

ISL29011

Digital Ambient Light Sensor and Proximity Sensor with Interrupt Function

FN6467
Rev 6.00
May 1, 2014

The ISL29011 is an integrated ambient and infrared light-to-digital converter with a built-in IR LED driver and I²C Interface (SMBus Compatible). This device provides not only ambient light sensing to allow robust backlight/display brightness control but also infrared sensing to allow proximity estimation featured with interrupt function.

For ambient light sensing, an internal ADC has been designed based on the charge-balancing A/D conversion technique. The ADC conversion time is nominally 90ms and is user adjustable from 11μs to 90ms, depending on oscillator frequency and ADC resolution. This ADC is capable of rejecting 50Hz and 60Hz flicker noise caused by artificial light sources. The lux-range-select feature allows users to program the lux range for optimized counts/lux.

For proximity sensing, the ADC is used to digitize the output signal from the photodiode array when the internal IR LED driver is turned on and off for the programmed time periods under user-selected modulation frequency to drive the external IR LED. As this proximity sensor employs a noise cancellation scheme to highly reject unwanted IR noise, the digital output of proximity sensing decreases with distance. The driver output current is user selectable up to 100mA to drive different types of IR emitter LEDs.

Six different modes of operation can be selected via the I²C interface: Programmable ALS once with auto power-down, programmable IR sensing once, programmable proximity sensing once, programmable continuous ALS sensing, programmable continuous IR sensing and programmable continuous proximity sensing. The programmable one-time operation modes greatly reduce power because an immediate automatic shutdown reduces overall supply current less than 0.5μA.

The ISL29011 supports both hardware and software interrupts that remain asserted until the host clears it through the I²C interface for ambient light sensing and proximity detection.

Designed to operate on supplies from 2.25V to 3.63V, the ISL29011 is specified for operation over the -40°C to +85°C ambient temperature range. It is packaged in a clear, Pb-free 8 Ld ODFN package.

Applications

- Display and keypad dimming adjustment and proximity sensing for:
 - Mobile devices: smart phone, PDA, GPS
 - Computing devices: Notebook PC, Webpad
 - Consumer devices: LCD-TV, digital picture frame, digital camera
- Industrial and medical light and proximity sensing

Features

Proximity Sensing

- Ambient IR cancellation during proximity sensing
 - Works under direct sunlight
- IR LED driver with programmable source current
 - Adjustable current drive from 100mA to 12.5mA
- Programmable LED current modulation frequency
- Variable conversion resolution

Ambient Light Sensing

- Simple output code directly proportional to lux
- Adjustable sensitivity up to 65 counts per lux
- Selectable range (via I²C)
 - Range 1 = 0.015 lux to 1,000 lux
 - Range 2 = 0.06 lux to 4,000 lux
 - Range 3 = 0.24 lux to 16,000 lux
 - Range 4 = 0.96 lux to 64,000 lux
- Integrated 50Hz/60Hz noise rejection
- Works under various light sources, including sunlight

Ideal Spectral Response for Light and Proximity Sensor

- Light sensor close to human eye response
 - Excellent light sensor IR and UV rejection
- Proximity sensor range from 850nm to 950nm
 - Can use either 850nm or 950nm LED solution

Ultra Low Power

- 90μA max operating current
- Software shutdown and automatic shutdown
 - 0.5μA max shutdown current

Easy to Use

- I²C (SMBus compatible) output
- No complex algorithms needed
- Temperature compensated
- Small form factor
 - 8 Ld 2.0mmx2.1mmx0.7mm ODFN package

Additional Features

- I²C and SMBus compatible
- 1.7V to 3.63V supply for I²C interface
- 2.25V to 3.63V sensor power supply
- Pb-Free (RoHS compliant)

Ordering Information

PART NUMBER (Notes 1, 2, 3)	TEMP. RANGE (°C)	PACKAGE Tape and Reel (Pb-Free)	PKG. DWG. #
ISL29011IROZ-T7	-40 to +85	8 Ld ODFN	L8.2.1x2.0
ISL29011IROZ-EVALZ	Evaluation Board		

NOTES:

- Please refer to [TB347](#) for details on reel specifications.
- These Intersil Pb-free plastic packaged products employ special Pb-free material sets; molding compounds/die attach materials and NiPdAu plate - e4 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
- For Moisture Sensitivity Level (MSL), please see device information page for [ISL29011](#). For more information on MSL, please see tech brief [TB477](#).

Pin Configuration

EXPOSED PAD CAN BE CONNECTED TO GND OR
ELECTRICALLY ISOLATED

Pin Descriptions

PIN NUMBER	PIN NAME	DESCRIPTION	
1	VDDD	Positive digital supply: 2.25V to 3.63V.	
2	VDDA	Positive analog supply: 2.25V to 3.63V, VDDA and VDDD should be externally shorted.	
3	GND	Ground. The thermal pad is also connected to the GND pin.	
4	REXT	External resistor pin setting the internal reference current and the conversion time. 499kΩ with a 1% tolerance resistor is recommended.	
5	SCL	I ² C serial clock line	The I ² C bus lines can be pulled from 1.7V to above V _{DD} , 3.63V max.
6	SDA	I ² C serial data line	
7	$\overline{\text{INT}}$	Interrupt pin; LO for interrupt/alarms. The $\overline{\text{INT}}$ pin is an open drain.	
8	IRDR	IR LED driver pin connecting to the anode of the external IR LED. The source current of the IR LED driver can be programmed through I ² C.	
		Exposed pad connected to ground or electrically isolated.	

Block Diagram

Absolute Maximum Ratings ($T_A = +25^\circ\text{C}$)

$V_{\text{SUP}}(V_{\text{DD}}, V_{\text{DDA}})$ Supply Voltage between V_{DD} and GND	4V
V_{DDA} Supply Voltage between V_{DDA} and GND	$V_{\text{DD}} \pm 0.5\text{V}$
$I^2\text{C}$ Bus (SCL, SDA) and $\overline{\text{INT}}$ Pin Voltage	-0.2V to 4V
$I^2\text{C}$ Bus (SCL, SDA) and $\overline{\text{INT}}$ Pin Current	<10mA
IRDR Pin Voltage	-0.2V to $V_{\text{DD}} + 0.5\text{V}$
R_{EXT} Pin Voltage	-0.2V to $V_{\text{DD}} + 0.5\text{V}$
ESD Rating	
Human Body Model	3kV

Thermal Information

Thermal Resistance (Typical)	θ_{JA} ($^\circ\text{C}/\text{W}$)	θ_{JC} ($^\circ\text{C}/\text{W}$)
8 Ld ODFN (Notes 4, 5)	88	14
Maximum Die Temperature	+90 $^\circ\text{C}$	
Storage Temperature	-40 $^\circ\text{C}$ to +100 $^\circ\text{C}$	
Operating Temperature	-40 $^\circ\text{C}$ to +85 $^\circ\text{C}$	
Pb-Free Reflow Profile (*)	see TB477	
*Peak temperature during solder reflow +235 $^\circ\text{C}$ max		

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTE:

- θ_{JA} is measured in free air with the component mounted on a high effective thermal conductivity test board with “direct attach” features. See Tech Brief [TB379](#).
- For θ_{JC} , the “case temp” location is the center of the exposed metal pad on the package underside.

IMPORTANT NOTE: All parameters having Min/Max specifications are guaranteed. Typical values are for information purposes only. Unless otherwise noted, all tests are at the specified temperature and are pulsed tests, therefore: $T_J = T_C = T_A$

Electrical Specifications $V_{\text{SUP}}(V_{\text{DD}}, V_{\text{DDA}}) = 3\text{V}$, $T_A = +25^\circ\text{C}$, $R_{\text{EXT}} = 499\text{k}\Omega$ 1% tolerance, 16-bit ADC operation, unless otherwise specified.

PARAMETER	DESCRIPTION	TEST CONDITIONS	MIN (Note 10)	TYP	MAX (Note 10)	UNITS
V_{SUP}	Power Supply Range for V_{DD} , V_{DDA}	(Note 6)	2.25		3.63	V
SR_{VDD}	Required Input Power-up Slew Rate	VDD rising edge between 0.4V and 2.25V		0.5		V/ms
$I_{\text{SUP(OFF)}}$	Supply Current when Powered Down	Software disabled or auto power-down		0.1	0.5	μA
$I_{\text{SUP(ON)}}$	Supply Current of Ambient Light and IR Sensing			70	90	μA
f_{OSC}	Internal Oscillator Frequency		675	750	825	kHz
t_{int}	ADC Integration/Conversion Time	16-bit ADC data		90		ms
$F_{\text{I}^2\text{C}}$	$I^2\text{C}$ Clock Rate Range			1 to 400		kHz
DATA_0	Count Output When Dark	$E = 0$ lux		1	5	Counts
DATA_FS	Full Scale ADC Code				65535	Counts
$\frac{\Delta\text{DATA}}{\text{DATA}}$	Count Output Variation Over Three Light Sources: Fluorescent, Incandescent and Sunlight	Ambient light sensing		± 10		%
DATA_1	Light Count Output With LSB of 0.015 lux/count	$E = 300$ lux, Fluorescent light (Note 7), Ambient light sensing, Range 1 (1k lux)	15000	20000	25000	Counts
DATA_2	Light Count Output With LSB of 0.06 lux/count	$E = 300$ lux, Fluorescent light (Note 7), Ambient light sensing, Range 2 (4k lux)		5000		Counts
DATA_3	Light Count Output With LSB of 0.24 lux/count	$E = 300$ lux, Fluorescent light (Note 7), Ambient light sensing, Range 3 (16k lux)		1250		Counts
DATA_4	Light Count Output With LSB of 0.96 lux/count	$E = 300$ lux, Fluorescent light (Note 7), Ambient light sensing, Range 4 (64k lux)		312		Counts
DATA_IR1	Infrared Count Output	$E = 210$ lux, Sunlight (Note 8), IR sensing, Range 1	15000	20000	25000	Counts
DATA_IR2	Infrared Count Output	$E = 210$ lux, Sunlight (Note 8), IR sensing, Range 2		5000		Counts
DATA_IR3	Infrared Count Output	$E = 210$ lux, Sunlight (Note 8), IR sensing, Range 3		1250		Counts
DATA_IR4	Infrared Count Output	$E = 210$ lux, Sunlight (Note 8), IR sensing, Range 4		312		Counts
V_{REF}	Voltage of R_{EXT} Pin			0.52		V

Electrical Specifications $V_{SUP}(V_{DDD}, V_{DDA}) = 3V$, $T_A = +25^\circ C$, $R_{EXT} = 499k\Omega$ 1% tolerance, 16-bit ADC operation, unless otherwise specified. (Continued)

PARAMETER	DESCRIPTION	TEST CONDITIONS		MIN (Note 10)	TYP	MAX (Note 10)	UNITS
I_{INT}	INT Current Sinking Capability			4	5		mA

NOTES:

- V_{SUP} is the common voltage to V_{DDD} and V_{DDA} .
- 550nm green LED is used in production test. The 550nm LED irradiance is calibrated to produce the same DATA count against an illuminance level of 300 lux fluorescent light.
- 850nm infrared LED is used in production test. The 850nm LED irradiance is calibrated to produce the same DATA_IR count against an illuminance level of 210 lux sunlight at sea level.
- See "Register Set" on page 10.

I²C Electrical Specifications For SCL and SDA unless otherwise noted, $V_{SUP}(V_{DDD}, V_{DDA}) = 3V$, $T_A = +25^\circ C$, $R_{EXT} = 499k\Omega$ 1% tolerance, 16-bit ADC operation.

PARAMETER	DESCRIPTION	TEST CONDITIONS	MIN (Note 10)	TYP	MAX (Note 10)	UNITS
V_{I^2C}	Supply Voltage Range for I ² C Interface		1.7		3.63	V
f_{SCL}	SCL Clock Frequency				400	kHz
V_{IL}	SCL and SDA Input Low Voltage				0.55	V
V_{IH}	SCL and SDA Input High Voltage		1.25			V
V_{hys}	Hysteresis of Schmitt Trigger Input		$0.05V_{DD}$			V
V_{OL}	Low-Level Output Voltage (Open-drain) at 4mA Sink Current				0.4	V
I_i	Input Leakage for Each SDA, SCL Pin		-10		10	μA
t_{SP}	Pulse Width of Spikes that must be Suppressed by the Input Filter				50	ns
t_{AA}	SCL Falling Edge to SDA Output Data Valid				900	ns

I²C Electrical Specifications

For SCL and SDA unless otherwise noted, $V_{SUP}(V_{DDD}, V_{DDA}) = 3V$, $T_A = +25^\circ C$, $R_{EXT} = 499k\Omega$ 1% tolerance, 16-bit ADC operation. (Continued)

PARAMETER	DESCRIPTION	TEST CONDITIONS	MIN (Note 10)	TYP	MAX (Note 10)	UNITS
C_i	Capacitance for each SDA and SCL pin				10	pF
$t_{HD:STA}$	Hold Time (Repeated) START Condition	After this period, the first clock pulse is generated.	600			ns
t_{LOW}	LOW Period of the SCL clock	Measured at the 30% of VDD crossing	1300			ns
t_{HIGH}	HIGH period of the SCL Clock		600			ns
$t_{SU:STA}$	Set-up Time for a Repeated START Condition		600			ns
$t_{HD:DAT}$	Data Hold Time		30			ns
$t_{SU:DAT}$	Data Set-up Time		100			ns
t_R	Rise Time of both SDA and SCL Signals		$20 + 0.1 \times C_b$			ns
t_F	Fall Time of both SDA and SCL Signals		$20 + 0.1 \times C_b$			ns
$t_{SU:STO}$	Set-up Time for STOP Condition		600			ns
t_{BUF}	Bus Free Time Between a STOP and START Condition		1300			ns
C_b	Capacitive Load for Each Bus Line				400	pF
$R_{pull-up}$	SDA and SCL System Bus Pull-Up Resistor	Maximum is determined by t_R and t_F	1			k Ω
$t_{VD:DAT}$	Data Valid Time				0.9	μs
$t_{VD:ACK}$	Data Valid Acknowledge Time				0.9	μs

FIGURE 1. I²C TIMING DIAGRAM

Principles of Operation

Photodiodes and ADC

The ISL29011 contains two photodiode arrays which convert light into current. The spectral response for ambient light sensing and IR sensing is shown in Figure 8 in the performance curves section. After light is converted to current during the light signal process, the current output is converted to digital by a built-in 16-bit Analog-to-Digital Converter (ADC). An I²C command reads the ambient light or IR intensity in counts.

The converter is a charge-balancing integrating type 16-bit ADC. The chosen method for conversion is best for converting small current signals in the presence of an AC periodic noise. A 100ms integration time, for instance, highly rejects 50Hz and 60Hz power line noise simultaneously. See “Integration and Conversion Time” on page 11.

The built-in ADC offers user flexibility in integration time or conversion time. Integration time is determined by an internal oscillator (f_{OSC}), and the n-bit ($n = 4, 8, 12, 16$) counter inside the ADC. A good balancing act of integration time and resolution depending on the application is required for optimal results.

The ADC has I²C programmable range select to dynamically accommodate various lighting conditions. For very dim conditions, the ADC can be configured at its lowest range (Range 1) in the ambient light sensing. For very bright conditions, the ADC can be configured at its highest range (Range 4) in the proximity sensing.

Low-Power Operation

The ISL29011 initial operation is at the power-down mode after a supply voltage is provided. The data registers contain the default value of zero. When the ISL29011 receives an I²C command to do a one-time measurement from an I²C master, it will start ADC conversion with light or proximity sensing. It will go to the

power-down mode automatically after one conversion is finished and keep the conversion data available for the master to fetch anytime afterwards. The ISL29011 will continuously do ADC conversion with light or proximity sensing, if it receives an I²C command of continuous measurement. It will continuously update the data registers with the latest conversion data, and it will go to the power-down mode after it receives the I²C command of power-down.

Ambient Light, IR and Proximity Sensing

There are six operational modes in ISL29011: Programmable ALS once with auto power-down, programmable IR sensing once with auto power-down, programmable proximity sensing once with auto power-down, programmable continuous ALS sensing, programmable continuous IR sensing, programmable continuous proximity sensing. These six modes can be programmed in series to fulfill the application needs. The detailed program configuration is listed in “Register Set” on page 10.

When the part is programmed for ambient light sensing, the ambient light with wavelength within the “Ambient Light Sensing” spectral response curve in Figure 8 is converted into current. With ADC, the current is converted to an unsigned n-bit (up to 16 bits) digital output.

When the part is programmed for infrared (IR) sensing, the IR light with wavelength within the “IR or Proximity Sensing” spectral response curve on Figure 8 is converted into current. With ADC, the current is converted to an unsigned n-bit (up to 16 bits) digital output.

When the part is programmed for proximity sensing, the external IR LED is turned on by the built-in IR LED driver through the IRDR pin. The amplitude of the IR LED current and the IR LED modulation frequency can be programmed through Command Register II. When the IR from the LED reaches an object and gets reflected back, the reflected IR light with wavelength within the

“IR or Proximity Sensing” spectral response curve in Figure 8 is converted into current. With ADC, the current is converted to an unsigned n-bit (up to 16 bits) digital output. The output reading is inversely proportional to the square of the distance between the sensor and the object.

Interrupt Function

The active low interrupt pin is an open drain pull-down configuration. There is also an interrupt bit in the I²C register. The interrupt serves as an alarm or monitoring function to determine whether the ambient light level or the proximity detection level exceeds the upper threshold or goes below the lower threshold. The user can also configure the persistency of the interrupt. This reduces the possibility of false triggers, such as noise or sudden spikes in ambient light conditions. An unexpected camera flash,

Example:

State 0: Ambient light

Operation Mode = ALS continuous
 Interrupt Persist = 1
 Resolution = 16 bits
 Range = 1000 Lux
 Scheme, Frequency & IRDR = X (DONT CARE)
 Threshold High = 100 Lux
 Threshold Low = 10 Lux
 Command1 = 101x xx00
 Command2 = xxxx 0000
 Hi Threshold = 655
 Lo Threshold = 66

State 1: Proximity - interrupt when NEAR

Operation Mode = Proximity continuous
 Interrupt Persist = 4
 Resolution = 12 bits
 Range = 1
 Scheme = 1
 Frequency = 0
 IRDR = 100mA
 Threshold High = NEAR
 Threshold Low = OFF
 Command1 = 111x xx01
 Command2 = 1011 0100
 Hi Threshold = 1535 (75% of 2047)
 Lo Threshold = -2048 (OFF)

Command = {Range, Resolution, IRDR, Scheme, Frequency & Persist}

for example, can be ignored by setting the persistency to 8 integration cycles.

Changing States - Avoiding Unintentional Interrupts

A common application for the ISL29011 is alternating between ambient light and proximity measurements. The two states have different command words and threshold settings. To avoid an unintentional interrupt the device should be powered down before the state change. The conversion should not be enabled until the new command word and thresholds have been set. A safe sequence is to set the operation mode to power-down, set the command word and thresholds to the new state, then set the operation mode to desired setting.

Sequence State 0 -> State 1

Off:
 Write Byte Command1 = 0
State 1 setup:
 Write Word (Command 1&2) = B401h
 Write Word (Hi Threshold) = 05FFh
 Write Word (Lo Threshold) = F800h
On:
 Write Byte Command1 = E1h

Sequence State 1 -> State 0

Off:
 Write Byte Command1 = 0
State 0 setup:
 Write Word (Command 1&2) = B000h
 Write Word (Hi Threshold) = 028Fh
 Write Word (Lo Threshold) = 0042h
On:
 Write Byte Command1 = A0h

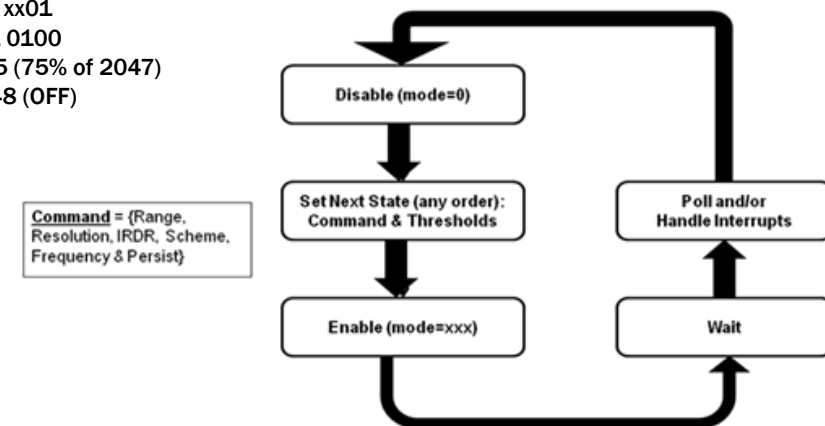

FIGURE 2. CHANGING STATES FLOW EXAMPLE

I²C Interface

There are eight 8-bit registers available inside the ISL29011. The two command registers define the operation of the device. The command registers do not change until the registers are overwritten. The two 8-bit data Read Only registers are for the ADC output and the Timer output. The data registers contain the ADC's latest digital output. The four 8-bit interrupt registers hold 16-bit interrupt high and low thresholds.

The ISL29011's I²C interface slave address is internally hard-wired as 1000100. When 1000100x with x as R or \bar{W} is sent after the Start condition, this device compares the first seven bits of this byte to its address and matches.

Figure 3 shows a sample one-byte read. Figure 4 shows a sample one-byte write. The I²C bus master always drives the SCL (clock) line, while either the master or the slave can drive the SDA (data) line. Figure 4 shows a sample write. Every I²C transaction begins with the master asserting a start condition (SDA falling while SCL remains high). The following byte is driven by the master, and includes the slave address and read/write bit. The receiving device is responsible for pulling SDA low during the acknowledgement period. Every I²C transaction ends with the master asserting a stop condition (SDA rising while SCL remains high).

For more information about the I²C standard, please consult the Philips™ I²C specification documents.

FIGURE 3. I²C READ TIMING DIAGRAM SAMPLE

FIGURE 4. I²C WRITE TIMING DIAGRAM SAMPLE

Register Set

There are eight registers that are available in the ISL29011.

Table 1 summarizes their functions.

TABLE 1. REGISTER SET

ADDR	REG NAME	BIT								DEFAULT
		7	6	5	4	3	2	1	0	
00h	COMMANDI	OP2	OP1	OP0	0	0	FLAG	PRST1	PRST0	00h
01h	COMMANDII	Scheme	FREQ	IS1	IS0	RES1	RES0	RANGE1	RANGE0	00h
02h	DATA _{LSB}	D7	D6	D5	D4	D3	D2	D1	D0	00h
03h	DATA _{MSB}	D15	D14	D13	D12	D11	D10	D9	D8	00h
04h	INT_LT_LSB	TL7	TL6	TL5	TL4	TL3	TL2	TL1	TL0	00h
05h	INT_LT_MSB	TL15	TL14	TL13	TL12	TL11	TL10	TL9	TL8	00h
06h	INT_HT_LSB	TH7	TH6	TH5	TH4	TH3	TH2	TH1	TH0	FFh
07h	INT_HT_MSB	TH15	TH14	TH13	TH12	TH11	TH10	TH9	TH8	FFh
08h	TEST	0	0	0	0	0	0	0	0	00h

Command Register I 00 (hex)

The first command register has the following functions:

1. Operation Mode; Bits 7, 6, and 5: These three bits are determine the operation mode of the device.

TABLE 2. OPERATION MODE

BITS 7 TO 5	OPERATION
000	Power-down the device
001	ALS once
010	IR once
011	Proximity once
100	Reserved (Do not use)
101	ALS continuous
110	IR continuous
111	Proximity continuous

2. Interrupt flag; Bit 2: This is the status bit of the interrupt. The bit is set to logic high when the interrupt thresholds have been triggered, and logic low when not yet triggered. Once triggered, INT pin stays low and the status bit stays high. Both interrupt pin and the status bit are automatically cleared at the end of Command Register I transfer.

TABLE 3. INTERRUPT FLAG

BIT 2	OPERATION
0	Interrupt is cleared or not triggered yet
1	Interrupt is triggered

3. Interrupt persist; Bits 1 and 0: The interrupt pin and the interrupt flag is triggered/set when the data sensor reading is out of the interrupt threshold window after m consecutive number of integration cycles. The interrupt persist bits determine m.

TABLE 4. INTERRUPT PERSIST

BITS 1 TO 0	NUMBER OF INTEGRATION CYCLES
00	1
01	4
10	8
11	16

Command Register II 01 (hex)

The second command register has the following functions:

1. Proximity Sensing Scheme; Bit 7: This bit programs the function of the proximity detection. Logic 0 of this bit, Scheme 0, makes full n (4, 8, 12, 16) bits (unsigned) proximity detection. The range of Scheme 0 proximity count is from 0 to 2^n . Logic 1 of this bit, Scheme 1, makes n-1 (3, 7, 11, 15) bits (2's complementary) proximity_less_ambient detection. The range of Scheme 1 proximity count is from $-2^{(n-1)}$ to $2^{(n-1)}$. The sign bit is extended for resolutions less than 16. While Scheme 0 has wider dynamic range, Scheme 1 proximity detection is less affected by the ambient IR noise variation.

TABLE 5. PROXIMITY SENSING SCHEME

BIT 7	OPERATION
0	Sensing IR from LED and ambient
1	Sensing IR from LED with ambient IR rejection

2. Modulation Frequency; Bit 6: This bit sets the IR LED driver's modulation frequency.

TABLE 6. MODULATION FREQUENCY

BIT 6	MODULATION FREQUENCY (kHz)
0	DC
1	360

3. Amplitude of IR driver current; Bits 5 and 4: This device provides current source to drive an external IR LED. The drive capability can be programmed through Bits 5 and 4. For example, the device sources 12.5mA out of the IRDR pin if Bits 5 and 4 are 0.

TABLE 7. CURRENT SOURCE CAPABILITY AT IRDR PIN

BITS 5 TO 4	IRDR PIN SOURCE CURRENT
00	12.5mA IR LED driver
01	25mA IR LED driver
10	50mA IR LED driver
11	100mA IR LED driver

4. Resolution; Bits 3 and 2: determine the ADC's resolution and the number of clock cycles per conversion in Internal Timing Mode. Changing the number of clock cycles does more than just change the resolution of the device. It also changes the integration time, which is the period the device's analog-to-digital (A/D) converter samples the photodiode current signal for a measurement. The ONLY 16-bit ADC resolution is capable of rejecting 50Hz and 60Hz flicker caused by artificial light sources. Table 8 lists possible ADC resolution.

TABLE 8. RESOLUTION/WIDTH

BITS 3 TO 2	NUMBER OF CLOCK CYCLES	n-BIT ADC
00	$2^{16} = 65,536$	16
01	$2^{12} = 4,096$	12
10	$2^8 = 256$	8
11	$2^4 = 16$	4

5. Range; Bits 1 and 0: The Full Scale Range (FSR) can be adjusted via I²C using Bits 1 and 0. Table 9 lists the possible values of FSR for the 499kΩ R_{EXT} resistor.

TABLE 9. RANGE/FSR LUX

BITS 1:0	k	RANGE (k)	FSR (LUX) @ ALS SENSING	FSR @ IR SENSING
00	1	Range1	1,000	Refer to page 4
01	2	Range2	4,000	Refer to page 4
10	3	Range3	16,000	Refer to page 4
11	4	Range4	64,000	Refer to page 4

Data Registers (02 hex and 03 hex)

The device has two 8-bit read-only registers to hold the data from LSB to MSB for ADC. The most significant bit (MSB) is accessed at 03 hex, and the least significant bit (LSB) is accessed at 02 hex. For 16-bit resolution, the data is from D0 to D15; for 12-bit resolution, the data is from D0 to D11; for 8-bit resolution, the data is from D0 to D7. The registers are refreshed after every conversion cycle.

TABLE 10. DATA REGISTERS

ADDRESS (hex)	CONTENTS
02	D0 is LSB for 4, 8, 12 or 16-bit resolution, D3 is MSB for 4-bit resolution, D7 is MSB for 8-bit resolution.
03	D15 is MSB for 16-bit resolution, D11 is MSB for 12-bit resolution.

Interrupt Registers (04, 05, 06 and 07 hex)

Registers 04 and 05 hex set the low (LO) threshold for the interrupt pin and the interrupt flag. 04 hex is the LSB and 05 hex is the MSB. By default, the Interrupt threshold LO is 00 hex for both LSB and MSB.

Registers 06 and 07 hex set the high (HI) threshold for the interrupt pin and the interrupt flag. 06 hex is the LSB and 07 hex is the MSB. By default, the Interrupt threshold HI is FF hex for both LSB and MSB.

Test Register (08 hex)

Register 8 is a reserved register that holds 00h during normal operation.

Calculating Lux

The ISL29011's ADC output codes, DATA, are directly proportional to lux in the ambient light sensing.

$$E_{\text{cal}} = \alpha \times \text{DATA} \quad (\text{EQ. 1})$$

Here, E_{cal} is the calculated lux reading. The constant α is determined by the Full Scale Range and the ADC's maximum output counts. The constant is independent on the light sources (fluorescent, incandescent and sunlight) because of the light sources IR component is removed during the light signal process. The constant can also be viewed as the sensitivity: The smallest lux measurement the device can measure as shown in Equation 2.

$$\alpha = \frac{\text{Range}(k)}{\text{Count}_{\text{max}}} \quad (\text{EQ. 2})$$

Here, Range(k) is defined in Table 9. $\text{Count}_{\text{max}}$ is the maximum output counts from the ADC.

The transfer function used for n-bit ADC becomes Equation 3:

$$E_{\text{cal}} = \frac{\text{Range}(k)}{2^n} \times \text{DATA} \quad (\text{EQ. 3})$$

Here, $n = 4, 8, 12$ or 16 . This is the number of ADC bits programmed in the command register. The 2^n represents the maximum number of counts possible from the ADC output. Data is the ADC output stored in the data registers (02 hex and 03 hex).

Integration and Conversion Time

The ADC resolution and f_{OSC} determines the integration time, t_{int} as shown in Equation 4.

$$t_{\text{int}} = 2^n \times \frac{1}{f_{\text{OSC}}} = 2^n \times \frac{R_{\text{EXT}}}{725\text{kHz} \times 499\text{k}\Omega} \quad (\text{EQ. 4})$$

where n is the number of bits of resolution and $n = 4, 8, 12$ or 16 . 2^n , therefore, is the number of clock cycles. n can be programmed at the command register 01 (hex) bits 3 and 2.

TABLE 11. INTEGRATION TIME OF n-BIT ADC

R_{EXT} (k Ω)	n = 16-BIT (ms)	n = 12-BIT (ms)	n = 8-BIT (μ s)	n = 4-BIT (μ s)
499**	90	5.63	351	21.6

**Recommended R_{EXT} resistor value

External Scaling Resistor R_{EXT} for f_{OSC} and Range

The ISL29011 uses an external resistor R_{EXT} to fix its internal oscillator frequency, f_{OSC} and the light sensing range, Range. f_{OSC} and Range are inversely proportional to R_{EXT} . For user simplicity, the proportionality constant is referenced to 499k Ω as shown in Equations 5 and 6:

$$\text{Range} = \frac{499\text{k}\Omega}{R_{EXT}} \times \text{Range}(k) \quad (\text{EQ. 5})$$

$$f_{OSC} = \frac{499\text{k}\Omega}{R_{EXT}} \times 725\text{kHz} \quad (\text{EQ. 6})$$

Noise Rejection

In general, integrating type ADC's have excellent noise-rejection characteristics for periodic noise sources whose frequency is an integer multiple of the conversion rate. For instance, a 60Hz AC unwanted signal's sum from 0ms to $k \times 16.66\text{ms}$ ($k = 1, 2, \dots, k_i$) is zero. Similarly, setting the device's integration time to be an integer multiple of the periodic noise signal, greatly improves the light sensor output signal in the presence of noise.

ADC Output in IR Sensing

The ISL29011's ADC output codes, DATA, are directly proportional to the IR intensity received in the IR sensing.

$$\text{DATA}_{IR} = \beta \times E_{IR} \quad (\text{EQ. 7})$$

Here, E_{IR} is the received IR intensity. The constant β changes with the spectrum of background IR noise like sunlight and incandescent light. The β also changes with the ADC's range and resolution selections.

ADC Output in Proximity Sensing

In the proximity sensing, the ADC output codes, DATA, are directly proportional to the total IR intensity from the background IR noise and from the IR LED driven by the ISL29011.

$$\text{DATA}_{PROX} = \beta \times E_{IR} + \gamma \times E_{LED} \quad (\text{EQ. 8})$$

Here, β and E_{IR} have the same meanings in Equation 7. The constant γ depends on the spectrum of the used IR LED and the ADC's range and resolution selections. E_{LED} is the IR intensity, which is emitted from the IR LED and reflected by a specific object to the ISL29011. E_{LED} depends on the current to the IR LED and the surface of the object. E_{LED} decreases with the square of the distance between the object and the sensor.

If background IR noise is small, E_{IR} can be neglected, and the ADC output directly decreases with the distance. If there is significant background IR noise, ISL29011 offers two schemes to reduce the effect. The first way is to do a proximity sensing using Scheme 0, immediately followed by an IR sensing. The differential reading of ADC outputs from the proximity and IR sensing will then reduce the effect of background IR noise and directly decrease with the distance between the object and the sensor. The second way is to do a proximity sensing using Scheme 1 to do on-chip background IR noise subtraction. While Scheme 0 has wider dynamic range, Scheme 1 proximity detection is faster but with half the resolution. Please refer to "Typical Performance Curves" on page 15 for ADC output versus distance using Scheme 0 detection.

Figure 11 shows the ISL29011 configured at 12-bit ADC resolution and sensitivity range selected at 16000 (range 3) for the proximity reading. A 12.5mA external LED current at 360kHz modulation frequency detects three different sensing objects: 92% brightness paper, 18% gray card and ESD black foam. Figure 12 shows the ISL29011 configured at 12-bit ADC resolution and sensitivity range selected at 1000 (range 1) for the proximity reading, with a programmed external LED at 360kHz modulation frequency, detecting the same sensing object: 18% gray card under four different external LED current: 12.5mA, 25mA, 50mA and 100mA to compare the proximity readout versus distance.

The ISL29011 Proximity sensing relies on the amount of IR reflected back from the objects to be detected. Clearly, it can not detect an optically black object that reflects no light. However, the ISL29011 is sensitive enough to detect a black ESD foam, which reflects slightly less than 1% of IR, as shown in Figure 11 on page 15. For biological objects, blonde hair reflects more than brunette hair, as expected and shown in Figure 13. Also notice that skin tissue is much more reflective than hair. IR penetrates into the skin and is reflected or scattered back from within. As a result, the proximity count peaks at contact and monotonically decreases as skin moves away. This characteristic is very different from that of a plain paper reflector.

Interrupt Function

An interrupt event (FLAG) is governed by Bit 2 in COMMAND1. The user must set Bit 2 in COMMAND1 to be logic low (0), which means \overline{INT} is cleared or not triggered yet. Then ISL29011 will issue an ambient (ALS/IR) or proximity interrupt flag if the actual count stored in Register 0x2 and 0x3 are outside the user's programmed window. The user must read Register 0x0 to clear interrupt.

Interrupt persistency at Bit 1 and Bit 0 of COMMAND1 is another useful option available for both ambient/IR and proximity measurement. Persistency requires x-in-a-row interrupt flags before the \overline{INT} pin is driven low. Then, user must read Register 0x0 to clear Interrupt.

V_{DD} Power-up and Power Supply Considerations

Upon power-up, please ensure a VDD slew rate of 0.5V/ms or greater. For more information, see the application note [AN1534](#).

LED Modulation for Proximity Detection

The ISL29011 offers two ways to modulate the LED in the Proximity Detection Mode - DC or 360kHz (with 50% duty cycle) by Bit 6 of register 01h. At the IRDR pin, there are four different IRDR LED currents; 12.5, 25, 50, and 100mA outputs selectable by Bits 4 and 5 of register 01h. With the LED running in the DC mode, the proximity detection is twice as sensitive but consumes 2 times more current. The sensitivity of LED 50mA, DC 50mA is identical to that of 100mA, 360kHz modulation. Please note that the ISL29011 does not include a LED.

Current Consumption Estimation

The low power operation is achieved through sequential readout in the serial fashion, as shown in Figure 5, the device requires three different phases in serial during the entire detection cycle to do ambient light sensing, infrared sensing and proximity sensing. The external IR LED will only be turned on during the proximity sensing phase under user program controlled current at modulated frequency depends on user selections. Figure 5 also shows the current consumption during each ALS, IR sensing and Proximity sensing phase. For example, at 8-bit ADC resolution the integration time is 0.4ms. If user programmed 50mA current to supply external IR LED at 360kHz modulated frequency, during the entire operation cycle that includes ALS, IR sensing and Proximity sensing three different serial phases, the detection occurs once every 30ms, the average current consumption including external IR LED drive current can be calculated from Equation 9:

$$[(0.07\text{mA} + 0.07\text{mA} + 1\text{mA} + (50\text{mA} * 50\%)) * 0.4\text{ms}] / 30\text{ms} = 0.35\text{mA} \quad (\text{EQ. 9})$$

If at a 12-bit ADC resolution where the integration time for each serial phase becomes 7ms and the total detection time becomes 100ms, the average current can be calculated from Equation 10:

$$[(0.07\text{mA} + 0.07\text{mA} + 1\text{mA} + (50\text{mA} * 50\%)) * 7\text{ms}] / 100\text{ms} = 1.83\text{mA} \quad (\text{EQ. 10})$$

Suggested PCB Footprint

It is important that the users check the “Surface Mount Assembly Guidelines for Optical Dual FlatPack No Lead (ODFN Package)” before starting ODFN product board mounting.

Layout Considerations

The ISL29011 is relatively insensitive to layout. Like other I²C devices, it is intended to provide excellent performance even in significantly noisy environments. There are only a few considerations that will ensure best performance.

Route the supply and I²C traces as far as possible from all sources of noise. Use two power-supply decoupling capacitors 1μF and 0.1μF and place them close to the VDDA and VDDD pins of the device.

Typical Circuit

A typical application for the ISL29011 is shown in Figure 6. The ISL29011's I²C address is internally hardwired as 1000100. The device can be tied onto a system's I²C bus together with other I²C compliant devices.

Soldering Considerations

Convection heating is recommended for reflow soldering; direct-infrared heating is not recommended. The plastic ODFN package does not require a custom reflow soldering profile, and is qualified to +260°C. A standard reflow soldering profile with a +260°C maximum is recommended.

DATE	REVISION	CHANGE
May 1, 2014	FN6467.6	Added theta jc (bottom) of 14 C/W to the thermal information table on page 4. Updated the paragraph for "VDD Power-up and Power Supply Considerations" on page 12.
April 11, 2012	FN6467.5	<ul style="list-style-type: none"> Page 12, Table 11, removed row with Rext = 250k On page 4, Electrical Specs: changed TYP value for V_{IRLED} (Voltage Head Room of IRDR Pin) from VDD-0.6 to VDD-1.0 and added to Conditions column: "IRDR = 90mA, IS<1:0> = 0 (Note 8)" On page 8, added section, "Changing States - Avoiding Unintentional Interrupts" with Figure 2, "Changing States Flow Example".

About Intersil

Intersil Corporation is a leading provider of innovative power management and precision analog solutions. The company's products address some of the largest markets within the industrial and infrastructure, mobile computing and high-end consumer markets.

For the most updated datasheet, application notes, related documentation and related parts, please see the respective product information page found at www.intersil.com.

You may report errors or suggestions for improving this datasheet by visiting www.intersil.com/ask.

Reliability reports are also available from our website at www.intersil.com/support
