The Renesas ISL317xE are $\pm 15 \mathrm{kV}$ IEC61000 ESD protected, 3.3V powered single transceivers that meet both the RS-485 and RS-422 standards for balanced communication. These devices have very low bus currents $(+125 \mu \mathrm{~A} /-100 \mu \mathrm{~A})$, so they present a true " $1 / 8$ unit load" to the RS-485 bus. This allows up to 256 transceivers on the network without violating the RS-485 specification's 32 unit load maximum, and without using repeaters. For example, in a remote utility meter reading system, individual meter readings are routed to a concentrator using an RS-485 network, so the high allowed node count minimizes the number of repeaters required.

Receiver ( $R x$ ) inputs feature a "Full Fail-Safe" design, which ensures a logic high $R x$ output if $R x$ inputs are floating, shorted, or terminated but undriven.

Hot Plug circuitry ensures that the Tx and Rx outputs remain in a high impedance state while the power supply stabilizes.
The ISL3170E through ISL3175E utilize slew rate limited drivers which reduce EMI, and minimize reflections from improperly terminated transmission lines, or unterminated stubs in multidrop and multipoint applications. Slew rate limited versions also include receiver input filtering to enhance noise immunity in the presence of slow input signals.
The ISL3170E, ISL3171E, ISL3173E, ISL3174E, ISL3176E, and ISL3177E are configured for full duplex (separate Rx input and Tx output pins) applications. The half duplex versions multiplex the Rx inputs and Tx outputs to allow transceivers with output disable functions in 8 Ld packages.

## Features

- IEC61000 ESD protection on RS-485 I/O pins . . . $\pm 15 \mathrm{kV}$
- Class 3 ESD level on all other pins
$>7 \mathrm{kV}$ HBM
- Full fail-safe (open, short, terminated/floating) receivers
- Hot plug - Tx and Rx outputs remain three-state during power-up (only versions with output enable pins)
- True $1 / 8$ unit load allows up to 256 devices on the bus
- Single 3.3 V supply
- High data rates
up to 20Mbps
- Low quiescent supply current. $.800 \mu \mathrm{~A}(\mathrm{Max})$
- Ultra low shutdown supply current . . . . . . . . . . . . . 10nA
- -7 V to +12 V common-mode input/output voltage range
- Half and full duplex pinouts
- Three state Rx and Tx outputs available
- Current limiting and thermal shutdown for driver overload protection
- Tiny MSOP packages consume $50 \%$ less board space
- Pb-free (RoHS compliant)

## Applications

- Automated utility meter reading systems
- High node count systems
- Field bus networks
- Security camera networks
- Building environmental control/lighting systems
- Industrial/process control networks

NOTES:

1. Add " $-T$ " suffix for 2.5 k tape and reel options. Refer to TB347 for details on reel specifications.
2. Add "-T7A" suffix for 250 unit tape and reel options. Refer to TB347 for details on reel specifications.
3. These Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and $100 \%$ matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb -free soldering operations). $\mathrm{Pb}-\mathrm{free}$ products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
4. For Moisture Sensitivity Level (MSL), see the product information page for the ISL3170E, ISL3171E, ISL3172E, ISL3173E, ISL3174E, ISL3175E, ISL3176E, ISL3177E, ISL3178E. For more information on MSL refer to TB363.

## Pin Descriptions

| PIN | FUNCTION |
| :---: | :---: |
| RO | Receiver output: If $A-B \geq-50 \mathrm{mV}$, RO is high; If $A-B \leq-200 \mathrm{mV}$, RO is low; if $A$ and $B$ are unconnected (floating) or shorted, $\mathrm{RO}=\mathrm{High}$. |
| $\overline{\mathrm{RE}}$ | Receiver output enable. RO is enabled when $\overline{R E}$ is low; RO is high impedance when $\overline{R E}$ is high. If the $R x$ enable function is not required, connect $\overline{R E}$ directly to GND or through a $1 \mathrm{k} \Omega$ to $3 \mathrm{k} \Omega$ resistor to GND. |
| DE | Driver output enable. The driver outputs, $Y$ and $Z$, are enabled by bringing $D E$ high, and are high impedance when $D E$ is low. If the Tx enable function is not required, connect $D E$ to $\mathrm{V}_{\mathrm{CC}}$ through a $1 \mathrm{k} \Omega$ to $3 \mathrm{k} \Omega$ resistor. |
| DI | Driver input. A low on DI forces output Y low and output $Z$ high. Similarly, a high on DI forces output Y high and output Z low. |
| GND | Ground connection. |
| A/Y | $\pm 15 \mathrm{kV}$ IEC61000 ESD Protected RS-485/422 level, noninverting receiver input and noninverting driver output. Pin is an input if $D E=0$; pin is an output if $D E=1$. |
| B/Z | $\pm 15 \mathrm{kV}$ IEC61000 ESD Protected RS-485/422 level, Inverting receiver input and inverting driver output. Pin is an input if DE $=0$; pin is an output if $D E=1$. |
| A | $\pm 15 \mathrm{kV}$ IEC61000 ESD Protected RS-485/422 level, noninverting receiver input. |
| B | $\pm 15 \mathrm{kV}$ IEC61000 ESD Protected RS-485/422 level, inverting receiver input. |
| Y | $\pm 15 \mathrm{kV}$ IEC61000 ESD Protected RS-485/422 level, noninverting driver output. |
| Z | $\pm 15 \mathrm{kV}$ IEC61000 ESD Protected RS-485/422 level, inverting driver output. |
| $\mathrm{V}_{\mathrm{CC}}$ | System power supply input (3.0V to 3.6 V ). |
| NC | No Connection. |

## Operating Conditions

Temperature Range $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.
NOTE:
5. $\theta_{\mathrm{JA}}$ is measured with the component mounted on a high-effective thermal conductivity test board in free air. Refer to TB379 for details.

Electrical Specifications Test Conditions: $\mathrm{V}_{\mathrm{CC}}=3.0 \mathrm{~V}$ to 3.6 V ; unless otherwise specified. Typicals are at $\mathrm{V}_{\mathrm{CC}}=3.3 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, (Note 6)

## NOTES:

6. All currents into device pins are positive; all currents out of device pins are negative. All voltages are referenced to device ground unless otherwise specified.
7. Supply current specification is valid for loaded drivers when $D E=0 \mathrm{~V}$.
8. Applies to peak current. See "Typical Performance Curves" starting on page 14 for more information.
9. When testing devices with the shutdown feature, keep $\overline{\mathrm{RE}}=0$ to prevent the device from entering SHDN.
10. When testing devices with the shutdown feature, the $\overline{\mathrm{RE}}$ signal high time must be short enough (typically $<100 \mathrm{~ns}$ ) to prevent the device from entering SHDN.
11. Versions with a shutdown feature are put into shutdown by bringing $\overline{R E}$ high and DE low. If the inputs are in this state for less than 50 ns, the parts are ensured not to enter shutdown. If the inputs are in this state for at least 600 ns , the parts are ensured to have entered shutdown. See "Low Power Shutdown Mode" on page 13.
12. Keep $\overline{R E}=V C C$, and set the $D E$ signal low time $>600 \mathrm{~ns}$ to ensure that the device enters SHDN.
13. Set the $\overline{\operatorname{RE}}$ signal high time $>600 \mathrm{~ns}$ to ensure that the device enters SHDN.
14. Does not apply to the ISL3171E, ISL3174E, or ISL3177E.
15. $\Delta \mathrm{t}_{\text {SKEW }}$ is the magnitude of the difference in propagation delays of the specified terminals of two units tested with identical test conditions ( $\mathrm{V}_{\mathrm{CC}}$, temperature, etc.). Applies only to the ISL3176E through ISL3178E.
16. ISL3170E through ISL3175E only.
17. $\mathrm{V}_{\mathrm{CC}} \geq 3.15 \mathrm{~V}$.
18. Limits established by characterization and are not production tested.
19. If the Tx or Rx enable function is not needed, connect the enable pin to the appropriate supply (see "Pin Descriptions" on page 4) through a $1 \mathrm{k} \Omega$ to $3 \mathrm{k} \Omega$ resistor.
20. Parameters with MIN and/or MAX limits are $100 \%$ tested at $+25^{\circ} \mathrm{C}$, unless otherwise specified. Temperature limits established by characterization and are not production tested.
21. If the $D E$ or $\overline{R E}$ input voltage exceeds the $V_{C C}$ voltage by more than 500 mV , then current will flow into the logic pin. The current is limited by a $340 \Omega$ resistor (so $\approx 13 \mathrm{~mA}$ with $\mathrm{V}_{\mathrm{IN}}=5 \mathrm{~V}$ and $\mathrm{V}_{\mathrm{CC}}=0 \mathrm{~V}$ ) so no damage will occur if $\mathrm{V}_{\mathrm{CC}} \leq \mathrm{V}_{\mathrm{IN}} \leq 7 \mathrm{~V}$ for short periods of time.

## Application Information

RS-485 and RS-422 are differential (balanced) data transmission standards for use in long haul or noisy environments. RS-422 is a subset of RS-485, so RS-485 transceivers are also RS-422 compliant. RS-422 is a point-to-multipoint (multidrop) standard, which allows only one driver and up to 10 receivers on each bus, assuming one unit load devices.. RS-485 is a true multipoint standard, which allows up to 32 one-unit load devices (any combination of drivers and receivers) on each bus. To allow for multipoint operation, the RS-485 specification requires that drivers must handle bus contention without sustaining any damage.
Another important advantage of RS-485 is the extended common-mode range (CMR), which specifies that the driver outputs and receiver inputs withstand signals that range from +12 V to -7 V . RS-422 and RS-485 are intended for runs as long as 4000 ft , so the wide CMR is necessary to handle ground potential differences, as well as voltages induced in the cable by external fields.

## Receiver Features

These devices utilize a differential input receiver for maximum noise immunity and common mode rejection. Input sensitivity is better than $\pm 200 \mathrm{mV}$, as required by the RS-422 and RS-485 specifications.
Receiver input resistance of $96 \mathrm{k} \Omega$ surpasses the RS-422 specification of $4 \mathrm{k} \Omega$ and is eight times the RS-485 "Unit Load (UL)" requirement of $12 \mathrm{k} \Omega$ minimum. Thus, these products are known as "one-eighth UL" transceivers and there can be up to 256 of these devices on a network while still complying with the RS-485 loading specification.

Receiver inputs function with common-mode voltages as great as $+9 \mathrm{~V} /-7 \mathrm{~V}$ outside the power supplies (that is, +12 V and -7 V ), making them ideal for long networks where induced voltages and ground potential differences are realistic concerns.
All the receivers include a "Full Fail-Safe" function that guarantees a high level receiver output if the receiver inputs are unconnected (floating) or shorted. Fail-safe with shorted inputs is achieved by setting the Rx upper switching point to -50 mV , thereby ensuring that the Rx sees 0 V differential as a high input level.
Receivers easily meet the data rates supported by the corresponding driver, and all receiver outputs (except on the ISL3171E, ISL3174E, and ISL3177E) are tri-statable using the active low $\overline{\mathrm{RE}}$ input.

## Driver Features

The RS-485/422 driver is a differential output device that delivers at least 1.5 V across a $54 \Omega$ load (RS-485) and at least 2 V across a $100 \Omega$ load (RS-422). The drivers feature low propagation delay skew to maximize bit width and to minimize EMI.

All drivers are tri-statable through the active high DE input, except on the ISL3171E, ISL3174E, and ISL3177E.
The 250 kbps and 500 kbps driver outputs are slew rate limited to minimize EMI and to reduce reflections in unterminated or improperly terminated networks. Outputs of the ISL3176E through ISL3178E drivers are not limited, so faster output transition times allow data rates of at least 20Mbps.

## Hot Plug Function

When a piece of equipment powers up, a period of time occurs in which the processor or ASIC driving the RS-485 control lines ( $D E, \overline{R E}$ ) is unable to ensure that the RS-485 $T x$ and $R x$ outputs are kept disabled. If the equipment is connected to the bus, a driver activating prematurely during power up may crash the bus. To avoid this scenario, the ISL317XE versions with output enable pins incorporate a "Hot Plug" function. During power up, circuitry monitoring $\mathrm{V}_{\mathrm{CC}}$ ensures that the Tx and Rx outputs remain disabled for a period of time, regardless of the state of DE and $\overline{R E}$. This gives the processor/ASIC a chance to stabilize and drive the RS-485 control lines to the proper states.

## ESD Protection

All pins on these devices include Class 3 ( $>7 \mathrm{kV}$ ) Human Body Model (HBM) ESD protection structures, but the RS-485 pins (driver outputs and receiver inputs) incorporate advanced structures allowing them to survive ESD events in excess of $\pm 15 \mathrm{kV}$ HBM and $\pm 15 \mathrm{kV}$ IEC61000. The RS-485 pins are particularly vulnerable to ESD damage because they typically connect to an exposed port on the exterior of the finished product. Simply touching the port pins, or connecting a cable, can cause an ESD event that might destroy unprotected ICs. These new ESD structures protect the device whether or not it is powered up, and without degrading the RS-485 common mode range of -7 V to +12 V . This built-in ESD protection eliminates the need for board level protection structures (for example, transient suppression diodes), and the associated, undesirable capacitive load they present.

## IEC61000-4-2 Testing

The IEC61000 test method applies to finished equipment, rather than to an individual IC. Therefore, the pins most likely to suffer an ESD event are those that are exposed to the outside world (the RS-485 pins in this case), and the IC is tested in its typical application configuration (power applied) rather than testing each pin-to-pin combination. The lower current limiting resistor coupled with the larger charge storage capacitor yields a test that is much more severe than the HBM test. The extra ESD protection built into this device's RS-485 pins allows the design of equipment meeting Level 4 criteria without the need for additional board level protection on the RS-485 port.

## AIR-GAP DISCHARGE TEST METHOD

For this test method, a charged probe tip moves toward the IC pin until the voltage arcs to it. The current waveform delivered to the IC pin depends on approach speed, humidity, temperature, etc., so it is difficult to obtain repeatable results. The ISL317XE RS-485 pins withstand $\pm 15 \mathrm{kV}$ air-gap discharges.

## CONTACT DISCHARGE TEST METHOD

During the contact discharge test, the probe contacts the tested pin before the probe tip is energized, thereby eliminating the variables associated with the air-gap discharge. The result is a more repeatable and predictable test, but equipment limits prevent testing devices at voltages higher than $\pm 8 \mathrm{kV}$. The ISL317XE survive $\pm 8 \mathrm{kV}$ contact discharges on the RS-485 pins.

## Data Rate, Cables, and Terminations

RS-485/422 are intended for network lengths up to 4000ft, but the maximum system data rate decreases as the transmission length increases. Devices operating at 20Mbps are limited to lengths less than 100ft, while the 250kbps versions can operate at full data rates with lengths of several thousand feet.
Twisted pair is the cable of choice for RS-485/422 networks. Twisted pair cables tend to pick up noise and other electromagnetically induced voltages as common mode signals, which are effectively rejected by the differential receivers in these ICs.

Proper termination is imperative when using the 20Mbps devices to minimize reflections. Short networks using the 250 kbps versions do not need to be terminated, but terminations are recommended unless power dissipation is an overriding concern.

In point-to-point, or point-to-multipoint (single driver on bus) networks, the main cable should be terminated in its characteristic impedance (typically $120 \Omega$ ) at the end farthest from the driver. In multi-receiver applications, keep stubs connecting receivers to the main cable as short as possible. Multipoint (multi-driver) systems require that the main cable be terminated in its characteristic impedance at both ends. Keep stubs connecting a transceiver to the main cable as short as possible.

## Built-In Driver Overload Protection

As stated previously, the RS-485 spec requires that drivers survive worst case bus contentions undamaged. These devices meet this requirement via driver output short circuit current limits, and on-chip thermal shutdown circuitry.
The driver output stages incorporate short circuit current limiting circuitry which ensures that the output current never exceeds the RS-485 spec, even at the common-mode voltage range extremes. Additionally, these devices utilize a foldback circuit which reduces the short circuit current, and thus the power dissipation, whenever the contending voltage exceeds either supply.

In the event of a major short circuit condition, devices use a thermal shutdown feature that disables the drivers whenever the die temperature becomes excessive. This eliminates the power dissipation, allowing the die to cool. The drivers automatically re-enable after the die temperature drops about $15^{\circ}$. If the contention persists, the thermal shutdown/re-enable cycle repeats until the fault is cleared. Receivers stay operational during thermal shutdown.

## Low Power Shutdown Mode

These CMOS transceivers all use a fraction of the power required by their bipolar counterparts, but some also include a shutdown feature that reduces the already low quiescent $I_{C C}$ to a $10 n A$ trickle. These devices enter shutdown whenever the receiver and driver are simultaneously disabled ( $\overline{\mathrm{RE}}=\mathrm{V}_{\mathrm{CC}}$ and $\mathrm{DE}=\mathrm{GND}$ ) for a period of at least 600 ns . Disabling both the driver and the receiver for less than 50ns guarantees that the transceiver will not enter shutdown.

Note that receiver and driver enable times increase when the transceiver enables from shutdown. Refer to Notes 9 through 13 at the end of the "Electrical Specifications table" on page 9, for more information.

| Aug 31,2017 | FN6307.6 | Applied new header/footer. <br> Added Related Literature on page 1. <br> Added Note 2 to Ordering Information table on page 2. <br> Updated the Receiving Truth table on page 3. <br> Updated POD M10.118 on page 20 from rev 0 to rev 1. Changes: <br> Updated to new POD template. Added land pattern <br> Added Revision History and About Intersil sections. |

## Package Outline Drawing

## M8.118

## 8 LEAD MINI SMALL OUTLINE PLASTIC PACKAGE

## Rev 4, 7/11

TYPICAL RECOMMENDED LAND PATTERN

For the most recent package outline drawing, see M8.118.

NOTES:

1. Dimensions are in millimeters.
2. Dimensioning and tolerancing conform to JEDEC MO-187-AA and AMSEY14.5m-1994.
3. Plastic or metal protrusions of $\mathbf{0 . 1 5 \mathrm { mm }}$ max per side are not included.
4. Plastic interlead protrusions of 0.15 mm max per side are not included.
5. Dimensions are measured at Datum Plane "H".
6. Dimensions in () are for reference only.

## Package Outline Drawing

## M8.15

## 8 LEAD NARROW BODY SMALL OUTLINE PLASTIC PACKAGE

Rev 4, 1/12

$\underline{\underline{\text { TYPICAL RECOMMENDED LAND PATTERN }}}$

## NOTES:

1. Dimensioning and tolerancing per ANSI Y14.5M-1994.
2. Package length does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15 mm ( 0.006 inch) per side.
3. Package width does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.25 mm ( 0.010 inch ) per side.
4. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
5. Terminal numbers are shown for reference only.
6. The lead width as measured 0.36 mm ( 0.014 inch ) or greater above the seating plane, shall not exceed a maximum value of 0.61 mm ( 0.024 inch).
7. Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact.
8. This outline conforms to JEDEC publication MS-012-AA ISSUE C.

## Package Outline Drawing

## M10.118

10 LEAD MINI SMALL OUTLINE PLASTIC PACKAGE
Rev 1, 4/12

TYPICAL RECOMMENDED LAND PATTERN

Package Outline Drawing
For the most recent package outline drawing, see M14.15.

## M14.15

14 LEAD NARROW BODY SMALL OUTLINE PLASTIC PACKAGE
Rev 1, 10/09

NOTES:

1. Dimensions are in millimeters.

Dimensions in () for Reference Only.
2. Dimensioning and tolerancing conform to AMSEY14.5m-1994.
3. Datums $A$ and $B$ to be determined at Datum $H$.
4. Dimension does not include interlead flash or protrusions. Interlead flash or protrusions shall not exceed 0.25 mm per side.
5. The pin \#1 indentifier may be either a mold or mark feature.
6. Does not include dambar protrusion. Allowable dambar protrusion shall be 0.10 mm total in excess of lead width at maximum condition.
7. Reference to JEDEC MS-012-AB.

TYPICAL RECOMMENDED LAND PATTERN

## Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.
Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.
(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.
(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
