### **FEATURES:**

- Phase-Lock Loop Clock Distribution
- 10MHz to 133MHz operating frequency
- · Distributes one clock input to one bank of five outputs
- · Zero Input-Output Delay
- Output Skew < 250ps
- Low jitter <200 ps cycle-to-cycle</li>
- IDT2305-1 for Standard Drive
- IDT2305-1H for High Drive
- · No external RC network required
- Operates at 3.3V VDD
- · Power down mode
- · Available in SOIC/TSSOP packages

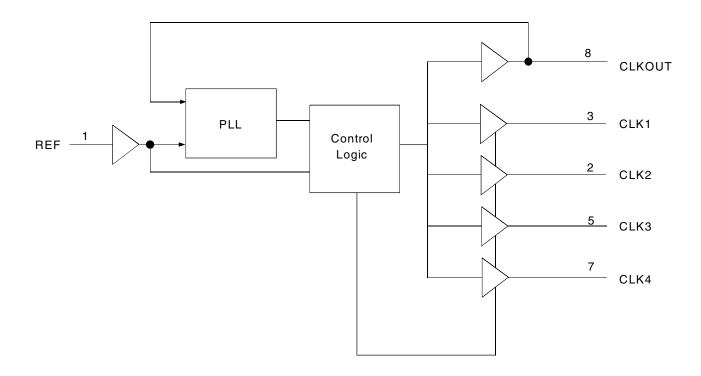

### **DESCRIPTION:**

The IDT2305 is a high-speed phase-lock loop (PLL) clock buffer, designed to address high-speed clock distribution applications. The zero delay is achieved by aligning the phase between the incoming clock and the output clock, operable within the range of 10 to 133MHz.

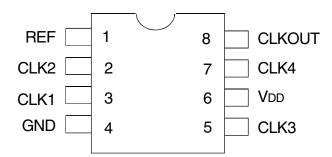

The IDT2305 is an 8-pin version of the IDT2309. IDT2305 accepts one reference input, and drives out five low skew clocks. The -1H version of this device operates, up to 133MHz frequency and has a higher drive than the -1 device. All parts have on-chip PLLs which lock to an input clock on the REF pin. The PLL feedback is on-chip and is obtained from the CLKOUT pad. In the absence of an input clock, the IDT2305 enters power down. In this mode, the device will draw less than  $25\mu A$ , the outputs are tri-stated, and the PLL is not running, resulting in a significant reduction of power.

The IDT2305 is characterized for both Industrial and Commercial operation.

## **APPLICATIONS:**

- SDRAM
- Telecom
- Datacom
- PC Motherboards/Workstations
- Critical Path Delay Designs

# ABSOLUTE MAXIMUM RATINGS(1)

Symbol	Rating	Max.	Unit
VDD	Supply Voltage Range	-0.5 to +4.6	V
VI <sup>(2)</sup>	Input Voltage Range (REF)	-0.5 to +5.5	V
Vı	Input Voltage Range	-0.5 to	V
	(except REF)	VDD+0.5	
IIK (VI < 0)	Input Clamp Current	-50	mA
Io (Vo = 0 to VDD)	Continuous Output Current	±50	mA
VDD or GND	Continuous Current	±100	mA
TA = 55°C	Maximum Power Dissipation	0.7	W
(in still air)(3)			
Tstg	Storage Temperature Range	-65 to +150	°C
Operating	Commercial Temperature	0 to +70	°C
Temperature	Range		
Operating	Industrial Temperature	-40 to +85	°C
Temperature	Range		

#### NOTES:

- 1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
- The maximum package power dissipation is calculated using a junction temperature of 150°C and a board trace length of 750 mils.

## **PIN DESCRIPTION**

Pin Name	Pin Number	Туре	Functional Description
REF	1	IN	Input reference clock, 5 Volt tolerant input
CLK2 <sup>(1)</sup>	2	Out	Output clock
CLK1 <sup>(1)</sup>	3	Out	Output clock
GND	4	Ground	Ground
CLK3 <sup>(1)</sup>	5	Out	Output clock
VDD	6	PWR	3.3V Supply
CLK4 <sup>(1)</sup>	7	Out	Output clock
CLKOUT <sup>(1)</sup>	8	Out	Output clock, internal feedback on this pin

### NOTES:

1. Weak pull down on all outputs.

### ZERO DELAYAND SKEW CONTROL

All outputs should be uniformly loaded in order to achieve Zero I/O Delay. Since the CLKOUT pin is the internal feedback for the PLL, its relative loading can affect and adjust the input/output delay. The Output Load Difference diagram illustrates the PLL's relative loading with respect to the other outputs that can adjust the Input-Output (I/O) Delay.

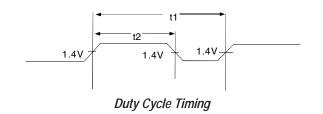

For designs utilizing zero I/O Delay, all outputs including CLKOUT must be equally loaded. Even if the output is not used, it must have a capacitive load equal to that on the other outputs in order to obtain true zero I/O Delay. If I/O Delay adjustments are needed, use the Output Load Difference diagram to calculate loading differences between the CLKOUT pin and other outputs. For zero output-to-output skew, all outputs must be loaded equally.
