

### 18.6.2.17 Channel 1 Control LOWER (CTL1\_L)—Offset 70h

Contains fields that control the DMA transfer. Part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 70h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00304801h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0b RO	<b>Reserved (RSV1):</b> Reserved.
26:25	0b RO	<b>Source AMBA Layer (SMS):</b> Hardcoded the Master interface attached to the source of channel 1

Bit Range	Default & Access	Field Name (ID): Description
8:7	0b RW	<b>Destination Address Increment (DINC):</b> Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change 00 = Increment 01 = Decrement 1x = No change NOTE: Incrementing or decrementing is done for alignment to the next DST_TR_WIDTH boundary.
6:4	0b RW	<b>Source transfer width (SRC_TR_WIDTH):</b> Decoding for this field: Value - Size(bits) ----- 000 - 8 001 - 16 010 - 32 011 - 64 100 - 128 101 - 256 11x - 256
3:1	0b RW	<b>Destination transfer width (DST_TR_WIDTH):</b> Decoding for this field: Value - Size(bits) ----- 000 - 8 001 - 16 010 - 32 011 - 64 100 - 128 101 - 256 11x - 256
0	1b RW	<b>Interrupt enable (INT_EN):</b> If set, then all interrupt-generating sources are enabled. Functions as a global mask bit for all interrupts for the channel. RAW interrupt registers still assert if INT_EN = 0.

18.6.2.18 Channel 1 Control UPPER (CTL1\_U)—Offset 74h

Contains fields that control the DMA transfer. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, the content is written to the control register location of the LLI in system memory at the end of the block transfer.

Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR1] + 74h

BAR1 Type: PCI Configuration Register (Size: 32 bits)

BAR1 Reference: [B:0, D:20, F:1] + 14h

Default: 0000002h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0b RO	<b>Reserved (RSV):</b> Reserved.

Bit Range	Default & Access	Field Name (ID): Description
11:0	002h RW	<b>Block length (BLOCK_TS):</b> When the DMAC is the flow controller, the user writes this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of single transactions to perform for every block transfer. A single transaction is mapped to a single AMBA beat. Width: The width of the single transaction is determined by CTL1_L.SRC_TR_WIDTHH.

### 18.6.2.19 Channel 1 Source Status (SSTAT1)—Offset 78h

This register is a temporary placeholder for the source status information on its way to the SSTAT1 register location of the LLI. The source status information should be retrieved by software from the SSTAT1 register location of the LLI, and not by a read of this register over the DMAC slave interface.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 78h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0b RW	<b>Channel Source Status (SSTAT):</b> Source status information retrieved by hardware from the address pointed to by the contents of the SSTATAR1 register.

### 18.6.2.20 Channel 1 Destination Status (DSTAT1)—Offset 80h

This register is a temporary placeholder for the destination status information on its way to the DSTAT1 register location of the LLI. The destination status information should be retrieved by software from the DSTAT1 register location of the LLI and not by a read of this register over the DMAC slave interface

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 80h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0b RW	<b>Channel Destination Status (DSTAT)</b> : Destination status information retrieved by hardware from the address pointed to by the contents of the DSTATAR1 register

### 18.6.2.21 Channel 1 Source Status Address (SSTATAR1)—Offset 88h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of this register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 88h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0b RW	<b>Channel Source Status Address (SSTATAR)</b> : Pointer from where hardware can fetch the source status information, which is registered in the SSTAT1 register and written out to the SSTAT1 register location of the LLI before the start of the next block.

### 18.6.2.22 Channel 1 Destination Status Address (DSTATAR1)—Offset 90h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of this register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 90h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0b RW	<b>Channel Destination Status Address (DSTATAR)</b> : Pointer from where hardware can fetch the destination status information, which is registered in the DSTAT1 register and written out to the DSTAT1 register location of the LLI before the start of the next block.

### 18.6.2.23 Channel 1 Configuration LOWER (CFG1\_L)—Offset 98h

Contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This register need to be programmed before enable the channel.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 98h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000E20h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
RELOAD_DST	RSV2			SRC_HS_POL	RSV1		HS_SEL_SRC	CH_PRIOR	RSV0
RELOAD_SRC				DST_HS_POL			HS_SEL_DST		
							FIFO_EMPTY		
							CH_SUSP		

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	<b>Reload destination enable (RELOAD_DST):</b> The DARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0b RW	<b>Reload source enable (RELOAD_SRC):</b> The SAR register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:20	0b RO	<b>Reserved (RSV2):</b> Reserved.
19	0b RW	<b>Source handshake polarity (SRC_HS_POL):</b> 0 = Active high 1 = Active low
18	0b RW	<b>Destination handshake polarity (DST_HS_POL):</b> 0 = Active high 1 = Active low
17:12	0b RW	<b>Reserved (RSV1):</b> Reserved.
11	1b RW	<b>Source Handshake select (HS_SEL_SRC):</b> Used to select which handshake interface is active for source requests on this channel 0 = HW handshake. SW ones are ignored 1 = SW handshake. HW ones are ignored If source peripheral is memory this bit is ignored
10	1b RW	<b>Destination Handshake select (HS_SEL_DST):</b> Used to select which handshake interface is active for destination requests on this channel 0 = HW handshake. SW ones are ignored 1 = SW handshake. HW ones are ignored If destination peripheral is memory this bit is ignored
9	1b RO	<b>Channel FIFO empty status (FIFO_EMPTY):</b> Indicates if there is data left in the channel FIFO. Can be used in conjunction with CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0b RW	<b>Channel Suspend control (CH_SUSP):</b> Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.

Bit Range	Default & Access	Field Name (ID): Description
7:5	001b RW	<b>Channel Priority (CH_PRIOR)</b> : Priority value equal to 7 is the highest priority, and 0 is the lowest. This field must be programmed within the following range: 0: 1 A programmed value outside this range will cause erroneous behavior.
4:0	0b RO	<b>Reserved (RSV0)</b> : Reserved.

### 18.6.2.24 Channel 1 configuration UPPER (CFG1\_U)—Offset 9Ch

Contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This register need to be programmed before enable the channel.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 9Ch

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000004h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSV5				DEST_PER		RSV4		SRC_PER
								SS_UPD_EN
								DS_UPD_EN
								PROTCTL
								FIFO_MODE
								FCMODE

Bit Range	Default & Access	Field Name (ID): Description
31:12	0b RO	<b>Reserved (RSV5)</b> : Reserved.
11	0b RW	<b>Destination hardware interface (DEST_PER)</b> : Assigns a hardware handshaking interface (0-1) to the channel destination if the CFG1_L.HS_SEL_DST field is 0; otherwise, this field is ignored. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.
10:8	0b RO	<b>Reserved (RSV4)</b> : Reserved.
7	0b RW	<b>Source hardware interface (SRC_PER)</b> : Assigns a hardware handshaking interface (0-1) to the channel source if the CFG1_L.HS_SEL_SRC field is 0; otherwise, this field is ignored. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.
6	0b RW	<b>Source Status Update Enable (SS_UPD_EN)</b> : Source status information is fetched only from the location pointed to by the SSTATAR1 register, stored in the SSTAT1 register and written out to the SSTAT1 location of the LLI if this field is high
5	0b RW	<b>Destination Status Update Enable (DS_UPD_EN)</b> : Destination status information is fetched only from the location pointed to by the DSTATAR1 register, stored in the DSTAT1 register and written out to the DSTAT0 location of the LLI if this field is high

Bit Range	Default & Access	Field Name (ID): Description
4:2	001b RW	<b>AHB bus protocol bus control (PROTCTL):</b> Protection Control bits used to drive the AHB HPROT[3:1] bus. The AMBA Specification recommends that the default value of HPROT indicates a non-cached, non-buffered, privileged data access. The reset value is used to indicate such an access. HPROT[0] is tied high because all transfers are data accesses, as there are no opcode fetches. There is a one-to-one mapping of these register bits to the HPROT[3:1] master interface signals.
1	0b RW	<b>Channel FIFO mode control (FIFO_MODE):</b> Determines how much space or data needs to be available in the FIFO before a burst transaction request is serviced. 0 = Space/data available for single AHB transfer of the specified transfer width. 1 = Data available is greater than or equal to half the FIFO depth for destination transfers and space available is greater than half the fifo depth for source transfers. The exceptions are at the end of a burst transaction request or at the end of a block transfer.
0	0b RW	<b>Channel flow control mode (FCMODE):</b> Determines when source transaction requests are serviced when the Destination Peripheral is the flow controller. 0 = Source transaction requests are serviced when they occur. Data pre-fetching is enabled. 1 = Source transaction requests are not serviced until a destination transaction request occurs. In this mode, the amount of data transferred from the source is limited so that it is guaranteed to be transferred to the destination prior to block termination by the destination. Data pre-fetching is disabled.

### 18.6.2.25 Channel 1 Source Gather (SGR1)—Offset A0h

The CTL1\_L.SINC field controls whether the address increments or decrements. For a fixed-address control, then the address remains constant throughout the transfer and this register is ignored.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + A0h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0

31:2	0b RO	<b>Reserved (RSV):</b> Reserved.
1:0	0b RW	<b>Raw Status for IntBlock Interrupt (RAW):</b> Interrupt events are stored in this Raw Interrupt Status register before masking. Each bit in this register is cleared by writing a 1 to the corresponding location in the correspondent Clear register

### 18.6.2.29 Raw Status for IntSrcTran Interrupt (RAW\_SRC\_TRAN)—Offset 2D0h

Source Transaction Complete Interrupt. Generated after completion of the last AHB transfer of the requested single/burst transaction from the handshaking interface (either the hardware or software handshaking interface) on the source side. NOTE: If the source is memory, then IntSrcTran interrupt should be ignored, as there is no concept of a DMA transaction level for memory

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 2D0h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

### 18.6.2.30 Raw Status for IntDstTran Interrupt (RAW\_DST\_TRAN)—Offset 2D8h

Destination Transaction Complete Interrupt. Generated after completion of the last AHB transfer of the requested single/burst transaction from the handshaking interface (either the hardware or software handshaking interface) on the destination side. NOTE: If the destination for a channel is memory, then that channel will never generate the IntDstTran interrupt. Because of this, the corresponding bit in this field will not be set.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 2D8h

9:8	0b RW	<b>Destination Last Transaction Request write enable (LSTDST_WE):</b> 0 = write disabled 1 = write enabled
7:2	0b RO	<b>Reserved (RSVO):</b> Reserved.
1:0	0b RW	<b>Destination Last Transaction Request register (LSTDST):</b> This bit is written only if the corresponding channel write enable bit in the Write Enable field is asserted on the same AHB write transfer, and if the channel is enabled in the CH_EN_REG register

### 18.6.2.54 DMA Configuration (DMA\_CFG\_REG)—Offset 398h

Used to enable the DMA controller (DMAC), which must be done before any channel activity can begin. If the global channel enable bit is cleared while any channel is still active, then DMA\_EN still returns 1 to indicate that there are channels still active until hardware has terminated all activity on all channels, at which point the DMA\_EN bit returns 0

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 398h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RO	<b>Reserved (RSV):</b> Reserved.
0	0b RW	<b>DMA global enable (DMA_EN):</b> 0 = disabled 1 = enabled

### 18.6.2.55 Channel Enable (CH\_EN\_REG)—Offset 3A0h

Software can read this register in order to find out which channels are currently inactive if needs to set up a new channel. It can then enable an inactive channel with the required priority.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 3A0h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:20, F:1] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0b RO	<b>Reserved (RSV1):</b> Reserved.
9:8	0b RW	<b>Channel enable register (CH_EN_WE):</b> Reserved.
7:2	0b RO	<b>Reserved (RSV0):</b> Reserved.
1:0	0b RW	<b>Channel enable register (CH_EN):</b> Setting this bit enables a channel. Clearing this bit disables the channel. 0 = Disable the Channel 1 = Enable the Channel The CH_EN_REG.CH_EN bit is automatically cleared by hardware to disable the channel after the last AMBA transfer of the DMA transfer to the destination has completed. Software can therefore poll this bit to determine when this channel is free for a new DMA transfer.

## 19.0 I<sup>2</sup>C\* Controller/GPIO Controller

The Intel® Quark™ SoC X1000 has an I<sup>2</sup>C\* controller connected to the I/O Fabric. Both 7-bit and 10-bit addressing modes are supported. This controller operates in master mode only.

In addition, this PCI function also provides a GPIO controller. The SoC provides a total of 16 GPIOs that are split between the Legacy Bridge (D:31 F:0) and the GPIO controller (D:21 F:2). This chapter details the non-Legacy GPIOs provided by the GPIO controller.

### 19.1 I<sup>2</sup>C Controller

#### 19.1.1 Signal Descriptions

I<sup>2</sup>C is a two-wire bus for inter-IC communication. Data and clock signals carry information between the connected devices.

Please see [Chapter 2.0, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Type:** The buffer type found in [Chapter 4.0, “Electrical Characteristics”](#)
- **Description:** A brief explanation of the signal’s function

**Table 119. I<sup>2</sup>C\* Signals**

Signal Name	Direction/Type	Description
I2C_DATA	I/O	I <sup>2</sup> C Serial Data
I2C_CLK	I/O	I <sup>2</sup> C Serial Clock

#### 19.1.2 Features

##### 19.1.2.1 I<sup>2</sup>C\* Protocol

The I<sup>2</sup>C bus is a two-wire serial interface, consisting of a serial data line and a serial clock. These wires carry information between the devices connected to the bus. Each device is recognized by a unique address and can operate as either a “transmitter” or “receiver,” depending on the function of the device. Devices are considered slaves when performing data transfers, as the SoC is always a Master. A master is a device that initiates a data transfer on the bus and generates the clock signals to permit that transfer. At that time, any device addressed is considered a slave.

- The SoC is always the I<sup>2</sup>C master; and it supports multi-master mode.

- The SoC can support clock stretching by slave devices.
- The I2C\_DATA line is a bidirectional signal and changes only while the I2C\_CLK line is low, except for STOP, START, and RESTART conditions.
- The output drivers are open-drain or open-collector to perform wire-AND functions on the bus.
- The maximum number of devices on the bus is limited by the maximum capacitance specification:
  - 130 pF for standard and fast mode
- Data is transmitted in byte packages.

### 19.1.2.2 I<sup>2</sup>C\* Modes of Operation

The I<sup>2</sup>C module can operate in the following modes:

- Standard mode (with a bit rate up to 100 Kb/s)
- Fast mode (with a bit rate up to 400 Kb/s)

The I<sup>2</sup>C module can communicate with devices using only these modes as long as they are attached to the bus. Additionally, fast mode devices are downward compatible.

- Fast mode devices can communicate with standard mode devices in a 0–100 Kb/s I<sup>2</sup>C bus system.

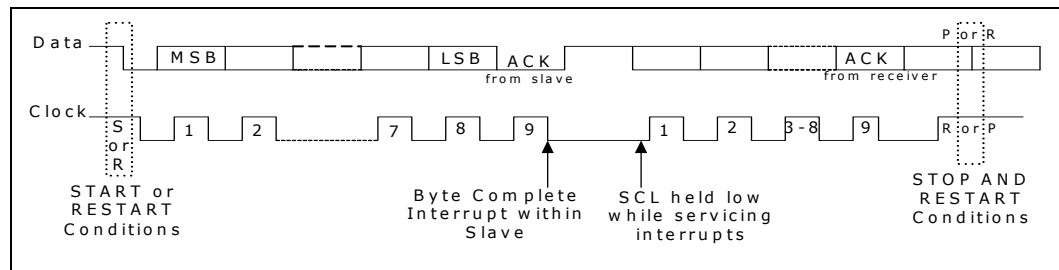

However, according to the I<sup>2</sup>C specification, standard mode devices are not upward compatible and should not be incorporated in a fast-mode I<sup>2</sup>C bus system since they cannot follow the higher transfer rate and unpredictable states would occur.

### 19.1.2.3 Functional Description

- The I<sup>2</sup>C master is responsible for generating the clock and controlling the transfer of data.
- The slave is responsible for either transmitting or receiving data to/from the master.
- The acknowledgement of data is sent by the device that is receiving data, which can be either a master or a slave.
- Each slave has a unique address that is determined by the system designer:
  - When a master wants to communicate with a slave, the master transmits a START/RESTART condition that is then followed by the slave's address and a control bit (R/W), to determine if the master wants to transmit data or receive data from the slave.
  - The slave then sends an acknowledge (ACK) pulse after the address.
- If the master (master-transmitter) is writing to the slave (slave-receiver):
  - The receiver gets one byte of data.
  - This transaction continues until the master terminates the transmission with a STOP condition.
- If the master is reading from a slave (master-receiver):
  - The slave transmits (slave-transmitter) a byte of data to the master, and the master then acknowledges the transaction with the ACK pulse.
  - This transaction continues until the master terminates the transmission by not acknowledging (NACK) the transaction after the last byte is received, and then the master issues a STOP condition or addresses another slave after issuing a RESTART condition. This behavior is illustrated in [Figure 39](#).

**Figure 39. Data Transfer on the I<sup>2</sup>C\* Bus**

#### 19.1.2.3.1 START and STOP Conditions

When the bus is idle, both the clock and data signals are pulled high through external pull-up resistors on the bus.

When the master wants to start a transmission on the bus, the master issues a START condition.

- This is defined to be a high-to-low transition of the data signal while clock is a '1'.
- When the master wants to terminate the transmission, the master issues a STOP condition. This is defined to be a low-to-high transition of the data line while clock is a 1. [Figure 40](#) shows the timing of the START and STOP conditions.
- When data is being transmitted on the bus, the data line must be stable when clock is a 1.

**Figure 40. START and STOP Conditions**

The signal transitions for the START/STOP conditions, as depicted above, reflect those observed at the output of the Master driving the I<sup>2</sup>C bus. Care should be taken when observing the data/clock signals at the input of the Slave(s), because unequal line delays may result in an incorrect data/clock timing relationship.

#### 19.1.2.3.2 Addressing Slave Protocol

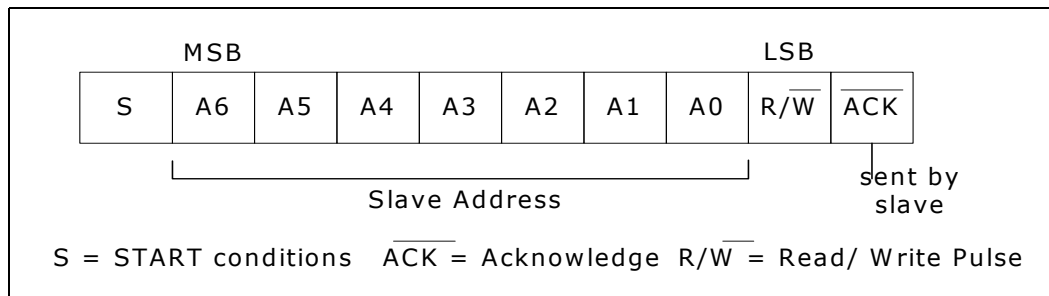

There are two address formats—7-bit address format and 10-bit address format.

##### 7-bit Address Format

- During the seven-bit address format, the first seven bits (bits 7:1) of the first byte set the slave address and the LSB bit (bit 0) is the R/W bit as shown in [Figure 41](#).

- When bit 0 (R/W) is set to 0, the master writes to the slave. When bit 0 (R/W) is set to 1, the master reads from the slave.

Figure 41. 7-Bit Address Format

**10-bit Address Format**

- During 10-bit addressing, 2 bytes are transferred to set the 10-bit address. The transfer of the first byte contains the following bit definition.
  - The first five bits (bits 7:3) notify the slaves that this is a 10-bit transfer. The next two bits (bits 2:1) set the slave’s address bits 9:8. The LSB bit (bit 0) is the RW bit.
  - The second byte transferred sets bits 7:0 of the slave address.
  - Figure 42 shows the 10-bit address format, and Table 120 defines the special purpose and reserved first byte addresses.

Figure 42. 10-bit Address Format

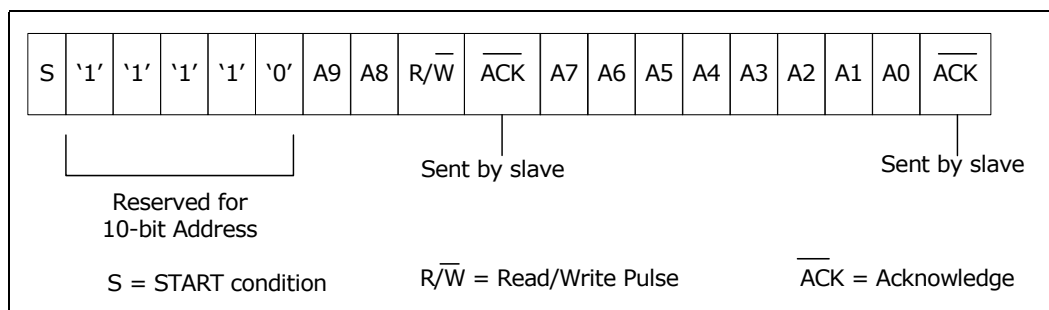

Table 120. I<sup>2</sup>C\* Definition of Bits in First Byte

Slave Address	RW Bit	Description
0000 000	0	<b>General Call Address</b> —The I <sup>2</sup> C controller places the data in the receive buffer and issues a General Call interrupt.
0000 000	1	<b>START byte</b> —For more details, refer to I <sup>2</sup> C bus specification section 3.15.
0000 001	X	<b>CBUS address</b> —I <sup>2</sup> C controller ignores these accesses.
0000 010	X	<b>Reserved</b>
0000 011	X	<b>Reserved</b>
0000 1XX	X	<b>High-speed master code</b>
1111 1XX	X	<b>Reserved</b>
1111 0XX	X	<b>Ten (10)-bit slave addressing</b>

### 19.1.2.3.3 Transmit and Receive Protocol

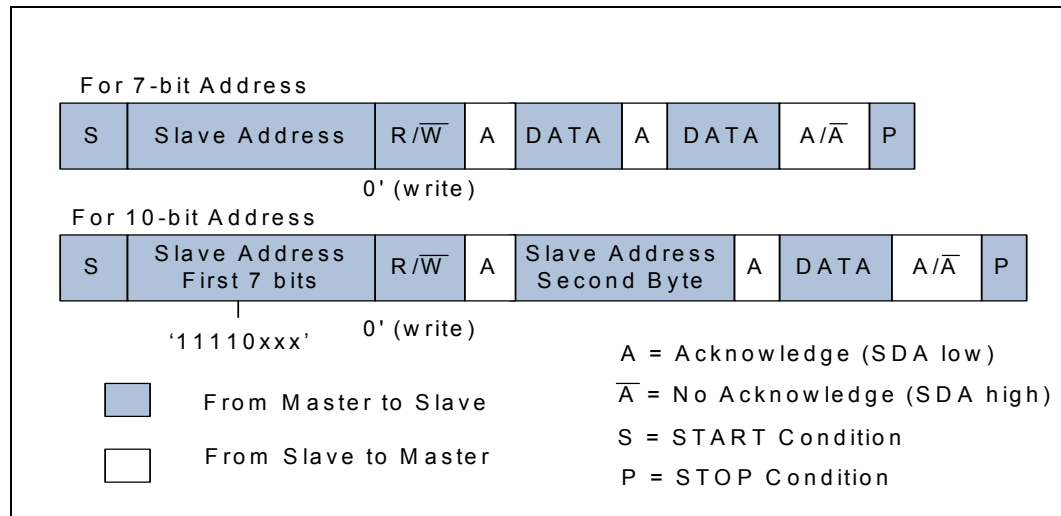

The master can initiate data transmission and reception to/from the bus, acting as either a master-transmitter or master-receiver. A slave responds to requests from the master by either transmitting data or receiving data to/from the bus, acting as either a slave-transmitter or slave-receiver, respectively.

#### Master-Transmitter and Slave-Receiver

All data is transmitted in byte format, with no limit on the number of bytes transferred per data transfer. After the master sends the address and RW bit or the master transmits a byte of data to the slave, the slave-receiver must respond with the acknowledge signal (ACK). When a slave-receiver does not respond with an ACK pulse, the master aborts the transfer by issuing a STOP condition. The slave must leave the SDA line high so that the master can abort the transfer.

If the master-transmitter is transmitting data as shown in Figure 43, then the slave-receiver responds to the master-transmitter with an acknowledge pulse after every byte of data is received.

Figure 43. Master Transmitter Protocol

#### Master-Receiver and Slave-Transmitter

If the master is receiving data as shown in Figure 44, the master responds to the Slave-Transmitter with an acknowledge pulse after a byte of data has been received, except for the last byte. This is the way the Master-Receiver notifies the Slave-Transmitter that this is the last byte. The Slave-Transmitter relinquishes the SDA line after detecting the No Acknowledge (NACK) so that the master can issue a STOP condition.

When a master does not want to relinquish the bus with a STOP condition, the master can issue a RESTART condition. This is identical to a START condition except it occurs after the ACK pulse. The master can then communicate with the same slave or a different slave.

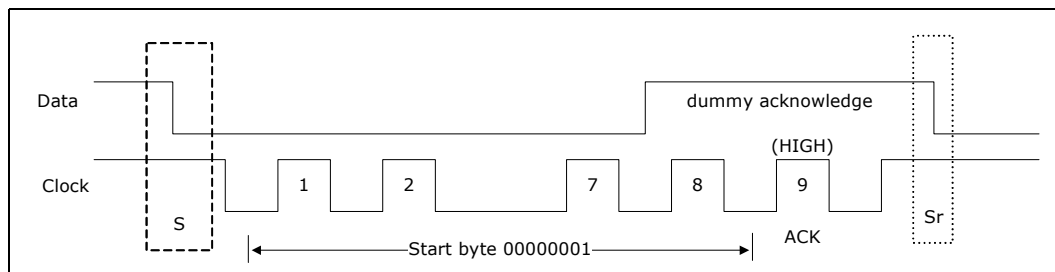

Figure 44. Master Receiver Protocol

#### 19.1.2.3.4 START BYTE Transfer Protocol

The START BYTE Transfer protocol is set up for systems that do not have an on-board dedicated I<sup>2</sup>C hardware module. When the I<sup>2</sup>C controller is a master, it supports the generation of START BYTE transfers at the beginning of every transfer in case a slave device requires it. This protocol consists of 7 '0's being transmitted followed by a 1, as illustrated in Figure 45. This allows the processor that is polling the bus to under-sample the address phase until 0s are detected. Once the microcontroller detects a 0, it switches from the under sampling rate to the correct rate of the master.

Figure 45. START Byte Transfer

The START BYTE procedure is as follows:

1. Master generates a START condition.
2. Master transmits the START byte (0000 0001).
3. Master transmits the ACK clock pulse. (Present only to conform with the byte handling format used on the bus.)
4. No slave sets the ACK signal to 0.
5. Master generates a RESTART (R) condition.

A hardware receiver does not respond to the START BYTE because it is a reserved address and resets after the RESTART condition is generated.

### 19.1.3 Use

#### 19.1.3.1 Master Mode Operation

To use the I<sup>2</sup>C controller as a master, perform the following steps:

1. Disable the I<sup>2</sup>C controller by writing 0 (zero) to IC\_ENABLE.ENABLE.
2. Write to the IC\_CON register to set the maximum speed mode supported (IC\_CON.SPEED) and to specify whether the I<sup>2</sup>C controller starts its transfers in 7/10 bit addressing mode.
3. Write to the IC\_TAR register the address of the I<sup>2</sup>C device to be addressed. The desired speed of the I<sup>2</sup>C controller master-initiated transfers, either 7-bit or 10-bit addressing, is controlled by the IC\_TAR.IC\_10BITADDR\_MASTER bit field.
4. Enable the I<sup>2</sup>C controller by writing a 1 in IC\_ENABLE.
5. Write the transfer direction and data to be sent to the IC\_DATA\_CMD register. If the IC\_DATA\_CMD register is written before the I<sup>2</sup>C controller is enabled, the data and commands are lost as the buffers are kept cleared when I<sup>2</sup>C controller is not enabled.

RESTART and STOP conditions are generated only under software control through specific IC\_DATA\_CMD fields. When the Transmit FIFO is empty the I<sup>2</sup>C controller does not automatically generate a STOP condition and pauses the I<sup>2</sup>C bus by holding SCL low. As part of the command definition (IC\_DATA\_CMD) software must specify if a particular command is going to be followed by a STOP or RESTART condition by setting either IC\_DATA\_CMD.STOP or IC\_DATA\_CMD.RESTART.

The I<sup>2</sup>C controller supports switching back and forth between reading and writing dynamically. To transmit data, write the data to be written to the lower byte of the I<sup>2</sup>C Rx/Tx Data Buffer and Command Register (IC\_DATA\_CMD). The IC\_DATA\_CMD.CMD should be written to 0 for I<sup>2</sup>C write operations. Subsequently, a read command may be issued by writing "don't cares" to IC\_DATA\_CMD.DAT register bits, and a 1 should be written to the IC\_DATA\_CMD.CMD bit.

#### 19.1.3.2 Disabling I<sup>2</sup>C\* Controller

The register IC\_ENABLE is added to allow software to unambiguously determine when the hardware has completely shutdown in response to the IC\_ENABLE.ENABLE register being set from 1 to 0.

##### Procedure

1. Define a timer interval ( $t_{i2c\_poll}$ ) equal to 10 times the signaling period for the highest I<sup>2</sup>C transfer speed used in the system and supported by the I<sup>2</sup>C controller. For example, if the highest I<sup>2</sup>C transfer mode is 400Kb/s, then this  $t_{i2c\_poll}$  is 25  $\mu$ s.
2. Define a maximum time-out parameter, MAX\_T\_POLL\_COUNT, such that if any repeated polling operation exceeds this maximum value, an error is reported.
3. Execute a blocking thread/process/function that prevents any further I<sup>2</sup>C master transactions to be started by software, but allows any pending transfers to be completed.
4. The variable POLL\_COUNT is initialized to zero (0).
5. Set IC\_ENABLE.ENABLE to zero (0).
6. Read the IC\_ENABLE\_STATUS.IC\_EN bit. Increment POLL\_COUNT by one. If POLL\_COUNT  $\geq$  MAX\_T\_POLL\_COUNT, exit with the relevant error code.
7. If IC\_ENABLE\_STATUS.IC\_EN is 1, then sleep for  $t_{i2c\_poll}$  and proceed to the previous step. Otherwise, exit with a relevant success code.

### 19.1.4 References

UM10204 I2C-Bus Specification and User Manual, Revision 03

## 19.2 GPIO Controller

### 19.2.1 Signal Descriptions

Please see [Chapter 2.0, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Type:** The buffer type found in [Chapter 4.0, “Electrical Characteristics”](#)
- **Description:** A brief explanation of the signal’s function

Table 121. GPIO Signals

Signal Name	Direction/ Type	Description
GPIO[7:0]	I/O CMOS3.3	General Purpose IO available in the S0 state

### 19.2.2 Features

The GPIO Controller provides 8 GPIO pins via Port A of the controller.

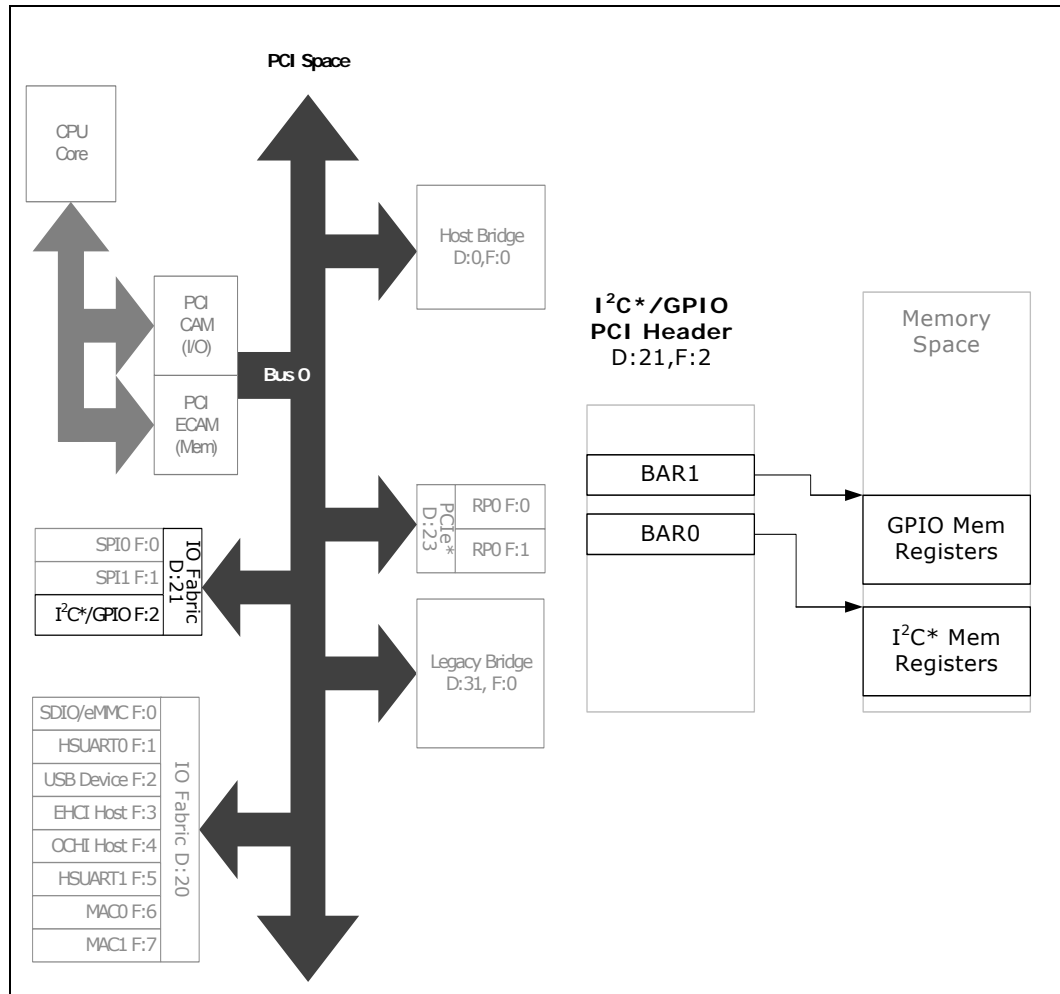

- 8 Independently configurable GPIOs
- Separate data register and data direction for each GPIO
- Interrupt source mode supported for each GPIO
- Debounce logic for interrupt sources
- Metastability registers for GPIO read data

## 19.3 Register Map

See [Chapter 5.0, “Register Access Methods”](#) for additional information.

Figure 46. I<sup>2</sup>C\*/GPIO Register Map

## 19.4 PCI Configuration Registers

Table 122. Summary of PCI Configuration Registers—0/21/2

Offset Start	Offset End	Register ID—Description	Default Value

### 19.4.1 Vendor ID (VENDOR\_ID)—Offset 0h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

VENDOR\_ID: [B:0, D:21, F:2] + 0h

Default: 8086h

Bit Range	Default & Access	Description
15: 0	8086h RO	Vendor ID (value): PCI Vendor ID for Intel

## 19.4.2 Device ID (DEVICE\_ID)—Offset 2h

### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

DEVICE\_ID: [B:0, D:21, F:2] + 2h

Default: 0934h

15	12	8	4	0												
0	0	0	0	1	0	0	0	1	0	0	1	1	0	1	0	0
value																

Bit Range	Default & Access	Description
15: 0	0934h RO	Device ID (value): PCI Device ID

## 19.4.3 Command Register (COMMAND\_REGISTER)—Offset 4h

### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

COMMAND\_REGISTER: [B:0, D:21, F:2] + 4h

Default: 0000h

15	12	8	4	0										
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD0				IntrDis	RSVD	SERREN	RSVD				MasEn	MEMen	RSVD	

Bit Range	Default & Access	Description
15: 11	0h RO	RSVD0 (RSVD0): Reserved
10	0b RW	Interrupt Disable (IntrDis): Interrupt disable. Disables generation of interrupt messages in the PCI Express function. 1 =) disabled, 0 =) not disabled
9	0h RO	Reserved (RSVD): Reserved.
8	0b RW	SERR Enable (SERREN): When set, this bit enables the non-fatal and fatal errors detected by the function to be reported to the root complex.
7: 3	00h RO	Reserved (RSVD): Reserved.
2	0b RW	Bus Master Enable (MasEn): 0=)disables upstream requests 1=)enables upstream requests.
1	0b RW	Memory Space Enable (MEMen): Device support for Memory transactions. 0 =) not supported. 1 =) supported.
0	0h RO	Reserved (RSVD): Reserved.

### 19.4.4 Status Register (STATUS)—Offset 6h

**Access Method**

Type: PCI Configuration Register  
(Size: 16 bits)

STATUS: [B:0, D:21, F:2] + 6h

Default: 0010h

15	12	8	4	0
0	0	0	1	0
RSVD0	SigSysErr	RcdMasAb	RSVD	DEVSEL
			RSVD	FastB2B
			capable_66Mhz	hasCapList
			IntrStatus	RSVD1

Bit Range	Default & Access	Description
15	0h RO	<b>RSVDO (RSVDO)</b> : Reserved
14	0b RW	<b>Signaled System Error (SigSysErr)</b> : Set when a function detects a system error and the SERR Enable bit is set
13	0b RW	<b>Received master abort (RcdMasAb)</b> : Set when requester receives a completion with Unsupported Request completion status
12: 11	0h RO	<b>Reserved (RSVD)</b> : Reserved.
10: 9	0b RO	<b>DEVSEL Timing (DEVSEL)</b> : Deprecated: Hardwired to 0
8	0h RO	<b>Reserved (RSVD)</b> : Reserved.
7	0b RO	<b>Fast Back-to-Back Capable (FastB2B)</b> : Deprecated: Hardwired to 0
6	0h RO	<b>Reserved (RSVD)</b> : Reserved.
5	0b RO	<b>66MHz-Capable (capable_66Mhz)</b> : Deprecated: Hardwired to 0
4	1h RO	<b>Capabilities List (hasCapList)</b> : Indicates the presence of one or more capability register sets.
3	0b RO	<b>Interrupt Status (IntrStatus)</b> : Indicates that the function has a legacy interrupt request outstanding. This bit has no meaning if Message Signaled Interrupts are being used
2: 0	0h RO	<b>RSVD1 (RSVD1)</b> : Reserved

### 19.4.5 Revision ID and Class Code (REV\_ID\_CLASS\_CODE)—Offset 8h

**Access Method**

Type: PCI Configuration Register  
(Size: 32 bits)

REV\_ID\_CLASS\_CODE: [B:0, D:21, F:2] + 8h

Default: 0C800010h

Bit Range	Default & Access	Description
3: 0	0h RO	<b>Completion Code (comp_code)</b> : Completion code having run BIST if BIST is supported. 0=)success. non-zero=)failure

### 19.4.10 Base Address Register (BAR0)—Offset 10h

**Access Method**

Type: PCI Configuration Register  
(Size: 32 bits)

BAR0: [B:0, D:21, F:2] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31: 12	0h RW	<b>address (address)</b> : Used to determine the size of memory required by the device and to assign a start address for this required amount of memory.
11: 4	00h RO	<b>Reserved (RSVD)</b> : Reserved.
3	0b RO	<b>Prefetchable (prefetchable)</b> : Defines the block of memory as prefetchable or not. A block of memory is prefetchable if it fulfils the following 3 conditions (1) no side effects on reads, (2) the device returns all bytes on reads regardless of the byte enables, and (3) host bridges can merge processor writes into this range without causing errors. Hardwired to 0
2: 1	00b RO	<b>Type (memType)</b> : Hardwired to 0 to indicate a 32-bit decoder
0	0b RO	<b>Memory Space Indicator (isIO)</b> : Hardwired to 0 to indicate the register is a memory address decoder

### 19.4.11 Base Address Register (BAR1)—Offset 14h

**Access Method**

Type: PCI Configuration Register  
(Size: 32 bits)

BAR1: [B:0, D:21, F:2] + 14h

Default: 00000000h

Bit Range	Default & Access	Description
31: 12	0h RW	<b>address (address)</b> : Used to determine the size of memory required by the device and to assign a start address for this required amount of memory.
11: 4	00h RO	<b>Reserved (RSVD)</b> : Reserved.
3	0b RO	<b>Prefetchable (prefetchable)</b> : Defines the block of memory as prefetchable or not. A block of memory is prefetchable if it fulfils the following 3 conditions (1) no side effects on reads, (2) the device returns all bytes on reads regardless of the byte enables, and (3) host bridges can merge processor writes into this range without causing errors. Hardwired to 0
2: 1	00b RO	<b>Type (memType)</b> : Hardwired to 0 to indicate a 32-bit decoder
0	0b RO	<b>Memory Space Indicator (isIO)</b> : Hardwired to 0 to indicate the register is a memory address decoder

### 19.4.12 Cardbus CIS Pointer (CARDBUS\_CIS\_POINTER)—Offset 28h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

CARDBUS\_CIS\_POINTER: [B:0, D:21, F:2] + 28h

Default: 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
value											

Bit Range	Default & Access	Description
31: 0	0h RO	<b>Cardbus CIS Pointer (value)</b> : Reserved. Hardwire to 0.

### 19.4.13 Subsystem Vendor ID (SUB\_SYS\_VENDOR\_ID)—Offset 2Ch

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

SUB\_SYS\_VENDOR\_ID: [B:0, D:21, F:2] + 2Ch

Default: 0000h

15	12	8	4	0							
0	0	0	0	0	0	0	0	0	0	0	0
value											

Bit Range	Default & Access	Description
15: 0	0h RO	<b>Subsystem Vendor ID (value)</b> : PCI Subsystem Vendor ID

### 19.4.14 Subsystem ID (SUB\_SYS\_ID)—Offset 2Eh

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

SUB\_SYS\_ID: [B:0, D:21, F:2] + 2Eh

Default: 0000h

15	12	8	4	0
0	0	0	0	0
value				

Bit Range	Default & Access	Description
15: 0	0h RO	Subsystem ID (value): PCI Subsystem ID

### 19.4.15 Expansion ROM Base Address (EXP\_ROM\_BASE\_ADR)—Offset 30h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

EXP\_ROM\_BASE\_ADR: [B:0, D:21, F:2] + 30h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
ROM_base_addr						RSVD		AddrDecodeEn

Bit Range	Default & Access	Description
31: 11	0h RW	ROM Start Address (ROM_base_addr): Used to determine the size of memory required by the ROM and to assign a start address for this required amount of memory.
10: 1	000h RO	Reserved (RSVD): Reserved.
0	0h RW	Address Decode Enable (AddrDecodeEn): A 1 in this field enables the function's ROM address decoder assuming that the Memory Space bit in the Command Register is also set to 1

### 19.4.16 Capabilities Pointer (CAP\_POINTER)—Offset 34h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

CAP\_POINTER: [B:0, D:21, F:2] + 34h

Default: 00000080h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVDO							value	

Bit Range	Default & Access	Description
31: 8	0h RO	<b>RSVDO (RSVDO)</b> : Reserved
7: 0	80h RO	<b>Capabilities Pointer (value)</b> : Pointer to memory location of first entry of linked list of configuration register sets each of which supports a feature. Points to PM (power management) register set at location 0x80

### 19.4.17 Interrupt Line Register (INTR\_LINE)—Offset 3Ch

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

INTR\_LINE: [B:0, D:21, F:2] + 3Ch

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RW	<b>Interrupt Line Register (value)</b> : The value in this register tells which input of the system interrupt controller(s) the device's interrupt pin is connected to. The device itself does not use this value, rather it is used by device drivers and operating systems. Device drivers and operating systems can use this information to determine priority and vector information.

### 19.4.18 Interrupt Pin Register (INTR\_PIN)—Offset 3Dh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

INTR\_PIN: [B:0, D:21, F:2] + 3Dh

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	03h RO	<b>Interrupt Pin Register (value):</b> The Interrupt Pin register tells which interrupt pin the device (or device function) uses. A value of 1 corresponds to INTA#. A value of 2 corresponds to INTB#. A value of 3 corresponds to INTC#. A value of 4 corresponds to INTD#. Devices (or device functions) that do not use an interrupt pin must put a 0 in this register. The values 05h through FFh are reserved. For this system function 0 is connected to INTA, 1 to INTB, 2 to INTC 3 to INTD, 4 to INTA, 5 to INTB etc.

### 19.4.19 MIN\_GNT (MIN\_GNT)—Offset 3Eh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MIN\_GNT: [B:0, D:21, F:2] + 3Eh

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RO	<b>MIN_GNT (value):</b> Hardwired to 0

### 19.4.20 MAX\_LAT (MAX\_LAT)—Offset 3Fh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MAX\_LAT: [B:0, D:21, F:2] + 3Fh

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RO	<b>MAX_LAT (value):</b> Hardwired to 0

### 19.4.21 Capability ID (PM\_CAP\_ID)—Offset 80h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

PM\_CAP\_ID: [B:0, D:21, F:2] + 80h

Default: 01h

Bit Range	Default & Access	Description
8: 6	0h RO	<b>Aux Current (aux_curr)</b> : Hardwired to 0 as the D3hot state is not supported
5	0h RO	<b>Device Specific Initialisation (DSI)</b> : Hardwired to 0 to indicate that the device does not require a device specific initialisation sequence following transition to the D0 uninitialised state
4	0h RO	<b>Reserved (RSVD)</b> : Reserved.
3	0h RO	<b>PME Clock (PME_clock)</b> : Deprecated. Hardwired to 0
2: 0	011b RO	<b>Version (version)</b> : This function complies with revision 1.2 of the PCI Power Management Interface Specification

### 19.4.24 Power Management Control/Status Register (PMCSR)—Offset 84h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

PMCSR: [B:0, D:21, F:2] + 84h

Default: 0008h

15	12	8	4	0
0	0	0	0	0
PME_status	Data_scale	Data_select	PME_en	RSVD
				no_soft_reset
				RSVD
				power_state

Bit Range	Default & Access	Description
15	0h RW	<b>PME Status (PME_status)</b> : Set if function has experienced a PME (even if PME_en (bit 8 of PMCSR register) is not set).
14: 13	0h RO	<b>Data Scale (Data_scale)</b> : Hardwired to 0 as the data register is not supported
12: 9	0h RO	<b>Data Select (Data_select)</b> : Hardwired to 0 as the data register is not supported
8	0b RW	<b>PME Enable (PME_en)</b> : Enable device function to send PME messages when an event occurs. 1=)enabled. 0=)disabled
7: 4	0h RO	<b>Reserved (RSVD)</b> : Reserved.
3	1b RO	<b>No Soft Reset (no_soft_reset)</b> : Devices do perform an internal reset when transitioning from D3hot to D0
2	0h RO	<b>Reserved (RSVD)</b> : Reserved.
1: 0	00b RW	<b>Power State (power_state)</b> : Allows software to read current PM state or transition device to a new PM state, where 2'b00 = D0, 2'b01=D1, 2'b10=D2, 2'b11=D3hot

### 19.4.25 PM CSR PCI-to-PCI Bridge Support Extension (PMCSR\_BSE)—Offset 86h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

PMCSR\_BSE: [B:0, D:21, F:2] + 86h

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RO	PM CSR PCI-to-PCI Bridge Support Extension (value): Not Supported. Hardwired to 0.

### 19.4.26 Power Management Data Register (DATA\_REGISTER)—Offset 87h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

DATA\_REGISTER: [B:0, D:21, F:2] + 87h

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RO	Power Management Data Register (value): Not Supported. Hardwired to 0

### 19.4.27 Capability ID (MSI\_CAP\_ID)—Offset A0h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MSI\_CAP\_ID: [B:0, D:21, F:2] + A0h

Default: 05h

Bit Range	Default & Access	Description
7: 0	05h RO	<b>Capability ID (value)</b> : Identifies the feature associated with this register set. Hardwired value as per PCI SIG assigned capability ID

### 19.4.28 Next Capability Pointer (MSI\_NXT\_CAP\_PTR)—Offset A1h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MSI\_NXT\_CAP\_PTR: [B:0, D:21, F:2] + A1h

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	00h RO	<b>Next Capability Pointer (value)</b> : Hardwired to 0 as this is the last capability structure in the chain

### 19.4.29 Message Control (MESSAGE\_CTRL)—Offset A2h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

MESSAGE\_CTRL: [B:0, D:21, F:2] + A2h

Default: 0100h

15	12	8	4	0
0	0	0	0	0
RSVD0		perVecMskCap	bit64Cap	multiMsgEn
		multiMsgCap	MSIEnable	

Bit Range	Default & Access	Description
15: 9	0h RO	<b>RSVD0 (RSVD0)</b> : Reserved
8	1h RO	<b>Per Vector Masking Capable (perVecMskCap)</b> : Hardwired to 1 to indicate the function supports PVM
7	0h RO	<b>64 bit Address Capable (bit64Cap)</b> : This bit is hardwired to 0 to indicate that the function is not capable of sending a 64-bit message address.
6: 4	0h RW	<b>Multi-Message Enable (multiMsgEn)</b> : As only one vector is supported per function, software should only write a value of 0x0 to this field
3: 1	0h RO	<b>Multiple Message Enable (multiMsgCap)</b> : This field is hardwired to 0x0 to indicate that the function is requesting a single vector

Bit Range	Default & Access	Description
0	0h RW	<b>MSI Enable (MSIEnable)</b> : Set to enable MSI to request service. If set then it's prohibited to use the INTx pin. System configuration software sets this bit to enable MSI.

### 19.4.30 Message Address (MESSAGE\_ADDR)—Offset A4h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

MESSAGE\_ADDR: [B:0, D:21, F:2] + A4h

Default: 00000000h

Bit Range	Default & Access	Description
31: 2	0h RW	<b>Message Address (address)</b> : If the Message Enable bit (bit 0 of the Message Control register) is set, the contents of this register specify the DWORD-aligned address (AD[31:2]) for the MSI memory write transaction. AD[1:0] are driven to zero during the address phase. This field is read/write
1: 0	0h RO	<b>RSVDO (RSVDO)</b> : Reserved

### 19.4.31 Message Data (MESSAGE\_DATA)—Offset A8h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

MESSAGE\_DATA: [B:0, D:21, F:2] + A8h

Default: 0000h

Bit Range	Default & Access	Description
15: 0	0h RW	<b>Data Field (MsgData)</b> : System-specified message data. If the Message Enable bit (bit 0 of the Message Control register) is set, the message data is driven onto the lower word (AD[15:0]) of the memory write transactions data phase. AD[31:16] are driven to zero during the memory write transactions data phase. C/BE[3::0]# are asserted during the data phase of the memory write transaction. None of the message bits will be changed by hardware

### 19.4.32 Mask Bits for MSI (PER\_VEC\_MASK)—Offset ACh

#### Access Method

**Table 123. Summary of Memory Mapped I/O Registers—BAR0 (Continued)**

Offset Start	Offset End	Register Name (Register Symbol)	Default Value
14h	17h	"Standard Speed Clock SCL High Count (IC_SS_SCL_HCNT)—Offset 14h" on page 759	00000190h
18h	1Bh	"Standard Speed Clock SCL Low Count (IC_SS_SCL_LCNT)—Offset 18h" on page 760	000001D6h
1Ch	1Fh	"Fast Speed Clock SCL High Count (IC_FS_SCL_HCNT)—Offset 1Ch" on page 760	00000003Ch

A0h	A3h	"SS and FS Spike Suppression Limit (IC_FS_SPKLEN)—Offset A0h" on page 777	00000007h

**19.5.1.1 Control Register (IC\_CON)—Offset 0h**

Can be written only when the I2C is disabled (IC\_ENABLE==0). Writes while the I2C controller is enabled have no effect.

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 0h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:2] + 10h

**Default:** 00000037h

Bit Range	Default & Access	Field Name (ID): Description
9	0b WO	<b>Stop Bit Control (STOP):</b> This bit controls whether a STOP is issued after the byte is sent or received: - 1 STOP is issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master immediately tries to start a new transfer by issuing a START and arbitrating for the bus. - 0 STOP is not issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the master continues the current transfer by sending/receiving data bytes according to the value of the CMD bit. If the Tx FIFO is empty, the master holds the SCL line low and stalls the bus until a new command is available in the Tx FIFO.
8	0b WO	<b>Command (CMD):</b> This bit controls whether a read or a write is performed. This bit controls the direction only in I2C master mode. 0 = Write 1 = Read When a command is entered in the TX FIFO, this bit distinguishes the write and read commands. If a '1' is written to this bit after receiving a RD_REQ interrupt, then a TX_ABRT interrupt occurs. NOTE: It is possible that while attempting a master I2C read transfer, a RD_REQ interrupt may have occurred simultaneously due to a remote I2C master addressing I2C controller. In this type of scenario, the I2C controller ignores the IC_DATA_CMD write, generates a TX_ABRT interrupt, and waits to service the RD_REQ interrupt.
7:0	0b RW	<b>Data Buffer (DAT):</b> Contains the data to be transmitted or received on the I2C bus. When writing to this register and want to perform a read, DAT field is ignored by the I2C controller. When reading this register, DAT return the value of data received on the I2C controller interface.

### 19.5.1.4 Standard Speed Clock SCL High Count (IC\_SS\_SCL\_HCNT)—Offset 14h

Sets the SCL clock high-period count for standard speed (SS). Can be written only when the I2C is disabled (IC\_ENABLE=0). Writes at other times have no effect.

#### Access Method

Type: Memory Mapped I/O Register  
 (Size: 32 bits)

Offset: [BAR0] + 14h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:21, F:2] + 10h

Default: 00000190h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0b RO	<b>Reserved (RSV):</b> Reserved.

Bit Range	Default & Access	Field Name (ID): Description
15:0	0190h RW	<b>SS SCL clock high-period count (IC_SS_SCL_HCNT):</b> Must be set before any I2C bus transaction can take place to ensure proper I/O timing. The minimum valid value is 6; hardware prevents values less than this being written, and if attempted results in 6 being set. This register must not be programmed to a value higher than 65525, because I2C controller uses a 16-bit counter to flag an I2C bus idle condition when this counter reaches a value of IC_SS_SCL_HCNT + 10.

### 19.5.1.5 Standard Speed Clock SCL Low Count (IC\_SS\_SCL\_LCNT)—Offset 18h

Sets the SCL clock low-period count for standard speed (SS). Can be written only when the I2C is disabled (IC\_ENABLE==0). Writes at other times have no effect.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 18h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:2] + 10h

**Default:** 000001D6h

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	0	1
RSV				IC_SS_SCL_LCNT				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0b RO	<b>Reserved (RSV):</b> Reserved.
15:0	01d6h RW	<b>SS SCL clock low-period count (IC_SS_SCL_LCNT):</b> Must be set before any I2C bus transaction can take place to ensure proper I/O timing. The minimum valid value is 8; hardware prevents values less than this being written, and if attempted results in 8 being set.

### 19.5.1.6 Fast Speed Clock SCL High Count (IC\_FS\_SCL\_HCNT)—Offset 1Ch

Sets the SCL clock high-period count for fast speed (FS). Can be written only when the I2C is disabled (IC\_ENABLE==0). Writes at other times have no effect.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 1Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:2] + 10h

**Default:** 0000003Ch

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 2Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:2] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSV						RSVD0	RSVD1	RSVD2
						R_START_DET	R_STOP_DET	R_ACTIVITY
						R_TX_ABRT	R_RD_REQ	R_TX_EMPTY
						R_TX_OVER	R_RX_FULL	R_RX_OVER
						R_RX_UNDER		

Bit Range	Default & Access	Field Name (ID): Description
31:12	0b RO	<b>Reserved (RSV):</b> Reserved.
11	0b RO	<b>RSVD0:</b> Reserved
10	0b RO	<b>Start Detected (R_START_DET):</b> Indicates whether a START or RESTART condition has occurred on the I2C interface
9	0b RO	<b>Stop Detected (R_STOP_DET):</b> Indicates whether a STOP condition has occurred on the I2C interface.
8	0b RO	<b>Activity (R_ACTIVITY):</b> This bit captures I2C controller activity and stays set until it is cleared. There are four ways to clear it: <ul style="list-style-type: none"> <li>- Disabling the controller</li> <li>- Reading the IC_CLR_ACTIVITY register</li> <li>- Reading the IC_CLR_INTR register</li> <li>- System reset</li> </ul> Once this bit is set, it stays set unless one of the four methods is used to clear it. Even if the controller is idle, this bit remains set until cleared, indicating that there was activity on the bus
7	0b RO	<b>RSVD1:</b> Reserved
6	0b RO	<b>TX Abort (R_TX_ABRT):</b> This bit indicates if the I2C controller, in transmitter mode, is unable to complete the intended actions on the contents of the transmit FIFO. This situation is referred to as a 'transmit abort'. When this bit is set to 1, the IC_TX_ABRT_SOURCE register indicates the reason why the transmit abort takes places.  NOTE: The controller flushes/resets/empties the TX FIFO whenever this bit is set. The TX FIFO remains in this flushed state until the register IC_CLR_TX_ABRT is read. Once this read is performed, the TX FIFO is then ready to accept more data bytes for transmission
5	0b RO	<b>Read Requested (R_RD_REQ):</b> This bit is set to 1 when I2C controller is acting as a slave and another I2C master is attempting to read data from it. The controller holds the I2C bus in a wait state (SCL=0) until this interrupt is serviced, which means that the slave has been addressed by a remote master that is asking for data to be transferred. The processor must respond to this interrupt and then write the requested data to the IC_DATA_CMD register. This bit is set to 0 just after the processor reads the IC_CLR_RD_REQ register
4	0b RO	<b>TX Empty (R_TX_EMPTY):</b> This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register. It is automatically cleared by hardware when the buffer level goes above the threshold. When the IC_ENABLE bit 0 is 0, the TX FIFO is flushed and held in reset. There the TX FIFO looks like it has no data within it, so this bit is set to 1, provided there is activity in the master state machine. When there is no longer activity, then with ic_en=0, this bit is set to 0.

Bit Range	Default & Access	Field Name (ID): Description
8	0b RW	<b>Activity Mask (M_ACTIVITY)</b> : This bit captures I2C controller activity and stays set until it is cleared. There are four ways to clear it: - Disabling the controller - Reading the IC_CLR_ACTIVITY register - Reading the IC_CLR_INTR register - System reset Once this bit is set, it stays set unless one of the four methods is used to clear it. Even if the controller is idle, this bit remains set until cleared, indicating that there was activity on the bus
7	0b RO	<b>RSVD1</b> : Reserved
6	1b RW	<b>TX Abort Mask (M_TX_ABRT)</b> : This bit indicates if the I2C controller, in transmitter mode, is unable to complete the intended actions on the contents of the transmit FIFO. This situation is referred to as a 'transmit abort'. When this bit is set to 1, the IC_TX_ABRT_SOURCE register indicates the reason why the transmit abort takes places.  NOTE: The controller flushes/resets/empties the TX FIFO whenever this bit is set. The TX FIFO remains in this flushed state until the register IC_CLR_TX_ABRT is read. Once this read is performed, the TX FIFO is then ready to accept more data bytes for transmission
5	0b RO	<b>RSVD2</b> : Reserved
4	1b RW	<b>TX Empty Mask (M_TX_EMPTY)</b> : This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register. It is automatically cleared by hardware when the buffer level goes above the threshold. When the IC_ENABLE bit 0 is 0, the TX FIFO is flushed and held in reset. There the TX FIFO looks like it has no data within it, so this bit is set to 1, provided there is activity in the master state machine. When there is no longer activity, then with ic_en=0, this bit is set to 0. Reset value
3	1b RW	<b>TX Overflow Mask (M_TX_OVER)</b> : Set during transmit if the transmit buffer is filled to 16 items and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register. When the module is disabled, this bit keeps its level until the master state machine goes into idle, and when ic_en goes to 0, this interrupt is cleared
2	1b RW	<b>RX Full Mask (M_RX_FULL)</b> : Set when the receive buffer reaches or goes above the RX_TL threshold in the IC_RX_TL register. It is automatically cleared by hardware when buffer level goes below the threshold. If the module is disabled (IC_ENABLE[0]=0), the RX FIFO is flushed and held in reset; therefore the RX FIFO is not full. So this bit is cleared once the IC_ENABLE bit 0 is programmed with a 0, regardless of the activity that continues
1	1b RW	<b>RX Overflow Mask (M_RX_OVER)</b> : Set if the receive buffer is completely filled to 16 items and an additional byte is received from an external I2C device. The I2C Controller acknowledges this, but any data bytes received after the FIFO is full are lost. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master state machine goes into idle, and when ic_en goes to 0, this interrupt is cleared.
0	1b RW	<b>RX Underflow Mask (M_RX_UNDER)</b> : Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master state machine goes into idle, and when ic_en goes to 0, this interrupt is cleared.

### 19.5.1.10 Raw Interrupt Status (IC\_RAW\_INTR\_STAT)—Offset 34h

Unlike the IC\_INTR\_STAT register, these bits are not masked so they always show the true status of the I2C controller

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 34h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:2] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0b RO	<b>Reserved (RSV):</b> Reserved.
11	0b RO	<b>RSVD0:</b> Reserved
10	0b RO	<b>Start Detected (START_DET):</b> Indicates whether a START or RESTART condition has occurred on the I2C interface
9	0b RO	<b>Stop Detected (STOP_DET):</b> Indicates whether a STOP condition has occurred on the I2C interface.
8	0b RO	<b>Activity (ACTIVITY):</b> This bit captures I2C controller activity and stays set until it is cleared. There are four ways to clear it: <ul style="list-style-type: none"> <li>- Disabling the controller</li> <li>- Reading the IC_CLR_ACTIVITY register</li> <li>- Reading the IC_CLR_INTR register</li> <li>- System reset</li> </ul> Once this bit is set, it stays set unless one of the four methods is used to clear it. Even if the controller is idle, this bit remains set until cleared, indicating that there was activity on the bus
7	0b RO	<b>RSVD1:</b> Reserved
6	0b RO	<b>TX Abort (TX_ABRT):</b> This bit indicates if the I2C controller, in transmitter mode, is unable to complete the intended actions on the contents of the transmit FIFO. This situation is referred to as a 'transmit abort'. When this bit is set to 1, the IC_TX_ABRT_SOURCE register indicates the reason why the transmit abort takes places.  NOTE: The controller flushes/resets/empties the TX FIFO whenever this bit is set. The TX FIFO remains in this flushed state until the register IC_CLR_TX_ABRT is read. Once this read is performed, the TX FIFO is then ready to accept more data bytes for transmission
5	0b RO	<b>RSVD2:</b> Reserved
4	0b RO	<b>TX Empty (TX_EMPTY):</b> This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register. It is automatically cleared by hardware when the buffer level goes above the threshold. When the IC_ENABLE bit 0 is 0, the TX FIFO is flushed and held in reset. There the TX FIFO looks like it has no data within it, so this bit is set to 1, provided there is activity in the master state machine. When there is no longer activity, then with ic_en=0, this bit is set to 0.
3	0b RO	<b>TX Overflow (TX_OVER):</b> Set during transmit if the transmit buffer is filled to 16 items and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register. When the module is disabled, this bit keeps its level until the master state machine goes into idle, and when ic_en goes to 0, this interrupt is cleared
2	0b RO	<b>RX Full (RX_FULL):</b> Set when the receive buffer reaches or goes above the RX_TL threshold in the IC_RX_TL register. It is automatically cleared by hardware when buffer level goes below the threshold. If the module is disabled (IC_ENABLE[0]=0), the RX FIFO is flushed and held in reset; therefore the RX FIFO is not full. So this bit is cleared once the IC_ENABLE bit 0 is programmed with a 0, regardless of the activity that continues

Bit Range	Default & Access	Field Name (ID): Description
1	0b RO	<b>RX Overflow (RX_OVER)</b> : Set if the receive buffer is completely filled to 16 items and an additional byte is received from an external I2C device. The I2C Controller acknowledges this, but any data bytes received after the FIFO is full are lost. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master state machine goes into idle, and when ic_en goes to 0, this interrupt is cleared.
0	0b RO	<b>RX Underflow (RX_UNDER)</b> : Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master state machine goes into idle, and when ic_en goes to 0, this interrupt is cleared.

### 19.5.1.11 Receive FIFO Threshold Level (IC\_RX\_TL)—Offset 38h

Controls the level of entries (or above) that triggers the RX\_FULL interrupt (bit 2 in IC\_RAW\_INTR\_STAT register)

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 38h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:2] + 10h

**Default:** 0000000Fh

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	0	1
RSV							RX_TL	

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	<b>Reserved (RSV)</b> : Reserved.
7:0	0Fh RW	<b>Receive FIFO Threshold Level (RX_TL)</b> : The valid range is 0-255, with the additional restriction that hardware does not allow this value to be set to a value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 1 entry, and a value of 255 sets the threshold for 256 entries

### 19.5.1.12 Transmit FIFO Threshold Level (IC\_TX\_TL)—Offset 3Ch

Controls the level of entries (or below) that trigger the TX\_EMPTY interrupt (bit 4 in IC\_RAW\_INTR\_STAT register).

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 3Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	<b>Reserved (RSV):</b> Reserved.
7:0	00h RW	<b>Transmit FIFO Threshold Level (TX_TL):</b> The valid range is 0-255, with the additional restriction that it may not be set to value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 0 entries, and a value of 255 sets the threshold for 255 entries

### 19.5.1.13 Clear Combined and Individual Interrupt (IC\_CLR\_INTR)—Offset 40h

Read this register to clear the combined interrupt, all individual interrupts, and the IC\_TX\_ABRT\_SOURCE register.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 40h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RO	<b>Reserved (RSV):</b> Reserved.
0	0b RO	<b>Clear Combined and Individual Interrupt (CLR_INTR):</b> This bit does not clear hardware clearable interrupts but clears the software clearable interrupts. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE

### 19.5.1.14 Clear RX\_UNDER Interrupt (IC\_CLR\_RX\_UNDER)—Offset 44h

Clear a single interrupt type

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 44h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RO	<b>Reserved (RSV):</b> Reserved.
0	0b RO	<b>Clear RX_UNDER (CLR_RX_UNDER):</b> Read this register to clear the RX_UNDER interrupt (bit 0) of the IC_RAW_INTR_STAT

### 19.5.1.15 Clear RX\_OVER Interrupt (IC\_CLR\_RX\_OVER)—Offset 48h

Clear a single interrupt type

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 48h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RO	<b>Reserved (RSV):</b> Reserved.
0	0b RO	<b>Clear RX_OVER (CLR_RX_OVER):</b> Read this register to clear the RX_OVER interrupt (bit 1) of the IC_RAW_INTR_STAT

### 19.5.1.16 Clear TX\_OVER Interrupt (IC\_CLR\_TX\_OVER)—Offset 4Ch

Clear a single interrupt type

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 4Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:2] + 10h

RSV								CLR_RD_REQ

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RO	Reserved (RSV): Reserved.
0	0b RO	Clear RD_REQ (CLR_RD_REQ): Read this register to clear the RD_REQ interrupt (bit 5) of the IC_RAW_INTR_STAT

### 19.5.1.18 Clear TX\_ABRT Interrupt (IC\_CLR\_TX\_ABRT)—Offset 54h

Clear a single interrupt type

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

Offset: [BAR0] + 54h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:21, F:2] + 10h

Default: 00000000h

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 60h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RO	<b>Reserved (RSV):</b> Reserved.
0	0b RO	<b>Clear STOP_DET (CLR_STOP_DET):</b> Read this register to clear the STOP_DET interrupt (bit 9) of the IC_RAW_INTR_STAT

### 19.5.1.21 Clear START\_DET Interrupt (IC\_CLR\_START\_DET)—Offset 64h

Clear a single interrupt type

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 64h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:2] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RO	<b>Reserved (RSV):</b> Reserved.
0	0b RO	<b>Clear START_DET (CLR_START_DET):</b> Read this register to clear the START_DET interrupt (bit 10) of the IC_RAW_INTR_STAT

### 19.5.1.22 Enable (IC\_ENABLE)—Offset 6Ch

Controls whether the I2C controller is enabled. Software can disable I2C controller while it is active.

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 6Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:2] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSV								ENABLE

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RO	<b>Reserved (RSV):</b> Reserved.
0	0b RW	<p><b>Enable I2C Controller (ENABLE):</b> 0: Disabled (TX/RX FIFOs are held in an erased state) 1: Enabled</p> <p>NOTE: ensure that the controller is disabled properly. When disabled, the following occurs:                      - The TX FIFO and RX FIFO get flushed.                      - Status bits in the IC_INTR_STAT register are still active until the I2C Controller goes into IDLE state.                      If the module is transmitting, it stops as well as deletes the contents of the transmit buffer after the current transfer is complete.                      If the module is receiving, the controller stops the current transfer at the end of the current byte and does not acknowledge the transfer.                      There is a two I2C clocks delay when enabling or disabling the controller</p>

**19.5.1.23 Status (IC\_STATUS)—Offset 70h**

Read-only register used to indicate the current transfer status and FIFO status. The status register may be read at any time. None of the bits in this register request an interrupt. - When the I2C is disabled by writing 0 in bit 0 of the IC\_ENABLE register: bits 1 and 2 are set to 1, bits 3 and 4 are set to 0 - When the master or slave state machines goes to idle and ic\_en=0: bits 5 and 6 are set to 0

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 70h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:2] + 10h

**Default:** 00000006h

5	0b RO	<b>Master FSM Activity Status (MST_ACTIVITY):</b> When the Master Finite State Machine (FSM) is not in the IDLE state, this bit is set. 0: Master FSM is in IDLE state so the Master part is not Active 1: Master FSM is not in IDLE state so the Master part is Active NOTE: IC_STATUS[0]-that is, ACTIVITY bit-is the OR of SLV_ACTIVITY and MST_ACTIVITY bits
4	0b RO	<b>Receive FIFO Completely Full (RFF):</b> When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty location, this bit is cleared. 0: Receive FIFO is not full 1: Receive FIFO is full
3	0b RO	<b>Receive FIFO Not Empty (RFNE):</b> This bit is set when the receive FIFO contains one or more entries; it is cleared when the receive FIFO is empty. 0: Receive FIFO is empty 1: Receive FIFO is not empty
2	1b RO	<b>Transmit FIFO Completely Empty (TFE):</b> When the transmit FIFO is completely empty, this bit is set. When it contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt. 0: Transmit FIFO is not empty 1: Transmit FIFO is empty
1	1b RO	<b>Transmit FIFO Not Full (TFNF):</b> Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full. 0: Transmit FIFO is full 1: Transmit FIFO is not full
0	0b RO	<b>Activity (ACTIVITY):</b> I2C Activity Status. 0: Not Active 1: Active

### 19.5.1.24 Transmit FIFO Level (IC\_TXFLR)—Offset 74h

Contains the number of valid data entries in the transmit FIFO buffer. It is cleared whenever: - The I2C is disabled - There is a transmit abort that is, TX\_ABRT bit is set in the IC\_RAW\_INTR\_STAT register - The slave bulk transmit mode is aborted. The register increments whenever data is placed into the transmit FIFO and decrements when data is taken from the transmit FIFO

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 74h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:2] + 10h

### 19.5.1.26 SDA Hold (IC\_SDA\_HOLD)—Offset 7Ch

This register controls the amount of hold time on the SDA signal after a negative edge of SCL line in units of I2C clock period. The value programmed must be greater than the minimum hold time in each mode for the value to be implemented: 1 cycle. Writes to this register succeed only when I2C controller is disabled (IC\_ENABLE=0)

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 7Ch

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:2] + 10h

**Default:** 00000001h

31	28	24	20	16	12	8	4	0

RSV				IC_SDA_HOLD				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0b RO	<b>Reserved (RSV):</b> Reserved.
15:0	0001h RW	<b>SDA Hold (IC_SDA_HOLD):</b> Sets the required SDA hold time in units of the I2C clock period.

### 19.5.1.27 Transmit Abort Source (IC\_TX\_ABRT\_SOURCE)—Offset 80h

Used to indicate the source of the TX\_ABRT interrupt. Except for Bit 9, this register is cleared whenever the IC\_CLR\_TX\_ABRT register or the IC\_CLR\_INTR register is read. To clear Bit 9, the source of the ABRT\_SBYTE\_NORSTRT must be fixed first; RESTART must be enabled (IC\_CON[5]=1), the SPECIAL bit must be cleared (IC\_TAR[11]), or the GC\_OR\_START bit must be cleared (IC\_TAR[10]). Once the source of the ABRT\_SBYTE\_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT\_SBYTE\_NORSTRT is not fixed before attempting to clear this bit, Bit 9 clears for one cycle and is then re-asserted

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR0] + 80h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:2] + 10h

0	0	0	0	0	0	0	0	0
RSV							GPIO_INTEN	

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	<b>Reserved (RSV):</b> Reserved.
7:0	0b RW	<b>Interrupt Enable (GPIO_INTEN):</b> Allows each bit of Port A to be configured for interrupts. By default the generation of interrupts is disabled. Whenever a 1 is written to a bit of this register, it configures the corresponding bit on Port A to become an interrupt; otherwise, Port A operates as a normal GPIO signal. Interrupts are disabled on the corresponding bits of Port A if the corresponding data direction register is set to Output. 0 Configure Port A bit as normal GPIO signal (default) 1 Configure Port A bit as interrupt

### 19.5.2.4 Interrupt Mask (GPIO\_INTMASK)—Offset 34h

Controls masking for Port A bits configured as interrupt sources

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 34h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:21, F:2] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	<b>Reserved (RSV):</b> Reserved.
7:0	0b RW	<b>Interrupt Mask (GPIO_INTMASK):</b> Controls whether an interrupt on Port A can create an interrupt for the interrupt controller by not masking it. By default, all interrupts bits are unmasked. Whenever a 1 is written to a bit in this register, it masks the interrupt generation capability for this signal; otherwise interrupts are allowed through. The unmasked status can be read as well as the resultant status after masking. 0 Interrupt bits are unmasked (default) 1 Mask interrupt

**19.5.2.5 Interrupt Type (GPIO\_INTTYPE\_LEVEL)—Offset 38h**

Controls the type of interrupt associated with Port A bits configured as interrupt source

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 38h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:21, F:2] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	<b>RSV:</b> Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0b RW	<b>Interrupt Type (GPIO_INTTYPE_LEVEL)</b> : Controls the type of interrupt that can occur on Port A. Whenever a 0 is written to a bit of this register, it configures the interrupt type to be level-sensitive; otherwise, it is edge-sensitive. 0 Level-sensitive (default) 1 Edge-sensitive

### 19.5.2.6 Interrupt Polarity (GPIO\_INT\_POLARITY)—Offset 3Ch

Controls the interrupt polarity associated with Port A bits configured as interrupt sources

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 3Ch

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:21, F:2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	<b>Reserved (RSV)</b> : Reserved.
7:0	0b RW	<b>Interrupt Polarity (GPIO_INT_POLARITY)</b> : Controls the polarity of edge or level sensitivity that can occur on input of Port A. Whenever a 0 is written to a bit of this register, it configures the interrupt type to falling-edge or active-low sensitive; otherwise, it is rising-edge or active-high sensitive. 0 Active-low (default) 1 Active-high

### 19.5.2.7 Interrupt Status (GPIO\_INTSTATUS)—Offset 40h

Stores the interrupt status after masking for Port A bits configured as interrupt sources

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 40h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:21, F:2] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	<b>Reserved (RSV):</b> Reserved.
7:0	0b RW	<b>Interrupt Status (GPIO_INTSTATUS):</b> After mask. See GPIO_RAW_INTSTATUS for raw interrupt values and GPIO_INTMASK for interrupt mask configuration

### 19.5.2.8 Raw Interrupt Status (GPIO\_RAW\_INTSTATUS)—Offset 44h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 44h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:21, F:2] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	<b>Reserved (RSV):</b> Reserved.
7:0	0b RW	<b>Raw Interrupt Status (GPIO_RAW_INTSTATUS):</b> Raw interrupt of status of Port A (premasking bits)

### 19.5.2.9 Debounce Enable (GPIO\_DEBOUNCE)—Offset 48h

Controls the debounce logic associated to a Port A bit configured as interrupt source

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 48h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:21, F:2] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	<b>Reserved (RSV):</b> Reserved.
7:0	0b RW	<b>Debounce Enable (GPIO_DEBOUNCE):</b> Controls whether an external signal that is the source of an interrupt needs to be debounced to remove any spurious glitches. Writing a 1 to a bit in this register enables the debouncing circuitry. A signal must be valid for two periods of an external clock before it is internally processed. 0 No debounce (default) 1 Enable debounce

### 19.5.2.10 Clear Interrupt (GPIO\_PORTA\_EOI)—Offset 4Ch

Controls edge-type interrupt clearing

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 4Ch

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:21, F:2] + 14h

**Default:** 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	<b>Reserved (RSV):</b> Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0b RW	<b>Clear Interrupt (GPIO_PORTA_EOI)</b> : Controls the clearing of edge type interrupts from Port A. When a 1 is written into a corresponding bit of this register, the interrupt is cleared. All interrupts are cleared when Port A is not configured for interrupts. 0 No interrupt clear (default) 1 Clear interrupt

### 19.5.2.11 Port A External Port (GPIO\_EXT\_PORTA)—Offset 50h

Used by the software to read values from the GPIO Port bits

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 50h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:21, F:2] + 14h

**Default:** 00000000h

0	0	0	0	0	0	0	0	0	0
RSV							GPIO_EXT_PORTA		

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RO	<b>Reserved (RSV)</b> : Reserved.
7:0	0b RW	<b>External Port (GPIO_EXT_PORTA)</b> : When the Port is configured as Input, then reading this location reads the values on the external signal. When the data direction is set as Output, reading this location reads the Port data register contents

### 19.5.2.12 Synchronization Level (GPIO\_LS\_SYNC)—Offset 60h

Controls if a level-sensitive interrupt type need to be synchronized to the system clock

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR1] + 60h

**BAR1 Type:** PCI Configuration Register (Size: 32 bits)

**BAR1 Reference:** [B:0, D:21, F:2] + 14h

**Default:** 00000000h

## 20.0 SPI Interface

The Intel® Quark™ SoC X1000 implements two SPI controllers that support master mode.

### 20.1 Signal Descriptions

Please see [Chapter 2.0, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Type:** The buffer type found in [Chapter 4.0, “Electrical Characteristics”](#)
- **Description:** A brief explanation of the signal’s function

**Table 125. SPI Interface Signals**

Signal Name	Direction/ Type	Description
SPI[0/1]_SCK	O CMOS3.3	<b>SPI Serial Clock</b>
SPI[[0/1]_SS_B	O CMOS3.3	<b>SPI Slave Select</b> SPI Slave Select is active low.
SPI[0/1]_MOSI	O CMOS3.3	<b>SPI Master Output Slave Input</b>
SPI[0/1]_MISO	I CMOS3.3	<b>SPI Slave Output Master Input</b>

### 20.2 Features

Compliant with the Motorola\* Serial Peripheral Interface:

- supports master mode only
- supports one slave select output
- supports MSB first transfer only
- supports SCLK frequencies up to 25 MHz
- does not support slave mode operation
- does not support SPI boot
- does not support wait mode

#### 20.2.1 SPI Controller

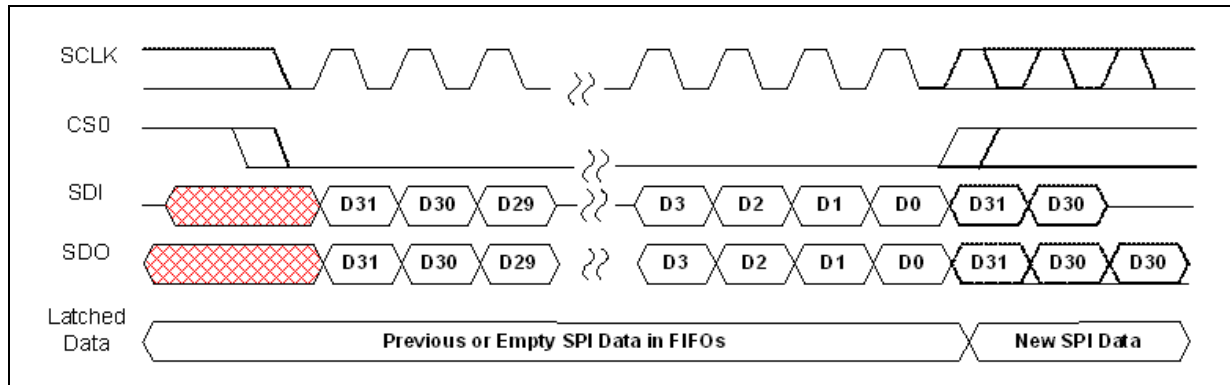

The SPI unit provides one-channel, 4-wire serial input/output interface to directly connect SPI-compatible devices.

Four pins are used to transfer data between the CPU and external device:

- SCLK defines the bit rate at which serial data is driven onto, and sampled from, the bus;
- SS\_B or CS defines the boundaries of a basic data “unit”, comprised of multiple serial bits.
- MOSI or SDO is the serial data path for outbound data, from system to peripheral
- MISO or SDI is the serial data path for inbound data, from peripheral to system

Serial data is transferred between the system and an external peripheral through FIFOs in the SPI. Transfers are initiated by the host processor and data is transferred over a single transfer. Operation is full duplex. Separate FIFOs and serial data paths allow simultaneous transfers in both directions to/from the external peripheral. Transfer is started when either new data is available in the transmit FIFO or memory is available in the receive FIFO. Transfer is terminated when either new data is not available in the transmit FIFO or memory is not available in the receive FIFO.

Figure 47. Generic SPI Waveform

### 20.2.1.1 Processor-Initiated Data Transfer

Transmit data (from system to peripheral) is written by the host processor to the SPI Transmit FIFO. The FIFO is seen as one 32-bit location by the processor and a write to the FIFO takes the form of a single 32-bit write transaction to the data register (SSDR). The SPI moves the data from the Transmit FIFO, serializes it, and sends it over the serial wire (SDO) to the peripheral. Receive data from the peripheral (on SDI) is converted to parallel words and stored in the Receive FIFO register file. When passed, a programmable “fullness” threshold triggers an interrupt to the Interrupt Controller (and subsequently, if enabled, to an interrupt input to the CPU). The interrupt service routine responds by identifying the source of the interrupt and then doing a read from the Receive FIFO. The SPI differentiates between the two FIFOs according to whether the transfer is a READ or a WRITE transfer. Read bursts automatically target the Receive FIFO, while write bursts write data to the Transmit FIFO. From a memory map point of view, they are at the same address. FIFOs are 32DWORDS deep or 128 Bytes in aggregate.

### 20.2.1.2 Data Format

Data in the FIFOs is always stored with one sample per 32-bit word regardless of the format’s data word length. Within each 32-bit field, the stored data sample is right justified, with the word’s LSB in bit 0, and unused bits packed as zeroes on the left-hand (MSB) side. Logic in the SPI guarantees that data is properly transmitted on SDO according to the selected frame format and MSB first.

### 20.2.1.3 FIFO Operation

#### 20.2.1.3.1 Processor-Initiated Data Transfers

There are two separate and independent FIFOs for “incoming” (from peripheral) and “outgoing” (to peripheral) serial data. FIFOs are filled or emptied by single transfers or SRAM-like bursts initiated by the system processor. Both FIFO’s are the same size and arranged as 32-word positions that are a maximum of 32-bits wide. FIFO word width is programmable from 4 to 32 bits. When FIFO width is programmed to less than a 32-bit width, only the programmed numbers of bits are available in all word positions.

Each FIFO consists of a dual-port register file with control circuitry to make it work as a FIFO, with independent read and write ports. Single FIFO write bursts may be between 1 and 32 words in length, and between 4 and 32 bits per word thus transferring from 4 bits up to 1024 data samples per burst. Also continuous operation is possible by keeping the transmit FIFO loaded with data for much larger data transfers.

FIFO filling and emptying may be performed by the system processor in response to an interrupt from the FIFO logic. Each FIFO has a programmable threshold at which an interrupt is triggered. When the threshold value is exceeded, an interrupt is generated which, if enabled, signals the host processor to empty an “inbound” FIFO or to refill an “outbound” FIFO.

The system can also poll status bits to learn how full a FIFO is.

#### 20.2.1.4 Baud Rate Generation

The SCLK is generated in the SPI unit from the 200 MHz input system clock (`sys_clk`) according to register configuration.

Two clock synthesis stages are implemented to achieve different SPI baud-rates:

- an internal clock (`clk_ssp`) is generated from the input reference clock based on the value of `SPI_DDS_RATE.DDS_CLK_RATE[23:0]`. `clk_ssp` is used in the SPI unit to clock the logic interfacing the SPI link and to generate SCLK. The relationship between `sys_clk` and `ssp_clk` frequencies is expressed by  

$$f_{clk\_ssp} = f_{sys\_clk} (DDS\_CLK\_RATE/2^{24})$$
- `clk_ssp` is used to generate SCLK. The relationship between `ssp_clk` and SCLK frequencies is expressed by  

$$f_{SCLK} = f_{clk\_ssp} / (2 * (SCR + 1))$$

Table 126 lists a subset of the possible register configurations and relative SCLK frequencies. While the table is not exhaustive of all possible register settings, the following guidelines should be considered:

- To guarantee negligible jitter and duty cycle deviation from 50% it is recommended to not set `DDS_CLK_RATE` to values greater than `h33333` and not listed in the table.
- A duty cycle of 50% and virtually no jitter is guaranteed for any setting where `DDS_CLK_RATE` is one hot.
- For a given SCLK frequency not listed in Table 126, best jitter and duty cycle values are obtained by setting the lower possible value of `DDS_CLK_RATE`.
- There is no limitation for SCR values.

Table 126. SPI Clock Frequency Settings (Sheet 1 of 2)

DDS_CLK_RATE[23:0] (hex)	SCLK_INT Frequency	SCR[7:0] (dec)	SCLK Frequency (MHz)	SCLK Frequency (KHz)	Duty Cycle (%)
800000	100.000	0	25.000		50
800000	100.000	2	16.667		50

8000	0.391	194		1.002	50

## 20.3 Register Map

See Chapter 5.0, “Register Access Methods” for additional information.

Figure 48. SPI Register Map

## 20.4 PCI Configuration Registers

Registers listed are for Function 0 (SPI Controller 0). Function 1 (SPI Controller 1) contains the same registers. Differences between SPI Controllers Ports will be noted in individual registers.

**Table 127. Summary of PCI Configuration Registers—0/21/0**

Offset Start	Offset End	Register ID—Description	Default Value
0h	1h	"Vendor ID (VENDOR_ID)—Offset 0h" on page 792	8086h
2h	3h	"Device ID (DEVICE_ID)—Offset 2h" on page 793	0935h
4h	5h	"Command Register (COMMAND_REGISTER)—Offset 4h" on page 793	0000h
6h	7h	"Status Register (STATUS)—Offset 6h" on page 794	0010h
8h	Bh	"Revision ID and Class Code (REV_ID_CLASS_CODE)—Offset 8h" on page 795	0C800010h
Ch	Ch	"Cache Line Size (CACHE_LINE_SIZE)—Offset Ch" on page 795	00h
Dh	Dh	"Latency Timer (LATENCY_TIMER)—Offset Dh" on page 796	00h
Eh	Eh	"Header Type (HEADER_TYPE)—Offset Eh" on page 796	80h
Fh	Fh	"BIST (BIST)—Offset Fh" on page 796	00h
10h	13h	"Base Address Register (BAR0)—Offset 10h" on page 797	00000000h
28h	2Bh	"Cardbus CIS Pointer (CARDBUS_CIS_POINTER)—Offset 28h" on page 798	00000000h

B0h	B3h	"Pending Bits for MSI (PER_VEC_PEND)—Offset B0h" on page 806	00000000h

### 20.4.1 Vendor ID (VENDOR\_ID)—Offset 0h

#### Access Method

Type: PCI Configuration Register (Size: 16 bits) **VENDOR\_ID:** [B:0, D:21, F:0] + 0h

Default: 8086h

Bit Range	Default & Access	Description
15: 0	8086h RO	<b>Vendor ID (value):</b> PCI Vendor ID for Intel

### 20.4.2 Device ID (DEVICE\_ID)—Offset 2h

#### Access Method

Type: PCI Configuration Register (Size: 16 bits) **DEVICE\_ID:** [B:0, D:21, F:0] + 2h

Default: 0935h

Bit Range	Default & Access	Description
15: 0	0935h RO	<b>Device ID (value):</b> PCI Device ID

### 20.4.3 Command Register (COMMAND\_REGISTER)—Offset 4h

#### Access Method

Type: PCI Configuration Register (Size: 16 bits) **COMMAND\_REGISTER:** [B:0, D:21, F:0] + 4h

Default: 0000h

Bit Range	Default & Access	Description
15: 11	0h RO	<b>RSVDO (RSVDO):</b> Reserved
10	0b RW	<b>Interrupt Disable (IntrDis):</b> Interrupt disable. Disables generation of interrupt messages in the PCI Express function. 1 =) disabled, 0 =) not disabled

Bit Range	Default & Access	Description
9	0h RO	<b>Reserved (RSVD):</b> Reserved.
8	0b RW	<b>SERR Enable (SERREn):</b> When set, this bit enables the non-fatal and fatal errors detected by the function to be reported to the root complex.
7: 3	00h RO	<b>Reserved (RSVD):</b> Reserved.
2	0b RW	<b>Bus Master Enable (MasEn):</b> 0=)disables upstream requests 1=)enables upstream requests.
1	0b RW	<b>Memory Space Enable (MEMEn):</b> Device support for Memory transactions. 0 =) not supported. 1 =) supported.
0	0h RO	<b>Reserved (RSVD):</b> Reserved.

### 20.4.4 Status Register (STATUS)—Offset 6h

#### Access Method

Type: PCI Configuration Register  
(Size: 16 bits)

STATUS: [B:0, D:21, F:0] + 6h

Default: 0010h

15	12	8	4	0
0	0	0	1	0
RSVD0	SigSysErr	RcdMasAb	RSVD	DEVSEL
			RSVD	FastB2B
			capable_66Mhz	hasCapList
			IntrStatus	RSVD1

Bit Range	Default & Access	Description
15	0h RO	<b>RSVD0 (RSVD0):</b> Reserved
14	0b RW	<b>Signaled System Error (SigSysErr):</b> Set when a function detects a system error and the SERR Enable bit is set
13	0b RW	<b>Received master abort (RcdMasAb):</b> Set when requester receives a completion with Unsupported Request completion status
12: 11	0h RO	<b>Reserved (RSVD):</b> Reserved.
10: 9	0b RO	<b>DEVSEL Timing (DEVSEL):</b> Deprecated: Hardwired to 0
8	0h RO	<b>Reserved (RSVD):</b> Reserved.
7	0b RO	<b>Fast Back-to-Back Capable (FastB2B):</b> Deprecated: Hardwired to 0
6	0h RO	<b>Reserved (RSVD):</b> Reserved.
5	0b RO	<b>66MHz-Capable (capable_66Mhz):</b> Deprecated: Hardwired to 0

Bit Range	Default & Access	Description
7: 0	0h RW	<b>Cache Line Size (value)</b> : Implemented as a R/W register for legacy purposes but has no effect on device functionality.

### 20.4.7 Latency Timer (LATENCY\_TIMER)—Offset Dh

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**LATENCY\_TIMER:** [B:0, D:21, F:0] + Dh

**Default:** 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RO	<b>Latency Timer (value)</b> : Deprecated. Hardwire to 0.

### 20.4.8 Header Type (HEADER\_TYPE)—Offset Eh

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**HEADER\_TYPE:** [B:0, D:21, F:0] + Eh

**Default:** 80h

7	4	0
1	0	0
multiFnDev	cfgHdrFormat	

Bit Range	Default & Access	Description
7	1h RO	<b>Multi-Function Device (multiFnDev)</b> : Hard-wired to 1 to indicate that this is a multi-function device
6: 0	0h RO	<b>Configuration Header Format (cfgHdrFormat)</b> : Hard-wired to 0 to indicate that this configuration header is a Type 0 header, i.e. it is an endpoint rather than a bridge.

### 20.4.9 BIST (BIST)—Offset Fh

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**BIST:** [B:0, D:21, F:0] + Fh

**Default:** 00h

7	0	0	0	4	0	0	0	0	0
BIST_capable	start_bist	RSVD			comp_code				

Bit Range	Default & Access	Description
7	0h RO	<b>BIST_capable (BIST_capable)</b> : Hard-wired to 0. (Returns 1 if the function implements a BIST)
6	0h RO	<b>Start (start_bist)</b> : Set to start the functions BIST if BIST is supported.
5: 4	0h RO	<b>Reserved (RSVD)</b> : Reserved.
3: 0	0h RO	<b>Completion Code (comp_code)</b> : Completion code having run BIST if BIST is supported. 0=)success. non-zero=)failure

### 20.4.10 Base Address Register (BAR0)—Offset 10h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**BAR0:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
address						RSVD	prefetchable	memType	isIO

Bit Range	Default & Access	Description
31: 12	0h RW	<b>address (address)</b> : Used to determine the size of memory required by the device and to assign a start address for this required amount of memory.
11: 4	00h RO	<b>Reserved (RSVD)</b> : Reserved.
3	0b RO	<b>Prefetchable (prefetchable)</b> : Defines the block of memory as prefetchable or not. A block of memory is prefetchable if it fulfils the following 3 conditions (1) no side effects on reads, (2) the device returns all bytes on reads regardless of the byte enables, and (3) host bridges can merge processor writes into this range without causing errors. Hardwired to 0
2: 1	00b RO	<b>Type (memType)</b> : Hardwired to 0 to indicate a 32-bit decoder
0	0b RO	<b>Memory Space Indicator (isIO)</b> : Hardwired to 0 to indicate the register is a memory address decoder

### 20.4.14 Expansion ROM Base Address (EXP\_ROM\_BASE\_ADR)—Offset 30h

**Access Method**

Type: PCI Configuration Register  
(Size: 32 bits)

EXP\_ROM\_BASE\_ADR: [B:0, D:21, F:0] + 30h

Default: 00000000h

Bit Range	Default & Access	Description
31: 11	0h RW	<b>ROM Start Address (ROM_base_addr)</b> : Used to determine the size of memory required by the ROM and to assign a start address for this required amount of memory.
10: 1	000h RO	<b>Reserved (RSVD)</b> : Reserved.
0	0h RW	<b>Address Decode Enable (AddrDecodeEn)</b> : A 1 in this field enables the function's ROM address decoder assuming that the Memory Space bit in the Command Register is also set to 1

### 20.4.15 Capabilities Pointer (CAP\_POINTER)—Offset 34h

**Access Method**

Type: PCI Configuration Register  
(Size: 32 bits)

CAP\_POINTER: [B:0, D:21, F:0] + 34h

Default: 00000080h

Bit Range	Default & Access	Description
31: 8	0h RO	<b>RSVD0 (RSVD0)</b> : Reserved
7: 0	80h RO	<b>Capabilities Pointer (value)</b> : Pointer to memory location of first entry of linked list of configuration register sets each of which supports a feature. Points to PM (power management) register set at location 0x80

### 20.4.16 Interrupt Line Register (INTR\_LINE)—Offset 3Ch

**Access Method**

Type: PCI Configuration Register  
(Size: 8 bits)

INTR\_LINE: [B:0, D:21, F:0] + 3Ch

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RW	<b>Interrupt Line Register (value):</b> The value in this register tells which input of the system interrupt controller(s) the device's interrupt pin is connected to. The device itself does not use this value, rather it is used by device drivers and operating systems. Device drivers and operating systems can use this information to determine priority and vector information.

### 20.4.17 Interrupt Pin Register (INTR\_PIN)—Offset 3Dh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

INTR\_PIN: [B:0, D:21, F:0] + 3Dh

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	01h RO	<b>Interrupt Pin Register (value):</b> The Interrupt Pin register tells which interrupt pin the device (or device function) uses. A value of 1 corresponds to INTA#. A value of 2 corresponds to INTB#. A value of 3 corresponds to INTC#. A value of 4 corresponds to INTD#. Devices (or device functions) that do not use an interrupt pin must put a 0 in this register. The values 05h through FFh are reserved. For this system function 0 is connected to INTA, 1 to INTB, 2 to INTC 3 to INTD, 4 to INTA, 5 to INTB etc.

### 20.4.18 MIN\_GNT (MIN\_GNT)—Offset 3Eh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MIN\_GNT: [B:0, D:21, F:0] + 3Eh

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RO	<b>MIN_GNT (value):</b> Hardwired to 0

### 20.4.19 MAX\_LAT (MAX\_LAT)—Offset 3Fh

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

MAX\_LAT: [B:0, D:21, F:0] + 3Fh

Default: 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	0h RO	MAX_LAT (value): Hardwired to 0

### 20.4.20 Capability ID (PM\_CAP\_ID)—Offset 80h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

PM\_CAP\_ID: [B:0, D:21, F:0] + 80h

Default: 01h

7	4	0
0	0	1
value		

Bit Range	Default & Access	Description
7: 0	01h RO	Capability ID (value): Identifies the feature associated with this register set. Hardwired value as per PCI SIG assigned capability ID

### 20.4.21 Next Capability Pointer (PM\_NXT\_CAP\_PTR)—Offset 81h

#### Access Method

Type: PCI Configuration Register  
(Size: 8 bits)

PM\_NXT\_CAP\_PTR: [B:0, D:21, F:0] + 81h

Default: A0h

7	4	0
1	0	0
value		

Bit Range	Default & Access	Description
7: 0	a0h RO	Next Capability Pointer (value): Pointer to the next register set of feature specific configuration registers. Hardwired to 0xA0 to point to the MSI Capability Structure

Bit Range	Default & Access	Description
15	0h RW	<b>PME Status (PME_status)</b> : Set if function has experienced a PME (even if PME_en (bit 8 of PMCSR register) is not set).
14: 13	0h RO	<b>Data Scale (Data_scale)</b> : Hardwired to 0 as the data register is not supported
12: 9	0h RO	<b>Data Select (Data_select)</b> : Hardwired to 0 as the data register is not supported
8	0b RW	<b>PME Enable (PME_en)</b> : Enable device function to send PME messages when an event occurs. 1=enabled. 0=disabled
7: 4	0h RO	<b>Reserved (RSVD)</b> : Reserved.
3	1b RO	<b>No Soft Reset (no_soft_reset)</b> : Devices do perform an internal reset when transitioning from D3hot to D0
2	0h RO	<b>Reserved (RSVD)</b> : Reserved.
1: 0	00b RW	<b>Power State (power_state)</b> : Allows software to read current PM state or transition device to a new PM state, where 2'b00 = D0, 2'b01=D1, 2'b10=D2, 2'b11=D3hot

### 20.4.24 PM CSR PCI-to-PCI Bridge Support Extension (PMCSR\_BSE)—Offset 86h

**Access Method**

Type: PCI Configuration Register  
(Size: 8 bits)

PMCSR\_BSE: [B:0, D:21, F:0] + 86h

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RO	<b>PM CSR PCI-to-PCI Bridge Support Extension (value)</b> : Not Supported. Hardwired to 0.

### 20.4.25 Power Management Data Register (DATA\_REGISTER)—Offset 87h

**Access Method**

Type: PCI Configuration Register  
(Size: 8 bits)

DATA\_REGISTER: [B:0, D:21, F:0] + 87h

Default: 00h

Bit Range	Default & Access	Description
7: 0	0h RO	<b>Power Management Data Register (value)</b> : Not Supported. Hardwired to 0

### 20.4.26 Capability ID (MSI\_CAP\_ID)—Offset A0h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**MSI\_CAP\_ID:** [B:0, D:21, F:0] + A0h

**Default:** 05h

7	4	0
0	0	1
value		

Bit Range	Default & Access	Description
7: 0	05h RO	<b>Capability ID (value)</b> : Identifies the feature associated with this register set. Hardwired value as per PCI SIG assigned capability ID

### 20.4.27 Next Capability Pointer (MSI\_NXT\_CAP\_PTR)—Offset A1h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**MSI\_NXT\_CAP\_PTR:** [B:0, D:21, F:0] + A1h

**Default:** 00h

7	4	0
0	0	0
value		

Bit Range	Default & Access	Description
7: 0	00h RO	<b>Next Capability Pointer (value)</b> : Hardwired to 0 as this is the last capability structure in the chain

### 20.4.28 Message Control (MESSAGE\_CTRL)—Offset A2h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**MESSAGE\_CTRL:** [B:0, D:21, F:0] + A2h

**Default:** 0100h

15	12	8	4	0
0 0 0 0	0 0 0 0	1	0 0 0 0	0 0 0 0
RSVD0		perVecMskCap	bit64Cap	multiMsgEn
			multiMsgCap	MSIEnable

Bit Range	Default & Access	Description
15: 9	0h RO	<b>RSVD0 (RSVD0)</b> : Reserved
8	1h RO	<b>Per Vector Masking Capable (perVecMskCap)</b> : Hardwired to 1 to indicate the function supports PVM
7	0h RO	<b>64 bit Address Capable (bit64Cap)</b> : This bit is hardwired to 0 to indicate that the function is not capable of sending a 64-bit message address.
6: 4	0h RW	<b>Multi-Message Enable (multiMsgEn)</b> : As only one vector is supported per function, software should only write a value of 0x0 to this field
3: 1	0h RO	<b>Multiple Message Enable (multiMsgCap)</b> : This field is hardwired to 0x0 to indicate that the function is requesting a single vector
0	0h RW	<b>MSI Enable (MSI Enable)</b> : Set to enable MSI to request service. If set then it's prohibited to use the INTx pin. System configuration software sets this bit to enable MSI.

### 20.4.29 Message Address (MESSAGE\_ADDR)—Offset A4h

**Access Method**

Type: PCI Configuration Register  
(Size: 32 bits)

MESSAGE\_ADDR: [B:0, D:21, F:0] + A4h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0
address								RSVD0

Bit Range	Default & Access	Description
31: 2	0h RW	<b>Message Address (address)</b> : If the Message Enable bit (bit 0 of the Message Control register) is set, the contents of this register specify the DWORD-aligned address (AD[31:2]) for the MSI memory write transaction. AD[1:0] are driven to zero during the address phase. This field is read/write
1: 0	0h RO	<b>RSVD0 (RSVD0)</b> : Reserved

### 20.4.30 Message Data (MESSAGE\_DATA)—Offset A8h

**Access Method**

Type: PCI Configuration Register  
(Size: 16 bits)

MESSAGE\_DATA: [B:0, D:21, F:0] + A8h

Default: 0000h

Bit Range	Default & Access	Description
15: 0	0h RW	<b>Data Field (MsgData):</b> System-specified message data. If the Message Enable bit (bit 0 of the Message Control register) is set, the message data is driven onto the lower word (AD[15:0]) of the memory write transactions data phase. AD[31:16] are driven to zero during the memory write transactions data phase. C/BE[3:0]# are asserted during the data phase of the memory write transaction. None of the message bits will be changed by hardware

### 20.4.31 Mask Bits for MSI (PER\_VEC\_MASK)—Offset ACh

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

PER\_VEC\_MASK: [B:0, D:21, F:0] + ACh

Default: 00000000h

Bit Range	Default & Access	Description
31: 1	0h RO	<b>RSVDO (RSVDO):</b> Reserved
0	0h RW	<b>Vector 0 Mask (MSIMask):</b> Mask Bit for Vector 0. If this bit is set, the function will not send MSI messages

### 20.4.32 Pending Bits for MSI (PER\_VEC\_PEND)—Offset B0h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

PER\_VEC\_PEND: [B:0, D:21, F:0] + B0h

Default: 00000000h

Bit Range	Default & Access	Description
31: 1	0h RO	<b>RSVDO (RSVDO)</b> : Reserved
0	0h RO	<b>Vector 0 Pending (value)</b> : Pending Bit for Vector 0.

## 20.5 Memory Mapped Registers

**Table 128. Summary of Memory Mapped I/O Registers—BAR0**

Offset Start	Offset End	Register ID—Description	Default Value
0h	3h	"SPI Control Register 0 (SSCR0)—Offset 0h" on page 807	00000000h
4h	7h	"SPI Control Register 1 (SSCR1)—Offset 4h" on page 808	00000000h
8h	Bh	"SPI Status Register (SSSR)—Offset 8h" on page 810	0003E004h
10h	13h	"SPI Data Register (SSDR)—Offset 10h" on page 811	00000000h
28h	2Bh	"DDS Clock Rate Register (DDS_RATE)—Offset 28h" on page 812	00028F5Ch

### 20.5.1 SPI Control Register 0 (SSCR0)—Offset 0h

The SPI control register 0 controls various SPI functions.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSCR0:** [BAR0] + 0h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0b RO	<b>RSV</b> : Reserved.
15:8	0b RW	<b>Serial Clock Rate (SCR)</b> : This bitfield is used to select the baud, or bit rate, of the SPI. A total of 256 different bit rates can be selected to further divide the frequency of the clock obtained by dividing the input system clock according to the DDS_RATE register, see DDS_RATE Register description. The resultant clock is driven on the SCLK pin and is used by the SPIs transmit logic to drive data on the MOSI pin, and to latch data on the MISO pin. The SCLK frequency is given by $DDS\_FREQ / (2 \times (SCR + 1))$ where SCR is a decimal integer in the range 0 to 255 and DDS_FREQ is determined by the value programmed in the DDS_RATE Register.

Bit Range	Default & Access	Description
7	0b RW	<p><b>Synchronous Serial Port Enable (SSE):</b> The SPI enable bit is used to enable and disable all SPI operations. When the SPI is disabled, all of its clocks are powered down to minimize power consumption. Note that the SSE is the only control bit within the SPI which is reset to a known state. It is cleared to zero to ensure the SPI is disabled following a reset. When the SSE bit is cleared during active operation, the SPI is disabled immediately, causing the current frame being transmitted to be terminated. Clearing SSE resets the SPIs FIFOs and the SPI status bits. However, the SPIs control registers and the Receive FIFO Overrun (ROR) status bit are not reset.</p> <p>Note: After reset or after clearing the SSE, the user must ensure the SSCR1 and SSSR registers are properly reconfigured or reset before re-enabling the SPI with the SSE; other control bits in SSCR0 may be written at the same time as the SSE.</p> <p>0 : SPI operation disabled 1 : SPI operation enabled</p>
6:5	0b RW	<p><b>Frame Format (FRF):</b> 00 : Motorola* Serial Peripheral Interface (SPI) 01 : Reserved, undefined operation 10 : Reserved, undefined operation 11 : Reserved, undefined operation</p>
4:0	0b RW	<p><b>Data Size Select (DSS):</b> The 5-bit data size select field is used to select the size of the data transmitted and received by the SPI. Data can be 4 to 32 bits in length. When data is programmed to be less than 16 bits, received data is automatically right justified and the upper bits in the receive FIFO are zero-filled by receive logic. Transmit data should not be left justified by the user before being placed in the transmit FIFO; transmit logic in the SPI will automatically left justify the data sample according to the value of DSS before the sample is transmitted on MOSI. Although it is possible to program data sizes of 1, 2, and 3 bits, these sizes are reserved and produce unpredictable results in the SPI.</p> <p>00000 : Reserved, undefined operation 00001 : Reserved, undefined operation 00010 : Reserved, undefined operation 00011 : 4-bit data 00100 : 5-bit data 00101 : 6-bit data 00110 : 7-bit data 00111 : 8-bit data 01000 : 9-bit data 01001 : 10-bit data 01010 : 11-bit data 01011 : 12-bit data 01100 : 13-bit data 01101 : 14-bit data 01110 : 15-bit data 01111 : 16-bit data 10000 : 17-bit data 10001 : 18-bit data 10010 : 19-bit data 10011 : 20-bit data 10100 : 21-bit data 10101 : 22-bit data 10110 : 23-bit data 10111 : 24-bit data 11000 : 25-bit data 11001 : 26-bit data 11010 : 27-bit data 11011 : 28-bit data 11100 : 29-bit data 11101 : 30-bit data 11110 : 31-bit data 11111 : 32-bit data</p>

### 20.5.2 SPI Control Register 1 (SSCR1)—Offset 4h

The SPI Control Register 1 controls various SPI functions.

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

SSCR1: [BAR0] + 4h

BAR0 Type: PCI Configuration Register (Size: 32 bits)

BAR0 Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0					
0	0	0	0	0	0	0	0	0					
RSV1				STRF	EFWR	RFT	TFT	RSVO	SPH	SPO	LBM	TIE	RIE

Bit Range	Default & Access	Description
31:18	00h RO	<b>RSV1:</b> Reserved.
17	0b RW	<b>Select FIFO for Enable FIFO Write/Read (STRF):</b> This bit selects whether the Transmit or Receive FIFO is enabled for writes and reads whenever the EFWR is programmed to one, which puts the SPI in a special functional mode. 0 : Transmit FIFO is selected for both writes and reads through the SSDR. 1 : Receive FIFO is selected for both writes and reads through the SSDR
16	0b RW	<b>Enable FIFO Write/Read Function (EFWR):</b> This bit enables a special functional mode for the SPI. 0 : the SPI operates in normal mode. 1 : the SPI enters a mode in which whenever the CPU reads or writes to the SPI Data register it actually reads and writes exclusively to either the Transmit FIFO or the Receive FIFO depending on the programmed state of the Select FIFO for EFWR (STRF) bit. In this special mode, data will not be transmitted on the MOSI pin and data input on the MISO pin will not be stored. This mode can be used to test, through software, whether or not the Transmit FIFO or the Receive FIFO operates properly as a first-in-first-out memory stack.
15:11	0b RW	<b>Receive FIFO Interrupt Threshold (RFT):</b> The receive FIFO interrupt threshold sets the threshold at or above which the FIFO controller triggers, if enabled, a CPU interrupt request. This level should be set to the desired threshold value minus 1.
10:6	0b RW	<b>Transmit FIFO Interrupt Threshold (TFT):</b> The transmit FIFO interrupt threshold sets the threshold at or below which the FIFO controller triggers, if enabled, a CPU interrupt request. This level should be set to the desired threshold value minus 1.
5	0b RO	<b>RSVO:</b> Reserved.
4	0b RW	<b>Serial Clock Phase (SPH):</b> The serial clock (SCLK) phase bit determines the phase relationship between the SCLK and the Chip Select (CS) pins. 0 : SCLK remains in its inactive/idle state (as determined by the SPO setting) for one full cycle after CS is asserted low at the beginning of a frame. SCLK continues to transition for the rest of the frame and is then held in its inactive state for one-half of an SCLK period before CS is deasserted high at the end of the frame. 1 : SCLK remains in its inactive/ idle state (as determined by the SPO setting) for half a cycle after CS is asserted low at the beginning of a frame. SCLK continues to transition for the rest of the frame and is then held in its inactive state for one full SCLK period before CS is de-asserted high at the end of the frame. The combination of the SPO and SPH settings determines when SCLK is active during the assertion of CS and which SCLK edge is used to transmit and receive data on the MOSI and MISO pins. When SPO and SPH are programmed to the same value (both 0 or 1), transmit data is driven on the falling edge of SCLK and receive data is latched on the rising edge of SCLK. When SPO and SPH are programmed to opposite values (one 0 and the other 1), transmit data is driven on the rising edge of SCLK and receive data is latched on the falling edge of SCLK.

Bit Range	Default & Access	Description
31:18	00h RO	<b>RSV:</b> Reserved.
17:13	1Fh RO	<b>Receive FIFO Level (RFL):</b> This 5-bit value shows how many valid entries are currently in the Receive FIFO (up to 32).
12:8	0b RO	<b>Transmit FIFO Level (TFL):</b> This 5-bit value shows how many valid entries are currently in the Transmit FIFO (up to 32).
7	0b RW/C	<b>Receiver Overrun Status (ROR):</b> The receiver overrun status bit is a read/write bit which is set when the receive logic attempts to place data into the receive FIFO after it has been completely filled. Each time a new piece of data is received, the set signal to the ROR bit is asserted, and the newly received data is discarded. This process is repeated for each new piece of data received until at least one empty FIFO entry exists. When the ROR bit is set, an interrupt request is made to the CPU which cannot be locally masked by any SPI register bit. Writing a 1 to this bit resets ROR status and its interrupt request; writing a 0 to this bit does not affect ROR status. Receiver Overrun Status is a non-maskable interrupt
6	0b RO	<b>Receive FIFO Service Request Flag (RFS):</b> The receive FIFO service request flag is a read-only bit which is set when the receive FIFO is nearly filled and requires service to prevent an overrun. RFS is set any time the receive FIFO has the same or more entries of valid data than indicated by the Receive FIFO Threshold, and it is cleared when it has fewer entries than the threshold value. When the RFS bit is set, an interrupt request is made unless RIE is cleared. After the CPU reads the FIFO such that it has fewer entries than the RFT value, the RFS flag (and the service request and/or interrupt) is automatically cleared.
5	0b RO	<b>Transmit FIFO Service Request Flag (TFS):</b> The Transmit FIFO service request flag is a read-only bit which is set when the transmit FIFO is nearly empty and requires service to prevent an underrun. TFS is set any time the transmit FIFO has the same or fewer entries of valid data than indicated by the Transmit FIFO Threshold, and it is cleared when it has more entries of valid data than the threshold value. When the TFS bit is set, an interrupt request is made unless TIE is cleared. After the CPU fills the FIFO such that it exceeds the threshold, the TFS flag (and the service request and/or interrupt) is automatically cleared.
4	0b RO	<b>SPI Busy Flag (BSY):</b> The receive FIFO not empty flag is a read-only bit which is set whenever the receive FIFO contains one or more entries of valid data and is cleared when it no longer contains any valid data. This bit can be polled when using programmed I/O to remove remaining bytes of data from the receive FIFO since CPU interrupt requests are only made when the Receive FIFO Threshold has been met or exceeded. This bit does not request an interrupt.
3	0b RO	<b>Receive FIFO Not Empty Flag (RNE):</b> The receive FIFO not empty flag is a read-only bit which is set whenever the receive FIFO contains one or more entries of valid data and is cleared when it no longer contains any valid data. This bit can be polled when using programmed I/O to remove remaining bytes of data from the receive FIFO since interrupt requests are only made when the Receive FIFO Threshold has been met or exceeded. This bit does not request an interrupt.
2	1b RO	<b>Transmit FIFO Not Full Flag (TNF):</b> The transmit FIFO not full flag is a read-only bit which is set whenever the transmit FIFO contains one or more entries which do not contain valid data. TNF is cleared when the FIFO is completely full. This bit can be polled when using programmed I/O to fill the transmit FIFO over its threshold level. This bit does not request an interrupt.
1:0	0b RO	<b>Alternative Frame (ALT_FRM):</b> This field is not supported and should be treated as reserved.

#### 20.5.4 SPI Data Register (SSDR)—Offset 10h

The SPI Data Register is one 32-bit location that can be accessed by 32-bit data transfers. Transfers can be single word transfer or 2 to 32 -word bursts. The SSDR represents two physical registers: the first is temporary storage for data on its way out through the Transmit FIFO; the other is temporary storage for data coming in through the Receive FIFO. As the register is accessed by the system, FIFO control logic transfers

data automatically between register and FIFO as fast as the system moves it. Data in the FIFO shifts up or down to accommodate the new word (unless it is an attempted write to a full Transmit FIFO). For outbound data transfers (write from system to SPI peripheral), the register may be loaded (written) by the system processor anytime it is below its threshold level. When a data size of less than 32-bits is selected, the user should not left-justify data written to the transmit FIFO. Transmit logic left-justifies the data and ignores any unused bits. Received data less than 32-bits is automatically right justified in the receive buffer.

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSDR:** [BAR0] + 10h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
SSDR								

Bit Range	Default & Access	Description
31:0	00h RW	<b>SPI Data (SSDR):</b> Data to be written to/read from Transmit/Receive FIFO

**20.5.5 DDS Clock Rate Register (DDS\_RATE)—Offset 28h**

The DDS Clock Rate Register determines the SCLK frequency, along with SCR field of SSCR0 register. This register determines the frequency DDS\_FREQ of an internal clock used to clock part of the SPI core logic and to drive the SPI output clock (SCLK). Note that SCLK frequency is not the same as this clock, but is a divided version according to SCR bit in SSCR0 register.

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**DDS\_RATE:** [BAR0] + 28h

**BAR0 Type:** PCI Configuration Register (Size: 32 bits)

**BAR0 Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00028F5Ch

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	1	0	0
RSV				DDS_CLK_RATE				

Bit Range	Default & Access	Description
31:24	0b RO	<b>RSV:</b> Reserved.
23:0	028F5Ch RW	<b>DDS Clock Rate (DDS_CLK_RATE):</b> DDS_CLK_RATE is a 24 bit value that is incrementally added to a 24 bit wrapping internal counter to cause the clock output to toggle. The frequency of the internal generated clock is given by: $DDS\_FREQ = SYS\_FREQ * (DDS\_CLK\_RATE / 2^{exp24})$ where SYS_FREQ is 200MHz. <b>NOTE:</b> in order to minimize jitter and duty cycle on the generated clock, this register should be set as described in the SPI section of the design specification document.

§ §

## 21.0 Legacy Bridge

---

The Legacy Bridge is a collection of hardware blocks that are critical to implement a PC/AT compatible platform. Certain legacy hardware functions are required to support commercially available, shrink-wrap operating systems. In addition, the Legacy Bridge provides interrupt decoding and routing functionality, power management features, and a SPI interface for system firmware.

### 21.1 Features

The key features of the various blocks are as follows:

- General Purpose Input Output
  - Legacy control interface for SoC GPIOs
  - I/O mapped registers
- 8259 Programmable Interrupt Controller
  - Legacy interrupt support
  - 15 total interrupts through two cascaded controllers
  - I/O mapped registers
- I/O Advanced Programmable Interrupt Controller
  - Legacy-free interrupt support
  - 24 total interrupts
  - Memory mapped registers
- 8254 Programmable Interval Timer
  - Legacy timer support
  - Three timers with fixed uses: System Timer, Refresh Request Signal, and Speaker Tone
  - I/O mapped registers
- HPET - High Performance Event Timers
  - Legacy-free timer support
  - Three timers and one counter
  - Memory mapped registers
- Real-Time Clock (RTC)
  - 242-byte RAM backed by battery (aka CMOS RAM)
  - Can generate wake/interrupt when time matches programmed value
  - I/O and indexed registers
- Watchdog Timer (WDT)
  - Provides ability to trigger a reset in the event of an unresponsive system
  - Resolution from 1 $\mu$ sec to 17 minutes

- I/O mapped registers
- Serial Peripheral Interface (SPI)
  - Support for one SPI Flash, of up to 16 Mbyte, only. No other SPI peripherals are supported.
  - Stores boot FW and system configuration data
  - Supports SPI clock frequency of 20 MHz.
  - Memory mapped registers
- Power Management Controller (PMC)
  - Provides a software interface to control many of the power management features present in the SoC. See the *Intel® Quark SoC X1000 UEFI Firmware Writer's Guide* (Order #330236) for more information.

The following features are not supported by the Legacy Bridge:

- LPC Interface
- Serial IRQ (SERIRQ)
- SMBus

**Table 129. Miscellaneous Legacy Signals**

Signal Name	Direction/Type	Description
SMI_B	I CMOS3.3	External System Management Interrupt: This signal is typically generated by the external system management controller.
THRM_B	I CMOS3.3	Thermal Alarm: Generated by external hardware to cause an SMI_B/SCI (if enabled).

## 21.2 Register Map

See [Chapter 5.0, "Register Access Methods"](#) for additional information.

Figure 49. Legacy Bridge Register Map

### 21.3 PCI Configuration Registers

D4h	4	"BIOS Decode Enable (BCE)—Offset D4h" on page 825	FF000000h
D8h	4	"BIOS Control (BC)—Offset D8h" on page 826	00000100h
F0h	4	"Root Complex Base Address (RCBA)—Offset F0h" on page 827	00000000h

### 21.3.1 PCI Device ID and Vendor ID Fields (PCI\_DEVICE\_VENDOR)—Offset 0h

**Access Method**

**Type:** PCI Configuration Register  
(Size: 32 bits)

**PCI\_DEVICE\_VENDOR:** [B:0, D:31, F:0] + 0h

**Default:** 095E8086h

Bit Range	Default & Access	Description
31:16	095Eh RO	<b>Device ID (DEVICE_ID):</b> PCI Device ID
15:0	8086h RO	<b>Vendor ID (VENDOR_ID):</b> PCI Vendor ID for Intel

### 21.3.2 PCI Status and Command Fields (PCI\_STATUS\_COMMAND)—Offset 4h

**Access Method**

**Type:** PCI Configuration Register  
(Size: 32 bits)

**PCI\_STATUS\_COMMAND:** [B:0, D:31, F:0] + 4h

**Default:** 00000003h

Bit Range	Default & Access	Description
31:24	00h RO	<b>BIST</b> : PCI BIST Field
23:16	00h RO	<b>Header Type (HEADER)</b> : PCI Header Type Field
15:8	00h RO	<b>Latency Timer (LATENCY)</b> : PCI Latency Timer Field
7:0	00h RO	<b>Cache Line Size (CACHE_LINE_SIZE)</b> : PCI Cache Line Size Field

### 21.3.5 PCI Subsystem ID and Subsystem Vendor ID Fields (PCI\_SUBSYSTEM)—Offset 2Ch

This register is initialized to logic 0 by the assertion of RESET#. This register can be written only once after RESET# de-assertion.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**PCI\_SUBSYSTEM:** [B:0, D:31, F:0] + 2Ch

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0000h RW/O	<b>Subsystem Vendor ID (SUBSYSTEM_VENDOR_ID)</b> : This is written by BIOS. No hardware action taken.
15:0	0000h RW/O	<b>Subsystem ID (SUBSYSTEM_ID)</b> : This is written by BIOS. No hardware action taken.

### 21.3.6 GPIO Base Address (GBA)—Offset 44h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**GBA:** [B:0, D:31, F:0] + 44h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
EN	RSV2			BA			RSV1		

Bit Range	Default & Access	Description
31	0b RW	<b>Enable (EN):</b> When set, decode of the I/O range pointed to by the BA is enabled.
30:16	0b RO	<b>Reserved (RSV2):</b> Reserved.
15:7	0b RW	<b>Base Address (BA):</b> Provides the 128 bytes of I/O space for GPIO.
6:0	0b RO	<b>Reserved (RSV1):</b> Reserved.

### 21.3.7 PM1\_BLK Base Address (PM1BLK)—Offset 48h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**PM1BLK:** [B:0, D:31, F:0] + 48h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0

0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
EN	RSV2			BA			RSV1		

Bit Range	Default & Access	Description
31	0b RW	<b>Enable (EN):</b> When set, decode of the I/O range pointed to by the BA is enabled.
30:16	0b RO	<b>Reserved (RSV2):</b> Reserved.
15:4	0b RW	<b>Base Address (BA):</b> Provides the 16 bytes of I/O space for PM1_BLK.
3:0	0b RO	<b>Reserved (RSV1):</b> Reserved.

### 21.3.8 GPE0\_BLK Base Address (GPE0BLK)—Offset 4Ch

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**GPE0BLK:** [B:0, D:31, F:0] + 4Ch

Type: PCI Configuration Register  
(Size: 32 bits)

PABCDRC: [B:0, D:31, F:0] + 60h

Default: 80808080h

31	28	24	20	16	12	8	4	0			
1	0 0 0	0 0 0 0	1 0 0 0	0 0 0 0	1 0 0 0	0 0 0 0	1 0 0 0	0 0 0 0			
REND	RSVD	IRD	RENC	RSVC	IRC	RENB	RSVB	IRB	RENA	RSVA	IRA

Bit Range	Default & Access	Description
31	1b RW	<b>Interrupt Routing Enable for PIRQD (REND):</b> When cleared, PIRQD is routed to one of the legacy interrupts specified in bits[27:24]. When set, PIRQD is not routed to the 8259.
30:28	0b RO	<b>Reserved (RSVD):</b> Reserved.
27:24	0b RW	<b>IRQ for PIRQD (IRD):</b> Indicates how to route PIRQD. 0h - Reserved 1h - Reserved 2h - IRQ2 3h - IRQ3 4h - IRQ4 5h - IRQ5 6h - IRQ6 7h - IRQ7 8h - IRQ8 9h - IRQ9 Ah - IRQ10 Bh - IRQ11 Ch - IRQ12 Dh - Reserved Eh - IRQ14 Fh - IRQ15
23	1b RW	<b>Interrupt Routing Enable for PIRQC (RENC):</b> When cleared, PIRQC is routed to one of the legacy interrupts specified in bits[19:16]. When set, PIRQC is not routed to the 8259.
22:20	0b RO	<b>Reserved (RSVC):</b> Reserved.
19:16	0b RW	<b>IRQ for PIRQC (IRC):</b> Indicates how to route PIRQC.
15	1b RW	<b>Interrupt Routing Enable for PIRQB (RENB):</b> When cleared, PIRQB is routed to one of the legacy interrupts specified in bits[11:8]. When set, PIRQB is not routed to the 8259.
14:12	0b RO	<b>Reserved (RSVB):</b> Reserved.
11:8	0b RW	<b>IRQ for PIRQB (IRB):</b> Indicates how to route PIRQB.
7	1b RW	<b>Interrupt Routing Enable for PIRQA (RENA):</b> When cleared, PIRQA is routed to one of the legacy interrupts specified in bits[3:0]. When set, PIRQA is not routed to the 8259.
6:4	0b RO	<b>Reserved (RSVA):</b> Reserved.
3:0	0b RW	<b>IRQ for PIRQA (IRA):</b> Indicates how to route PIRQA.

### 21.3.11 PIRQE, PIRQF, PIRQG and PIRQH Routing Control (PEFGHRC)—Offset 64h

**Access Method**

Type: PCI Configuration Register (Size: 32 bits) **PEFGHRC:** [B:0, D:31, F:0] + 64h

**Default:** 80808080h

31	28	24	20	16	12	8	4	0			
1	0	0	0	0	0	0	0	0			
0	0	0	0	1	0	0	0	0			
0	0	0	0	0	0	0	0	0			
0	0	0	0	0	0	0	0	0			
0	0	0	0	0	0	0	0	0			
0	0	0	0	0	0	0	0	0			
0	0	0	0	0	0	0	0	0			
RENH	RSVH	IRH	RENG	RSVG	IRG	RENF	RSVF	IRF	RENE	RSVE	IRE

Bit Range	Default & Access	Description
31	1b RW	<b>Interrupt Routing Enable for PIRQH (RENH):</b> When cleared, PIRQH is routed to one of the legacy interrupts specified in bits[27:24]. When set, PIRQH is not routed to the 8259.
30:28	0b RO	<b>Reserved (RSVH):</b> Reserved.
27:24	0b RW	<b>IRQ for PIRQH (IRH):</b> Indicates how to route PIRQH.
23	1b RW	<b>Interrupt Routing Enable for PIRQG (RENG):</b> When cleared, PIRQG is routed to one of the legacy interrupts specified in bits[19:16]. When set, PIRQG is not routed to the 8259.
22:20	0b RO	<b>Reserved (RSVG):</b> Reserved.
19:16	0b RW	<b>IRQ for PIRQG (IRG):</b> Indicates how to route PIRQG.
15	1b RW	<b>Interrupt Routing Enable for PIRQF (RENF):</b> When cleared, PIRQF is routed to one of the legacy interrupts specified in bits[11:8]. When set, PIRQF is not routed to the 8259.
14:12	0b RO	<b>Reserved (RSVF):</b> Reserved.
11:8	0b RW	<b>IRQ for PIRQF (IRF):</b> Indicates how to route PIRQF.
7	1b RW	<b>Interrupt Routing Enable for PIRQE (RENE):</b> When cleared, PIRQE is routed to one of the legacy interrupts specified in bits[3:0]. When set, PIRQE is not routed to the 8259.
6:4	0b RO	<b>Reserved (RSVE):</b> Reserved.
3:0	0b RW	<b>IRQ for PIRQE (IRE):</b> Indicates how to route PIRQE.

### 21.3.12 Watch Dog Timer Base Address (WDTBA)—Offset 84h

**Access Method**

Type: PCI Configuration Register (Size: 32 bits) **WDTBA:** [B:0, D:31, F:0] + 84h

**Default:** 00000000h

Bit Range	Default & Access	Description
25	1b RW	<b>C8-CF Enable (EC8)</b> : Enables decoding of BIOS range FFC80000h - FFCFFFFFFh and FF880000h - FF8FFFFFFh. 0 = Disable 1 = Enable
24	1b RW	<b>C0-C8 Enable (EC0)</b> : Enables decoding of BIOS range FFC00000h - FFC7FFFFFFh and FF800000h - FF87FFFFFFh. 0 = Disable 1 = Enable
23:0	0b RO	<b>Reserved (RSV)</b> : Reserved.

### 21.3.14 BIOS Control (BC)—Offset D8h

#### Access Method

Type: PCI Configuration Register (Size: 32 bits) BC: [B:0, D:31, F:0] + D8h

Default: 00000100h

31	28	24	20	16	12	8	4	0					
0	0	0	0	0	0	0	1	0					
0	0	0	0	0	0	0	0	0					
0	0	0	0	0	0	0	0	0					
RSV3							PFE	RSV2	SMM_WPD	RSV1	CD	LE	WPD

Bit Range	Default & Access	Description
31:9	0b RO	<b>Reserved (RSV3)</b> : Reserved.
8	1b RW	<b>Prefetch Enable (PFE)</b> : When set, BIOS prefetching is enabled. An access to BIOS causes a 64-byte fetch of the line starting at that region. Subsequent accesses within that region result in data being returned from the prefetch buffer. The prefetch buffer is invalidated when this bit is cleared, or a BIOS access occurs to a different line than what is currently in the buffer
7:6	0b RO	<b>Reserved (RSV2)</b> : Reserved.
5	0b RW	<b>SMM Write Protect Disable (SMM_WPD)</b> : When LE is clear: Setting this bit has no effect. When LE is set: Setting this bit enables both read and write cycles to the SPI Flash, clearing this bit blocks write cycles to the SPI Flash. This bit is not writeable unless the processor is in SMM mode. This bit must be cleared before the processor exits SMM mode to prevent write cycles to SPI flash when the processor is in a non-SMM mode.
4:3	0b RO	<b>Reserved (RSV1)</b> : Reserved.
2	0b RW	<b>Cache Disable (CD)</b> : Enable caching in read buffer for direct memory read.
1	0b RW/P	<b>Lock Enable (LE)</b> : When cleared, setting the WPD bit will not generate SMIs and the WPD bit is used to enable write cycles to the SPI Flash. When set, enables setting the WPD bit to generate SMIs and the SMM_WPD bit is used to enable write cycles to the SPI Flash. Once set, this bit can only be cleared by a reset.

Bit Range	Default & Access	Description
0	0b RW	<b>Write Protect Disable (WPD)</b> : When LE is clear: Setting this bit enables both read and write cycles into the SPI Flash, clearing this bit blocks write cycles to the SPI Flash. When LE is set: Setting this bit will generate an SMI, the SMM_WPD bit must then be used to enable write cycles to the SPI Flash. This bit must be cleared before the processor exits SMM mode in order to clear the SMI source.

### 21.3.15 Root Complex Base Address (RCBA)—Offset F0h

#### Access Method

Type: PCI Configuration Register  
(Size: 32 bits)

RCBA: [B:0, D:31, F:0] + F0h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
BA				RSV				EN

Bit Range	Default & Access	Description
31:14	0b RW	<b>Base Address (BA)</b> : Base Address for the root complex register block decode range. This address is aligned on a 16 KB boundary.
13:1	0b RO	<b>Reserved (RSV)</b> : Reserved.
0	0b RW	<b>Enable (EN)</b> : When set, enables the range specified in BA to be claimed as the RCRB.

## 21.4 Memory Mapped Registers

### 21.4.1 Root Complex Register Block

This block describes all registers and base functionality that are related to SoC configuration but not a specific interface. It contains the root complex register block. Accesses in this space are limited to 32-bit quantities. Burst accesses are not allowed.

**Table 131. Summary of Memory Mapped I/O Registers—RCBA**

Offset Start	Offset End	Register ID—Description	Default Value
0h	3h	"Root Complex Topology Capabilities List (RCTCL)—Offset 0h" on page 828	00010005h
4h	7h	"Element Self Description (ESD)—Offset 4h" on page 828	00000102h
3140h	3141h	"Interrupt Queue Agent 0 (IRQAGENT0)—Offset 3140h" on page 829	0000h
3142h	3143h	"Interrupt Queue Agent 1 (IRQAGENT1)—Offset 3142h" on page 829	0000h
3144h	3145h	"Interrupt Queue Agent 2 (IRQAGENT2)—Offset 3144h" on page 830	0000h
3146h	3147h	"Interrupt Queue Agent 3 (IRQAGENT3)—Offset 3146h" on page 830	0000h
3400h	3403h	"Root Complex Topology Capabilities List (RCTCL)—Offset 0h" on page 828	00000000h

### 21.4.1.1 Root Complex Topology Capabilities List (RCTCL)—Offset 0h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**RCTCL:** [RCBA] + 0h

**RCBA Type:** PCI Configuration Register (Size: 32 bits)

**RCBA Reference:** [B:0, D:31, F:0] + F0h

**Default:** 00010005h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0			
NEXTCAP				CAPVER				CAPID			

Bit Range	Default & Access	Description
31:20	0b RO	<b>Next Capability (NEXTCAP):</b> Indicates next item in the list
19:16	1h RO	<b>Capability Version (CAPVER):</b> Indicates the version of the capability structure.
15:0	0005h RO	<b>Capability ID (CAPID):</b> Indicates this is a PCI Express link capability section of an RCRB

### 21.4.1.2 Element Self Description (ESD)—Offset 4h

Provides information about the root complex element containing the Link Declaration Capability

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ESD:** [RCBA] + 4h

**RCBA Type:** PCI Configuration Register (Size: 32 bits)

**RCBA Reference:** [B:0, D:31, F:0] + F0h

**Default:** 00000102h

31	28	24	20	16	12	8	4	0											
0	0	0	0	0	0	0	0	0											
PORTNUM				COMPID				NUMLE				RSV				ETYP			

Bit Range	Default & Access	Description
31:24	0b RO	<b>Port Number (PORTNUM):</b> A value of 0 to indicate the egress port
23:16	0b RW/O	<b>Component ID (COMPID):</b> Indicates the component ID assigned to this element by software. This is written once by BIOS and is locked until a reset.
15:8	01h RO	<b>Number of Link Entries (NUMLE):</b> Indicates that one link entry is described by this RCRB.

Bit Range	Default & Access	Description
7:4	0b RO	<b>Reserved (RSV)</b> : Reserved.
3:0	2h RO	<b>Element Type (ETYPE)</b> : Indicates that the element type is a root complex internal link

### 21.4.1.3 Interrupt Queue Agent 0 (IRQAGENT0)—Offset 3140h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**IRQAGENT0:** [RCBA] + 3140h

**RCBA Type:** PCI Configuration Register (Size: 32 bits)

**RCBA Reference:** [B:0, D:31, F:0] + F0h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
RSV		RSV_RW	INTAPR	

Bit Range	Default & Access	Description
15:8	0b RO	<b>Reserved (RSV)</b> : Reserved.
7:4	0b RW	<b>Reserved (RSV_RW)</b> : Reserved.
3:0	0b RW	<b>Interrupt A Pin Route (INTAPR)</b> : Indicates which PIRQ routing used for INTA#. Legal values are [0x0-0x7] corresponding to PIRQ[A-H]. For example, INTA# will be routed to PIRQG if this field is set to 0x6.

### 21.4.1.4 Interrupt Queue Agent 1 (IRQAGENT1)—Offset 3142h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**IRQAGENT1:** [RCBA] + 3142h

**RCBA Type:** PCI Configuration Register (Size: 32 bits)

**RCBA Reference:** [B:0, D:31, F:0] + F0h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
INTDPR	INTCPR	INTBPR	INTAPR	

Bit Range	Default & Access	Description
15:12	0b RW	<b>Interrupt D Pin Route (INTDPR)</b> : Indicates which PIRQ routing used for INTD#. Legal values are [0x0-0x7] corresponding to PIRQ[A-H]. For example, INTD# will be routed to PIRQG if this field is set to 0x6.
11:8	0b RW	<b>Interrupt C Pin Route (INTCPR)</b> : Indicates which PIRQ routing used for INTC#. Legal values are [0x0-0x7] corresponding to PIRQ[A-H]. For example, INTC# will be routed to PIRQG if this field is set to 0x6.
7:4	0b RW	<b>Interrupt B Pin Route (INTBPR)</b> : Indicates which PIRQ routing used for INTB#. Legal values are [0x0-0x7] corresponding to PIRQ[A-H]. For example, INTB# will be routed to PIRQG if this field is set to 0x6.
3:0	0b RW	<b>Interrupt A Pin Route (INTAPR)</b> : Indicates which PIRQ routing used for INTA#. Legal values are [0x0-0x7] corresponding to PIRQ[A-H]. For example, INTA# will be routed to PIRQG if this field is set to 0x6.

### 21.4.1.5 Interrupt Queue Agent 2 (IRQAGENT2)—Offset 3144h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**IRQAGENT2:** [RCBA] + 3144h

**RCBA Type:** PCI Configuration Register (Size: 32 bits)

**RCBA Reference:** [B:0, D:31, F:0] + F0h

**Default:** 0000h

15	12	8	4	0
0	0	0	0	0
RSV		RSV_RW	INTAPR	

Bit Range	Default & Access	Description
15:8	0b RO	<b>Reserved (RSV)</b> : Reserved.
7:4	0b RW	<b>Reserved (RSV_RW)</b> : Reserved.
3:0	0b RW	<b>Interrupt A Pin Route (INTAPR)</b> : Indicates which PIRQ routing used for INTA#. Legal values are [0x0-0x7] corresponding to PIRQ[A-H]. For example, INTA# will be routed to PIRQG if this field is set to 0x6.

### 21.4.1.6 Interrupt Queue Agent 3 (IRQAGENT3)—Offset 3146h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**IRQAGENT3:** [RCBA] + 3146h

**RCBA Type:** PCI Configuration Register (Size: 32 bits)

**RCBA Reference:** [B:0, D:31, F:0] + F0h

**Default:** 0000h

15	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0
INTDPR		INTCPR		INTBPR
				INTAPR

Bit Range	Default & Access	Description
15:12	0b RW	<b>Interrupt D Pin Route (INTDPR)</b> : Indicates which PIRQ routing used for INTD#. Legal values are [0x0-0x7] corresponding to PIRQ[A-H]. For example, INTD# will be routed to PIRQG if this field is set to 0x6.
11:8	0b RW	<b>Interrupt C Pin Route (INTCPR)</b> : Indicates which PIRQ routing used for INTC#. Legal values are [0x0-0x7] corresponding to PIRQ[A-H]. For example, INTC# will be routed to PIRQG if this field is set to 0x6.
7:4	0b RW	<b>Interrupt B Pin Route (INTBPR)</b> : Indicates which PIRQ routing used for INTB#. Legal values are [0x0-0x7] corresponding to PIRQ[A-H]. For example, INTB# will be routed to PIRQG if this field is set to 0x6.
3:0	0b RW	<b>Interrupt A Pin Route (INTAPR)</b> : Indicates which PIRQ routing used for INTA#. Legal values are [0x0-0x7] corresponding to PIRQ[A-H]. For example, INTA# will be routed to PIRQG if this field is set to 0x6.

### 21.4.1.7 RTC Configuration (RC)—Offset 3400h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**RC:** [RCBA] + 3400h

**RCBA Type:** PCI Configuration Register (Size: 32 bits)

**RCBA Reference:** [B:0, D:31, F:0] + F0h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	
RSV							RSVRW	UPR_LOCK	LWR_LOCK

Bit Range	Default & Access	Description
31:3	0b RO	<b>Reserved (RSV)</b> : Reserved.
2	0b RW	<b>Reserved (RSVRW)</b> : Reserved.
1	0b RW/O	<b>Upper 128 Byte Lock (UPR_LOCK)</b> : When set, bytes 38h-3Fh in the upper 128 byte bank of RTC RAM are locked. Writes will be dropped and reads will not return any guaranteed data.
0	0b RW/O	<b>Lower 128 Byte Lock (LWR_LOCK)</b> : When set, bytes 38h-3Fh in the lower 128 byte bank of RTC RAM are locked. Writes will be dropped and reads will not return any guaranteed data.

## 21.5 IO Registers

The Legacy Bridge contains a mix of fixed address I/O Registers and I/O Registers that are mapped by BARs in the Legacy Bridge configuration space. This sections describes the Fixed I/O registers and the Legacy ACPI I/O Register.s All other I/O Registers are described in the relevant sections later in this chapter.

### 21.5.1 Fixed IO Registers

Table 132. Summary of I/O Registers

Offset Start	Offset End	Register ID—Description	Default Value
61h	61h	"NMI Status and Control Register (NSC)—Offset 61h" on page 832	00h
70h	70h	"NMI Enable and RTC Index Register (NMIE)—Offset 70h" on page 833	80h
B2h	B2h	"Software SMI Control Port (SWSMICTL)—Offset B2h" on page 833	00h
B3h	B3h	"Software SMI Status Port (SWSMISTS)—Offset B3h" on page 834	00h
CF9h	CF9h	"Reset Control Register (RSTC)—Offset CF9h" on page 834	00h

#### 21.5.1.1 NMI Status and Control Register (NSC)—Offset 61h

##### Access Method

Type: I/O Register  
(Size: 8 bits)

NSC: 61h

Default: 00h

Bit Range	Default & Access	Description
7	0b RO	<b>SERR# NMI Status (SERR_NMI_STATUS):</b> Set on errors from a PCIe port or internal functions that generate SERR#. SERR# NMI Enable in this register must be cleared in order for this bit to be set. To reset the interrupt, set bit 2 to 1 and then set it to 0.
6	0b RO	<b>Reserved (RSVD):</b> Reserved.
5	0b RO	<b>Timer Counter 2 Status (CNTR2_STATUS):</b> Reflects the current state of the 8254 counter 2 output. Counter 2 must be programmed for this bit to have a determinate value.
4	0b RO	<b>Refresh Cycle Toggle Status (CNTR1_TOGGLE_STATUS):</b> Reflects the current state of 8254 counter 1.
3	0b RO	<b>Reserved (RSVD):</b> Reserved.

Bit Range	Default & Access	Description
2	0b RW	<b>SERR# NMI Enable (SERR_NMI_ENABLE)</b> : When set, SERR# NMIs are disabled. When cleared, SERR# NMIs are enabled.
1	0b RW	<b>Reserved (SPKR_ENABLE)</b> : Reserved
0	0b RW	<b>Timer Counter 2 Enable (CNTR2_ENABLE)</b> : When cleared, counter 2 counting is disabled. When set, counting is enabled.

### 21.5.1.2 NMI Enable and RTC Index Register (NMIE)—Offset 70h

Access Method

Type: I/O Register  
(Size: 8 bits)

NMIE: 70h

Default: 80h

7		4		0
1	0	0	0	0
NMI_ENABLE				RTC_INDEX

Bit Range	Default & Access	Description
7	1b WO	<b>NMI Enable (NMI_ENABLE)</b> : When set, NMI sources disabled. When cleared, NMI sources enabled.
6:0	0b WO	<b>Real Time Clock Index (RTC_INDEX)</b> : Selects RTC register or CMOS RAM address to access.

### 21.5.1.3 Software SMI Control Port (SWSMICTL)—Offset B2h

Access Method

Type: I/O Register  
(Size: 8 bits)

SWSMICTL: B2h

Default: 00h

7		4		0
0	0	0	0	0
				CONTROL

Bit Range	Default & Access	Description
7:0	0b RW	<b>Software SMI Control Port (CONTROL)</b> : This port is used to pass a command between the OS and the SMI handler. Writes to this port store data, set APM bit of SMI Status register of GPE0 Block, and generate SMI_B when APM is set.

### 21.5.1.4 Software SMI Status Port (SWSMISTS)—Offset B3h

Access Method

Type: I/O Register  
(Size: 8 bits)

SWSMISTS: B3h

Default: 00h

Bit Range	Default & Access	Description
7:0	0b RW	<b>Software SMI Status Port (STATUS):</b> This port is used to pass data between the OS and the SMI handler. This is a scratchpad register.

### 21.5.1.5 Reset Control Register (RSTC)—Offset CF9h

Access Method

Type: I/O Register  
(Size: 8 bits)

RSTC: CF9h

Default: 00h

Bit Range	Default & Access	Description
7:5	0b RO	<b>Reserved (RSV2):</b> Reserved.
4	0b RO	<b>Reserved (RSVD):</b> Reserved.
3	0b RW	<b>Cold Reset (COLD_RST):</b> This bit causes SLPMODE, and RSTRDY# to be driven low, while SLPRDY# remains high. In response to this, the platform will perform a full power cycle
2	0b RO	<b>Reserved (RSV1):</b> Reserved.
1	0b RW	<b>Warm Reset (WARM_RST):</b> This bit causes RSTRDY# to be driven low, with SLPMODE high, while SLPRDY# remains high. In response to this, the platform will pulse RESET_BTN_B low to reset the CPU and all peripherals
0	0b RO	<b>Reserved (RSVD):</b> Reserved.

Bit Range	Default & Access	Description
10	0b RO	<b>Reserved (RSVD):</b> Reserved.
9:0	0b RO	<b>Reserved (RSV1):</b> Reserved.

### 21.5.2.2 GPE0 Enable Register (GPE0EN)—Offset 4h

#### Access Method

Type: I/O Register  
(Size: 32 bits)

GPE0EN: [GPE0BLK] + 4h

GPE0BLK Type: PCI Configuration Register (Size: 32 bits)

GPE0BLK Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000000h

31	28	24	20	16	12	8	4	0					
0	0	0	0	0	0	0	0	0					
RSV2				PCIE	RMU	SCLT	GPIO	EGPE	THRM	SWGPE	RSVD	RSV1	

Bit Range	Default & Access	Description
31:18	0b RO	<b>Reserved (RSV2):</b> Reserved.
17	0b RW	<b>PCIe Enable (PCIE):</b> When set enables GPE0STS.PCIE to generate SCI/SMI.
16	0b RW	<b>Remote Management Unit Enable (RMU):</b> When set enables GPE0STS.RMU to generate SCI/SMI.
15	0b RW	<b>Device Enable (SCLT):</b> When set enables GPE0STS.SCLT to generate SCI/SMI.
14	0b RW	<b>GPIO Enable (GPIO):</b> When set enables GPE0STS.GPIO to generate SCI/SMI.
13	0b RW	<b>External GPE Enable (EGPE):</b> When set enables GPE0STS.EGPE to generate SCI/SMI.
12	0b RW	<b>Thermal Enable (THRM):</b> When set enables GPE0STS.THRM to generate SCI/SMI.
11	0b RW	<b>Software GPE Enable (SWGPE):</b> When set enables GPE0STS.SWGPE to generate SCI/SMI.
10	0b RO	<b>Reserved (RSVD):</b> Reserved.
9:0	0b RO	<b>Reserved (RSV1):</b> Reserved.

### 21.5.2.3 SMI Enable Register (SMIEN)—Offset 10h

**Access Method**

Type: I/O Register  
(Size: 32 bits)

SMIEN: [GPE0BLK] + 10h

GPE0BLK Type: PCI Configuration Register (Size: 32 bits)

GPE0BLK Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000000h

31	28	24	20	16	12	8	4	0											
0	0	0	0	0	0	0	0	0											
RSV2				PCIE	RMU	SCLT	RSV1	RSVD	SERR	GPIO	ESMI	RSVD	RSVD	RSVD	APM	SPI	SLP	SWT	BIOS

Bit Range	Default & Access	Description
31:18	0b RO	<b>Reserved (RSV2):</b> Reserved.
17	0b RW	<b>PCIe Enable (PCIE):</b> When set enables SMISTS.PCIE to generate SMI.
16	0b RW	<b>Remote Management Unit Enable (RMU):</b> When set enables SMISTS.RMU to generate SMI
15	0b RW	<b>Device Enable (SCLT):</b> When set enables SMISTS.SCLT to generate SMI.
14:12	0b RO	<b>Reserved (RSV1):</b> Reserved.
11	0b RO	<b>Reserved (RSVD):</b> Reserved.
10	0b RW	<b>SERR Enable (SERR):</b> When set enables SMISTS.SERR to generate SMI_B
9	0b RW	<b>GPIO Enable (GPIO):</b> When set enables SMISTS.GPIO to generate SMI_B
8	0b RW	<b>External SMI Enable (ESMI):</b> When set enables SMISTS.ESMI to generate SMI_B
7	0b RO	<b>Reserved (RSVD):</b> Reserved.
6	0b RO	<b>Reserved (RSVD):</b> Reserved.
5	0b RO	<b>Reserved (RSVD):</b> Reserved.
4	0b RW	<b>APM Enable (APM):</b> When set enables SMISTS.APM to generate SMI_B
3	0b RW	<b>SPI Enable (SPI):</b> When set enables SMISTS.SPI to generate SMI_B
2	0b RW	<b>Sleep (SLP):</b> When set enables SMISTS.SLP to generate SMI_B
1	0b RW	<b>Software Timer (SWT):</b> When set enables SMISTS.SWT to generate SMI_B
0	0b RW	<b>BIOS:</b> When set enables SMISTS.BIOS to generate SMI_B

Bit Range	Default & Access	Description
1	0b RW/1C	<b>Software Timer (SWT)</b> : Set when the software SMI has expired.
0	0b RW/1C	<b>BIOS Status (BIOS)</b> : Set when software sets PM1C.GRLS.

### 21.5.2.5 General Purpose Event Control Register (GPEC)—Offset 18h

**Access Method**

**Type:** I/O Register  
(Size: 32 bits)

**GPEC:** [GPE0BLK] + 18h

**GPE0BLK Type:** PCI Configuration Register (Size: 32 bits)

**GPE0BLK Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 00000000h

Bit Range	Default & Access	Description
31:2	0b RO	<b>Reserved (RSV)</b> : Reserved.
1	0b WO	<b>Software General Purpose Event (SWGPE)</b> : Sets GPE0S.SWGPE when written with 1. This bit always reads back as 0.
0	0b RW	<b>Thermal Polarity (TPOL)</b> : This bit controls the polarity of THRM_B needed to set GPE0S.THRM. When set, a HIGH value on THRM_B will set GPE0S.THRM. When cleared, a LOW value on THRM_B will set GPE0S.THRM.

### 21.5.2.6 Power Management Configuration Core Well Register (PMCW)—Offset 28h

**Access Method**

**Type:** I/O Register  
(Size: 32 bits)

**PMCW:** [GPE0BLK] + 28h

**GPE0BLK Type:** PCI Configuration Register (Size: 32 bits)

**GPE0BLK Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 00000000h

Bit Range	Default & Access	Description
31	0b RW	<b>Periodic SMI Enable (RES)</b> : When set, an SMIS.SWT will be set by the rate specified by PSRS.
30:4	0b RO	<b>Reserved (RSV)</b> : Reserved.
3	0b RW/O	<b>SMI Lock (SMIL)</b> : When set, writes to SMIE have no effect. This bit is only cleared by Core Well reset
2:0	0b RW	<b>Periodic SMI Rate Selection (PSRS)</b> : Indicates when the timer will time out and cause an SMI_B. All values are +/- 30us (RTC Clock). Valid values are: 000b - 1.5ms 001b - 16ms 010b - 32ms 011b - 64ms 100b - 8 sec 101b - 16 sec 110b - 32 sec 111b - 64 sec

### 21.5.2.7 Power Management Configuration Suspend Well Register (PMSW)—Offset 2Ch

Access Method

Type: I/O Register  
(Size: 32 bits)

PMSW: [GPE0BLK] + 2Ch

GPE0BLK Type: PCI Configuration Register (Size: 32 bits)

GPE0BLK Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000000h

Bit Range	Default & Access	Description
31:2	0b RO	<b>Reserved (RSV)</b> : Reserved.
1	0b RW	<b>CPU BIST Enable (CBE)</b> : CPU BIST enable INIT functionality not supported.
0	0b RW	<b>DRAM Initialization Scratch pad (DRAMI)</b> : This bit does not affect hardware functionality. It is provided as a BIOS scratchpad bit that is maintained through warm resets.

Type: I/O Register  
(Size: 16 bits)

PM1S: [PM1BLK] + 0h

PM1BLK Type: PCI Configuration Register (Size: 32 bits)  
PM1BLK Reference: [B:0, D:31, F:0] + 48h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
WAKE	PCIEWSTS	RSV3	RTC	RSV2
				GLOB
				RSV1
				TO

Bit Range	Default & Access	Description
15	0b RW/1C	<b>Wake Status (WAKE):</b> Resume Well. This bit is set when the system is in an Sx state and an enable wake event occurs. Upon setting this bit, the Legacy Bridge will transition the system to the S0 state. This bit is not affected by warm resets
14	0b RW/1C	<b>PCIe Wake Status (PCIEWSTS):</b> This bit is set by hardware to indicate that the system woke due to a PCI Express wakeup event.
13:11	0b RO	<b>Reserved (RSV3):</b> Reserved.
10	0b RW/1C	<b>RTC Status (RTC):</b> Resume Well. This bit is set when the RTC asserts IRQ8#, and is not affected by any other enable bit. This bit is not affected by warm resets
9:6	0b RO	<b>Reserved (RSV2):</b> Reserved.
5	0b RW/1C	<b>Global Status (GLOB):</b> Set when SMIS.BRLS is written to '1'. It always cause an SCI (regardless of PM1C.SCIEN)
4:1	0b RO	<b>Reserved (RSV1):</b> Reserved.
0	0b RW/1C	<b>Timer Overflow Status (TO):</b> Set anytime bit 22 of PM1T goes low. See PM1E.TO for the effect of this bit being set

### 21.5.3.2 PM1 Enable Register (PM1E)—Offset 2h

#### Access Method

Type: I/O Register  
(Size: 16 bits)

PM1E: [PM1BLK] + 2h

PM1BLK Type: PCI Configuration Register (Size: 32 bits)  
PM1BLK Reference: [B:0, D:31, F:0] + 48h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
RSV4	PWAKED	RSV3	RTC	RSV2
				GLOB
				RSV1
				TO

Bit Range	Default & Access	Description
15	0b RO	<b>Reserved (RSV4):</b> Reserved.

Bit Range	Default & Access	Description
0	0b RW	<b>SCI Enable (SCIEN)</b> : When set, events in GPE0_BLK generate SCI. When cleared, events generate SMI_B.

### 21.5.3.4 Power Management 1 Timer Register (PM1T)—Offset 8h

#### Access Method

**Type:** I/O Register  
(Size: 32 bits)

**PM1T:** [PM1BLK] + 8h

**PM1BLK Type:** PCI Configuration Register (Size: 32 bits)

**PM1BLK Reference:** [B:0, D:31, F:0] + 48h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSV				VAL				

Bit Range	Default & Access	Description
31:24	0b RO	<b>Reserved (RSV)</b> : Reserved.
23:0	0b RO	<b>Timer Value (VAL)</b> : Returns the running count of the PM timer. This counter runs off a 3.579545 MHz clock (derived from 14.31818 MHz divided by 4). It is reset on a platform reset, and runs continuously in S0. Any time bit 22 goes from 1 to 0, PM1S.TO is set

## 21.6 Legacy GPIO

The SoC provides a total of 16 GPIOs. Ten of these GPIOs are available for use during the S0 ACPI state. The remaining 6 GPIOs are available for use during both the S0 and S3 ACPI state. The GPIOs are split between the Legacy Bridge (0/31/0) and the GPIO Controller (0/21/2). The GPIOs within the Legacy Bridge are referred to as Legacy GPIOs and are described in this section.

### 21.6.1 Signal Descriptions

See [Chapter 2.0, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Type:** The buffer type found in [Chapter 4.0, “Electrical Characteristics”](#)
- **Description:** A brief explanation of the signal’s function

**Table 135. Legacy GPIO Signals**

Signal Name	Direction/ Type	Description
GPIO[9:8]	I/O Varies	These Legacy GPIO pins are powered and active in S0 only.
GPIO_SUS[5:0]	I/O Varies	These Legacy GPIO pins are powered and active in S3 and S0.

### 21.6.2 Features

GPIOs can generate general purpose events (GPEs) on rising and/or falling edges.

The suspend well GPIOs, GPIO\_SUS[5:0], can be used to generate wake events when the system is in the ACPI S3 state.

### 21.6.3 Use

Each GPIO has six registers that control how it is used, or report its status:

- Use Select
- I/O Select
- GPIO Level
- Trigger Positive Edge
- Trigger Negative Edge
- Trigger Status

The Use Select register selects a GPIO pin as a GPIO, or leaves it as its programmed function. This register must be set for all other registers to affect the GPIO.

The I/O Select register determines the direction of the GPIO.

The Trigger Positive Edge and Trigger Negative Edge registers enable general purpose events on a rising and falling edge respectively. This only applies to GPIOs set as input.

The Trigger Status register is used by software to determine if the GPIO triggered a GPE. This only applies to GPIOs set as input and with one or both of the Trigger modes enabled.

### 21.6.4 Register Map

Figure 50. Legacy GPIO Register Map

### 21.6.5 IO Mapped Registers

Table 136. Summary of I/O Registers—GBA

Offset Start	Offset End	Register ID—Description	Default Value

2Ch	2Fh	"Resume Well GPIO Trigger Positive Edge Enable (RGTPE)—Offset 2Ch" on page 852	00000000h

### 21.6.5.3 Core Well GPIO Level for Input or Output (CGLVL)—Offset 8h

**Access Method**

Type: I/O Register  
(Size: 32 bits)

CGLVL: [GBA] + 8h

GBA Type: PCI Configuration Register (Size: 32 bits)

GBA Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
RSV								LVL	

Bit Range	Default & Access	Description
31:2	0b RO	<b>Reserved (RSV):</b> Reserved.
1:0	0b RW	<b>Level (LVL):</b> If the GPIO is programmed to be an output (CGIO.IO[n] cleared), then this bit is used by software to drive a value on the pin. 1 = high, 0 = low. If the GPIO is programmed as an input, then this bit reflects the state of the input signal (1 = high, 0 = low.) and writes will have no effect. The value of this bit has no meaning if the GPIO is disabled (CGEN.EN[n] = 0).

### 21.6.5.4 Core Well GPIO Trigger Positive Edge Enable (CGTPE)—Offset Ch

**Access Method**

Type: I/O Register  
(Size: 32 bits)

CGTPE: [GBA] + Ch

GBA Type: PCI Configuration Register (Size: 32 bits)

GBA Reference: [B:0, D:31, F:0] + 44h

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSV								EN

Bit Range	Default & Access	Description
31:2	0b RO	<b>Reserved (RSV):</b> Reserved.
1:0	0b RW	<b>Enable (EN):</b> When set, the corresponding GPIO, is enabled to generate an SCI and bit 14 of GPE0 Status register of GPE0 Block will be set.

### 21.6.5.7 Core Well GPIO SMI Enable (CGSMI)—Offset 18h

**Access Method**

Type: I/O Register  
(Size: 32 bits)

CGSMI: [GBA] + 18h

GBA Type: PCI Configuration Register (Size: 32 bits)

GBA Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
RSV										EN	

Bit Range	Default & Access	Description
31:2	0b RO	Reserved (RSV): Reserved.
1:0	0b RW	Enable (EN): When set, the corresponding GPIO, is enabled to generate an SMI and bit 9 of SMI Status register of GPE0 Block will be set.

### 21.6.5.8 Core Well GPIO Trigger Status (CGTS)—Offset 1Ch

**Access Method**

Type: I/O Register  
(Size: 32 bits)

CGTS: [GBA] + 1Ch

GBA Type: PCI Configuration Register (Size: 32 bits)

GBA Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
RSV										TS	

Bit Range	Default & Access	Description
31:2	0b RO	Reserved (RSV): Reserved.
1:0	0b RW/1C	Trigger Status (TS): When set, the corresponding GPIO, if enabled as input via CGIO.IO[n], triggered an SMI/SCI/NMI. This will be set if a 0 to 1 transition occurred and CGTPE.TE[n] was set, or a 1 to 0 transition occurred and CGTNE.TE[n] was set. If both CGTPE.TE[n] and CGTNE.TE[n] are set, then this bit will be set on both a 0 to 1 and a 1 to=0 transition. This bit will not be set if the GPIO is configured as an output.

### 21.6.5.11 Resume Well GPIO Level for Input or Output (RGLVL)—Offset 28h

**Access Method**

Type: I/O Register  
(Size: 32 bits)

RGLVL: [GBA] + 28h

GBA Type: PCI Configuration Register (Size: 32 bits)  
GBA Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

Bit Range	Default & Access	Description
31:6	0b RO	<b>Reserved (RSV):</b> Reserved.
5:0	0h RW	<b>Level (LVL):</b> If the GPIO is programmed to be an output (RGIO.IO[n] cleared), then this bit is used by software to drive a value on the pin. 1 = high, 0 = low. If the GPIO is programmed as an input, then this bit reflects the state of the input signal (1 = high, 0 = low.) and writes will have no effect. The value of this bit has no meaning if the GPIO is disabled (RGEN.EN[n] = 0).

### 21.6.5.12 Resume Well GPIO Trigger Positive Edge Enable (RGTPPE)—Offset 2Ch

**Access Method**

Type: I/O Register  
(Size: 32 bits)

RGTPPE: [GBA] + 2Ch

GBA Type: PCI Configuration Register (Size: 32 bits)  
GBA Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

Bit Range	Default & Access	Description
31:6	0b RO	<b>Reserved (RSV):</b> Reserved.
5:0	0h RW	<b>Trigger Enable (TE):</b> When set, the corresponding GPIO, if enabled as input via RGIO.IO[n], will cause an NMI/SMI/SCI when a 0 to 1 transition occurs. When cleared, the GPIO is not enabled to trigger an NMI/SMI/SCI on a 0 to 1 transition. This bit has no meaning if RGIO.IO[n] is cleared (i.e. programmed for output)

### 21.6.5.13 Resume Well GPIO Trigger Negative Edge Enable (RGTNE)—Offset 30h

**Access Method**

Type: I/O Register  
(Size: 32 bits)

RGTNE: [GBA] + 30h

GBA Type: PCI Configuration Register (Size: 32 bits)  
GBA Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

Bit Range	Default & Access	Description
31:6	0b RO	<b>Reserved (RSV):</b> Reserved.
5:0	0h RW	<b>Trigger Enable (TE):</b> When set, the corresponding GPIO, if enabled as input via RGIO.IO[n], will cause an NMI/SMI/SCI when a 1 to 0 transition occurs. When cleared, the GPIO is not enabled to trigger an NMI/SMI/SCI on a 1 to 0 transition. This bit has no meaning if RGIO.IO[n] is cleared (i.e. programmed for output)

### 21.6.5.14 Resume Well GPIO GPE Enable (RGGPE)—Offset 34h

#### Access Method

Type: I/O Register  
(Size: 32 bits)

RGGPE: [GBA] + 34h

GBA Type: PCI Configuration Register (Size: 32 bits)

GBA Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

Bit Range	Default & Access	Description
31:6	0b RO	<b>Reserved (RSV):</b> Reserved.
5:0	0h RW	<b>Enable (EN):</b> When set, the corresponding GPIO, is enabled to generate an SCI and bit 14 of GPE0 Status register of GPE0 Block will be set.

### 21.6.5.15 Resume Well GPIO SMI Enable (RGSMI)—Offset 38h

**Access Method**

Type: I/O Register  
(Size: 32 bits)

RGSMI: [GBA] + 38h

GBA Type: PCI Configuration Register (Size: 32 bits)

GBA Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

31	28	24	20	16	12	8	4	0

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSV							TS	

Bit Range	Default & Access	Description
31:6	0b RO	<b>Reserved (RSV):</b> Reserved.
5:0	0h RW/1C	<b>Trigger Status (TS):</b> When set, the corresponding GPIO, if enabled as input via RGIO.IO[n], triggered an SMI/SCI/NMI. This will be set if a 0 to 1 transition occurred and RGTPE.TE[n] was set, or a 1 to 0 transition occurred and RGTNE.TE[n] was set. If both RGTPE.TE[n] and RGTNE.TE[n] are set, then this bit will be set on both a 0 to 1 and a 1 to=0 transition. This bit will not be set if the GPIO is configured as an output.

### 21.6.5.17 Core Well GPIO NMI Enable (CGNMIEN)—Offset 40h

**Access Method**

Type: I/O Register  
(Size: 32 bits)

CGNMIEN: [GBA] + 40h

GBA Type: PCI Configuration Register (Size: 32 bits)  
GBA Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

Bit Range	Default & Access	Description
31:2	0b RO	Reserved (RSV): Reserved.
1:0	0b RW	Enable (EN): When set, the corresponding GPIO, is enabled to generate an NMI.

### 21.6.5.18 Resume Well GPIO NMI Enable (RGNMIEN)—Offset 44h

**Access Method**

Type: I/O Register  
(Size: 32 bits)

RGNMIEN: [GBA] + 44h

GBA Type: PCI Configuration Register (Size: 32 bits)  
GBA Reference: [B:0, D:31, F:0] + 44h

Default: 00000000h

Bit Range	Default & Access	Description
31:6	0b RO	Reserved (RSV): Reserved.
5:0	0h RW	Enable (EN): When set, the corresponding GPIO, is enabled to generate an NMI.

## 21.7 Legacy SPI Controller

The Legacy SPI Controller provides an interface to a SPI Flash device that contains the SoC firmware.

### 21.7.1 Signal Descriptions

See [Chapter 2.0, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Type:** The buffer type found in [Chapter 4.0, “Electrical Characteristics”](#)
- **Description:** A brief explanation of the signal’s function

**Table 137. Legacy SPI Signals**

Signal Name	Direction/ Type	Description
LSPI_MOSI	O	Legacy SPI Data Output
LSPI_MISO	I	Legacy SPI Data Input
LSPI_SS_B	O	Legacy Chip Select Signal
LPSI_SCK	O	Legacy SPI Clock Output

### 21.7.2 Features

The Legacy SPI Controller provides access to system firmware that resides on a SPI Flash device connected to the 4-pin Legacy SPI interface. SPI Flash devices up to 16 MByte in size are supported. A SPI clock frequency of 20 MHz is supported.

The Legacy SPI Controller supports direct memory reads from the processor. All other operations are controlled via the SPI Host Interface registers that reside in the RCRB Memory Space in the range 3020h to 308Fh.

To protect the integrity of system firmware, the Legacy SPI Controller provides two write protection mechanisms, one scheme based on address ranges and one SMI\_B-based scheme. If either mechanism indicates an access should not be allowed, then that write access is blocked.

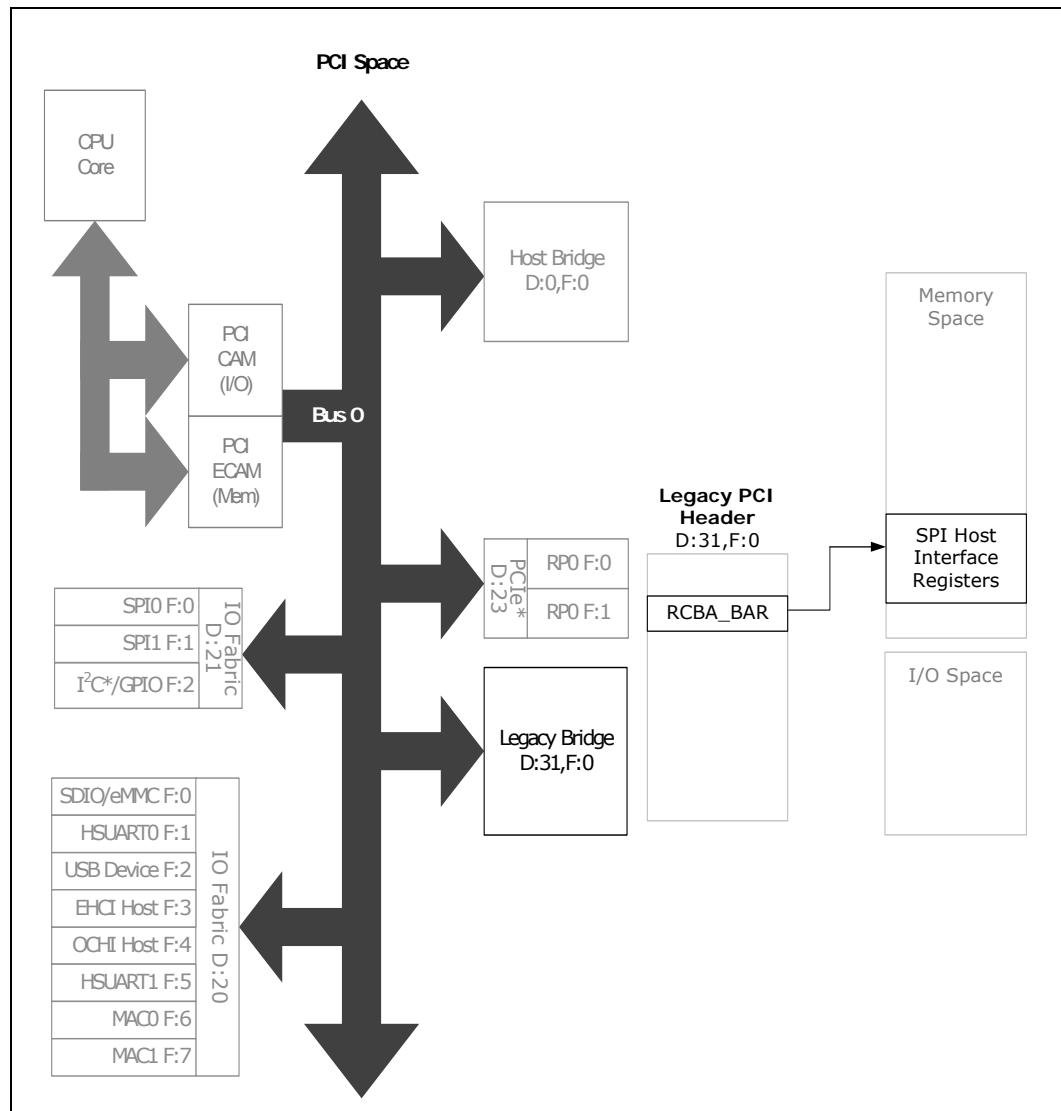

### 21.7.3 Register Map

See [Chapter 5.0, “Register Access Methods”](#) for additional information.

Figure 51. Legacy SPI Register Map

### 21.7.4 Legacy SPI Host Interface Registers

The SPI Host Interface registers are memory-mapped in the RCRB Memory Space in offset range 3020h to 308Fh.

**Warning:** Address locations that are not listed are considered reserved register locations. Reads to reserved registers may return non-zero values. Writes to reserved locations may cause system failure.

**Table 138. Summary of Memory Mapped I/O Registers—RCBA**

Offset Start	Offset End	Register ID—Description	Default Value
3020h	3021h	"SPI Status (SPISTS)—Offset 3020h" on page 859	0001h

### 21.7.4.1 SPI Status (SPISTS)—Offset 3020h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**SPISTS:** [RCBA] + 3020h

**RCBA Type:** PCI Configuration Register (Size: 32 bits)

**RCBA Reference:** [B:0, D:31, F:0] + F0h

**Default:** 0001h

15	12	8	4	0
0	0	0	0	1
CLD	RSV2			BA CD RSV1 CIP

Bit Range	Default & Access	Description
15	0b RW/O	<b>SPI Configuration Lock-Down (CLD):</b> When set to 1, the SPI Static Configuration information cannot be overwritten. Once set to 1, this bit can only be cleared by a hardware reset.
14:4	0b RO	<b>Reserved (RSV2):</b> Reserved.
3	0b RW/1C	<b>Blocked Access Status (BA):</b> Hardware sets this bit to 1 when an access is blocked from running on the SPI interface due to one of the protection policies or when any of the programmed cycle registers are written while a programmed access is already in progress. This bit is set for both programmed accesses and direct memory reads that get blocked. This bit remains asserted until cleared by software writing a 1 or hardware reset.
2	0b RW/1C	<b>Cycle Done Status (CD):</b> Hardware sets this bit to 1 when the SPI Cycle completes (i.e., SCIP bit is 0) after software sets the GO bit. This bit remains asserted until cleared by software writing a 1 or hardware reset. When this bit is set and the SMI Enable bit in the SPI Control register is set, an internal signal is asserted to the SMI_B generation block. Software must make sure this bit is cleared prior to enabling the SPI SMI_B assertion for a new programmed access. This bit gets set after the Status Register Polling sequence completes after reset de-asserts. It is cleared before and during that sequence.
1	0b RO	<b>Reserved (RSV1):</b> Reserved.
0	01h RO	<b>Cycle In Progress (CIP):</b> Hardware sets this bit when software sets the SPI Cycle Go bit in the SPI Control register. This bit remains set until the cycle completes on the SPI interface. Hardware automatically sets and clears this bit so that software can determine when read data is valid and/or when it is safe to begin programming the next command. Software must only program the next command when this bit is 0. This bit reports 1b during the Status Register Polling sequence after reset de-asserts; it is cleared when that sequence completes.

### 21.7.4.2 SPI Control (SPICTL)—Offset 3022h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**SPICTL:** [RCBA] + 3022h

**RCBA Type:** PCI Configuration Register (Size: 32 bits)

**RCBA Reference:** [B:0, D:31, F:0] + F0h

**Default:** 4001h

15	12	8	4	0
0	1 0 0 0	0 0 0 0	0 0 0 0	0 0 0 1
SMIEN	DC	DBCNT	RSV	COPTR
			SOPTR	ACS
				CG
				AR

Bit Range	Default & Access	Description
15	0b RW	<b>SMI_B Enable (SMIEN):</b> When set to 1, the SPI asserts an SMI_B request whenever the Cycle Done Status bit is 1.
14	1b RW	<b>Data Cycle (DC):</b> When set to 1, there is data that corresponds to this transaction. When 0, no data is delivered for this cycle, and the DBC and data fields themselves are don't care.
13:8	0b RW	<b>Data Byte Count (DBCNT):</b> Data Byte Count: This field specifies the number of bytes to shift in or out during the data portion of the SPI cycle. The valid settings (in decimal) are any value from 0 to 63. The number of bytes transferred is the value of this field plus 1. Note that when this field is 00_0000b, then there is 1 byte to transfer and that 11_1111b means there are 64 bytes to transfer.
7	0b RO	<b>Reserved (RSV):</b> Reserved.
6:4	0b RW	<b>Cycle Opcode Pointer (COPTR):</b> This field selects one of the programmed opcodes in the Opcode Menu Configuration register to be used as the SPI Command/Opcode. In the case of an Atomic Cycle Sequence, this determines the second command.
3	0b RW	<b>Sequence Prefix Opcode Pointer (SOPTR):</b> This field selects one of the two programmed prefix opcodes for use when performing an Atomic Cycle Sequence. A value of 0 points to the opcode in the least significant byte of the Prefix Opcode Configuration register. By making this programmable, the processor supports flash devices that have different opcodes for enabling writes to the data space vs. status register.
2	0b RW	<b>Atomic Cycle Sequence (ACS):</b> When set to 1 along with the SCGO assertion, the processor will execute a sequence of commands on the SPI interface without allowing the other SPI master component to arbitrate and interleave cycles. The sequence is composed of: Atomic Sequence Prefix Command (8-bit opcode only) Primary Command specified by software (can include address and data) Polling the Flash Status Register (opcode 05h) until bit 0 becomes 0b. The SPI Cycle in Progress bit remains set and the Cycle Done Status bit in the SPI Status register remains unset until the Busy bit in the Flash Status Register returns 0.
1	0b RW/S	<b>Cycle Go (CG):</b> This bit always returns 0 on reads. However, a write to this register with a 1 in this bit starts the SPI cycle defined by the other bits of this register. The SPI Cycle in Progress (SCIP) bit in the SPI Status register gets set by this action. Hardware must ignore writes to this bit while the SPI Cycle In Progress bit is set. Hardware allows other bits in this register to be programmed for the same transaction when writing this bit to 1. This saves an additional memory write.
0	1b RW	<b>Access Request (AR):</b> This bit is used by the software to request that the other SPI master stop initiating long transactions on the SPI bus. This bit defaults to a 1 and must be cleared by BIOS after completing the accesses for the boot process.

### 21.7.4.3 SPI Address (SPIADDR)—Offset 3024h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SPIADDR:** [RCBA] + 3024h

**RCBA Type:** PCI Configuration Register (Size: 32 bits)

**RCBA Reference:** [B:0, D:31, F:0] + F0h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0b RW	<b>Cycle Data (CD):</b> This field is shifted out during the data portion of the SPI cycle. This register also shifts in the data during the data portion of the SPI cycle

#### 21.7.4.6 SPI Data 1 - Lower 32 Bits (SPID1\_1)—Offset 3030h

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SPID1\_1:** [RCBA] + 3030h

**RCBA Type:** PCI Configuration Register (Size: 32 bits)

**RCBA Reference:** [B:0, D:31, F:0] + F0h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0								

Bit Range	Default & Access	Description
31:0	0b RW	<b>Cycle Data (CD):</b> This field is shifted out during the data portion of the SPI cycle. This register also shifts in the data during the data portion of the SPI cycle

#### 21.7.4.7 SPI Data 1 - Upper 32 Bits (SPID1\_2)—Offset 3034h

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SPID1\_2:** [RCBA] + 3034h

**RCBA Type:** PCI Configuration Register (Size: 32 bits)

**RCBA Reference:** [B:0, D:31, F:0] + F0h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0								

Bit Range	Default & Access	Description
31:0	0b RW	<b>Cycle Data (CD):</b> This field is shifted out during the data portion of the SPI cycle. This register also shifts in the data during the data portion of the SPI cycle

#### 21.7.4.8 SPI Data 2 - Lower 32 Bits (SPID2\_1)—Offset 3038h

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SPID2\_1:** [RCBA] + 3038h

**RCBA Type:** PCI Configuration Register (Size: 32 bits)

**RCBA Reference:** [B:0, D:31, F:0] + F0h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0b RW	<b>Cycle Data (CD):</b> This field is shifted out during the data portion of the SPI cycle. This register also shifts in the data during the data portion of the SPI cycle

### 21.7.4.9 SPI Data 2 - Upper 32 Bits (SPID2\_2)—Offset 303Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SPID2\_2:** [RCBA] + 303Ch

**RCBA Type:** PCI Configuration Register (Size: 32 bits)

**RCBA Reference:** [B:0, D:31, F:0] + F0h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0b RW	<b>Cycle Data (CD):</b> This field is shifted out during the data portion of the SPI cycle. This register also shifts in the data during the data portion of the SPI cycle

### 21.7.4.10 SPI Data 3 - Lower 32 Bits (SPID3\_1)—Offset 3040h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SPID3\_1:** [RCBA] + 3040h

**RCBA Type:** PCI Configuration Register (Size: 32 bits)

**RCBA Reference:** [B:0, D:31, F:0] + F0h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0b RW	<b>Cycle Data (CD):</b> This field is shifted out during the data portion of the SPI cycle. This register also shifts in the data during the data portion of the SPI cycle

### 21.7.4.11 SPI Data 3 - Upper 32 Bits (SPID3\_2)—Offset 3044h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SPID3\_2:** [RCBA] + 3044h

**RCBA Type:** PCI Configuration Register (Size: 32 bits)

**RCBA Reference:** [B:0, D:31, F:0] + F0h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0b RW	<b>Cycle Data (CD):</b> This field is shifted out during the data portion of the SPI cycle. This register also shifts in the data during the data portion of the SPI cycle

### 21.7.4.12 SPI Data 4 - Lower 32 Bits (SPID4\_1)—Offset 3048h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SPID4\_1:** [RCBA] + 3048h

**RCBA Type:** PCI Configuration Register (Size: 32 bits)

**RCBA Reference:** [B:0, D:31, F:0] + F0h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0b RW	<b>Cycle Data (CD):</b> This field is shifted out during the data portion of the SPI cycle. This register also shifts in the data during the data portion of the SPI cycle

### 21.7.4.13 SPI Data 4 - Upper 32 Bits (SPID4\_2)—Offset 304Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SPID4\_2:** [RCBA] + 304Ch

**RCBA Type:** PCI Configuration Register (Size: 32 bits)

**RCBA Reference:** [B:0, D:31, F:0] + F0h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:0	0b RW	<b>Cycle Data (CD):</b> This field is shifted out during the data portion of the SPI cycle. This register also shifts in the data during the data portion of the SPI cycle

### 21.7.4.14 SPI Data 5 - Lower 32 Bits (SPID5\_1)—Offset 3050h

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

SPID5\_1: [RCBA] + 3050h

RCBA Type: PCI Configuration Register (Size: 32 bits)

RCBA Reference: [B:0, D:31, F:0] + F0h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0b RW	<b>Cycle Data (CD):</b> This field is shifted out during the data portion of the SPI cycle. This register also shifts in the data during the data portion of the SPI cycle

### 21.7.4.15 SPI Data 5 - Upper 32 Bits (SPID5\_2)—Offset 3054h

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

SPID5\_2: [RCBA] + 3054h

RCBA Type: PCI Configuration Register (Size: 32 bits)

RCBA Reference: [B:0, D:31, F:0] + F0h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0b RW	<b>Cycle Data (CD):</b> This field is shifted out during the data portion of the SPI cycle. This register also shifts in the data during the data portion of the SPI cycle

### 21.7.4.16 SPI Data 6 - Lower 32 Bits (SPID6\_1)—Offset 3058h

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

SPID6\_1: [RCBA] + 3058h

RCBA Type: PCI Configuration Register (Size: 32 bits)

RCBA Reference: [B:0, D:31, F:0] + F0h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0b RW	<b>Cycle Data (CD):</b> This field is shifted out during the data portion of the SPI cycle. This register also shifts in the data during the data portion of the SPI cycle

### 21.7.4.17 SPI Data 6 - Upper 32 Bits (SPID6\_2)—Offset 305Ch

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SPID6\_2:** [RCBA] + 305Ch

**RCBA Type:** PCI Configuration Register (Size: 32 bits)

**RCBA Reference:** [B:0, D:31, F:0] + F0h

RSV2			BOSF			RSV1		

Bit Range	Default & Access	Description
31:24	0b RO	<b>Reserved (RSV2):</b> Reserved.
23:8	0b RW/L	<b>Bottom of System Flash (BOSF):</b> This field determines the bottom of the System BIOS. The processor will not run Programmed commands nor memory reads whose address field is less than this value. This field corresponds to bits 23:8 of the 3-byte address; bits 7:0 are assumed to be 00h for this vector when comparing to a potential SPI address. Software must always program 1s into the upper, Don't Care bits of this field based on the flash size. Hardware does not know the size of the flash array and relies upon the correct programming by software. The default value of 0000h results in all cycles allowed. Note: The SPI Host Controller prevents any Programmed cycle using the Address Register with an address less than the value in this register. Some flash devices specify that the Read ID command must have an address of 0000h or 0001h. If this command must be supported with these devices, it must be performed with the BBAR - BIOS Base Address programmed to 0h. Some of these devices have actually been observed to ignore the upper address bits of the Read ID command.
7:0	0b RO	<b>Reserved (RSV1):</b> Reserved.

#### 21.7.4.21 Prefix Opcode Configuration (PREOP)—Offset 3074h

This register is not writable when the SPI Configuration Lock-Down bit in the SPI Status register is set.

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**PREOP:** [RCBA] + 3074h

**RCBA Type:** PCI Configuration Register (Size: 32 bits)  
**RCBA Reference:** [B:0, D:31, F:0] + F0h

**Default:** 0004h

15	12	8	4	0

PO1				PO2

Bit Range	Default & Access	Description
15:8	0h RW/L	<b>Prefix Opcode 1 (PO1):</b> Software programs an SPI opcode into this field that is permitted to run as the first command in an atomic cycle sequence.
7:0	04h RW/L	<b>Prefix Opcode 2 (PO2):</b> Software programs an SPI opcode into this field that is permitted to run as the first command in an atomic cycle sequence.

### 21.7.4.22 Opcode Type Configuration (OPTYPE)—Offset 3076h

This register is not writable when the SPI Configuration Lock-Down bit in the SPI Status register is set. Entries in this register correspond to the entries in the Opcode Menu Configuration register. Note that the definition below only provides write protection for opcodes that have addresses associated with them. Therefore, any erase or write opcodes that do not use an address should be avoided (for example, Chip Erase. and Auto-Address Increment Byte Program.).

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**OPTYPE:** [RCBA] + 3076h

**RCBA Type:** PCI Configuration Register (Size: 32 bits)

malicious software can do. This keeps the hardware flexible enough to operate with a wide variety of SPI devices. It is recommended that BIOS avoid programming Write Enable opcodes in this menu. Malicious software could then perform writes and erases to the SPI flash without using the atomic cycle mechanism. Write Enable opcodes should only be programmed in the Prefix Opcode Configuration register.

**Access Method**

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

## 21.8 8254 Programmable Interval Timer

The 8254 contains three counters which have fixed uses. All registers are in the core well and clocked by a 14.31818 MHz clock.

### 21.8.1 Features

#### 21.8.1.1 Counter 0, System Timer

This counter functions as the system timer by controlling the state of IRQ0 and is programmed for Mode 3 operation. The counter produces a square wave with a period equal to the product of the counter period (838 ns) and the initial count value. The counter loads the initial count value one counter period after software writes the count value to the counter I/O address. The counter initially asserts IRQ0 and decrements the count value by two, each counter period. The counter negates IRQ0 when the count value reaches 0. It then reloads the initial count value and again decrements the initial count value by two, each counter period. The counter then asserts IRQ0 when the count value reaches 0, reloads the initial count value, and repeats the cycle, alternately asserting and negating IRQ0.

#### 21.8.1.2 Counter 1, Refresh Request Signal

This counter is programmed for Mode 2 operation and impacts the period of the NSC.RTS (NMI Status and Control Register, bit4, Refresh Cycle Toggle Status). Programming the counter to anything other than Mode 2 results in undefined behavior.

#### 21.8.1.3 Counter 2, Speaker Tone

This counter is typically programmed for Mode 3 operation.

### 21.8.2 Use

#### 21.8.2.1 Timer Programming

The counter/timers are programmed in the following fashion:

- Write a control word to select a counter
- Write an initial count for that counter.
- Load the least and/or most significant bytes (as required by Control Word bits 5, 4) of the 16-bit counter.
- Repeat with other counters

Only two conventions must be observed when programming the counters. First, for each counter, the control word must be written before the initial count is written. Second, the initial count must follow the count format specified in the control word (least significant byte only, most significant byte only, or least significant byte and then most significant byte).

A new initial count may be written to a counter at any time without affecting the counter's programmed mode. Counting will be affected as described in the mode definitions. The new count must follow the programmed count format.

If a counter is programmed to read/write two-byte counts, the following precaution applies: A program must not transfer control between writing the first and second byte to another routine which also writes into that same counter. Otherwise, the counter will be loaded with an incorrect count.

The Control Word Register at port 43h controls the operation of all three counters. Several commands are available:

- **Control Word Command:** Specifies which counter to read or write, the operating mode, and the count format (binary or BCD).
- **Counter Latch Command:** Latches the current count so that it can be read by the system. The countdown process continues.
- **Read Back Command:** Reads the count value, programmed mode, the current state of the OUT pins, and the state of the Null Count Flag of the selected counter.

Table 139 lists the six operating modes for the interval counters.

**Table 139. Counter Operating Modes**

Mode	Function	Description
0	Out signal on end of count (=0)	Output is 0. When count goes to 0, output goes to 1 and stays at 1 until counter is reprogrammed.
1	Hardware retriggerable one-shot	Output is 0. When count goes to 0, output goes to 1 for one clock time.
2	Rate generator (divide by n counter)	Output is 1. Output goes to 0 for one clock time, then back to 1 and counter is reloaded.
3	Square wave output	Output is 1. Output goes to 0 when counter rolls over, and counter is reloaded. Output goes to 1 when counter rolls over, and counter is reloaded, etc.
4	Software triggered strobe	Output is 1. Output goes to 0 when count expires for one clock time.
5	Hardware triggered strobe	Output is 1. Output goes to 0 when count expires for one clock time.

### 21.8.2.2 Reading from the Interval Timer

It is often desirable to read the value of a counter without disturbing the count in progress. There are three methods for reading the counters: a simple read operation, counter Latch Command, and the Read-Back Command. Each is explained below.

With the simple read and counter latch command methods, the count must be read according to the programmed format; specifically, if the counter is programmed for two byte counts, two bytes must be read. The two bytes do not have to be read one right after the other. Read, write, or programming operations for other counters may be inserted between them.

#### 21.8.2.2.1 Simple Read

The first method is to perform a simple read operation. The counter is selected through port 40h (counter 0), 41h (counter 1), or 42h (counter 2).

*Note:* Performing a direct read from the counter does not return a determinate value, because the counting process is asynchronous to read operations. However, in the case of counter 2, the count can be stopped by writing to the NSC.CNTR2\_ENABLE register field.

#### 21.8.2.2.2 Counter Latch Command

The Counter Latch Command, written to port 43h, latches the count of a specific counter at the time the command is received. This command is used to ensure that the count read from the counter is accurate, particularly when reading a two-byte count. The count value is then read from each counter's Count Register™ as was programmed by the Control Register.

The count is held in the latch until it is read or the counter is reprogrammed. The count is then unlatched. This allows reading the contents of the counters on the fly without affecting counting in progress. Multiple Counter Latch Commands may be used to latch more than one counter. Counter Latch Commands do not affect the programmed mode of the counter in any way.

If a Counter is latched and then, some time later, latched again before the count is read, the second Counter Latch Command is ignored. The count read will be the count at the time the first Counter Latch Command was issued.

#### 21.8.2.2.3 Read Back Command

The Read Back Command, written to port 43h, latches the count value, programmed mode, and current states of the OUT pin and Null Count flag of the selected counter or counters. The value of the counter and its status may then be read by I/O access to the counter address.

The Read Back Command may be used to latch multiple counter outputs at one time. This single command is functionally equivalent to several counter latch commands, one for each counter latched. Each counter's latched count is held until it is read or reprogrammed. Once read, a counter is unlatched. The other counters remain latched until they are read. If multiple count Read Back Commands are issued to the same counter without reading the count, all but the first are ignored.

The Read Back Command may additionally be used to latch status information of selected counters. The status of a counter is accessed by a read from that counter's I/O port address. If multiple counter status latch operations are performed without reading the status, all but the first are ignored.

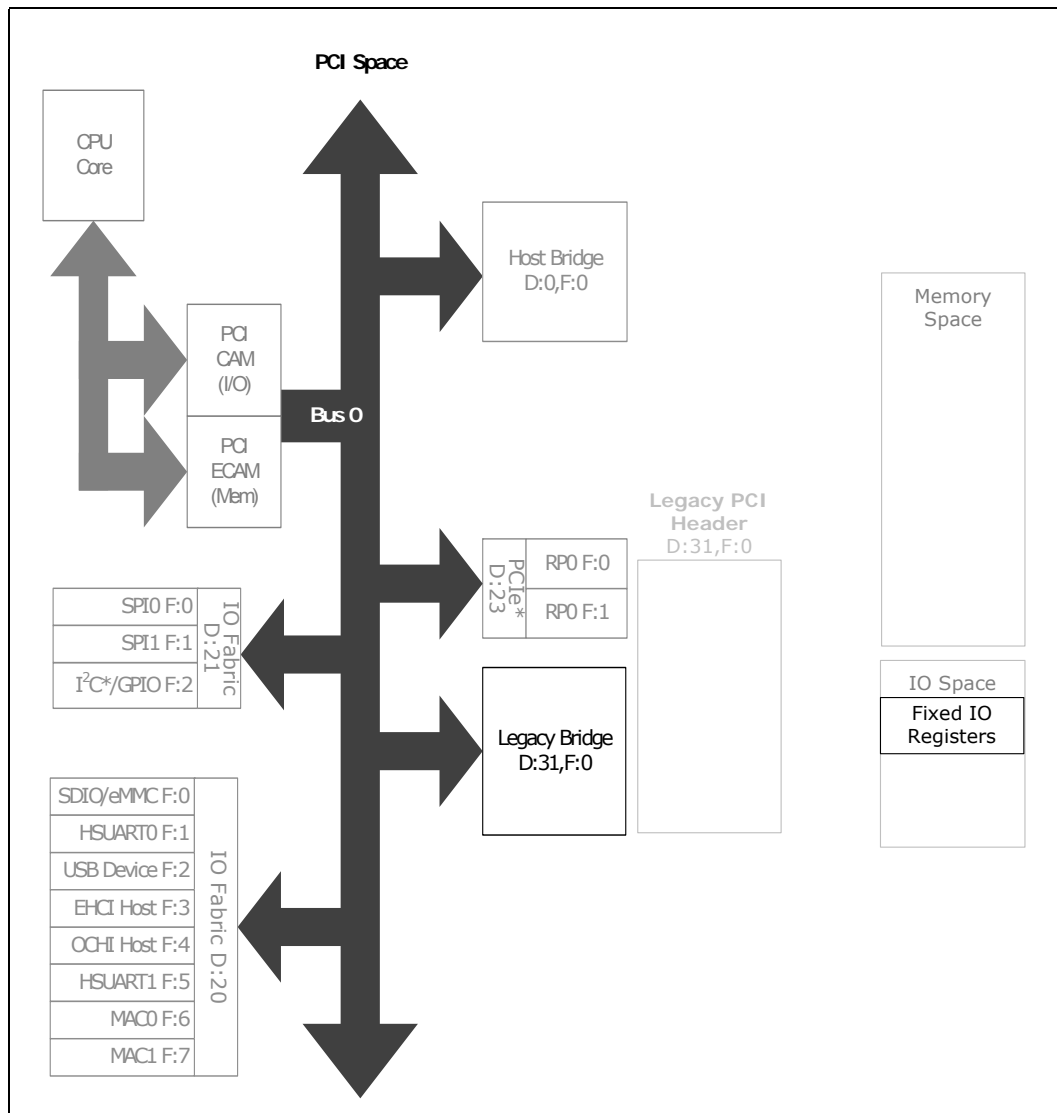

Both count and status of the selected counters may be latched simultaneously. This is functionally the same as issuing two consecutive separate Read Back Commands. If multiple count and/or status Read Back Commands are issued to the same counters without any intervening reads, all but the first are ignored.

If both count and status of a counter are latched, the first read operation from that counter returns the latched status, regardless of which was latched first. The next one or two reads, depending on whether the counter is programmed for one or two type counts, return the latched count. Subsequent reads return unlatched count.

### 21.8.3 Register Map

See [Chapter 5.0, "Register Access Methods"](#) for additional information.

Figure 52. 8254 Timers Register Map

### 21.8.4 Timer I/O Registers

The I/O ports listed in Table 140 have multiple register functions depending on the current programmed state of the 8254. The port numbers referenced in the register descriptions following Table 140 is one possible combination but not the only one.

Table 140. Register Aliases

Port	Alias	Register Name	Default Value	Access
40h	50h	Counter 0 Interval Time Status Byte Format (C0TS)	0xxxxxxb	RO
		Counter 0 Counter Access Port Register (C0AP)	Undefined	RW

#### 21.8.4.5 Counter 0 Counter Access Port Register (COAP)—Offset 50h

##### Access Method

Type: I/O Register  
(Size: 8 bits)

COAP: 50h

## 21.9.1 Features

### 21.9.1.1 Non-Periodic Mode - All Timers

This mode can be thought of as creating a one-shot. When a timer is set up for non-periodic mode, it generates an interrupt when the value in the main counter matches the value in the timer's comparator register. As timers 1 and 2 are 32-bit, they generate another interrupt when the main counter wraps.

T0CV cannot be programmed reliably by a single 64-bit write in a 32-bit environment unless only the periodic rate is being changed. If T0CV must be re-initialized, the following algorithm is performed:

1. Set T0C.TVS
2. Set T0CV[31:0]
3. Set T0C.TVS
4. Set T0CV[63:32]

Every timer is required to support the non-periodic mode of operation.

### 21.9.1.2 Periodic Mode - Timer 0 Only

In periodic mode, when the main counter value matches the value in T0CV, an interrupt is generated (if enabled). Hardware then increases T0CV by the last value written to T0CV. During run-time, T0CV can be read to find out when the next periodic interrupt will be generated. Software is expected to remember the last value written to T0CV.

Example: if the value written to T0CV is 00000123h, then:

- An interrupt will be generated when the main counter reaches 00000123h.
- T0CV will then be adjusted to 00000246h.
- Another interrupt will be generated when the main counter reaches 00000246h.
- T0CV will then be adjusted to 00000369h.

When the incremented value is greater than the maximum value possible for T0CV, the value wraps around through 0. For example, if the current value in a 32-bit timer is FFFF0000h and the last value written to this register is 20000, then after the next interrupt the value changes to 00010000h.

If software wants to change the periodic rate, it writes a new value to T0CV. When the timer's comparator matches, the new value is added to derive the next matching point. If software resets the main counter, the value in the comparator's value register must also be reset by setting T0C.TVS. To avoid race conditions, this should be done with the main counter halted. The following usage model is expected:

1. Software clears GCFG.EN to prevent any interrupts.
2. Software clears the main counter by writing a value of 00h to it.
3. Software sets T0C.TVS.
4. Software writes the new value in T0CV.
5. Software sets GCFG.EN to enable interrupts.

### 21.9.1.3 Interrupts

If each timer has a unique interrupt and the timer has been configured for edge-triggered mode, then there are no specific steps required. If configured to level-triggered mode, then its interrupt must be cleared by software by writing a '1' back to the bit position for the interrupt to be cleared.

Interrupts associated with the various timers have several interrupt mapping options. Software should mask GCFG.LRE when reprogramming HPET interrupt routing to avoid spurious interrupts.

#### 21.9.1.3.1 Mapping Option #1: Legacy Option (GCFG.LRE set)

This forces the following mapping:

Table 141. 8254 Interrupt Mapping

Timer	8259 Mapping	APIC Mapping	Comment
0	IRQ0	IRQ2	The 8254 timer does not cause any interrupts
1	IRQ8	IRQ8	RTC does not cause any interrupts.
2	T2C.IR	T2C.IRC	

#### 21.9.1.3.2 Mapping Option #2: Standard Option (GCFG.LRE cleared)

Each timer has its own routing control. The interrupts can be routed to various interrupts in the I/O APIC. T[2:0]C.IRC indicates which interrupts are valid options for routing. If a timer is set for edge-triggered mode, the timers should not be shared with any other interrupts.

## 21.9.2 Register Map

See Chapter 5.0, "Register Access Methods" for additional information.

Figure 53. HPET Register Map

### 21.9.3 Memory Mapped Registers

The HPET register space is memory mapped to a 1 KB block starting at address FED00000h. All registers are in the core well and reset by RESET\_BTN\_B. Accesses that cross register boundaries result in undefined behavior.

Table 142. Summary of Memory Mapped I/O Registers—0xFED00000

Offset Start	Offset End	Register ID—Description	Default Value

**21.9.3.1 General Capabilities and ID Register - Lower 32 Bits (GCID\_1)—Offset 0h**

**Access Method**

**Type:** Memory Mapped I/O Register      **GCID\_1:** [0xFED00000] + 0h  
 (Size: 32 bits)

**Default:** 8086A201h

Bit Range	Default & Access	Description
31:16	8086h RO	<b>Vendor ID (VID):</b> Value of 8086h indicates Intel.
15	1b RO	<b>Legacy Route Capable (LRC):</b> Indicates support for Legacy Interrupt Route.
14	0b RO	<b>Reserved (RSV):</b> Reserved.
13	1b RO	<b>Counter Size (CS):</b> This bit is set to indicate that the main counter is 64 bits wide.
12:8	00010b RO	<b>Number of Timers (NT):</b> Indicates that 3 timers are supported.

Bit Range	Default & Access	Description
7:0	01h RO	<b>Revision ID (RID)</b> : Indicates that revision 1.0 of the specification is implemented.

### 21.9.3.2 General Capabilities and ID Register - Upper 32 Bits (GCID\_2)—Offset 4h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)      **GCID\_2:** [0xFED00000] + 4h

**Default:** 0429B17Fh

31	28	24	20	16	12	8	4	0

0	1	1	1	1	1	1	1	1
CTP								

Bit Range	Default & Access	Description
31:0	0429B17Fh RO	<b>Counter Tick Period (CTP)</b> : Indicates a period of 69.841279ns, 14.1318 MHz clock.

### 21.9.3.3 General Configuration (GC)—Offset 10h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)      **GC:** [0xFED00000] + 10h

**Default:** 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
RSV								LRE	EN

Bit Range	Default & Access	Description
31:2	0b RO	<b>Reserved (RSV)</b> : Reserved.
1	0b RW	<b>Legacy Route Enable (LRE)</b> : When set, interrupts will be routed as follows: Timer 0 will be routed to IRQ0 in 8259 and IRQ2 in the I/O APIC Timer 1 will be routed to IRQ8 in 8259 and I/O APIC Timer 2 is routed to IRQ11 in 8259 and Timer 2 will be routed to IOxAPIC as per the routing in T2C.IR When set, the TnC.IR will have no impact for Timers 0 and 1.
0	0b RW	<b>Overall Enable (EN)</b> : When set, the timers can generate interrupts. When cleared, the main counter will halt and no interrupts will be caused by any timer. For level-triggered interrupts, if an interrupt is pending when this bit is cleared, the GIS.Tx will not be cleared.

### 21.9.3.4 General Interrupt Status Register (GIS)—Offset 20h

#### Access Method

Type: Memory Mapped I/O Register (Size: 32 bits) GIS: [0xFED00000] + 20h

Default: 00000000h

Bit Range	Default & Access	Description
31:3	0b RO	<b>Reserved (RSV):</b> Reserved.
2	0b RW/1C	<b>Timer 2 Status (T2):</b> In edge triggered mode, this bit always reads as 0. In level triggered mode, this bit is set when an interrupt is active.
1	0b RW/1C	<b>Timer 1 Status (T1):</b> In edge triggered mode, this bit always reads as 0. In level triggered mode, this bit is set when an interrupt is active.
0	0b RW/1C	<b>Timer 0 Status (T0):</b> In edge triggered mode, this bit always reads as 0. In level triggered mode, this bit is set when an interrupt is active.

### 21.9.3.5 Main Counter Value Register - Lower 32 Bits (MCV\_1)—Offset F0h

#### Access Method

Type: Memory Mapped I/O Register (Size: 32 bits) MCV\_1: [0xFED00000] + F0h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0b RW	<b>Counter Value (CV):</b> Reads return the current value of the lower 32 bits of the counter. Writes load the new value to the lower 32 bits of the counter.

### 21.9.3.6 Main Counter Value Register - Upper 32 Bits (MCV\_2)—Offset F4h

#### Access Method

Type: Memory Mapped I/O Register (Size: 32 bits) MCV\_2: [0xFED00000] + F4h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0b RW	<b>Counter Value (CV)</b> : Reads return the current value of the upper 32 bits of the counter. Writes load the new value to the upper 32 bits of the counter. Timers 1 and Timer 2 return 0.

### 21.9.3.7 Timer 0 Config and Capabilities Register - Lower 32 Bits (TOC\_1)—Offset 100h

#### Access Method

Type: Memory Mapped I/O Register  
(Size: 32 bits)

TOC\_1: [0xFED00000] + 100h

Default: 00000030h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	1	1
0	0	0	0	0	0	0	0	0

		RSV3			FID	FE	IR	T32M
								RSV2
								TVS
								TS
								PIC
								TYP
								IE
								IT
								RSV1

Bit Range	Default & Access	Description
31:16	0b RO	<b>Reserved (RSV3)</b> : Reserved.
15	0b RO	<b>FSB Interrupt Delivery (FID)</b> : Not Supported
14	0b RO	<b>FSB Enable (FE)</b> : Not supported, since FID is not supported.
13:9	0b RW	<b>Interrupt Route (IR)</b> : Indicates the routing for the interrupt to the IOxAPIC. If the value is not supported by this particular timer, the value read back will not match what is written. If GC.LRE is set, then Timers 0 and 1 have a fixed routing, and this field has no effect.
8	0b RW	<b>Timer 32-bit Mode (T32M)</b> : When set, this bit forces a 64-bit timer to behave as a 32-bit timer.
7	0b RO	<b>Reserved (RSV2)</b> : Reserved.
6	0b WO	<b>Timer Value Set (TVS)</b> : This bit will return 0 when read. Writes will only have an effect for Timer 0 if it is set to periodic mode. Writes will have no effect for Timers 1 and 2
5	1b RO	<b>Timer Size (TS)</b> : 1 = 64-bits, 0 = 32-bits. Set for timer 9. Cleared for timers 1 and 2
4	1b RO	<b>Periodic Interrupt Capable (PIC)</b> : When set, hardware supports a periodic mode for this timer's interrupt.
3	0b RW	<b>Timer Type (TYP)</b> : If PIC is set, this bit is read/write, and can be used to enable the timer to generate a periodic interrupt.
2	0b RW	<b>Interrupt Enable (IE)</b> : When set, enables the timer to cause an interrupt when it times out. When cleared, the timer count and generates status bits, but will not cause an interrupt.
1	0b RW	<b>Timer Interrupt Type (IT)</b> : When cleared, interrupt is edge triggered. When set, interrupt is level triggered and will be held active until it is cleared by writing 1 to GIS.Tn. If another interrupt occurs before the interrupt is cleared, the interrupt remains active.
0	0b RO	<b>Reserved (RSV1)</b> : Reserved.

### 21.9.3.8 Timer 0 Config and Capabilities Register - Upper 32 Bits (TOC\_2)—Offset 104h

Reads to this register return the current value of the comparator. The default value for each timer is all 1's for the bits that are implemented. Timer 0 is 64-bits wide. Timers 1 and 2 are 32-bits wide.

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits) **TOC\_2:** [0xFED00000] + 104h

**Default:** 00F00000h

Bit Range	Default & Access	Description
31:0	00f00000h RO	<b>Interrupt Route Capability (IRC):</b> Indicates support for IRQ20, 21, 22, 23

### 21.9.3.9 Timer 0 Comparator Value Register - Lower 32 Bits (TOCV\_1)—Offset 108h

Reads to this register return the current value of the comparator. The default value for each timer is all 1's for the bits that are implemented. Timer 0 is 64-bits wide. Timers 1 and 2 are 32-bits wide.

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits) **TOCV\_1:** [0xFED00000] + 108h

**Default:** FFFFFFFFh

Bit Range	Default & Access	Description
31:0	FFFFFFFh RW	<b>Comparator Value (CV):</b> Reads return the current value of the lower 32 bits of the comparator. Writes load the new value to the lower 32 bits of the comparator.

### 21.9.3.10 Timer 0 Comparator Value Register - Upper 32 Bits (TOCV\_2)—Offset 10Ch

Reads to this register return the current value of the comparator. The default value for each timer is all 1's for the bits that are implemented. Timer 0 is 64-bits wide. Timers 1 and 2 are 32-bits wide.

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits) **TOCV\_2:** [0xFED00000] + 10Ch

**Default:** FFFFFFFFh

Bit Range	Default & Access	Description
31:0	FFFFFFFFh RW	<b>Comparator Value (CV):</b> Reads return the current value of the upper 32 bits of the comparator. Writes load the new value to the upper 32 bits of the comparator.

### 21.9.3.11 Timer 1 Config and Capabilities Register - Lower 32 Bits (T1C\_1)—Offset 120h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)      **T1C\_1:** [0xFED00000] + 120h

**Default:** 00000000h

Bit Range	Default & Access	Description
31:16	0b RO	<b>Reserved (RSV3):</b> Reserved.
15	0b RO	<b>FSB Interrupt Delivery (FID):</b> Not Supported.
14	0b RO	<b>FSB Enable (FE):</b> Not supported, since FID is not supported.
13:9	0b RW	<b>Interrupt Route (IR):</b> Indicates the routing for the interrupt to the IOxAPIC. If the value is not supported by this particular timer, the value read back will not match what is written. If GC.LRE is set, then Timers 0 and 1 have a fixed routing, and this field has no effect.
8	0b RO	<b>Timer 32-bit Mode (T32M):</b> Not applicable since Timer 1 is a 32-bit timer.
7	0b RO	<b>Reserved (RSV2):</b> Reserved.
6	0b WO	<b>Timer Value Set (TVS):</b> This bit will return 0 when read. Writes will only have an effect for Timer 0 if it is set to periodic mode.
5	0b RO	<b>Timer Size (TS):</b> 1 = 64-bits, 0 = 32-bits. Set for timer 9. Cleared for timers 1 and 2.
4	0b RO	<b>Periodic Interrupt Capable (PIC):</b> When set, hardware supports a periodic mode for this timer's interrupt. This bit is set for timer 0, and cleared for timers 1 and 2.
3	0b RO	<b>Timer Type (TYP):</b> If PIC is set, this bit is read/write, and can be used to enable the timer to generate a periodic interrupt. This bit is RW for timer 0, and RO for timers 1 and 2.
2	0b RW	<b>Interrupt Enable (IE):</b> When set, enables the timer to cause an interrupt when it times out. When cleared, the timer count and generates status bits, but will not cause an interrupt.

Bit Range	Default & Access	Description
1	0b RW	<b>Timer Interrupt Type (IT)</b> : When cleared, interrupt is edge triggered. When set, interrupt is level triggered and will be held active until it is cleared by writing 1 to GIS.Tn. If another interrupt occurs before the interrupt is cleared, the interrupt remains active.
0	0b RO	<b>Reserved (RSV1)</b> : Reserved.

### 21.9.3.12 Timer 1 Config and Capabilities Register - Upper 32 Bits (T1C\_2)—Offset 124h

#### Access Method

## 21.9.4 References

IA-PC HPET (High Precision Event Timers) Specification, Revision 1.0a.

## 21.10 Real Time Clock (RTC)

The SoC contains a Motorola MC146818B-compatible real-time clock with 242 bytes of battery-backed RAM. The real-time clock performs two key functions—keeping track of the time of day and storing system data, even when the system is powered down. The RTC operates on an external 32.768 KHz crystal and a 3.3 V battery. An option is also provided to internally generate the 32.768 KHz clock.

The RTC supports two lockable memory ranges. By setting bits in the configuration space, two 8-byte ranges can be locked to read and write accesses. This prevents unauthorized reading of passwords or other system security information.

The RTC supports a date alarm that allows for scheduling a wake up event up to 30 days in advance.

### 21.10.1 Signal Descriptions

See [Chapter 2.0, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Type:** The buffer type found in [Chapter 4.0, “Electrical Characteristics”](#)
- **Description:** A brief explanation of the signal’s function

Table 143. RTC Signals

Signal Name	Direction/ Type	Description
RTCX1	I/O Analog	<b>Crystal Input 1:</b> This signal is connected to the 32.768 KHz crystal.
RTCX2	I/O Analog	<b>Crystal Input 2:</b> This signal is connected to the 32.768 KHz crystal.
RTCRST_B	I CMOS3.3	<b>RTC Reset:</b> When asserted, this signal resets register bits in the RTC well.
IVCCRTCEXT	I/O Analog	<b>External Capacitor Connection:</b> Connect to an edge cap (0.1uF ) on the motherboard to ground, inductance has to be < 1nH.
RTC_EXT_CLK_EN_B	I CMOS3.3	<b>RTC Internal Clock Select:</b> Used to select between the oscillator clock from the external 32.768 KHz crystal or an internally generated 32.768 KHz clock. 0 = External 32.768 KHz oscillator 1 = Internal 32.768 KHz Clock (Default)

## 21.10.2 Features

The Real Time Clock (RTC) module provides a battery backed-up date and time keeping device. Three interrupt features are available: time of day alarm with once a second to once a month range, periodic rates of 122 ms to 500 ms, and end of update cycle notification. Seconds, minutes, hours, days, day of week, month, and year are counted. The hour is represented in twelve or twenty-four hour format, and data can be represented in BCD or binary format. The design is meant to be functionally compatible with the Motorola MS146818B. The time keeping comes from a 32.768 KHz oscillating source, which is divided to achieve an update every second. The lower 14 bytes on the lower RAM block have very specific functions. The first ten are for time and date information. The next four (0Ah to 0Dh) are registers, which configure and report RTC functions. A host-initiated write takes precedence over a hardware update in the event of a collision.

### 21.10.2.1 Update Cycles

An update cycle occurs once a second, if the B.SET bit is not asserted and the divide chain is properly configured. During this procedure, the stored time and date are incremented, overflow checked, a matching alarm condition is checked, and the time and date are rewritten to the RAM locations. The update cycle starts at least 488 ms after A.UIP is asserted, and the entire cycle does not take more than 1984 ms to complete. The time and date RAM locations (00h to 09h) are disconnected from the external bus during this time.

### 21.10.2.2 Interrupts

The real-time clock interrupt is internally routed within the SoC both to the I/O APIC and the 8259. It is mapped to interrupt vector 8. This interrupt does not leave the SoC, nor is it shared with any other interrupt. However, the High Performance Event Timers can also be mapped to IRQ8#; in this case, the RTC interrupt is blocked.

### 21.10.2.3 Lockable RAM Ranges

The RTC battery-backed RAM supports two 8-byte ranges that can be locked via the RTC Configuration register. When the locking bits are set, the corresponding range in the RAM is not readable or writable. A write cycle to those locations has no effect. A read cycle to those locations does not return the location's actual value (resultant value is undefined).

Once a range is locked, the range can be unlocked only by a hard reset, which invokes the BIOS and allows it to relock the RAM range.

### 21.10.3 Register Map

See Chapter 5.0, “Register Access Methods” for additional information.

Figure 54. RTC Register Map

### 21.10.4 I/O Registers

The RTC internal registers and RAM are organized as two banks of 128 bytes each, called the standard and extended banks.

The first 14 bytes of the standard bank contain the RTC time and date information along with four registers, A - D, that are used for configuration of the RTC. The extended bank contains a full 128 bytes of battery backed SRAM. All data movement between the host CPU and the RTC is done through registers mapped to the standard I/O space.

*Note:* It is not possible to disable the extended bank.

*Note:* I/O Locations 70h and 71h are used for data movement to and from the standard bank. Locations 72h and 73h used for data movement to and from the extended bank. All of these I/O locations also have alias I/O locations, as indicated in [Table 144](#). Index addresses above 127 are not valid.

*Note:* Writes to 74h do not affect the NMI Enable bit of 70h

**Table 144. I/O Registers Alias Locations**

Register	Original I/O Location	Alias I/O Location
Real-Time Clock (Standard RAM) Index Register	70h	74h
Real-Time Clock (Standard RAM) Target Register	71h	75h
Extended RAM Index Register	72h	76h
Extended RAM Target Register	73h	77h

### 21.10.5 Indexed Registers

The RTC contains two sets of indexed registers, which are accessed using the two separate Index and Target registers (70/71h or 72/73h).

**Table 145. Indexed Registers**

Start	End	Name
00h	00h	Seconds
01h	01h	Seconds Alarm
02h	02h	Minutes
03h	03h	Minutes Alarm
04h	04h	Hours
05h	05h	Hours Alarm
06h	06h	Day of Week
07h	07h	Day of Month
08h	08h	Month
09h	09h	Year
0Ah	0Ah	Register A
0Bh	0Bh	Register B
0Ch	0Ch	Register C
0Dh	0Dh	Register D
0Eh	7Fh	114 Bytes of User RAM

### 21.10.5.1 Offset 0Ah: Register A

This register is in the RTC well, and is used for general configuration of the RTC functions.

#### Access Method

**Type:** RTC Indexed Register  
(Size: 8 bits)

**Default:** xxxxxxxb

7	4	0
x	xxx	xxxx
UIP	DV	RS

Bit Range	Default & Access	Description
7	xb RW	<b>Update in progress (UIP):</b> When set, an update is in progress. When cleared, the update cycle will not start for at least 488 $\mu$ s. The time, calendar, and alarm information in RAM is always available when this bit is cleared.
6: 4	xb RW	<b>Division Chain Select:</b> Controls the divider chain for the oscillator; not affected by RSMRST# or any other reset signal.  000b: Invalid 001b: Invalid 010b: Normal Operation 011b: Bypass 5 Stages (Test Mode Only) 100b: Bypass 10 Stages (Test Mode Only) 101b: Bypass 15 Stages (Test Mode Only) 110b: Divider Reset 111b: Divider Reset
3: 0	xb RW	<b>Rate Select:</b> Selects one of 13 taps of the 15 stage divider chain. The selected tap can generate a periodic interrupt when B.PIE bit is set. Otherwise this tap sets C.PF.  0000b: Interrupt Never Toggles 0001b: 3.90625 ms 0010b: 7.8125 ms 0011b: 122.070 $\mu$ s 0100b: 244.141 $\mu$ s 0101b: 488.281 $\mu$ s 0110b: 976.5625 $\mu$ s 0111b: 1.953125 ms 1000b: 3.90625 ms 1001b: 7.8125 ms 1010b: 15.625 ms 1011b: 31.25 ms 1100b: 62.5 ms 1101b: 125 ms 1110b: 250 ms 1111b: 500 ms

### 21.10.5.2 Offset 0Bh: Register B - General Configuration

This register resides in the resume well.

#### Access Method

**Type:** RTC Indexed Register  
(Size: 8 bits)

**Default:** x0x00xxxb

7			4				0
x	0	x	0	0	x	x	x
SET	PIE	AIE	UIE	SQWE	DM	HF	DSE

Bit Range	Default & Access	Description
7	xb RW	<b>Set Clock (SET)</b> : When cleared, an update cycle occurs once each second. If set, a current update cycle will abort and subsequent update cycles will not occur until SET is returned to zero. When set, SW may initialize time and calendar bytes safely.
6	0b RW	<b>Periodic Interrupt Enable (PIE)</b> : When set, and C.PF is set, an interrupt is generated.
5	xb RW	<b>Alarm Interrupt Enable (AIE)</b> : When set, and C.AF is set, an interrupt is generated.
4	0b RW	<b>Update-ended Interrupt Enable (UIE)</b> : When set and C.UF is set, an interrupt is generated.
3	0b RW	<b>Square Wave Enable (SQWE)</b> : Not implemented.
2	xb RW	<b>Data Mode (DM)</b> : When set, represents binary representation. When cleared, denotes BCD.
1	xb RW	<b>Hour Format (HF)</b> : When set, twenty-four hour mode is selected. When cleared, twelve-hour mode is selected. In twelve hour mode, the seventh bit represents AM (cleared) and PM (set).
0	xb RW	<b>Daylight Savings Enable (DSE)</b> : Not implemented

### 21.10.5.3 Offset 0Ch: Register C - Flag Register

All bits in this register are cleared when this register is read.

#### Access Method

**Type:** RTC Indexed Register  
(Size: 8 bits)

**Default:** 00x00000b

7			4			0
0	0	x	0		0000	
IRQF	PF	AF	UF		RSV1	

Bit Range	Default & Access	Description
7	0b RC	<b>Interrupt Request Flag (IRQF)</b> : This bit is an AND of the flag with its corresponding interrupt enable in register B, and causes the RTC Interrupt to be asserted.
6	0b RC	<b>Periodic Interrupt Flag (PF)</b> : Set when the tap as specified by A.RS is one.
5	xb RC	<b>Alarm Flag (AF)</b> : Set after all Alarm values match the current time.
4	0b RC	<b>Update-ended Flag (UF)</b> : Set immediately following an update cycle for each second.

Bit Range	Default & Access	Description
3: 0	0b RO	Reserved (RSV1)

### 21.10.5.4 Offset 0Dh: Register D - Flag Register

#### Access Method

Type: RTC Indexed Register  
(Size: 8 bits)

Default: 1xxxxxxb

Bit Range	Default & Access	Description
7	0b RC	<b>Valid RAM and Time Bit (VRT):</b> This bit should always be written as a 0 for write cycle, however it will return a 1 for read cycles.
6	0b RC	<b>Reserved (RSV1):</b> This bit always returns a 0 and should be set to 0 for write cycles.
5: 0	xb RC	<b>Date Alarm (DA):</b> These bits store the date of month alarm value. If set to 000000, then a don't care state is assumed. If the date alarm is not enabled, these bits will return zeros to mimic the functionality of the Motorola 146818B. These bits are not affected by any reset assertion.

## 21.11 Interrupt Decoding & Routing

The Legacy Bridge provides registers that are used to decode and route interrupts received from devices within the SoC.

The interrupt decoder is responsible for receiving interrupt messages from other devices in the SoC and decoding them for consumption by the interrupt router, the 8259 PICs and/or the I/O APIC.

The interrupt router is responsible for mapping each incoming interrupt to the appropriate PIRQx, for consumption by the 8259 PICs and/or I/O APIC.

### 21.11.1 Features

#### 21.11.1.1 Interrupt Decoder

The interrupt decoder receives interrupt messages from devices in the SoC. These interrupts can be split into two primary groups:

- For consumption by the interrupt router
- For consumption by the 8259 PIC

### 21.11.1.1.1 For Consumption by the Interrupt Router

When a PCI-mapped device in the SoC asserts or de-asserts an INT[A:D] interrupt, an interrupt message is sent to the decoder. This message is decoded to indicate to the interrupt router which specific interrupt is asserted or de-asserted and which device the INT[A:D] interrupt originated from.

### 21.11.1.1.2 For Consumption by the 8259 PIC

When a device in the SoC asserts or deasserts a legacy interrupt (IRQ), an interrupt message is sent to the decoder. This message is decoded to indicate to the 8259 PIC which specific interrupt (IRQ[3, 4, 5, 6, 7, 13, 14 or 15]) was asserted or deasserted.

### 21.11.1.2 Interrupt Router

The interrupt router aggregates the INT[A:D] interrupts for each PCI-mapped device in the SoC, received from the interrupt decoder. It then maps these aggregated interrupts to 8 PCI-based interrupts: PIRQ[A:H]. This mapping is configured using the 4 Interrupt Queue Agent Registers: IRQAGENT0, IRQAGENT1, IRQAGENT2 and IRQAGENT3.

**Table 146. IRQAGENT Description**

IRQAGENT	Description	Single-Function/ Multi-Function
0	Remote Management Unit	Single-Function (Supports INTA only)
1	PCIe* D:23	Multi-Function (Supports INTA, INTB, INTC & INTD)
2	Reserved	Single-Function (Supports INTA only)
3	IO Fabric D:20 & D21	Multi-Function (Supports INTA, INTB, INTC & INTD)

PCI based interrupts PIRQ[A:H] are then available for consumption by either the 8259 PICs or the IO-APIC, depending on the configuration of the 8 PIRQx Routing Control Registers: PIRQA, PIQRB, PIRQC, PIRQD, PIRQE, PIRQF, PIRQG, PIRQH.

When the PCI based interrupts are consumed by the IO-APIC, a fixed routing scheme is used where interrupts PIRQ[A:H] are routed to IO-APIC interrupts IRQ[16:23].

### 21.11.1.2.1 Routing PCI Based Interrupts to 8259 PIC

The interrupt router can be programmed to allow PIRQA-PIRQH to be routed internally to the 8259 as ISA compatible interrupts IRQ 3–7, 9–12 & 14–15. The assignment is programmable through the 8 PIRQx Routing Control Registers: PIRQA, PIQRB, PIRQC, PIRQD, PIRQE, PIRQF, PIRQG, PIRQH. See [Section 21.3](#) for register details. One or more PIRQs can be routed to the same IRQ input. If ISA Compatible Interrupts are not required, the Route registers can be programmed to disable steering.

The PIRQx# lines are defined as active low, level sensitive. When a PIRQx# is routed to specified IRQ line, software must change the IRQ's corresponding ELCR bit to level sensitive mode. The SoC internally inverts the PIRQx# line to send an active high level to the PIC. When a PCI interrupt is routed onto the PIC, the selected IRQ can no longer be used by an active high device (through SERIRQ). However, active low interrupts can share their interrupt with PCI interrupts.

## 21.12 8259 Programmable Interrupt Controllers (PIC)

The SoC provides an ISA-compatible programmable interrupt controller (PIC) that incorporates the functionality of two, cascaded 8259 interrupt controllers.

### 21.12.1 Features

In addition to providing support for ISA compatible interrupts, this interrupt controller can also support PCI based interrupts (PIRQs) by mapping the PCI interrupt onto a compatible ISA interrupt line. Each 8259 controller supports eight interrupts, numbered 0–7. Table 147 shows how the controllers are connected.

*Note:* The SoC does not implement any external PIRQ# signals. The PIRQs referred to in this section originate from the interrupt routing unit.

**Table 147. Interrupt Controller Connections**

8259	8259 Input	Connected Pin / Function
Master	0	Internal Timer / Counter 0 output or HPET Timer #0
	1	Reserved
	2	Slave controller INTR output
	3	IRQ3 via PIRQx
	4	IRQ4 via PIRQx
	5	IRQ5 via PIRQx
	6	IRQ6 via PIRQx
	7	IRQ7 via PIRQx
Slave	0	Inverted IRQ8# from internal RTC or HPET Timer #1
	1	IRQ9 via SCI or PIRQx
	2	IRQ10 via SCI or PIRQx
	3	IRQ11 via SCI or PIRQx or HPET Timer #2
	4	IRQ12 via PIRQx
	5	Reserved
	6	IRQ14 via PIRQx
	7	IRQ15 via PIRQx

The SoC cascades the slave controller onto the master controller through master controller interrupt input 2. This means there are only 15 possible interrupts for the SoC PIC.

Interrupts can be programmed individually to be edge or level, except for IRQ0, IRQ2 and IRQ8#.

*Note:* Active-low interrupt sources (such as a PIRQ#) are inverted inside the SoC. In the following descriptions of the 8259s, the interrupt levels are in reference to the signals at the internal interface of the 8259s, after the required inversions have occurred. Therefore, the term “high” indicates “active,” which means “low” on an originating PIRQ#.

#### 21.12.1.1 Interrupt Handling

##### 21.12.1.1.1 Generating Interrupts

The PIC interrupt sequence involves three bits, from the IRR, ISR, and IMR, for each interrupt level. These bits are used to determine the interrupt vector returned, and status of any other pending interrupts. Table 148 defines the IRR, ISR, and IMR.

**Table 148. Interrupt Status Registers**

Bit	Description
IRR	<b>Interrupt Request Register.</b> This bit is set on a low to high transition of the interrupt line in edge mode, and by an active high level in level mode.
ISR	<b>Interrupt Service Register.</b> This bit is set, and the corresponding IRR bit cleared, when an interrupt acknowledge cycle is seen, and the vector returned is for that interrupt.
IMR	<b>Interrupt Mask Register.</b> This bit determines whether an interrupt is masked. Masked interrupts will not generate INTR.

#### 21.12.1.1.2 Acknowledging Interrupts

The processor generates an interrupt acknowledge cycle that is translated into a Interrupt Acknowledge Cycle by the SoC. The PIC translates this command into two internal INTA# pulses expected by the 8259 controllers. The PIC uses the first internal INTA# pulse to freeze the state of the interrupts for priority resolution. On the second INTA# pulse, the master or slave sends the interrupt vector to the processor with the acknowledged interrupt code. This code is based upon the ICW2.IVBA bits, combined with the ICW2.IRL bits representing the interrupt within that controller.

*Note:* References to ICWx and OCWx registers are relevant to both the master and slave 8259 controllers.

**Table 149. Content of Interrupt Vector Byte**

Master, Slave Interrupt	Bits [7:3]	Bits [2:0]
IRQ7,15	ICW2.IVBA	111
IRQ6,14		110
IRQ5,13		101
IRQ4,12		100
IRQ3,11		011
IRQ2,10		010
IRQ1,9		001
IRQ0,8		000

#### 21.12.1.1.3 Hardware/Software Interrupt Sequence

1. One or more of the Interrupt Request lines (IRQ) are raised high in edge mode, or seen high in level mode, setting the corresponding IRR bit.
2. The PIC sends INTR active to the processor if an asserted interrupt is not masked.
3. The processor acknowledges the INTR and responds with an interrupt acknowledge cycle.
4. Upon observing the special cycle, the SoC converts it into the two cycles that the internal 8259 pair can respond to. Each cycle appears as an interrupt acknowledge pulse on the internal INTA# pin of the cascaded interrupt controllers.
5. Upon receiving the first internally generated INTA# pulse, the highest priority ISR bit is set and the corresponding IRR bit is reset. On the trailing edge of the first pulse, a slave identification code is broadcast by the master to the slave on a private, internal three bit wide bus. The slave controller uses these bits to determine if it must respond with an interrupt vector during the second INTA# pulse.

6. Upon receiving the second internally generated INTA# pulse, the PIC returns the interrupt vector. If no interrupt request is present because the request was too short in duration, the PIC returns vector 7 from the master controller.
7. This completes the interrupt cycle. In AEOI mode the ISR bit is reset at the end of the second INTA# pulse. Otherwise, the ISR bit remains set until an appropriate EOI command is issued at the end of the interrupt subroutine.

### 21.12.1.2 Initialization Command Words (ICWx)

Before operation can begin, each 8259 must be initialized. This is a four byte sequence to ICW1, ICW2, ICW3 and ICW4. The four initialization command words are referred to by their acronyms: ICW1, ICW2, ICW3, and ICW4.

The base address for each 8259 initialization command word is a fixed location in the I/O memory space: 20h for the master controller, and A0h for the slave controller.

#### 21.12.1.2.1 ICW1

A write to the master or slave controller base address with data bit 4 equal to 1 is interpreted as a write to ICW1. Upon sensing this write, the PIC expects three more byte writes to 21h for the master controller, or A1h for the slave controller, to complete the ICW sequence.

A write to ICW1 starts the initialization sequence during which the following automatically occur:

1. Following initialization, an interrupt request (IRQ) input must make a low-to-high transition to generate an interrupt.
2. The Interrupt Mask Register is cleared.
3. IRQ7 input is assigned priority 7.
4. The slave mode address is set to 7.
5. Special mask mode is cleared and Status Read is set to IRR.

#### 21.12.1.2.2 ICW2

The second write in the sequence (ICW2) is programmed to provide bits [7:3] of the interrupt vector that will be released during an interrupt acknowledge. A different base is selected for each interrupt controller.

#### 21.12.1.2.3 ICW3

The third write in the sequence (ICW3) has a different meaning for each controller.

- For the master controller, ICW3 is used to indicate which IRQ input line is used to cascade the slave controller. Within the SoC, IRQ2 is used. Therefore, MICW3.CCC is set to a 1, and the other bits are set to 0s.
- For the slave controller, ICW3 is the slave identification code used during an interrupt acknowledge cycle. On interrupt acknowledge cycles, the master controller broadcasts a code to the slave controller if the cascaded interrupt won arbitration on the master controller. The slave controller compares this identification code to the value stored in its ICW3, and if it matches, the slave controller assumes responsibility for broadcasting the interrupt vector.

#### 21.12.1.2.4 ICW4

The final write in the sequence (ICW4) must be programmed for both controllers. At the very least, ICW4.MM must be set to a 1 to indicate that the controllers are operating in an Intel Architecture-based system.

### 21.12.1.3 Operation Command Words (OCW)

These command words reprogram the Interrupt controller to operate in various interrupt modes.

- OCW1 masks and unmasks interrupt lines.
- OCW2 controls the rotation of interrupt priorities when in rotating priority mode, and controls the EOI function.
- OCW3 sets up ISR/IRR reads, enables/disables the special mask mode (SMM), and enables/disables polled interrupt mode.

### 21.12.1.4 Modes of Operation

#### 21.12.1.4.1 Fully Nested Mode

In this mode, interrupt requests are ordered in priority from 0 through 7, with 0 being the highest. When an interrupt is acknowledged, the highest priority request is determined and its vector placed on the bus. Additionally, the ISR for the interrupt is set. This ISR bit remains set until either: the processor issues an EOI command immediately before returning from the service routine; or if in AEOI mode, on the trailing edge of the second INTA#. While the ISR bit is set, all further interrupts of the same or lower priority are inhibited, while higher levels generate another interrupt.

Interrupt priorities can be changed in the rotating priority mode.

#### 21.12.1.4.2 Special Fully-Nested Mode

This mode is used in the case of a system where cascading is used, and the priority has to be conserved within each slave. In this case, the special fully-nested mode is programmed to the master controller. This mode is similar to the fully-nested mode with the following exceptions:

- When an interrupt request from a certain slave is in service, this slave is not locked out from the master's priority logic and further interrupt requests from higher priority interrupts within the slave are recognized by the master and initiate interrupts to the processor. In the normal-nested mode, a slave is masked out when its request is in service.
- When exiting the Interrupt Service routine, software has to check whether the interrupt serviced was the only one from that slave. This is done by sending a non-Specific EOI command to the slave and then reading its ISR. If it is 0, a non-specific EOI can also be sent to the master.

#### 21.12.1.4.3 Automatic Rotation Mode (Equal Priority Devices)

In some applications, there are a number of interrupting devices of equal priority. Automatic rotation mode provides for a sequential 8-way rotation. In this mode, a device receives the lowest priority after being serviced. In the worst case, a device requesting an interrupt has to wait until each of seven other devices are serviced at most once.

There are two ways to accomplish automatic rotation using OCW2.REOI; the Rotation on Non-Specific EOI Command (OCW2.REOI=101b) and the rotate in automatic EOI mode which is set by (OCW2.REOI=100b).

#### 21.12.1.4.4 Specific Rotation Mode (Specific Priority)

Software can change interrupt priorities by programming the bottom priority. For example, if IRQ5 is programmed as the bottom priority device, then IRQ6 is the highest priority device. The Set Priority Command is issued in OCW2 to accomplish this, where: OCW2.REOI=11xb, and OCW2.ILS is the binary priority level code of the bottom priority device.

In this mode, internal status is updated by software control during OCW2. However, it is independent of the EOI command. Priority changes can be executed during an EOI command by using the Rotate on Specific EOI Command in OCW2 (OCW2.REOI=111b) and OCW2.ILS=IRQ level to receive bottom priority.

#### 21.12.1.4.5 Poll Mode

Poll mode can be used to conserve space in the interrupt vector table. Multiple interrupts that can be serviced by one interrupt service routine do not need separate vectors if the service routine uses the poll command. Poll mode can also be used to expand the number of interrupts. The polling interrupt service routine can call the appropriate service routine, instead of providing the interrupt vectors in the vector table. In this mode, the INTR output is not used and the microprocessor internal Interrupt Enable flip-flop is reset, disabling its interrupt input. Service to devices is achieved by software using a Poll command.

The Poll command is issued by setting OCW3.PMC. The PIC treats its next I/O read as an interrupt acknowledge, sets the appropriate ISR bit if there is a request, and reads the priority level. Interrupts are frozen from the OCW3 write to the I/O read. The byte returned during the I/O read contains a 1 in Bit 7 if there is an interrupt, and the binary code of the highest priority level in Bits 2:0.

#### 21.12.1.4.6 Edge and Level Triggered Mode

In ISA systems this mode is programmed using ICW1.LTIM, which sets level or edge for the entire controller. In the SoC, this bit is disabled and a register for edge and level triggered mode selection, per interrupt input, is included. This is the Edge/Level control Registers ELCR1 and ELCR2.

If an ELCR bit is 0, an interrupt request will be recognized by a low-to-high transition on the corresponding IRQ input. The IRQ input can remain high without generating another interrupt. If an ELCR bit is 1, an interrupt request will be recognized by a high level on the corresponding IRQ input and there is no need for an edge detection. The interrupt request must be removed before the EOI command is issued to prevent a second interrupt from occurring.

In both the edge and level triggered modes, the IRQ inputs must remain active until after the falling edge of the first internal INTA#. If the IRQ input goes inactive before this time, a default IRQ7 vector is returned.

#### 21.12.1.4.7 End of Interrupt (EOI) Operations

An EOI can occur in one of two fashions: by a command word write issued to the PIC before returning from a service routine, the EOI command; or automatically when the ICW4.AEOI bit is set to 1.

#### 21.12.1.4.8 Normal End of Interrupt

In normal EOI, software writes an EOI command before leaving the interrupt service routine to mark the interrupt as completed. There are two forms of EOI commands: Specific and Non-Specific. When a Non-Specific EOI command is issued, the PIC clears the highest ISR bit of those that are set to 1. Non-Specific EOI is the normal mode of operation of the PIC within the SoC, as the interrupt being serviced currently is the

interrupt entered with the interrupt acknowledge. When the PIC is operated in modes that preserve the fully nested structure, software can determine which ISR bit to clear by issuing a Specific EOI.

An ISR bit that is masked is not cleared by a Non-Specific EOI if the PIC is in the special mask mode. An EOI command must be issued for both the master and slave controller.

#### 21.12.1.4.9 Automatic End of Interrupt Mode

In this mode, the PIC automatically performs a Non-Specific EOI operation at the trailing edge of the last interrupt acknowledge pulse. From a system standpoint, this mode should be used only when a nested multi-level interrupt structure is not required within a single PIC. The AEOI mode can only be used in the master controller and not the slave controller.

*Note:* Both the master and slave PICs have an AEOI bit: MICW4.AEOI and SICW4.AEOI respectively. Only the MICW4.AEOI bit should be set by software. The SICW4.AEOI bit should not be set by software.

#### 21.12.1.5 Masking Interrupts

##### 21.12.1.5.1 Masking on an Individual Interrupt Request

Each interrupt request can be masked individually by the Interrupt Mask Register (IMR). This register is programmed through OCW1. Each bit in the IMR masks one interrupt channel. Masking IRQ2 on the master controller masks all requests for service from the slave controller.

##### 21.12.1.5.2 Special Mask Mode

Some applications may require an interrupt service routine to dynamically alter the system priority structure during its execution under software control. For example, the routine may wish to inhibit lower priority requests for a portion of its execution but enable some of them for another portion.

The special mask mode enables all interrupts not masked by a bit set in the Mask register. Normally, when an interrupt service routine acknowledges an interrupt without issuing an EOI to clear the ISR bit, the interrupt controller inhibits all lower priority requests. In the special mask mode, any interrupts may be selectively enabled by loading the Mask Register with the appropriate pattern.

The special mask mode is set by OCW3.ESMM=1b & OCW3.SMM=1b, and cleared where OCW3.ESMM=1b & OCW3.SMM=0b.

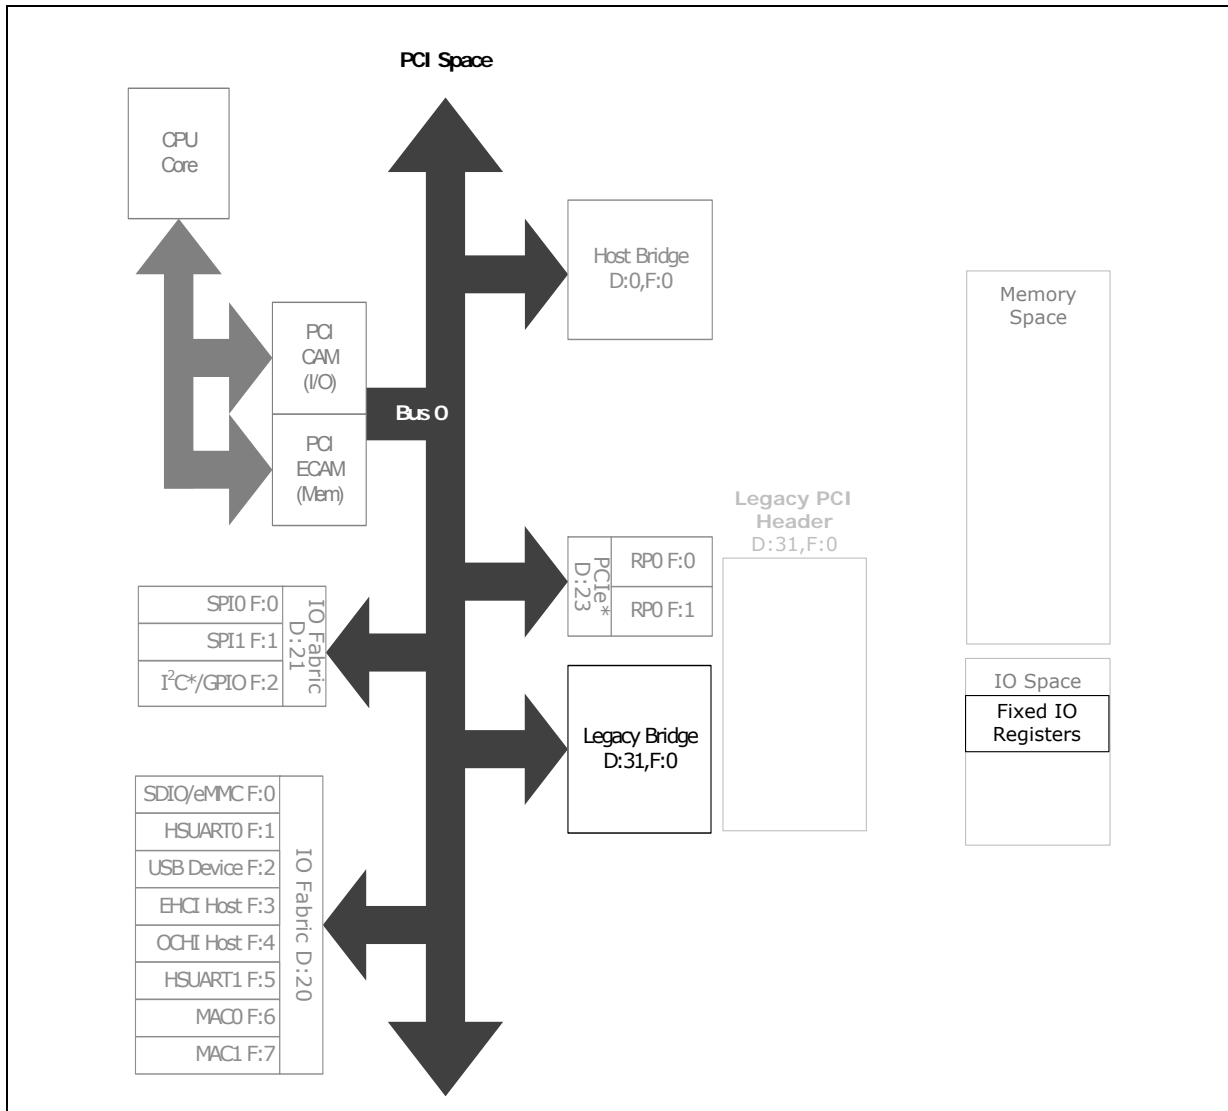

#### 21.12.1.6 Steering of PCI Interrupts

The SoC can be programmed to allow PIRQ[A:H]# to be internally routed to interrupts 3-7, 9-12, 14 or 15, through the PIRQx Route Control registers in Device 31:Function 0. One or more PIRQx# lines can be routed to the same IRQx input. The PIRQx# lines are defined as active low, level sensitive. When a PIRQx# is routed to specified IRQ line, software must change the corresponding ELCR1 or ELCR2 register to level sensitive mode. The SoC will internally invert the PIRQx# line to send an active high level to the PIC. When a PCI interrupt is routed onto the PIC, the selected IRQ can no longer be used by an ISA device

### 21.12.2 Register Map

See Chapter 5.0, "Register Access Methods" for additional information.

Figure 55. 8259 Register Map

### 21.12.3 I/O Registers

The interrupt controller registers are located at 20h and 21h for the master controller (IRQ0-7), and at A0h and A1h for the slave controller (IRQ8-13). These registers have multiple functions, depending upon the data written to them. [Table 150](#) describes the different register possibilities for each address.

*Note:* The register descriptions after [Table 150](#) represent one register possibility.

Table 150. 8259 I/O Registers Alias Locations

**21.12.3.1 Master Initialization Command Word 1 (MICW1)—Offset 20h**

A write to Initialization Command Word 1 starts the interrupt controller initialization sequence, during which the following occurs:

- The Interrupt Mask register is cleared.
- IRQ7 input is assigned priority 7.
- The slave mode address is set to 7.
- Special Mask Mode is cleared and Status Read is set to IRR.

Once this write occurs, the controller expects writes to ICW2, ICW3, and ICW4 to complete the initialization sequence.

### 21.12.3.2 Master Initialization Command Word 2 (MICW2)—Offset 21h

Master ICW2 is used to initialize the interrupt controller with the five most significant bits of the interrupt vector address. The value programmed for bits[7:3] is used by the CPU to define the base address in the interrupt vector table for the interrupt routines associated with each IRQ on the controller. Typical ISA ICW2 values are 08h for the master controller and 70h for the slave controller.

## 21.13 I/O APIC

The I/O Advanced Programmable Interrupt Controller (APIC) is used to support line interrupts more flexibly than the 8259 PIC. Line interrupts are routed to it from multiple sources, including legacy devices, via the interrupt decoder or they are routed to it from the interrupt router in the Legacy Bridge. These line-based interrupts are then used to generate interrupt messages targeting the local APIC in the processor.

### 21.13.1 Features

- 24 interrupt lines
  - IRQ0-23
- Edge or level trigger mode per interrupt
- Active low or high polarity per interrupt
- Works with local APIC in processor via MSIs
- MSIs can target specific processor core
- Established APIC programming model

Figure 56. Detailed I/O APIC Block Diagram

**Note:** INT13 is unavailable and is effectively tied low within the I/O APIC, INT14 & INT15 are unused in the

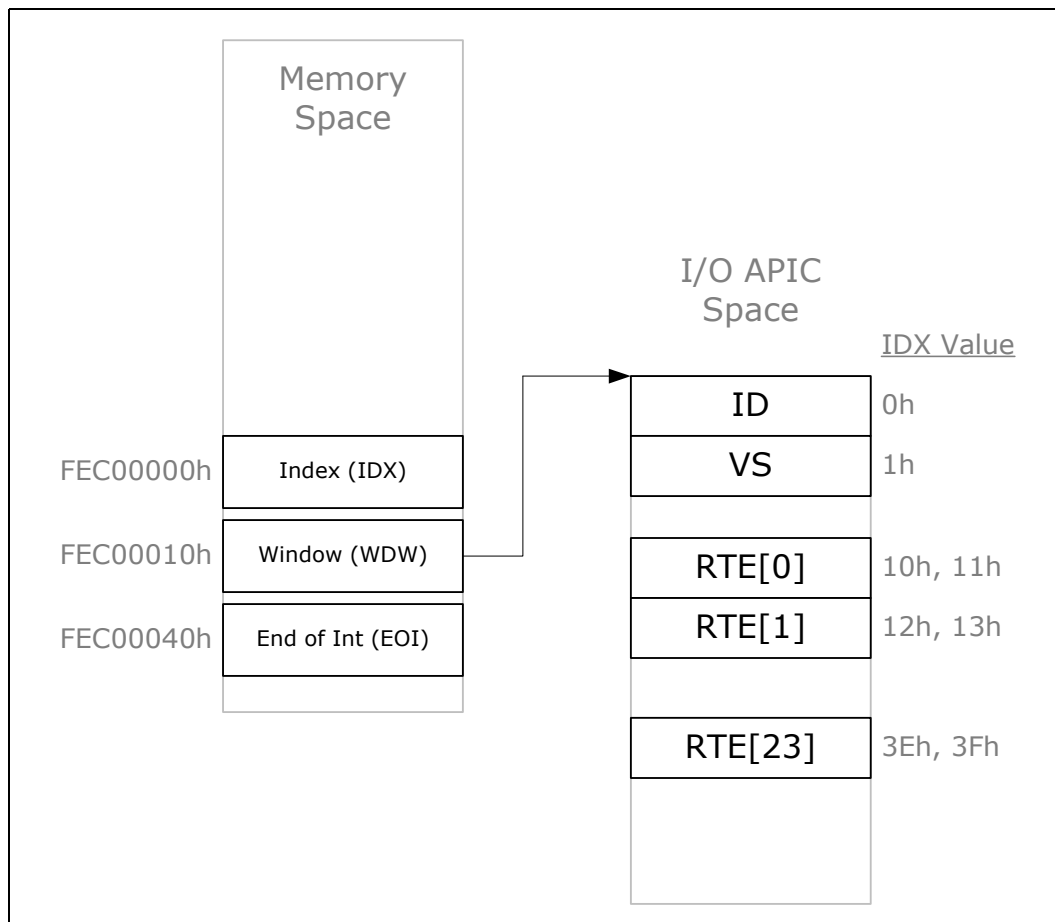

- **NMI/INIT:** This cannot be delivered while the CPU is in the Stop Grant state. In addition, this is a break event for power management.
- **SMI:** There is no way to block the delivery of the SMI\_B, except through BIOS.
- **Virtual Wire Mode B:** The Legacy Bridge does not support the INTR of the 8259 routed to the I/OxAPIC pin 0.

### 21.13.4 Register Map

See Chapter 5.0, “Register Access Methods” for additional information.

Figure 58. I/O APIC Register Map

### 21.13.5 Memory Mapped Registers

The APIC is accessed via an indirect addressing scheme. These registers are mapped into memory space. The registers are shown below.

Table 152. I/O APIC Memory Mapped Registers

Address	Symbol	Register
FEC00000h	IDX	Index Register
FEC00010h	WDW	Window Register
FEC00040h	EOI	End of Interrupt Register

### 21.13.5.1 Index Register (IDX)—Offset FEC00000h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)      **IDX:** FEC00000h

**Default:** 00h

7	4	0
0	0	0
IDX		

Bit Range	Default & Access	Description
7: 0	0h RW	<b>Index (IDX):</b> This 8-bit register selects which indirect register appears in the window register to be manipulated by software. Software will program this register to select the desired APIC internal register.

### 21.13.5.2 Window Register (WDW)—Offset FEC00010h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)      **WDW:** FEC00010h

**Default:** FFFFFFFFh

31	28	24	20	16	12	8	4	0
1	1	1	1	1	1	1	1	1
WDW								

Bit Range	Default & Access	Description
31: 0	FFFFFFFh RW	<b>Window (WDW):</b> This 32-bit register specifies the data to be read or written to the register pointed to by the IDX register. This register can be accessed only in DW quantities.

### 21.13.5.3 End of Interrupt Register (EOI)—Offset FEC00040h

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)      **EOI:** FEC00040h

**Default:** 00000000h

Bit Range	Default & Access	Description
31: 8	0b RO	RESERVED (RESERVED1): Reserved.
7: 0	0h RO	EOI (EOI): When a write is issued to this register, the IOxAPIC will check the lower 8 bits written to this register, and compare it with the vector field for each entry in the I/O Redirection Table. When a match is found, RTE.RIRR for that entry will be cleared. If multiple entries have the same vector, each of those entries will have RTE.RIRR cleared.

### 21.13.6 Index Registers

These registers are selected with the IDX register, and read/written through the WDW register. Accessing these registers must be done as DW requests, otherwise unspecified behavior will result. Software should not attempt to write to reserved registers. Reserved registers may return non-zero values when read.

*Note:* There is one pair of redirection (RTE) registers per interrupt line. Each pair forms a 64-bit RTE register.

*Note:* Specified offsets should be placed in IDX, not added to IDX.

**Table 153. Index Registers**

Offset	Symbol	Register
00	ID	Identification
01	VS	Version
02-0F	-	Reserved
10-11	RTE0	Redirection Table 0
12-13	RTE1	Redirection Table 1
...	...	...
3E-3F	RTE23	Redirection Table 23
40-FF	-	Reserved

#### 21.13.6.1 Identification Register (ID)—Offset 0h

##### Access Method

**Type:** Indirect I/O APIC Register      **ID:** 0h  
(Size: 32 bits)

**Default:** 00000000h

Bit Range	Default & Access	Description
31: 17	0h RW	<b>Reserved (RSVDO):</b> Reserved.
16	1b RW	<b>Mask (MSK):</b> When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0b RW	<b>Trigger Mode (TM):</b> When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0b RW	<b>Remote IRR (RIRR):</b> This is used for level triggered interrupts; its meaning is undefined for edge triggered interrupts. This bit is set when I/O APIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0b RW	<b>Polarity (POL):</b> This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low. 0: Active High 1: Active Low
12	0b RO	<b>Delivery Status (DS):</b> This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry.
11	0b RW	<b>Destination Mode (DSM):</b> This field is used by the local APIC to determine whether it is the destination of the message.
10: 8	0h RW	<b>Delivery Mode (DLM):</b> This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: 000: Fixed 001: Lowest Priority 010: SMI - Not supported. 011: Reserved 100: NMI - Not supported. 101: INIT - Not supported. 110: Reserved 111: ExtINT
7: 0	0h RW	<b>Vector (VCT):</b> This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

### 21.13.6.4 Redirection Table Entry Upper (RTE[0-23]U)—Offset 11h - 3Fh

Upper 32-bits of the RTE register.

#### Access Method

Type: Indirect I/O APIC Register  
(Size: 32 bits)

RTE[0-23]U: 11h - 3Fh

Default: 00000000h

Bit Range	Default & Access	Description
31: 24	0h RW	<b>Destination ID (DID):</b> Destination ID of the local APIC.
23: 16	0h RW	<b>Extended Destination ID (EDID):</b> Extended destination ID of the local APIC.

Bit Range	Default & Access	Description
15: 0	0h RW	<b>Reserved (RSVD):</b> Reserved.

## 21.14 Watchdog Timer

The Watchdog timer can be used to trigger a reset in the event that the system has become unresponsive.

### 21.14.1 Features

Selectable Prescaler - approximately 1 MHz (1  $\mu$ s to 1 s) and approximately 1 KHz (1 ms to 17 min)

- 33 MHz Clock (30 ns Clock Ticks)
- WDT Mode:
  - Second stage drives WDT\_TOUT high or inverts the previous value. Used only after first timeout occurs.
  - Status bit preserved in RTC well for possible error detection and correction
  - Drives WDT\_TOUT if OUTPUT is enabled
- Timer can be disabled (default state) or Locked (Hard Reset required to disable WDT)
- WDT Automatic Reload of Preload value when WDT Reload Sequence is performed

*Note:* WDT\_TOUT is not available as a top-level SoC output.

### 21.14.2 Use

This Watchdog timer provides a resolution that ranges from 1  $\mu$ s to ~17 minutes. The timer uses a 35-bit down-counter.

The counter is loaded with the value from the 1st Preload register. The timer is then enabled and it starts counting down. The time at which the WDT first starts counting down is called the first stage. If the host fails to reload the WDT before the 35-bit down counter reaches zero the WDT generates an internal interrupt within the WDT.

After the internal interrupt is generated when the first stage has counted down to zero, the WDT loads the value from the 2nd Preload register into the WDT's 35-bit Down-Counter and starts counting down. The WDT is now in the second stage. If the host still fails to reload the WDT before the second timeout, the WDT drives the WDT\_TOUT signal high and sets the timeout bit (WDT\_TIMEOUT). This bit indicates that the System has become unstable. The WDT\_TOUT signal is held high until the system is Reset or the WDT times out again (Depends on WDT Timeout Configuration). The process of reloading the WDT involves the following sequence of writes:

- Write 80 to offset WDTBA + 0Ch
- Write 86 to offset WDTBA + 0Ch
- Write 1 to WDT\_RELOAD in Reload Register.

The same process is used for setting the values in the preload registers. The only difference exists in step 3. Instead of writing a '1' to the WDT\_RELOAD, you write the desired preload value into the corresponding Preload register. This value is not loaded into the 35-bit down counter until the next time the WDT reenters the stage. For example, if Preload Value 2 is changed, it is not loaded into the 35-bit down counter until the next time the WDT enters the second stage.

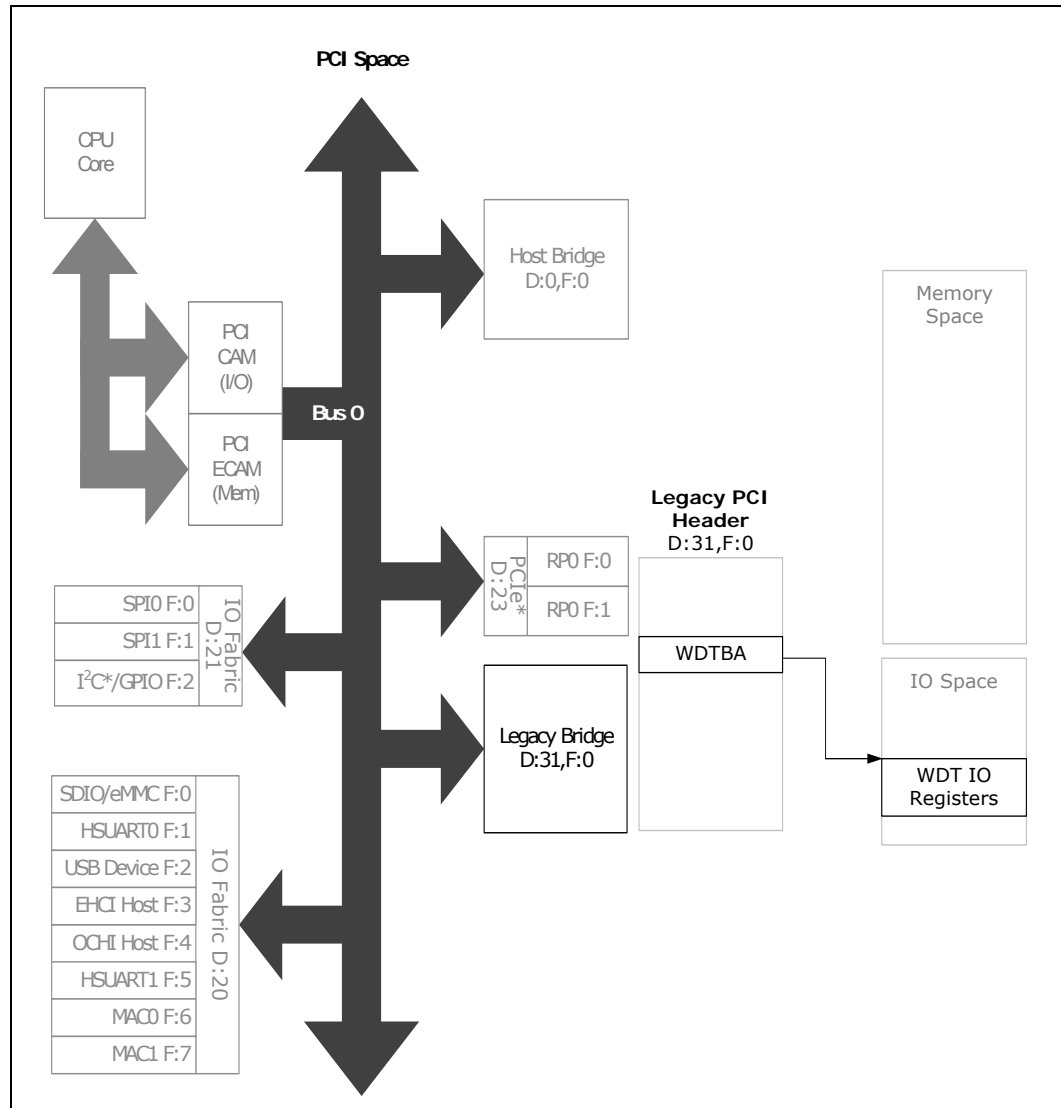

*Note:* The WDT output, WDT\_TOUT, is not available as a top-level SoC output pin

### 21.14.3 Register Map

See Chapter 5.0, “Register Access Methods” for additional information.

Figure 59. Watchdog Timer Register Map

**21.14.4.1 Preload Value 1 Register 0 (PV1R0)—Offset 0h**

**Access Method**

Type: I/O Register  
(Size: 8 bits)

PV1R0: [WDTBA] + 0h

WDTBA Type: PCI Configuration Register (Size: 32 bits)

WDTBA Reference: [B:0, D:31, F:0] + 84h

Default: FFh

Bit Range	Default & Access	Description
7:0	FFh RW	<b>Preload Value 1 [7:0] (PV1):</b> This register is used to hold the bits 7 down to 0 of the Preload Value 1 for the Watch Dog Timer. The Value in the Preload Register is Automatically transferred into the 35-bit down counter every time the WDT enters the first stage. The value loaded into the preload register needs to be one less than the intended period. This is because the timer makes use of zero-based counting (i.e. zero is counted as part of the decrement).

**21.14.4.2 Preload Value 1 Register 1 (PV1R1)—Offset 1h**

**Access Method**

Type: I/O Register  
(Size: 8 bits)

PV1R1: [WDTBA] + 1h

WDTBA Type: PCI Configuration Register (Size: 32 bits)

WDTBA Reference: [B:0, D:31, F:0] + 84h

Default: FFh

Bit Range	Default & Access	Description
7:0	FFh RW	<b>Preload Value 1[15:8] (PV1)</b> : This register is used to hold the bits 15 down to 8 of the Preload Value 1 for the Watch Dog Timer. The Value in the Preload Register is Automatically transferred into the 35-bit down counter every time the WDT enters the first stage. The value loaded into the preload register needs to be one less than the intended period. This is because the timer makes use of zero-based counting (i.e. zero is counted as part of the decrement).

### 21.14.4.3 Preload Value 1 Register 2 (PV1R2)—Offset 2h

#### Access Method

Type: I/O Register  
(Size: 8 bits)

PV1R2: [WDTBA] + 2h

WDTBA Type: PCI Configuration Register (Size: 32 bits)

WDTBA Reference: [B:0, D:31, F:0] + 84h

Default: 0Fh

7			4				0
0	0	0	0	0	1	1	1
RSV				PV1			

Bit Range	Default & Access	Description
7:4	0b RO	<b>Reserved (RSV)</b> : Reserved.
3:0	Fh RW	<b>Preload Value 1[19:16] (PV1)</b> : This register is used to hold the bits 19 down to 16 of the Preload Value 1 for the Watch Dog Timer. The Value in the Preload Register is Automatically transferred into the 35-bit down counter every time the WDT enters the first stage. The value loaded into the preload register needs to be one less than the intended period. This is because the timer makes use of zero-based counting (i.e. zero is counted as part of the decrement).

### 21.14.4.4 Preload Value 2 Register 0 (PV2R0)—Offset 4h

#### Access Method

Type: I/O Register  
(Size: 8 bits)

PV2R0: [WDTBA] + 4h

WDTBA Type: PCI Configuration Register (Size: 32 bits)

WDTBA Reference: [B:0, D:31, F:0] + 84h

Default: FFh

7			4				0
1	1	1	1	1	1	1	1
PV2							

Bit Range	Default & Access	Description
7:0	FFh RW	<b>Preload Value 2[7:0] (PV2)</b> : This register is used to hold the bits 7 down to 0 of the Preload Value 2 for the Watch Dog Timer. The Value in the Preload Register is Automatically transferred into the 35-bit down counter every time the WDT enters the first stage. The value loaded into the preload register needs to be one less than the intended period. This is because the timer makes use of zero-based counting (i.e. zero is counted as part of the decrement).

### 21.14.4.5 Preload Value 2 Register 1 (PV2R1)—Offset 5h

**Access Method**

Type: I/O Register  
(Size: 8 bits)

PV2R1: [WDTBA] + 5h

WDTBA Type: PCI Configuration Register (Size: 32 bits)

WDTBA Reference: [B:0, D:31, F:0] + 84h

Default: FFh

Bit Range	Default & Access	Description
7:0	FFh RW	<b>Preload Value 2[15:8] (PV2):</b> This register is used to hold the bits 15 down to 8 of the Preload Value 2 for the Watch Dog Timer. The Value in the Preload Register is Automatically transferred into the 35-bit down counter every time the WDT enters the first stage. The value loaded into the preload register needs to be one less than the intended period. This is because the timer makes use of zero-based counting (i.e. zero is counted as part of the decrement).

### 21.14.4.6 Preload Value 2 Register 2 (PV2R2)—Offset 6h

**Access Method**

Type: I/O Register  
(Size: 8 bits)

PV2R2: [WDTBA] + 6h

WDTBA Type: PCI Configuration Register (Size: 32 bits)

WDTBA Reference: [B:0, D:31, F:0] + 84h

Default: 0Fh

Bit Range	Default & Access	Description
7:4	0b RO	<b>Reserved (RSV):</b> Reserved.
3:0	Fh RW	<b>Preload Value 2[19:16] (PV2):</b> This register is used to hold the bits 19 down to 16 of the Preload Value 2 for the Watch Dog Timer. The Value in the Preload Register is Automatically transferred into the 35-bit down counter every time the WDT enters the first stage. The value loaded into the preload register needs to be one less than the intended period. This is because the timer makes use of zero-based counting (i.e. zero is counted as part of the decrement).

### 21.14.4.7 Reload Register 0 (RRO)—Offset Ch

**Access Method**

Type: I/O Register  
(Size: 8 bits)

RRO: [WDTBA] + Ch

WDTBA Type: PCI Configuration Register (Size: 32 bits)

WDTBA Reference: [B:0, D:31, F:0] + 84h

Default: 00h

7	4	0
0	0	0
WDT_RLDO		

Bit Range	Default & Access	Description
7:0	0b WO	<b>WDT Reload 0 (WDT_RLDO)</b> : The reload sequence is only necessary for the Reload register and Preload Value registers and is not used in Free Running mode.

#### 21.14.4.8 Reload Register 1 (RR1)—Offset Dh

##### Access Method

Type: I/O Register  
(Size: 8 bits)

RR1: [WDTBA] + Dh

WDTBA Type: PCI Configuration Register (Size: 32 bits)

WDTBA Reference: [B:0, D:31, F:0] + 84h

Default: 00h

7	4	0
0	0	0
RSV		WDT_TOUT
		WDT_RDL

Bit Range	Default & Access	Description
7:2	0b RO	<b>Reserved (RSV)</b> : Reserved.
1	0b RW/1C	<b>WDT Timeout (WDT_TOUT)</b> : This bit is located in the RTC Well and its value is not lost if the host resets the system. It is set to 1 if the host fails to reset the WDT before the 35-bit Down-Counter reaches zero for the second time in a row. This bit is cleared by performing the Register Unlocking Sequence followed by a 1 to this bit. 0 = Normal (Default) 1 = System has become unstable.
0	0b RW	<b>WDT Reload (WDT_RDL)</b> : To prevent a timeout the host must perform the Register Unlocking Sequence followed by a 1 to this bit.

#### 21.14.4.9 WDT Configuration Register (WDTCR)—Offset 10h

##### Access Method

Type: I/O Register  
(Size: 8 bits)

WDTCR: [WDTBA] + 10h

WDTBA Type: PCI Configuration Register (Size: 32 bits)

WDTBA Reference: [B:0, D:31, F:0] + 84h

Default: 00h

7				4				0
0	0	0	0	0	0	0	0	0
RSV2		WDT_TOUT_EN		WDT_RESET_EN	WDT_RESET_SEL	WDT_PRE_SEL	RSVD	

Bit Range	Default & Access	Description
7:6	0b RO	<b>Reserved (RSV2):</b> Reserved.
5	0b RW	<b>WDT Timeout Output Enable (WDT_TOUT_EN):</b> This bit indicates whether or not the WDT toggles the external WDT_TOUT signal if the WDT times out. 0 = Enabled (Default) 1 = Disabled
4	0b RW	<b>WDT Reset Enable (WDT_RESET_EN):</b> When this bit is enable (set to 1), it allows internal reset to be trigger when WDT timeout in the second stage. It either trigger COLD or WARM reset depend on WDT_RESET_SEL bit. 0 = Disable internal reset (Default) 1 = Enable internal COLD or WARM reset.
3	0b RW	<b>WDT Reset Select (WDT_RESET_SEL):</b> This determines which reset to be triggered when WDT_RESET_EN is set. 0 = Cold Reset (Default) 1 = Warm Reset
2	0b RW	<b>WDT Prescaler Select (WDT_PRE_SEL):</b> The WDT provides two options for prescaling the main Down Counter. The preload values are loaded into the main down counter right justified. The prescaler adjusts the starting point of the 35-bit down counter. 0 = The 20-bit Preload Value is loaded into bits 34:15 of the main down counter. The resulting timer clock is the PCI Clock (33 MHz) divided by 2 <sup>15</sup> . The approximate clock generated is 1 KHz, (1 ms to 10 min). (Default) 1 = The 20-bit Preload Value is loaded into bits 24:05 of the main down counter. The resulting timer clock is the PCI Clock (33 MHz) divided by 2 <sup>5</sup> . The approximate clock generated is 1 MHz, (1 us to 1sec)
1:0	0b RO	<b>Reserved (RSVD):</b> Reserved.

### 21.14.4.10 WDT Lock Register (WDTLR)—Offset 18h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**WDTLR:** [WDTBA] + 18h

**WDTBA Type:** PCI Configuration Register (Size: 32 bits)

**WDTBA Reference:** [B:0, D:31, F:0] + 84h

**Default:** 00h

7				4				0
0	0	0	0	0	0	0	0	0
RSV				WDT_TOUT_CNF	WDT_ENABLE	WDT_LOCK		

Bit Range	Default & Access	Description
7:3	0b RO	<b>Reserved (RSV):</b> Reserved.
2	0b RW	<b>WDT Timeout Configuration (WDT_TOUT_CNF):</b> This register is used to choose the functionality of the timer. 0 = Watchdog Timer Mode: When enabled (i.e. WDT_ENABLE goes from 0 to 1) the timer reloads Preload Value 1 and start decrementing. (Default) Upon reaching the second stage timeout the WDT_TOUT is driven high once and does not change again until Power is cycled or a hard reset occurs. 1 = Reserved
1	0b RW	<b>Watchdog Timer Enable (WDT_ENABLE):</b> The following bit enables or disables the WDT. 0 = Disabled (Default) 1 = Enabled Note: This bit cannot be modified if WDT_LOCK has been set. Note: In WDT mode Preload Value 1 is reloaded every time WDT_ENABLE goes from 0 to 1 or the WDT_RELOAD bit is written using the proper sequence of writes (See Register Unlocking Sequence). When the WDT second stage timeout occurs, a reset must happen. Note: Software must guarantee that a timeout is not about to occur before disabling the timer. A reload sequence is suggested.
0	0b RW/O	<b>Watchdog Timer Lock (WDT_LOCK):</b> Setting this bit locks the values of this register until a hard-reset occurs or power is cycled. 0 = Unlocked (Default) 1 = Locked Note: Writing a 0 has no effect on this bit. Write is only allowed from 0 to 1 once. It cannot be changed until either power is cycled or a hard reset occurs
