## Description

The 9ZML1232 is a 2-input/12-output differential mux for use in servers. It meets the demanding DB1200ZL performance specifications and utilizes Low-Power HCSL-compatible outputs to reduce power consumption and termination components. It is suitable for PCI-Express Gen1–3 or QPI/UPI applications, and uses a fixed external feedback to maintain low drift for demanding QPI applications.

## Applications

Clock Mux for Servers

## **Output Features**

• 12 – Low-Power (LP) HCSL Output Pairs

### Features

- 25MHz to 100MHz ZDB mode; supports PFT clock delay management
- 9 selectable SMBus addresses; multiple devices can share same SMBus segment
- Separate VDDIO for outputs; allows maximum power savings
- PLL or bypass mode; PLL can dejitter incoming clock
- Hardware or software-selectable PLL BW; minimizes jitter peaking in downstream PLLs
- Spread spectrum compatible; tracks spreading input clock for EMI reduction
- SMBus interface; unused outputs can be disabled
- Differential outputs are Low/Low in power down; maximum power savings

## **Key Specifications**

- Cycle-to-cycle jitter < 50ps
- Output-to-output skew < 65ps
- Input-to-output delay: Fixed at 0ps
- Input-to-output delay variation < 50ps
- Phase jitter: PCIe Gen3 < 1ps rms
- Phase jitter: QPI/UPI 9.6GB/s < 0.2ps rms

## **Absolute Maximum Ratings**

Stresses above the ratings listed below can cause permanent damage to the 9ZML1232. These ratings, which are standard values for Renesas commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS	NOTES
3.3V Core Supply Voltage	VDDA, R				4.6	V	1,2
3.3V Logic Supply Voltage	VDD				4.6	V	1,2
I/O Supply Voltage	VDDIO				4.6	V	1,2
Input Low Voltage	V <sub>IL</sub>		GND-0.5			V	1
Input High Voltage	V <sub>IH</sub>	Except for SMBus interface			V <sub>DD</sub> +0.5V	V	1
Input High Voltage	VIHSMB	SMBus clock and data pins			5.5V	V	1
Storage Temperature	Ts		-65		150	°C	1
Junction Temperature	Tj				125	°C	1
Input ESD protection	ESD prot	Human Body Model	2000			V	1

<sup>1</sup>Guaranteed by design and characterization, not 100% tested in production.

<sup>2</sup> Operation under these conditions is neither implied nor guaranteed.

<sup>2</sup> Measured from differential waveform.

<sup>3</sup> Slew rate is measured through the Vswing voltage range centered around differential 0V. This results in a +/-150mV window around differential 0V.

<sup>4</sup> Matching applies to rising edge rate for Clock and falling edge rate for Clock#. It is measured using a +/-75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage.

<sup>5</sup> Vcross is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock# falling).

<sup>6</sup> The total variation of all Vcross measurements in any particular system. Note that this is a subset of Vcross\_min/max (Vcross absolute) allowed. The intent is to limit Vcross induced modulation by setting Δ-Vcross to be smaller than Vcross absolute.

### Notes for preceding table:

<sup>1</sup> Measured into fixed 2 pF load cap. Input to output skew is measured at the first output edge following the corresponding input.

<sup>2</sup> Measured from differential cross-point to differential cross-point. This parameter can be tuned with external feedback path, if present.

<sup>3</sup> All Bypass Mode Input-to-Output specs refer to the timing between an input edge and the specific output edge created by it.

<sup>4</sup> This parameter is deterministic for a given device.

<sup>5</sup> Measured with scope averaging on to find mean value.

<sup>6</sup> t is the period of the input clock.

<sup>7</sup> Measured as maximum pass band gain. At frequencies within the loop BW, highest point of magnification is called PLL jitter peaking.

<sup>8.</sup> Guaranteed by design and characterization, not 100% tested in production.

<sup>9</sup> Measured at 3 db down or half power point.

<sup>10</sup> Duty cycle distortion is the difference in duty cycle between the output and the input clock when the device is operated in bypass mode <sup>11</sup> Measured from differential waveform.
