The EL5111T is a high voltage rail-to-rail input-output amplifier with low power consumption. The EL5111T is a single amplifier which exhibits beyond the rail input capability, rail-to-rail output capability, and is unity gain stable.

The maximum operating voltage range is from 4.5 V to 19 V . It can be configured for single or dual supply operation, and typically consumes only 3 mA . The EL5111T has an output short circuit capability of $\pm 300 \mathrm{~mA}$ and a continuous output current capability of $\pm 70 \mathrm{~mA}$.

The EL5111T features a high slew rate of $100 \mathrm{~V} / \mu \mathrm{s}$, and fast settling time. Also, the device provides common mode input capability beyond the supply rails, rail-to-rail output capability, and a bandwidth of 60 MHz (-3dB). This enables the amplifier to offer maximum dynamic range at any supply voltage. These features make the EL5111T an ideal amplifier solution for use in TFT-LCD panels as a $\mathrm{V}_{\text {COM }}$ driver or static gamma buffer, and in high speed filtering and signal conditioning applications. Other applications include battery power and portable devices, especially where low power consumption is important.
The EL5111T is available in small 5 Ld TSOT package. It features a standard operational amplifier pinout. The device operates over an ambient temperature range of
$-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

## Features

- 60 MHz (-3dB) Bandwidth
- 4.5 V to 19 V Maximum Supply Voltage Range
- 100V/us Slew Rate
- 3mA Supply Current
- $\pm 70 \mathrm{~mA}$ Continuous Output Current
- $\pm 300 \mathrm{~mA}$ Output Short Circuit Current
- Unity-gain Stable
- Beyond the Rails Input Capability
- Rail-to-rail Output Swing
- Built-in Thermal Protection
- $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ Ambient Temperature Range
- Pb-Free (RoHS Compliant)

## Applications* (see page 13)

- TFT-LCD Panels
- $\mathrm{V}_{\text {COM }}$ Amplifiers
- Static Gamma Buffers
- Drivers for A/D Converters
- Data Acquisition
- Video Processing
- Audio Processing
- Active Filters
- Test Equipment
- Battery-powered Applications
- Portable Equipment

NOTES:

1. Please refer to TB347 for details on reel specifications.
2. These Intersil Pb -free plastic packaged products employ special Pb -free material sets, molding compounds/die attach materials, and $100 \%$ matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb -free soldering operations). Intersil Pb -free products are MSL classified at Pb -free peak reflow temperatures that meet or exceed the Pb -free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), please see device information page for EL5111T. For more information on MSL please see techbrief TB363.

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:
4. $\theta_{\mathrm{J}}$ is measured in free air with the component mounted on a high effective thermal conductivity test board. See Tech Brief TB379.
5. For $\theta_{\mathrm{J}} \mathrm{C}$, the "case temp" location is taken at the package top center.

IMPORTANT NOTE: All parameters having Min/Max specifications are guaranteed. Typ values are for information purposes only. Unless otherwise noted, all tests are at the specified temperature and are pulsed tests, therefore: $T_{J}=T_{C}=T_{A}$
Electrical Specifications $\mathrm{V}_{\mathrm{S}^{+}}=+5 \mathrm{~V}, \mathrm{~V}_{\mathrm{S}^{-}}=-5 \mathrm{~V}, \mathrm{R}_{\mathrm{L}}=1 \mathrm{k} \Omega$ to $0 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, Unless Otherwise Specified.

NOTES:
6. Measured over $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ ambient operating temperature range. See the typical TCV OS production distribution shown in the "Typical Performance Curves" on page 6.
7. Typical slew rate is an average of the slew rates measured on the rising ( $20 \%$ to $80 \%$ ) and the falling ( $80 \%$ to $20 \%$ ) edges of the output signal.
8. Settling time measured as the time from when the output level crosses the final value on rising/falling edge to when the output level settles within a $\pm 0.1 \%$ error band. The range of the error band is determined by: Final Value(V) $\pm[$ Full Scale(V)*0.1\%].

## Applications Information

## Product Description

The EL5111T is a high voltage rail-to-rail input-output amplifier with low power consumption. The EL5111T is a single amplifier which exhibits beyond the rail input capability, rail-to-rail output capability, and is unity gain stable.

The EL5111T features a high slew rate of $100 \mathrm{~V} / \mu \mathrm{s}$, and fast settling time. Also, the device provides common mode input capability beyond the supply rails, rail-to-rail output capability, and a bandwidth of 60 MHz (-3dB). This enables the amplifier to offer maximum dynamic range at any supply voltage.

## Operating Voltage, Input and Output Capability

The EL5111T can operate on a single supply or dual supply configuration. The EL5111T operating voltage ranges from a minimum of 4.5 V to a maximum of 19 V . This range allows for a standard 5 V (or $\pm 2.5 \mathrm{~V}$ ) supply voltage to dip to $-10 \%$, or a standard 18 V (or $\pm 9 \mathrm{~V}$ ) to rise by $+5.5 \%$ without affecting performance or reliability.
The input common-mode voltage range of the EL5111T extends 500 mV beyond the supply rails. Also, the EL5111T is immune to phase reversal. However, if the common mode input voltage exceeds the supply voltage by more than 0.5 V , electrostatic protection diodes in the input stage of the device begin to conduct. Even though phase reversal will not occur, to maintain optimal reliability it is suggested to avoid input overvoltage conditions. Figure 30 shows the input voltage driven 500 mV beyond the supply rails and the device output swinging between the supply rails.
The EL5111T output typically swings to within 50 mV of positive and negative supply rails with load currents of $\pm 5 \mathrm{~mA}$. Decreasing load currents will extend the output voltage range even closer to the supply rails. Figure 31 shows the input and output waveforms for the device in a unity-gain configuration. Operation is from $\pm 5 \mathrm{~V}$ supply with a $1 k \Omega$ load connected to GND. The input is a $10 \mathrm{~V}_{\mathrm{P}-\mathrm{P}}$ sinusoid and the output voltage is approximately $9.9 \mathrm{~V}_{\mathrm{P}-\mathrm{p}}$.
Refer to the "Electrical Specifications" Table beginning on page 3 for specific device parameters. Parameter variations with operating voltage, loading and/or temperature are shown in the "Typical Performance Curves" on page 6.

FIGURE 30. OPERATION WITH BEYOND-THE-RAILS INPUT

FIGURE 31. OPERATION WITH RAIL-TO-RAIL INPUT AND OUTPUT

## Output Current

The EL5111T is capable of output short circuit currents of 300 mA (source and sink), and the device has built-in protection circuitry which limits the output current to $\pm 300 \mathrm{~mA}$ (typical).

To maintain maximum reliability, the continuous output current should never exceed $\pm 70 \mathrm{~mA}$. This $\pm 70 \mathrm{~mA}$ limit is determined by the characteristics of the internal metal interconnects. Also, see "Power Dissipation" on page 12 for detailed information on ensuring proper device operation and reliability for temperature and load conditions.

## Thermal Shutdown

The EL5111T has a built-in thermal protection which ensures safe operation and prevents internal damage to the device due to overheating. When the die temperature reaches $+165^{\circ} \mathrm{C}$ (typical) the device automatically shuts OFF the output by putting it in a high impedance state. When the die cools by $+15^{\circ} \mathrm{C}$ (typical) the device automatically turns ON the output by putting it in a low impedance (normal) operating state.

## Driving Capacitive Loads

As load capacitance increases, the -3dB bandwidth will decrease and peaking can occur. Depending on the application, it may be necessary to reduce peaking and to improve device stability. To improve device stability a snubber circuit or a series resistor may be added to the output of the EL5111T.

A snubber is a shunt load consisting of a resistor in series with a capacitor. An optimized snubber can improve the phase margin and the stability of the EL5111T. The advantage of a snubber circuit is that it does not draw any DC load current or reduce the gain.

Another method to reduce peaking is to add a series output resistor (typically between $1 \Omega$ to $10 \Omega$ ). Depending on the capacitive loading, a small value resistor may be the most appropriate choice to minimize any reduction in gain.

## Power Dissipation

With the high-output drive capability of the EL5111T amplifier, it is possible to exceed the $+150^{\circ} \mathrm{C}$ absolute maximum junction temperature under certain load current conditions. It is important to calculate the maximum power dissipation of the EL5111T in the application. Proper load conditions will ensure that the EL5111T junction temperature stays within a safe operating region.

The maximum power dissipation allowed in a package is determined according to Equation 1:
$P_{\text {DMAX }}=\frac{T_{\text {JMAX }}-T_{\text {AMAX }}}{\theta_{\text {JA }}}$
where:

- $T_{\text {JMAX }}=$ Maximum junction temperature
- $\mathrm{T}_{\text {AMAX }}=$ Maximum ambient temperature
- $\Theta_{\mathrm{JA}}=$ Thermal resistance of the package
- $P_{\text {DMAX }}=$ Maximum power dissipation allowed

The total power dissipation produced by an IC is the total quiescent supply current times the total power supply voltage, plus the power dissipation in the IC due to the load, or:
$P_{\text {DMAX }}=V_{S} \times I_{\text {SMAX }}+\left(V_{S}+-V_{\text {OUT }}\right) \times I_{\text {LOAD }}$
when sourcing, and:
$P_{\text {DMAX }}=\mathrm{V}_{\text {S }} \times \mathrm{I}_{\text {SMAX }}+\left(\mathrm{V}_{\text {OUT }}-\mathrm{V}_{\mathrm{S}^{-}}\right) \times \mathrm{I}_{\text {LOAD }}$
when sinking,
where:

$$
\begin{aligned}
& \text { - } \mathrm{V}_{\mathrm{S}}=\text { Total supply voltage }\left(\mathrm{V}_{\mathrm{S}^{+}}-\mathrm{V}_{\mathrm{S}^{-}}\right) \\
& \text {- } \mathrm{V}_{\mathrm{S}^{+}}=\text {Positive supply voltage } \\
& \text { - } \mathrm{V}_{\mathrm{S}^{-}}=\text {Negative supply voltage } \\
& \text { - I ISMAX = Maximum supply current } \\
& \text { (ISMAX = EL5111T quiescent current) }
\end{aligned}
$$

- $\mathrm{V}_{\text {OUT }}=$ Output voltage
- I LOAD $=$ Load current

Device overheating can be avoided by calculating the minimum resistive load condition, $\mathrm{R}_{\text {LOAD }}$, resulting in the highest power dissipation. To find R LOAD set the two PDMAX equations equal to each other and solve for $\mathrm{V}_{\text {OUT }} / \mathrm{I}_{\text {LOAD }}$. Reference the package power dissipation curves, Figures 32 and 33, for further information.

## Power Supply Bypassing and Printed Circuit Board Layout

The EL5111T can provide gain at high frequency, so good printed circuit board layout is necessary for optimum performance. Ground plane construction is highly recommended, trace lengths should be as short as possible and the power supply pins must be well bypassed to reduce any risk of oscillation.

For normal single supply operation (the $\mathrm{V}_{\mathrm{S}^{-}}$pin is connected to ground) a $4.7 \mu \mathrm{~F}$ capacitor should be placed from $\mathrm{V}_{\mathrm{S}}+$ to ground, then a parallel $0.1 \mu \mathrm{~F}$ capacitor should be connected as close to the amplifier as possible. One $4.7 \mu \mathrm{~F}$ capacitor may be used for multiple devices. For dual supply operation the same capacitor combination should be placed at each supply pin to ground.

## Products

Intersil Corporation is a leader in the design and manufacture of high-performance analog semiconductors. The Company's products address some of the industry's fastest growing markets, such as, flat panel displays, cell phones, handheld products, and notebooks. Intersil's product families address power management and analog signal processing functions. Go to www.intersil.com/products for a complete list of Intersil product families.
*For a complete listing of Applications, Related Documentation and Related Parts, please see the respective device information page on intersil.com: EL5111T
To report errors or suggestions for this datasheet, please go to www.intersil.com/askourstaff
FITs are available from our website at http://rel. intersil.com/reports/search.php

Rev. B 2/07
NOTES:

1. Plastic or metal protrusions of 0.15 mm maximum per side are not included.
2. Plastic interlead protrusions of 0.15 mm maximum per side are not included.
3. This dimension is measured at Datum Plane " H ".
4. Dimensioning and tolerancing per ASME Y14.5M-1994.
5. Index area - Pin \#1 I.D. will be located within the indicated zone (TSOT6 AND TSOT8 only).
6. TSOT5 version has no center lead (shown as a dashed line).
