Description

The F2911 is a high reliability, low insertion loss, 75Ω SPST RF switch designed for a multitude of wireless and RF applications. This device covers a broad frequency range from 1MHz to 3500MHz. In addition to providing low insertion loss, the F2911 also delivers excellent linearity and isolation performance while providing a 75Ω termination on one port in the isolation mode.

The F2911 uses a single positive supply voltage supporting either 3.3V or 1.8V control logic.

Competitive Advantage

The F2911 provides broadband RF performance to support the CATV market along with high power handling, and high isolation.

- Low insertion loss
- High isolation
- Excellent linearity
- Extended temperature range

Typical Applications

- CATV Infrastructure
- CATV Set-Top Boxes
- CATV Satellite Modems
- Data Network Equipment
- Fiber Networks

Features

- Low insertion loss: 0.33dB at 1200MHz
- High isolation: 53dB at 1200MHz
- Supply voltage: +2.7V to +5.5V
- 1.8V and 3.3V compatible control logic
- -40°C to +105°C operating temperature range
- 2mm x 2mm, 8-pin DFN package

Pin Descriptions

Table 1. Pin Descriptions

Pin	Name	Function
1, 4	NC	No internal connection. This pin may be connected to the exposed paddle and can be grounded.
2, 3	GND	Ground. This pin is internally connected to the ground paddle. Ground this pin as close to the device as possible.
5	RF1	RF1 port. This pin is matched to 75Ω in the insertion loss state only. If this pin is not 0V DC, then an external coupling capacitor must be used.
6	V_{DD}	Power supply. Bypass to GND with capacitors as shown in the Figure 16 as close as possible to pin.
7	V1	Logic control pin. See Table 7 for proper logic setting.
8	RF2	RF2 port. Matched to 75Ω. If this pin is not 0V DC, then an external coupling capacitor must be used.
	EP	Exposed pad. This pad is internally connected to GND. Solder this exposed pad to a PCB pad that uses multiple ground vias to provide heat transfer out of the device and into the PCB ground planes. These multiple ground vias are also required to achieve the specified RF performance.

Absolute Maximum Ratings

Stresses beyond those listed below may cause permanent damage to the device. Functional operation of the device at these or any other conditions beyond those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Unless otherwise noted:

- V_{DD} = +3.3V
- T_{EP} = 25°C
- $Z_S = Z_L$ = 75Ω
- f_{RF} = 1GHz
- Small signal tests done at 0dBm input power.
- RF2 is the driven port.
- All temperatures are referenced to the exposed paddle.
- Evaluation Kit (EVKit) traces and connector losses are de-embedded for the insertion loss and isolation plots. All other plots include the loss and effects of the PCB.

Application Information

Default Start-up

The V1 control pin includes no internal pull-down resistors to logic LOW or pull-up resistors to logic HIGH.

Power Supplies

A common V_{DD} power supply should be used for all pins requiring DC power. All supply pins should be bypassed with external capacitors to minimize noise and fast transients. Supply noise can degrade the noise figure, and fast transients can trigger ESD clamps and cause them to fail. Supply voltage change or transients should have a slew rate slower than 1V/20µs. In addition, all control pins should remain at 0V (± 0.3V) while the supply voltage ramps up or while it returns to zero.

Control Pin Interface

If a clean control signal cannot be guaranteed due to overshoot, undershoot, or ringing, etc., the following circuit at the input of the control pin is recommended.

Evaluation Kit (EVKit) Operation

External Supply Setup

Set up a main power supply in the voltage range of 2.7V to 5.5V with the power supply output disabled.

Connect the disabled power supply to J5 pin 1 (VCC) and ground to J5 pin 8 (GND).

Logic Control Setup

Using the EVKIT to set the control logic:

On connector J5, connect a 2-pin shunt from pin 3 (VCC) to pin 4 (VLOGIC). This connection allows the main power supply to power the EVKit logic control network (R1 and R2). Resistors R1 and R2 form a voltage divider to set the V_{IH} level over the 2.7V to 5.5V supply range for manual logic control.

See Table 7 for Switch Control Truth Table states. With the logic control network enabled (as noted above), pin 5 can be left open to provide a logic HIGH through pull-up resistor R1. To set a logic LOW for V1, connect a 2-pin shunt on J5 from pin 5 (V1) to pin 6 (GND).

Note that when using the on-board R1/R2 voltage divider, the current draw from the power supply will be higher by approximately the main power supply voltage divided by 33kΩ.

Using external control logic:

Remove any jumpers from connector J5. Connect the disabled external logic control to V1 (pin 5) of connector J5. See Table 7 for the Switch Control Truth Table settings. Note that even with the R1/R2 divider network disabled, R2 will still be a load (18kΩ to GND) for an external control signal applied to V1.

Turn On Procedure / Operation

Setup the supplies and EVKit as noted in the External Supply Setup and Logic Control Setup sections above.

Enable the power supply.

If using the EVKIT to manually set the control logic: Set the logic setting to achieve the desired Table 7 configuration by placing a shunt between J5 pins 5 and 6 for a logic LOW or leave pins 5 and 6 open for a logic HIGH.

If using the external control logic setup above: Enable the logic control signal. Set the logic signal level to achieve the desired Table 7 configuration. Note that external control logic should not be applied without the main power supply being present.

Turn Off Procedure

Set any external logic control to 0V.
Disable the main power supply.
