GENERAL DESCRIPTION

The 8400011-25 is a General Purpose Clock Generator and a member of the family of high performance devices from IDT. The 8400011-25 can accept frequency from a 22.4MHz to 170MHz and generate a 22.4MHz to 170MHz output. The 8400011-25 has excellent phase jitter performance, from 637kHz – 10MHz integration range. The 8400011-25 is packaged in a small 8-pin TSSOP, making it ideal for use in systems with limited board space.

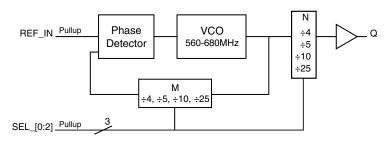

FEATURES

- One LVCMOS/LVTTL output, 15Ω output impedence
- Output frequency range: 22.4MHz 170MHz
- VCO range: 560MHz to 680MHz
- RMS phase jitter @ 125MHz (637kHz 10MHz): 0.36ps (typical)
- Full 3.3V or 2.5V operating supply
- -40°C to 85°C ambient operating temperature
- Available in lead-free (RoHS 6) package

All control pins have internal pullups or pulldowns; additional resistance is not required but can be added for additional protection. A $1k\Omega$ resistor can be used.

Power Considerations

This section provides information on power dissipation and junction temperature for the 840001I-25. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the 840001I-25 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for $V_{nn} = 3.3V + 5\% = 3.465V$, which gives worst case results.

Core and Output Power Dissipation

• Power (core, output) = V_{DD MAX} * (I_{DD} + I_{DDD}) = 3.465V * (83mA + 2mA) = **294.5mW**

LVCMOS Output Power Dissipation

- Output Impedance R_{out} Power Dissipation due to Loading 50Ω to V_{DDO}/2
 Output Current I_{OUT} = V_{DDO Max} / [2 * (50Ω + R_{OUT})] = 3.465V / [2 * (50Ω + 15Ω)] = 26.6mA
- Power Dissipation on the R_{out} per LVCMOS output Power $(R_{out}) = R_{out} * (I_{out})^2 = 15\Omega * (26.6mA)^2 = 10.6mW$ per output
- Dynamic Power Dissipation at 156.25MHz
 Power (156.25MHz) = C_{pp} * Frequency * (V_{ppp})² = 6pF * 156.25MHz * (3.465V)² = 11.26mW per output

Total Power Dissipation

- Total Power
 - = Power (core, output) + Power Dissipation (R_{out}) + Dyamic Power Dissipation (156.25MHz)
 - = 294.5mW + 10.6mW + 11.26mW
 - = 316.4mW

2. Junction Temperature.

Junction temperature, Tj, is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS[™] devices is 125°C.

The equation for Tj is as follows: Tj = $\theta_{JA} * Pd_{total} + T_{A}$

Tj = Junction Temperature

 θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_total = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming a moderate air flow of 1 meter per second and a multi-layer board, the appropriate value is 125.5°C/W per Table 5.

Therefore, Tj for an ambient temperature of 85°C with all outputs switching is:

 $85^{\circ}C + 0.316W * 125.5^{\circ}C/W = 124.7^{\circ}C$. This is below the limit of $125^{\circ}C$.

This calculation is only an example. Tj will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (multi-layer).
