# Renesns 

## Description

The F1958 is part of IDT's Glitch-Free ${ }^{\text {TM }}$ family of DSAs optimized for the demanding requirements of Base Station (BTS) radio cards and numerous other applications. This device is offered in a compact $4 \mathrm{~mm} \times 4 \mathrm{~mm} 24$-pin package with $50 \Omega$ input and output impedance for ease of integration into the radio or RF system.

The F1958 offers very high reliability due to its construction from a monolithic silicon die in a QFN package. The insertion loss is very low with minimal distortion. Additionally, the device is designed to have extremely accurate attenuation levels. These accurate attenuation levels improve system SNR and/or ACLR by ensuring system gain is as close to the targeted level as possible. In addition, the very fast settling time in parallel mode is ideal for fast switching systems. Finally, the device uses our Glitch-Free ${ }^{T M}$ technology in contrast to competing DSAs.

## Competitive Advantage

- Lowest insertion loss for best SNR
- Glitch-Free™ technology to protect power amplifiers or ADC during transitions between attenuation states
- Extremely accurate attenuation levels
- Ultra-low distortion
- MSL1 and 2000 V HBM ESD

## Typical Applications

- 3G/4G/4G+ Base Station Systems
- Distributed Antenna Systems, DAS
- Remote Radio Heads
- Active Antenna Systems, AAS Broadband Satellite Equipment
- NFC Infrastructure
- Military Communication Equipment

## Features

- Serial and 7-bit parallel interface
- 31.75dB range
- 0.25 dB steps
- Glitch-Free ${ }^{\text {TM: }}$ low transient overshoot
- 500 ns settling time for 0.25 dB steps
- Ultra linear > 63dBm IIP3
- Low insertion loss < 1.7dB at 4GHz
- Attenuation error $< \pm 0.2 \mathrm{~dB}$ at 4 GHz
- Bi-directional RF use
- 3.3 V or 5 V supply
- $-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$ operating temperature
- $4 \mathrm{~mm} \times 4 \mathrm{~mm}$ Thin QFN 24 -pin package

## Pin Descriptions

Table 1. Pin Descriptions

| Number | Name |  |
| :---: | :---: | :--- |
| 1 | D0 | Parallel control pin - 0.25dB. Pull high for attenuation. |
| 2 | $V_{\text {DD }}$ | Power supply input. Bypass to ground with capacitors as close as possible to pin. |
| 3 | $V_{\text {MODE }}$ | Parallel or serial programming mode pin. Leave open or logic LOW for parallel mode. Logic HIGH for <br> serial mode. |
| $4,6-13,15$ | GND | Internally grounded. These pins must be grounded as close to the device as possible. |
| 5 | RF1 | RF Port 1. Can be used as either the input or output RF (bi-directional). Port must be at 0V DC. An <br> external AC coupling capacitor must be used if there is a DC voltage present. |
| 14 | RF2 | RF Port 2. Can be used as either the input or output RF (bi-directional). Port must be at 0V DC. An <br> external AC coupling capacitor must be used if there is a DC voltage present. |
| 16 | LE | Serial latch enable. |
| 17 | CLK | Serial clock input. |
| 19 | DATA | Serial data input. |
| 20 | D6 | Parallel control pin - 16dB. Pull HIGH for attenuation. [a] |
| 21 | D5 | Parallel control pin - 8dB. Pull HIGH for attenuation. [a] |
| 22 | D3 | Parallel control pin - 4dB. Pull HIGH for attenuation. [a] |
| 23 | D2 | Parallel control pin - 2dB. Pull HIGH for attenuation. [a] |
| 24 | D1 | Parallel control pin - 1dB. Pull HIGH for attenuation. [a] |
| 18 | EPAD | Exposed paddle. Internally connected to ground. Solder this exposed paddle to a printed circuit board <br> (PCB) pad that uses multiple ground vias to provide heat transfer out of the device into the PCB ground <br> planes. These multiple ground vias are also required to achieve the specified RF performance. |

[a] There is a $500 \mathrm{k} \Omega$ pull-down resistor to ground.

## Programming

The F1958 can be programmed using either the parallel or the serial mode, which is selectable via $\mathrm{V}_{\text {MODE }}$ (pin 3). The serial mode is selected by pulling $\mathrm{V}_{\text {MODE }}$ to a logic HIGH, and the parallel mode is selected by floating $\mathrm{V}_{\text {MODE }}$ or setting it to logic LOW.

## Serial Mode

F1958 Serial Mode is selected by pulling $\mathrm{V}_{\text {MODE }}$ to a logic HIGH. The serial interface uses a 8 -bit word with only 7 bits used. The serial word is shifted in LSB (DO) first. When serial programming is used, all the parallel control input pins (1, 19-24) must be grounded.

Table 8. 7-Bit SPI Word Sequence

| Data Bit | Symbol |
| :---: | :---: |
| D7 | Not Used |
| D6 | Attenuation 16 dB Control Bit |
| D5 | Attenuation 8 dB Control Bit |
| D4 | Attenuation 4 dB Control Bit |
| D3 | Attenuation 2 dB Control Bit |

| $X$ | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 31.75 |

In the Serial Mode, the F1958 is programmed via the serial port on the rising edge of Latch Enable (LE). It is required that LE be kept logic LOW until all data bits are clocked into the shift register. The F1958 will change attenuation state after the data word is latched into the active register. Refer to Figure 33.

[a] $\left(\mathrm{t}_{\mathrm{CH}}+\mathrm{t}_{\mathrm{cL}}\right) \geq 1 / \mathrm{f}$.
[b] Once all desired data has been clocked in, LE must transition from LOW to HIGH after the minimum setup time $\mathrm{t}_{\mathrm{L}}$ and before any further CLK signals.

## Serial Mode Default Startup Condition

When the device is first powered up, it will default to the maximum attenuation of 31.75 dB independent of the $\mathrm{V}_{\text {MODE }}$ and parallel pin [D6:D0] conditions.

## Renesas

## Parallel Control Mode

For the F1958, the user has the option of running in one of two parallel modes. Direct Parallel Mode or Latched Parallel Mode.

## Direct Parallel Mode

Direct Parallel Mode is selected when $\mathrm{V}_{\text {MoDE }}$ is floating or a logic LOW and LE is a logic HIGH. In this mode, the device will immediately react to any voltage changes on the parallel control pins (1, 19-24). Use Direct Parallel Mode for the fastest settling time. The serial pins, CLK and DATA, can be either grounded or left opened in the Parallel Mode.

## Latched Parallel Mode

Latched Parallel Mode is selected when V Mode is floating or a logic LOW and LE is toggled from logic LOW to HIGH. To utilize Latched Parallel Mode:

- Set $\mathrm{V}_{\text {MODE }}$ to logic LOW or leave floating.
- Set LE to logic LOW.
- Adjust pins (1, 19-24) to the desired attenuation setting. (Note the device will not react to these pins while LE is a logic LOW).
- Set LE to a logic HIGH. The device will then transition to the attenuation settings reflected by pins D6-D0.
- If LE is set to a logic LOW then the attenuator will not change state.

The truth table for the Parallel Mode is identical for bits D6 to D0 as shown in the Serial Mode truth table; see Table 9.

## Renesns

## Evaluation Kit Operation

## Power Supply Setup

Set up a power supply in the voltage range of 3.0 V to 5.5 V with the power supply output disabled. The voltage can be applied via one of the following connections (see Figure 38):

- J11 connector
- J5 header connection (note the polarity of the GND pin on this connector)
- Pin $9\left(V_{D D}\right)$ and pin 10 (GND) on the J 6 header connection

Figure 38. Power Supply Connections

## Parallel Logic Control Setup

The Evaluation Board has the ability to control the F1958 in the Parallel Mode. For external control, apply logic voltages to the J6 header pins 1 through 7 (see Figure 39). For manual control, switches 1 through 7 on SW1 can be set. The switch is a three-position switch. The bottom position, "-" will ground the pin. The center position "O" will leave the pin open circuited. Setting the switch to the top position "+" will apply a voltage that is supplied to the switch.

The logic voltage can be applied in one of three ways:

- Apply a voltage through a SMA connector (J9). This connector is not supplied.
- Apply a voltage on pin 2 of the J 7 header connector.
- Short out the two header connectors, $\mathrm{J7}$ and JB , so a resistor divider will generate the correct logic voltage from the power supply on the Evaluation Board. The logic voltage will be $\mathrm{V}_{\mathrm{DD}}$.

## Serial Logic Control Setup

The Evaluation Board has the ability to control the F1958 in the Serial Mode. Connect the serial controller to the J10 header connection as shown in Figure 40. To use the Serial Mode, set SW1 switch 8 to the "+" or " 0 " position.

The attenuation setting can be programmed according to Table 9.
Figure 40. Serial Logic Connections

## Power-On Procedure

Set up the voltage supplies and Evaluation Board as described in the "Power Supply Setup" section and either the "Parallel Logic Control Setup" or "Serial Logic Control Setup" sections above.

- Enable the power supply.
- Enable the proper attenuation setting according to Table 9.

## Power-Off Procedure

- Set the logic control pins to a logic LOW.
- Disable the power supply.

## Application Information

## Digital Pin Voltage and Resistance Values

Table 14 provides the open-circuit DC voltage referenced to ground and resistance values for each of the control pins listed.
Table 14. Digital Pin Voltages and Resistance

| Pin | Name | Open Circuit <br> DC Voltage | Internal Connection |
| :---: | :---: | :---: | :---: |
| $3,16,17,18$ | $\mathrm{~V}_{\text {MODE }}$, LE, CLK, DATA | 0 V | $500 \mathrm{k} \Omega$ pull-down resistor to GND |
| $1,19-24$ | D0, D6 - D1 | 0 V | $500 \mathrm{k} \Omega$ pull-down resistor to GND |

## Power Supplies

A common power supply should be used for all pins requiring DC power. All supply pins should be bypassed with external capacitors to minimize noise and fast transients. Supply noise can degrade the noise figure and fast transients can trigger ESD clamps and cause them to fail. Supply voltage changes or transients should have a slew rate smaller than $1 \mathrm{~V} / 20 \mu \mathrm{~s}$. In addition, all control pins should remain at $0 \mathrm{~V}(+/-0.3 \mathrm{~V})$ while the supply voltage ramps or while it returns to zero.

If control signal integrity is a concern and clean signals cannot be guaranteed due to overshoot, undershoot, ringing, etc., the following circuit at the input of each control pin is recommended. This applies to pins for the $\operatorname{SPI}(16,17,18)$, parallel $(1,19-24)$ and $\mathrm{V}_{\text {mode }}$ pin (3) as shown below. Note the recommended resistor and capacitor values do not necessarily match the EVKit BOM for the case of poor control signal integrity. For multiple devices driven by a single control line, the component values will need to be adjusted accordingly so as not to load down the control line.
