Precision Single Digitally Controlled Potentiometer (XDCP ${ }^{\text {TM }}$ ) Low Noise, Low Power, ${ }^{2}{ }^{2}{ }^{\text {TM }}{ }^{\text {TM }}$ Bus, 128 Taps

Rev 1.00
April 15, 2010

The digitally controlled potentiometer is implemented with a combination of resistor elements and CMOS switches. The position of the wiper is controlled by the user through the $I^{2} \mathrm{C}$ bus interface. The potentiometer has an associated volatile Wiper Register (WR) and a non-volatile Initial Value Register (IVR) that can be directly written to and read by the user. The contents of the WR control the position of the wiper. At power up, the device recalls the contents of the DCP's IVR to the WR.

The highly precise ISL22317 features a low end-to-end temperature coefficient of TC_Ref $\pm 10 \mathrm{ppm} /{ }^{\circ} \mathrm{C}$ and precise resistance selection. It maintains less than $\pm 1 \%$ typical variance from the ideal resistance at each wiper position providing 99\% accuracy of selected resistance value. This highly accurate DCP eliminates the need for complex algorithms to guarantee precision. The ISL22317 allows the user to dial in an accurate resistance and the EEPROM memory stores the set value for life, or until changed by the user.

An external $0.5 \%$ or better reference resistor must be attached to the ISL22317. The ISL22317 will mirror both the precise resistance and temperature coefficient of the external resistor.

The DCP can be used as a three-terminal potentiometer or as a two-terminal variable resistor in a wide variety of applications including control, parameter adjustments, and signal processing.

## Pinout

## Features

- Precision Digitally Controlled Potentiometer
- 99\% Typical Accuracy Of Resistance Over Operational Conditions
- Zero-Compensated Wiper Resistance
- Integrated Digitally Controlled Potentiometer
- 128-Tap Positions
- $1^{2} C$ Serial Interface
- Pin Selectable Slave Address
- $10 \mathrm{k} \Omega, 50 \mathrm{k} \Omega$ and $100 \mathrm{k} \Omega$ Total Resistance
- Monotonic Over-Temperature
- Non-Volatile EEPROM Storage of Wiper Position
- 0 to VCC Terminal Voltage
- Single 2.7 V to 5.5 V Supply
- High Reliability
- 50 Years Retention @ $\leq+55^{\circ} \mathrm{C}$
- 15 Years Retention @+125 ${ }^{\circ} \mathrm{C}$
- 1,000,000 Cycles Endurance
- $3 m m x 3 m m$ Thin DFN Package -0.75 mm Max Thickness, 0.65 mm Pitch
- Pb-Free (RoHS Compliant)

## Applications

- Setting Precise Current Values for DC Margining and Backlight Control
- Replaces Complex Compensation Circuitry That Stores Values in Look-up Tables Needed for Precise Resistor Setting
- Setting Precise Resistance Values for Test and Measurement Circuits
- Adjust Specific Resistances in Analog Circuits
- Precise Calibration and Fine Tune-Up

## Ordering Information

| PART NUMBER (Notes 1, 2, 3) | PART MARKING | RESISTANCE OPTION (k $\Omega$ ) | TEMP. RANGE ( ${ }^{\circ} \mathrm{C}$ ) | PACKAGE (Pb-free) | PKG. DWG. \# |
| :---: | :---: | :---: | :---: | :---: | :---: |
| ISL22317TFRTZ | 317T | 100 | -40 to +125 | 10 Ld TDFN | L10.3x3B |
| ISL22317UFRTZ | 317U | 50 | -40 to +125 | 10 Ld TDFN | L10.3x3B |
| ISL22317WFRTZ | 317W | 10 | -40 to +125 | 10 Ld TDFN | L10.3x3B |

NOTES:

1. Add "-TK" suffix for tape and reel. Please refer to TB347 for details on reel specifications.
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and $100 \%$ matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb -free soldering operations). Intersil Pb -free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD020.
3. For Moisture Sensitivity Level (MSL), please see device information page for ISL22317. For more information on MSL please see techbrief TB363.

## Pin Descriptions

| TDFN <br> PIN \# | SYMBOL | DESCRIPTION |
| :---: | :---: | :--- |
| 1 | SCL | Open drain I ${ }^{2}$ C interface clock input |
| 2 | SDA | Open drain Serial data I/O for the I ${ }^{2}$ C interface |
| 3 | A1 | Device address input for the I ${ }^{2}$ C interface |
| 4 | REF_A | Terminal A for an external reference resistor |
| 5 | REF_B | Terminal B for an external reference resistor |
| 6 | GND | Device ground pin |
| 7 | RL | "Low" terminal of DCP |
| 8 | RW | "Wiper" terminal of DCP |
| 9 | RH | "High" terminal of DCP |
| 10 | VCC | Power supply pin |
|  | EPAD* | Exposed Die Pad internally connected to <br> GND |

*PCB thermal land for QFN/TDFN EPAD should be connected to GND plane or left floating. For more information refer to http://www.intersil.com/data/tb/TB389.pdf

| Absolute Maximum Ratings |  |
| :---: | :---: |
| Voltage at any Digital Interface Pin with respect to GND. | .3V |
| $V_{C C}$ | -0.3 V to +6.0V |
| Voltage at any DCP Pin with respect | GND . . . . . . . . . 0 V to $\mathrm{V}_{\text {CC }}$ |
| IW (10s) | $\pm 6 \mathrm{~mA}$ |
| Latchup (Note 6) | Class II, Level B at $+125^{\circ} \mathrm{C}$ |
| ESD |  |
| Human Body Model | .5kV |
| Machine Model. | .500V |

## Thermal Information

| Thermal Resistance (Typical, Notes 4, 5) | $\theta_{\mathrm{JA}}\left({ }^{\circ} \mathrm{C} / \mathrm{W}\right.$ ) | $\theta_{\mathrm{JC}}\left({ }^{\circ} \mathrm{C} / \mathrm{W}\right)$ |
| :---: | :---: | :---: |
| 10 Lead TDFN | 44 | 3 |
| Storage Temperature | -6 | to $+150^{\circ} \mathrm{C}$ |
| Maximum Junction Temperature (Plastic | ackage). | + $150^{\circ} \mathrm{C}$ |

## Recommended Operating Conditions

Temperature Range (Extended Industrial). . . . . . . . $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$
VCC .................................................... . . 2.7V to 5.5 V

Power Rating . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 15 mW
Wiper Current . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . $\pm 3.0 \mathrm{~mA}$

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:
4. $\theta_{\mathrm{JA}}$ is measured in free air with the component mounted on a high effective thermal conductivity test board with "direct attach" features. See Tech Brief TB379.
5. For $\theta_{\mathrm{JC}}$, the "case temp" location is the center of the exposed metal pad on the package underside.
6. Jedec Class II pulse conditions and failure criterion used. Level B exceptions is using a minimum negative pulse of -0.8 V on the A 1 pin.

Analog Specifications Over recommended operating conditions unless otherwise stated.

## NOTES:

7. Typical values are for $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$ and 3.3 V supply voltage.
8. LSB: $\left[V\left(R_{W}\right)_{127}-V\left(R_{W}\right)_{0}\right] / 127 . ~ V\left(R_{W}\right)_{127}$ and $V\left(R_{W}\right)_{0}$ are $V\left(R_{W}\right)$ for the $D C P$ register set to $7 F$ hex and 00 hex respectively. LSB is the incremental voltage when changing from one tap to an adjacent tap.
9. $Z S_{E R R O R}=V(R W)_{0} / L S B$.
10. $F S_{\text {error }}=\left[V(R W)_{127}-V_{C C}\right] / L S B$.
11. $\mathrm{DNL}=\left[\mathrm{V}(\mathrm{RW})_{\mathrm{i}}-\mathrm{V}(\mathrm{RW})_{\mathrm{i}-1}\right] / \mathrm{LSB}-1$, for $\mathrm{i}=1$ to 127 , where i is the DCP register setting.
12. $\operatorname{INL}=\left[V(R W)_{i}-i \cdot L S B-V(R W)_{0}\right] / L S B$ for $i=1$ to 127
13. $T C_{V}=\frac{\operatorname{Max}\left(V(R W)_{\mathrm{i}}\right)-\operatorname{Min}\left(\mathrm{V}(\mathrm{RW})_{\mathrm{i}}\right)}{\left[\operatorname{Max}\left(\mathrm{V}(\mathrm{RW})_{\mathrm{i}}\right)+\operatorname{Min}\left(\mathrm{V}(\mathrm{RW})_{\mathrm{i}}\right)\right] / 2} \times \frac{10^{6}}{}+165^{\circ} \mathrm{C}$ for $\mathrm{i}=15$ to 127 decimal, $\mathrm{T}=-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$. Max() is the maximum value of the wiper Min() is the minimum value of the wiper voltage over the temperature range.
14. $\mathrm{MI}=\left|R W_{127}-R W_{0}\right| 127$. MI is a minimum increment. $R W_{127}$ and $R W_{0}$ are the measured resistances for the $D C P$ register set to 7 F hex and 00 hex respectively.
15. $\mathrm{R}_{\text {OFFSET }}=\mathrm{RW}_{0} / \mathrm{MI}$, when measuring between RW and RL
16. $R_{D N L}=\left(R W_{i}-R W_{i-1}\right) / M I-1$, for $i=1$ to 127 .
17. $R_{I N L}=\left[R W_{i}-(M I \cdot i)-R W_{0}\right] / M I$, for $i=1$ to 127 .
18. $\mathrm{TC}_{\mathrm{R}}=\frac{[\operatorname{Max}(\mathrm{Ri})-\operatorname{Min}(\mathrm{Ri})]}{} \times 10^{6}$ for $\mathrm{i}=15$ to $127, \mathrm{~T}=-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C} . \operatorname{Max}()$ is the maximum value of the resistance and $\operatorname{Min}()$ is $T C_{R}=\frac{[\mathrm{Max}(\mathrm{Ri})-\mathrm{Min}(\mathrm{Ri})]}{[\mathrm{Max}(\mathrm{Ri})+\operatorname{Min}(\mathrm{Ri})] / 2} \times \frac{10}{+165^{\circ} \mathrm{C}}$ the minimum value of the resistance over the temperature range.
19. Limits should be considered typical and are not production tested.
20. In rheostat mode, if a current is injected into the RW terminal, the magnitude of the current should be such that the developed potential difference between RW and RL terminals is at least 300 mV , even at the minimum wiper setting. This ensures that the recommended operating condition of $\mathrm{V}(\mathrm{RW}) \geq \mathrm{V}(\mathrm{RL})+0.3 \mathrm{~V}$ is satisfied and the part operates in its most accurate resistance. Minimum and Maximum wiper setting can be calculated as follow, MIN code $=\left(0.3 V^{*} 127\right) /\left(I w^{*} R t o t a l\right)$, Max code $=\left[\left(V_{\text {CC }}-0.3 \mathrm{~V}\right)^{*} 127\right] /\left(\mathrm{Iw}^{*} \mathrm{R}_{\text {TOTAL }}\right)$.
21. $\mathrm{t}_{\mathrm{W}}$ is the time from a valid STOP condition at the end of a Write sequence of $\mathrm{I}^{2} \mathrm{C}$ serial interface, to the end of the self-timed internal non-volatile write cycle.
22. Parameters with MIN and/or MAX limits are $100 \%$ tested at $+25^{\circ} \mathrm{C}$, unless otherwise specified. Temperature limits established by characterization and are not production tested.

## Pin Description

## Potentiometers Pins

## RH AND RL

The high ( RH ) and low ( RL ) terminals of the ISL22317 are equivalent to the fixed terminals of a mechanical potentiometer. RH and RL are referenced to the relative position of the wiper and the voltage potential on the terminals. With WR set to 127 decimal, the wiper will be closest to RH. With the WR set to 0 , the wiper is closest to RL. The voltage potential on the RH terminal must be higher than voltage potential on RL terminal.

## RW

RW is the wiper terminal and is equivalent to the movable terminal of a mechanical potentiometer. The position of the wiper within the array is determined by the WR register.

## REF_A, REF_B

REF_A and REF_B are pins to connect an external resistor. If application is required to connect $R L$ terminal to GND, then the REF_B pin should also be connected to GND.

FIGURE 18. TC FOR VOLTAGE DIVIDER MODE (10k/50k/100k) IN ppm [ $R_{\text {REF }} 10 \mathrm{ppm} /{ }^{\circ} \mathrm{C}$ ]

FIGURE 20. WIPER RESISTANCE vs TAP POSITION WHEN PRECISION IS OFF

Warning! Do not connect REF_A to GND under any circumstances. That may damage the ISL22317.

## Bus Interface Pins

## SERIAL DATA INPUT/OUTPUT (SDA)

The SDA is a bidirectional serial data input/output pin for $I^{2} C$ interface. It receives device address, operation code, wiper address and data from an $I^{2} \mathrm{C}$ external master device at the rising edge of the serial clock SCL, and it shifts out data after each falling edge of the serial clock.

SDA requires an external pull-up resistor, since it is an open drain input/output.

## SERIAL CLOCK (SCL)

This input is the serial clock of the $\mathrm{I}^{2} \mathrm{C}$ serial interface.

## DEVICE ADDRESS (A1)

The address input is used to set the A1 bit of the 7 -bit $I^{2} \mathrm{C}$ interface slave address, see Table 4. A match in the slave address serial data stream must match with the Address input pins in order to initiate communication with the ISL22317. A
maximum of two ISL22317 devices may occupy the $\mathrm{I}^{2} \mathrm{C}$ serial bus with addresses 50 h and 54 h .

## Principles of Operation

The ISL22317 is an integrated circuit incorporating one DCP with its associated registers, non-volatile memory and an $I^{2} \mathrm{C}$ serial interface providing direct communication between a host and the potentiometer and memory. The resistor array is comprised of individual resistors connected in series. At either end of the array and between each resistor, is an electronic switch that transfers the potential at that point to the wiper.

The electronic switches on the device operate in a "make before break" mode when the wiper changes tap positions.

When the device is powered down, the last value stored in IVR will be maintained in the non-volatile memory. When power is restored, the contents of the IVR is recalled and loaded into the WR to set the wiper to the initial value.

## DCP Description

The DCP is implemented with a combination of resistor elements and CMOS switches. The physical ends of each DCP are equivalent to the fixed terminals of a mechanical potentiometer (RH and RL pins). The RW pin of the DCP is connected to intermediate nodes, and is equivalent to the wiper terminal of a mechanical potentiometer. The position of the wiper terminal within the DCP is controlled by a 7 -bit volatile Wiper Register (WR). When the WR of a DCP contains all zeroes ( $\mathrm{WR}<6: 0>$ : 00 h ), its wiper terminal ( RW ) is closest to its "Low" terminal (RL). When the WR register of a DCP contains all ones (WR<6:0>: 7Fh), its wiper terminal (RW) is closest to its "High" terminal (RH). As the value of the WR increases from all zeroes ( 0 ) to all ones ( 127 decimal), the wiper moves monotonically from the position closest to RL to the closest to RH.

While the ISL22317 is being powered up, the WR is reset to 40h ( 64 decimal), which locates RW roughly at the center between RL and RH. After the power supply voltage becomes large enough for reliable non-volatile memory reading, the WR will be reload with the value stored in a non-volatile Initial Value Register (IVR).

The WR and IVR can be read or written to directly using the $1^{2} \mathrm{C}$ serial interface as described in the following sections.

## Memory Description

The ISL22317 contains one non-volatile 8-bit Initial Value Register (IVR), one 8-bit non-volatile Mode Select Register (MSR), and two volatile 8-bit registers: Wiper Register (WR) and Access Control Register (ACR). Memory map of ISL22317 is in Table 1. The nonvolatile register (IVR) at address 0 , contains initial wiper position and the volatile register (WR) contains current wiper position.

TABLE 1. MEMORY MAP

| ADDRESS <br> (hex) | NON-VOLATILE | VOLATILE |
| :---: | :---: | :---: |
| 2 | NA | ACR |
| 1 | Mode Select Register | NA |
| 0 | IVR | WR |

The non-volatile IVR and volatile WR registers are accessible with the same address 0 .
The ISL22317 is pre-programed with 40 h in the IVR.
The Access Control Register (ACR) at address 2 contains information and control bits described below in Table 2.

The VOL bit (ACR<7>) determines whether the access is to wiper registers WR or initial value registers IVR.

TABLE 2. ACCESS CONTROL REGISTER (ACR)

| VOL | SHDN | WIP | 0 | 0 | 0 | 0 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

If VOL bit is 0 , the non-volatile IVR register is accessible. If VOL bit is 1 , only the volatile WR is accessible. Note, value is written to IVR register also is written to the WR. The default value of this bit is 0 .
The SHDN bit (ACR<6>) disables or enables Shutdown mode. When this bit is $0, D C P$ is in Shutdown mode. Default value of SHDN bit is 1 .

The WIP bit (ACR<5>) is read only bit. It indicates that non-volatile write operation is in progress. It is impossible to write to the WR or ACR while WIP bit is 1 .

The Mode Select Bit in Mode Select Register (MSR<7>) at address 1 allows selection of Rheostat or Voltage Divider Mode, see Table 3.

TABLE 3. MODE SELECT REGISTER (MSR)

| Mode <br> Select | Precision <br> Off | x | x | x | x | x | x |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :---: |
| $\left(\begin{array}{l}\text { (MSB })\end{array}\right.$ |  |  |  |  |  |  |  |
| (LSB) |  |  |  |  |  |  |  |

When this bit is 0 , DCP is in two-terminal Rheostat Mode. In Rheostat Mode, the RH pin should be left unconnected and DCP can be used as variable resistor between RW and RL pins.

When this bit is 1 , DCP is in three-terminal Voltage Divider Mode. In Voltage Divider Mode, signal is applied between RH and RL terminals. Total resistance between RH and RL terminals is precisely matched to external reference resistor. Refer to reference resistor value in "Analog Specifications" Table on page 3.
Default value of Mode Select Bit is 0 .
The Precision Off bit (MSR<6>) allows the user to turn off the matching mechanism and use the device as a regular, non-
precision DCP by setting this bit to 1 . Default value of the Precision Off bit is 0 , i.e. matching to external resistor is ON.

Note, if the external resistor between REF_A/REF_B is not populated, the DCP will work as a normal DCP without giving $99 \%$ precision and with $\sim 40 \%$ higher value of the resistance. It is highly recommended to use the bit option (MSR<6>) to turn OFF the precision mode first and then removing the external resistor.

All other bits MSR<5:0> are reserved and cannot be written. Any value read from these bits should be ignored.

## $I^{2} C$ Serial Interface

The ISL22317 supports an $I^{2} \mathrm{C}$ bi-directional bus oriented protocol. The protocol defines any device that sends data onto the bus as a transmitter and the receiving device as the receiver. The device controlling the transfer is a master and the device being controlled is the slave. The master always initiates data transfers and provides the clock for both transmit and receive operations. Therefore, the ISL22317 operates as a slave device in all applications.
All communication over the $\mathrm{I}^{2} \mathrm{C}$ interface is conducted by sending the MSB of each byte of data first.

## Protocol Conventions

Data states on the SDA line must change only during SCL LOW periods. SDA state changes during SCL HIGH are reserved for indicating START and STOP conditions (see Figure 21). On power-up of the ISL22317, the SDA pin is in the input mode.

All I ${ }^{2} \mathrm{C}$ interface operations must begin with a START condition, which is a HIGH to LOW transition of SDA while SCL is HIGH. The ISL22317 continuously monitors the SDA and SCL lines for the START condition and does not respond to any command until this condition is met (see Figure 21). A START condition is ignored during the power-up of the device.

All $I^{2} \mathrm{C}$ interface operations must be terminated by a STOP condition, which is a LOW to HIGH transition of SDA while SCL is HIGH (see Figure 21). A STOP condition at the end of a read operation, or at the end of a write operation, places the device in its standby mode.

An ACK, Acknowledge, is a software convention used to indicate a successful data transfer. The transmitting device, either master or slave, releases the SDA bus after transmitting eight bits. During the ninth clock cycle, the receiver pulls the SDA line LOW to acknowledge the reception of the eight bits of data (see Figure 22).

The ISL22317 responds with an ACK after recognition of a START condition followed by a valid Identification Byte, and once again after successful receipt of an Address Byte. The ISL22317 also responds with an ACK after receiving a Data Byte of a write operation. The master must respond with an ACK after receiving a Data Byte of a read operation

A valid Identification Byte contains 01010 as the five MSBs, and the following bit matching the logic value present at pin A1. The LSB is the Read/Write bit. Its value is " 1 " for a Read operation, and "0" for a Write operation (See Table 4).

TABLE 4. IDENTIFICATION BYTE FORMAT

| Logic value at pin A1 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 0 | 1 | 0 | A 1 | 0 | $\mathrm{R} / \overline{\mathrm{W}}$ |
| $(\mathrm{MSB})$ |  |  |  |  |  |  |  |
| (LSB) |  |  |  |  |  |  |  |

FIGURE 21. VALID DATA CHANGES, START, AND STOP CONDITIONS

FIGURE 22. ACKNOWLEDGE RESPONSE FROM RECEIVER

FIGURE 23. BYTE WRITE SEQUENCE

FIGURE 24. READ SEQUENCE

## Write Operation

A Write operation requires a START condition, followed by a valid Identification Byte, a valid Address Byte, a Data Byte, and a STOP condition. After each of the three bytes, the ISL22317 responds with an ACK. At this time, the device enters its standby state (see Figure 23). The non-volatile write cycle starts after a STOP condition is determined and requires up to 20 ms delay for the next non-volatile write.

## Read Operation

A Read operation consists of a three byte instruction followed by one or more Data Bytes (see Figure 24). The master initiates the operation issuing the following sequence: a START, the Identification byte with the R/W bit set to " 0 ", an

Address Byte, a second START, and a second Identification byte with the $R / \bar{W}$ bit set to " 1 ". After each of the three bytes, the ISL22317 responds with an ACK. Then the ISL22317 transmits Data Bytes as long as the master responds with an ACK during the SCL cycle following the eighth bit of each byte. The master terminates the read operation (issuing a $\overline{\mathrm{ACK}}$ and STOP condition) following the last bit of the last Data Byte (see Figure 24).
In order to read back the non-volatile IVR, it is recommended that the application reads the ACR first to verify the WIP bit is 0 . If the WIP bit (ACR[5]) is not 0 , the host should repeat its reading sequence again.

## Rheostat Mode Configuration

When DCP is used as a two-terminal variable resistor, the RH terminal should be left unconnected and MSR<7> is 0 . Resistance between RW and RL terminal can be calculated by Equation 1 :
$R i=\frac{\text { Rtotal }}{127} \times i$

Where $i$ is a decimal code from 0 to 127 . Note, that resistance accuracy will decrease at the lowest and the highest taps, where voltage drops $<0.3 \mathrm{~V}$. In other words, a minimum and maximum decimal code at which the DCP resistance not exceed $3 \%$ precision is as shown in Equations 2 and 3:
$i(\min )=\frac{0.3 \times 127}{\text { Iwiper } \times \text { Rtota } \mid}$
$i($ max $)=\frac{(\text { Vcc }-0.3) \times 127}{\text { Iwiper } \times \text { Rtotal }}$

Where Iwiper is a current going through the wiper terminal.

## Voltage Divider Mode Configuration

In Voltage Divider Mode, voltage or signal is applied between RH and RL terminals and MSR<7> is 1 . A potential at RH terminal must be higher than at RL terminal at any time. Total resistance between RH and RL terminal is fixed and matched to external reference resistor. Voltage on the wiper terminal RW can be calculated by Equation 4:
$\operatorname{Vrw}(\mathrm{i})=\frac{\mathrm{Vrh}-\mathrm{Vrl}}{127} \times \mathrm{i}$

Where $i$ is a decimal code from 0 to 127 . Note, that the wiper voltage accuracy will decrease at the lowest and the highest taps, where it is less than 0.3 V from ground or from $\mathrm{V}_{\mathrm{CC}}$ respectively.

## Applications Information

In order to get better accuracy in applications where RL pin is connected to GND, it is highly recommended that REF_B pin is also connected to GND.

The coupling capacitors of $1 \mu \mathrm{~F}$ and $0.1 \mu \mathrm{~F}$ should be placed close to VCC pin.

## Revision History

| DATE | REVISION | CHANGE |
| :--- | :--- | :--- |
| $4 / 6 / 10$ | FN6912.1 | Page 10 description of Pin A1 references Table 3 changed to Table 4. <br> Page 5, tHD:DAT parameter test condition,"From SCL rising edge ..." changed to "From SCL falling <br> edge ..." <br> Added MSL note to ordering information. Replaced POD to recent version with following changes: <br> 1. Removed mention of "b" from Note 4 since "b" does not exist on the drawing. <br> 2. Added Note 6 callout to lead width on "Bottom View". <br> 3. Corrected the word "indentifier" in Note 6 to read "identifier". |
| $5 / 26 / 09$ | FN6912.0 | Initial Release of Datasheet. Issued FN6912 making it a Rev 0. |
