**Output Capacitor**

The RPMH requires MLCC output capacitor for normal operation (see below table)

**OUTPUT VOLTAGE TRIMMING**

The RPMH-Series offers the feature of trimming the output voltage over a range between -20% to +10% for lower output voltages and from -40% to +10% for higher output voltages. This can be done by using external trim resistors. The values for the trim resistors in trim tables are according to standard E96 values; therefore, the specified voltage may slightly vary. Refer to **“Selection Guide”**

Vout<sub>nom</sub> = nominal output voltage [VDC]  
 Vout<sub>set</sub> = trimmed output voltage [VDC]  
 R<sub>up</sub> = trim up resistor [Ω]  
 R<sub>down</sub> = trim down resistor [Ω]  
 R<sub>HI</sub>, R<sub>LO</sub> = internal resistors [Ω]

Vout <sub>nom</sub>	R <sub>HI</sub>	R <sub>LO</sub>
3.3VDC	100kΩ	43.2kΩ
5VDC	100kΩ	24.9kΩ
12VDC	100MΩ	9.09MΩ
15VDC	100MΩ	7.15MΩ
24VDC	100MΩ	4.32MΩ

**Calculation:**

$$R_{up} = \frac{R_{HI} \times R_{LO} \times V_{out_{nom}}}{(V_{out_{set}} - V_{out_{nom}}) \times (R_{HI} + R_{LO})}$$

$$R_{down} = R_{HI} \times \frac{(V_{out_{set}} - V_{out_{nom}}) \times R_{LO} + V_{out_{set}} \times R_{HI}}{(V_{out_{nom}} - V_{out_{set}}) \times (R_{HI} + R_{LO})}$$

**Practical Example RPMH3.3-1.5, trim up**

Vout<sub>set</sub> = 3.63VDC

$$R_{up} = \frac{100k \times 43.2k \times 3.3}{(3.63 - 3.3) \times (100k + 43.2k)} = 301.676k\Omega$$

R<sub>up</sub> according to E96 ≈ **301kΩ**

**Practical Example RPMH3.3-1.5, trim down**

Vout<sub>set</sub> = 2.64VDC

$$R_{down} = 100k \times \frac{(2.64 - 3.3) \times 43.2k + 2.64 \times 100k}{(3.3 - 2.64) \times (100k + 43.2k)} = 249.162\Omega$$

R<sub>down</sub> according to E96 ≈ **249kΩ**

**Sequencing Multiple Modules**

To sequence multiple power module, the power good (PGOOD) pad and the CTRL pad may be used. In below schematic, the U2 starts after U1 (RPMHxx-1.5) reaches its set output voltage and the power good signal is set to high which then enables U2. After U2 reaches its set output voltage, it enables next module - until U(n).

Note that by default PGOOD pad is pulled high to internal Vcc (5 VDC) and CTRL of enabled modules are pulled up to Input Voltage. Accordingly, external pull-up and pull-down resistors (R1-R(n+2)) must be used to secure proper sequencing.
