DESCRIPTION:

This 32-bit bus transceiver is built using advanced dual metal CMOS technology. This high-speed, low power transceiver is ideal for asynchronous communication between two busses (A and B). The Direction and Output Enable controls are designed to operate the device as either four independent 8-bit transceivers or one 32-bit transceiver. The direction control pins (DIR) control the direction of data flow. The output enable pins (\overline{OE}) override the direction control and disable both ports. All inputs are designed with hysteresis for improved noise margin.

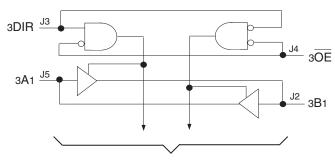

The ALVCH32245 has been designed with a ± 24 mA output driver. This driver is capable of driving a moderate to heavy load while maintaining speed performance.

The ALVCH32245 has "bus-hold" which retains the inputs' last state whenever the input bus goes to a high impedance. This prevents floating inputs and eliminates the need for pull-up/down resistors.
