

RTKA211805DE0000BU

The [RAA211805](#) is an integrated 5V, 300mA buck regulator with an ultra-low quiescent current (I_Q) of 5.5 μ A. It supports a wide input voltage range from 7V to 80V. The RAA211805 is offered in a TSOT23-5 package. The RTKA211805DE0000BU evaluation board provides a quick and comprehensive platform for evaluating the performance features of the RAA211805 buck regulator.

The RTKA211805DE0000BU evaluation board operates from a supply voltage of 7V to 80V_{DC}, delivering a continuous load up to 300mA at 5V output voltage.

Specifications

This board is configured and optimized for the following operating conditions:

- Input voltage range: 7V to 80V
- Output voltage: 5V
- Up to 300mA output current capability
- Inductor current limit of 750mA (typical) peak
- Operating temperature range: -40°C to +125°C

Features

- 7V to 80V input supply range
- Up to 300mA output current
- $I_Q = 5.5\mu$ A at 80V, at no load conditions, switching
- $I_Q = 4.5\mu$ A at 80V at no load and no switching conditions
- Minimum on-time of 75ns
- Fixed 5V V_{OUT}
- Variable frequency operation, frequency programmed by external inductor (15 μ H to 33 μ H)
- Pre-bias start-up/Monotonic/ smooth start-up
- Total of four external components
- Protections: Overcurrent (OC) Limit, input Undervoltage Lockout (UVLO), Over-Temperature Protection (OTP), output Overvoltage Protection (OVP)
- Accurate EN threshold

1. Functional Description

The RTKA211805DE0000BU evaluation board provides a comprehensive and versatile platform to assess functionality and prototype an application with the integrated 5V, 300mA buck regulator RAA211805. The board has options for evaluating most features of the RAA211805 and includes test points that facilitate probing.

1.1 Operational Characteristics

The RTKA211805DE0000BU evaluation board evaluates the RAA211805 with VIN from 7V to 80V and a continuous load of 300mA. Renesas recommends operating the board within the specifications for the proper functioning of the evaluation board.

Connect EN to VIN through a resistor, or connect EN to external logic voltage for enable and disable.

1.2 Connectors, Test Points, Selection Switches, and Jumper Descriptions

The RTKA211805DE0000BU evaluation board includes I/O connectors, test points, selection switches, and jumpers to provide a comprehensive and versatile platform for evaluating the RAA211805 (see [Table 1](#)).

Table 1. Connectors, Test Points, Selection Switches, and Jumper Descriptions

Reference Designator	Description
J1	Input voltage positive connection
J2	Input voltage return connection
J3	Output voltage positive connection
J4	Output voltage return connection
TP1	GND test point
TP2	VSW
TP3	ENABLE test point

1.3 Recommended Equipment

- Power supply that can deliver 80V or higher with at least 350mA source current capability
- Electronic load capable of sinking at least 350mA current
- 4-channel oscilloscope with voltage and current probes

1.4 Quick Start Guide

Use the Quick Setup Guide to configure and power up the board properly.

1. Set the power supply voltage to 24V and turn off the power supply. Connect the positive output of the power supply to J1 (VIN) and the negative output to J2 (GND).
2. Connect an electronic load to J3 (VOUT) for the positive connection and J4 (GND) for the negative connection.
3. Place scope probes to VOUT (J3), VSW (TP2), and/or other test points of interest.
4. Set the load current to 0.1A and turn on the power supply. The output voltage should be in regulation with a nominal 5V output.
5. Slowly increase the load up to 300mA. The output voltage should remain in regulation with a nominal 5V output.
6. Slowly sweep VIN from 7V to 80V. The output voltage should remain in regulation with a nominal 5V output.
7. Decrease the input voltage to 0V to shut down the regulator.

1.5 Enable

EN is connected to VIN through R2. EN can be driven by an external source or by removing R2. Do not leave this pin floating.

1.6 Soft-Start

RAA211805 is naturally current limited and automatically provides a smoothly rising V_{OUT} voltage at power up. Because the total output of the device is limited, a startup with a heavy load generates a longer V_{OUT} ramp; a startup with no load generates a faster ramp.

The approximate soft-start time^[1] based on the RTKA211805DE0000BU with 24V input at no load is 360µs and 590µs at full load.

1.7 Switching Frequency

The regulator is a variable frequency converter, and the switching frequency varies proportionally to the load. The maximum switching frequency is dependent on inductance and input voltage.

Figure 2 and Figure 3 show the bench data for the evaluation board. Use Equation 1 to approximate the switching frequency.

(EQ. 1)
$$\text{SwitchingFrequency} = \frac{2 \times I_{\text{load}}}{L \times I_{\text{peak}} \times I_{\text{peak}} \left(\frac{1}{V_{\text{IN}} - V_{\text{OUT}}} + \frac{1}{V_{\text{OUT}}} \right) \times \text{efficiency}}$$

Figure 2. Switching Frequency (Full Load, 300mA) vs. Input Voltage

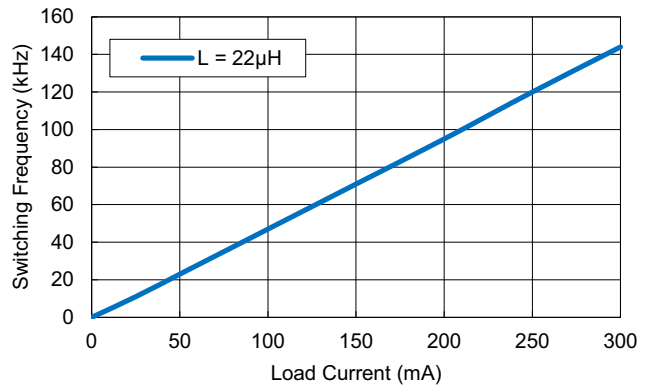

Figure 3. Switching Frequency vs. Load Current

1. Test conditions: V_{IN} = 24V, C_{OUT} = 2x22µF (PN:GRM187R61A226ME15D), C_{IN} = 4.7µF (PN:GRM31CC72A475KE11L), L = 22µH (PN:74404054330), Power supply: Chroma-632012P-100-50, Load: Resistive Load equivalent to full load at nominal V_{out}. Measured from 0 to 100% of nominal V_{OUT}.

2. Board Design

Figure 4. RTKA211805DE0000BU Evaluation Board (Top)

2.1 Layout Guidelines

The printed circuit board (PCB) layout is critical for properly operating the RAA211805. The following guidelines are recommended to achieve optimal performance.

- Use a multilayer PCB structure to achieve optimized performance. The evaluation board RTKA211805DE0000BU uses a 2-layer PCB with 1oz copper and a bottom layer as ground.
- Place the input capacitor as close as possible to the IC. The input capacitor is the most important component for any step-down converter and should be placed first in the layout.
- The copper area of the PHASE NODE should not be more than needed. Place the inductor close to the regulator.
- Place an output capacitor close to the inductor.
- Place and route the power component to keep the power loop area as minimum and short as possible.
- Keep all the power components on the same side of the PCB.
- Include thermal vias as necessary to improve heat dissipation.
