

Description

The 9SQL4954 is a member of IDT's 'Lite' family of server clocks. It generates 4 100MHz outputs that exceed the requirements of the CK420BQ CPU/SRC clocks. Each output has its own OE# pin for clock management and supports 2 different spread spectrum levels in addition to spread off. It also provides a copy of the 25MHz internal XO. The 9SQL4954 supports PCIe Common Clock (CC) and Independent Reference Clock (IR) architectures.

Recommended Application

PCIe Gen1, Gen2, Gen3, Gen4 Server Clock

Output Features

- 4 -100MHz Low-power HCSL (LP-HCSL) CPU/SRC pairs
- Integrated terminations for 85Ω Zout
- 1 - 3.3V LVCMOS REF output w/Wake-On-LAN (WOL) support

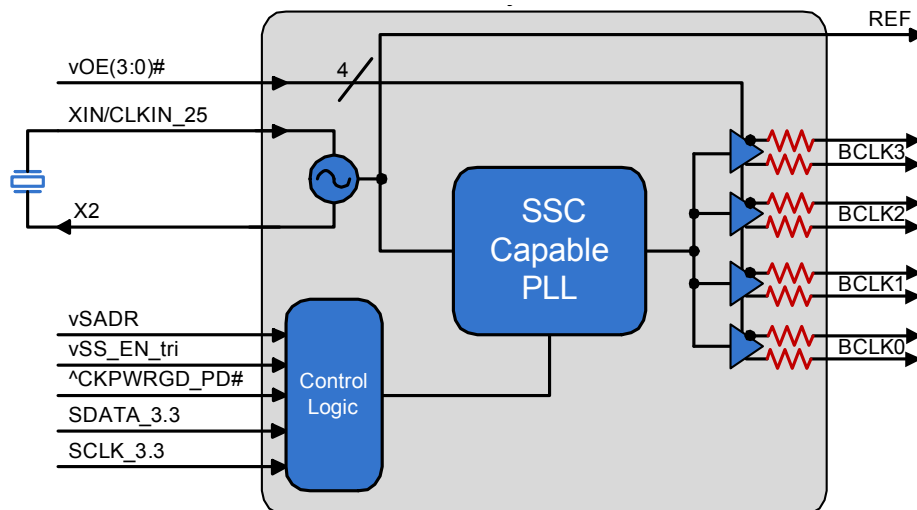

Key Specifications

- BCLK outputs:
 - Cycle-to-cycle jitter <50ps
 - Output-to-output skew <50ps
 - PCIe Gen1, Gen2, Gen3, Gen4 CC compliant
 - PCIe Gen2, Gen3 IR compliant
 - QPI/UPI compliant
 - SAS12G compliant (SSC off)
 - 12k-20M phase jitter <2ps rms (SSC off)
- REF output:
 - Phase jitter <200fs rms (SSC off)
- ±50ppm frequency accuracy on all clocks

Features/Benefits

- Direct connection to 85Ω transmission lines; saves 16 resistors and 27mm² compared to standard HCSL
- 142mW typical power consumption; eases thermal concerns @ 1/10 the power of CK420BQ
- Contains default configuration; SMBus interface not required for device operation
- OE# pins; support BCLK power management
- 25MHz input frequency; standard crystal frequency
- 25MHz REF output; eliminates XO from board
- Pin/SMBus selectable 0%, -0.25% or -0.5% spread on DIF outputs; minimize EMI and phase jitter for each application
- BCLK outputs blocked until PLL is locked; clean system start-up
- Two selectable SMBus addresses; multiple devices can easily share an SMBus segment
- Space saving 32-pin 5x5mm VFQFPN; minimal board space

Alternate Terminations

The 9SQL family can easily drive LVPECL, LVDS, and CML logic. See [“AN-891 Driving LVPECL, LVDS, and CML Logic with IDT's "Universal" Low-Power HCSL Outputs”](#) for details.

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 9SQL4954. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

¹ Measured from single-ended waveform.

² Measured from differential waveform.

³ Measured from -150 mV to +150 mV on the differential waveform (derived from REFCLK+ minus REFCLK-). The signal must be monotonic through the measurement region for rise and fall time. The 300 mV measurement window is centered on the differential zero crossing.

⁴ Measured at crossing point where the instantaneous voltage value of the rising edge of REFCLK+ equals the falling edge of REFCLK-.

⁵ Refers to the total variation from the lowest crossing point to the highest, regardless of which edge is crossing. Refers to all crossing points for this measurement.

⁶ Defines as the absolute minimum or maximum instantaneous period. This includes cycle to cycle jitter, relative PPM tolerance, and spread spectrum modulation.

⁷ Defined as the maximum instantaneous voltage including overshoot.

⁸ Defined as the minimum instantaneous voltage including undershoot.

⁹ Defined as the total variation of all crossing voltages of Rising REFCLK+ and Falling REFCLK-. This is the maximum allowed variance in V_{CROSS} for any particular system.

¹⁰ Refer to Section 4.3.7.1.1 of the PCI Express Base Specification, Revision 3.0 for information regarding PPM considerations.

¹¹ System board compliance measurements must use the test load. REFCLK+ and REFCLK- are to be measured at the load capacitors CL. Single ended probes must be used for measurements requiring single ended measurements. Either single ended probes with math or differential probe can be used for differential measurements. Test load CL = 2 pF.

¹² T_{STABLE} is the time the differential clock must maintain a minimum ±150 mV differential voltage after rising/falling edges before it is allowed to droop back into the VRB ±100 mV differential range.

¹³ PPM refers to parts per million and is a DC absolute period accuracy specification. 1 PPM is 1/1,000,000th of 100.000000 MHz exactly or 100 Hz. For 50 PPM, then we have an error budget of 100 Hz/PPM * 50 PPM = 5 kHz. The period is to be measured with a frequency counter with measurement window set to 100 ms or greater. The ±50PPM applies to systems that do not employ Spread Spectrum Clocking, or that use common clock source. For systems employing Spread Spectrum Clocking, there is an additional 2,500 PPM nominal shift in maximum period resulting from the 0.5% down spread resulting in a maximum average period specification of +2,550 PPM.

¹⁴ Matching applies to rising edge rate for REFCLK+ and falling edge rate for REFCLK-. It is measured using a ±75 mV window centered on the median cross point where REFCLK+ rising meets REFCLK- falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations. The Rise Edge Rate of REFCLK+ should be compared to the Fall Edge Rate of REFCLK-; the maximum allowed difference should not exceed 20% of the slowest edge rate.

1. Spread must be selected OFF or ON with the hardware latch pin. These bits should not be used to turn spread ON or OFF after power up. These bits can be used to change the spread amount, and B1[5] must be set to a 1 for these bits to have any effect on the part. If These bits are used to turn spread OFF or ON, the system will need to be reset.

“G” suffix to the part number are the Pb-Free configuration and are RoHS compliant.

“B” is the device revision designator (will not correlate with the datasheet revision).

Revision History

Rev.	Issue Date	Initiator	Description	Page #
F	11/4/2016	RDW	1. Updated test loads diagrams 2. Added typical Tdrive_PD# value 3. Slight adjustments to max REF slew rates 4. Added default impedance settings to Byte 12 and 13	4, 6, 10, 14
G	12/12/2016	RDW	1. Corrected impedance of differential test load from 100ohms to 85ohms	4
