HS-3182

ARINC 429 Bus Interface Line Driver Circuit

The HS-3182 is a monolithic dielectric ally isolated bipolar differential line driver designed to meet the specifications of ARINC 429. This device is intended to be used with a companion chip, HS-3282 CMOS ARINC Bus Interface Circuit, which provides the data formatting and processor interface function.

All logic inputs are TTL and CMOS compatible. In addition to the DATA (A) and DATA (B) inputs, there are also inputs for CLOCK and SYNC signals which are AND'd with the DATA inputs. This feature enhances system performance and allows the HS-3182 to be used with devices other than the HS-3182.

Three power supplies are necessary to operate the HS-3182: +V = +15V ±10%, -V = -15V ±10%, and V1 = 5V ±5%. V_{REF} is used to program the differential output voltage swing such that V_{OUT} (DIFF) = ±2VREF. Typically, V_{REF} = V1 = 5V ±5%, but a separate power supply may be used for VREF which should not exceed 6V.

The driver output impedance is 75Ω ±20% at +25°C. Driver output rise and fall times are independently programmed through the use of two external capacitors connected to the CA and CB inputs. Typical capacitor values are CA = CB = 75pF for high-speed operation (100kBPS), and CA = CB = 300pF for low-speed operation (12kBPS to 14.5kBPS). The outputs are protected against overvoltage and short circuit as shown in the Block Diagram. The HS-3182 is designed to operate over an ambient temperature range of -55°C to +125°C, or -40°C to +85°C.

t_R measured 50% to 90% x 2

t_F measured 50% to 10% x 2

V_{IH} = 5V V_{OL} = -4.75V to -5.25V

V_{IL} = 0V V_{OH} = 4.75V to 5.25V

When the Data (A) input is in the Logic One state and the Data (B) input is in the Logic Zero state, A_{OUT} is equal to V_{REF} and B_{OUT} is equal to $-V_{REF}$. This constitutes the Output High state. Data (A) and Data (B) both in the Logic Zero state causes both A_{OUT} and B_{OUT} to be equal to 0V which designates the output Null state. Data (A) in the Logic Zero state and Data (B) in the Logic One state causes A_{OUT} to be equal to $-V_{REF}$ and B_{OUT} to be equal to V_{REF} which is the Output Low state.
