## $\mu$ PD48576109 <br> $\mu$ PD48576118

## 576M-BIT Low Latency DRAM Separate I/O

## Description

The $\mu \mathrm{PD} 48576109$ is a $67,108,864$-word by 9 bit and the $\mu \mathrm{PD} 48576118$ is a $33,554,432$ word by 18 bit synchronous double data rate Low Latency RAM fabricated with advanced CMOS technology using one-transistor memory cell.
The $\mu \mathrm{PD} 48576109$ and $\mu \mathrm{PD} 48576118$ integrate unique synchronous peripheral circuitry and a burst counter. All input registers controlled by an input clock pair (CK and CK\#) are latched on the positive edge of CK and CK\#. These products are suitable for application which require synchronous operation, high speed, low voltage, high density and wide bit configuration.

## Specification

- Density: 576M bit
- Organization
- $\quad$ Separate I/O: 8 M words x 9 bits x 8 banks 4 M words x 18 bits x 8 banks
- Operating frequency: $533 / 400 / 300 \mathrm{MHz}$
- Interface: HSTL I/O
- Package: 144-pin TAPE FBGA
- Package size: $18.5 \times 11$
- Leaded and Lead free
- Power supply
- $\quad 2.5 \mathrm{~V}$ Vext
- $\quad 1.8$ V VDD
- 1.5 V or 1.8 V VddQ
- Refresh command
- Auto Refresh
- 16 K cycle / 32 ms for each bank
- 128 K cycle / 32 ms for total
- Operating case temperature : $\mathrm{Tc}=0$ to $95^{\circ} \mathrm{C}$

## Features

- SRAM-type interface
- Double-data-rate architecture
- PLL circuitry
- Cycle time: $1.875 \mathrm{~ns} @ \mathrm{trc}_{\mathrm{tr}}=15 \mathrm{~ns}$
$2.5 \mathrm{~ns} @$ trc $=15 \mathrm{~ns}$
$2.5 \mathrm{~ns} @ \mathrm{trc}_{\mathrm{Rc}}=20 \mathrm{~ns}$
$3.3 \mathrm{~ns} @ \mathrm{trC}_{\mathrm{R}}=20 \mathrm{~ns}$
- Non-multiplexed addresses
- Multiplexing option is available.
- Data mask for WRITE commands
- Differential input clocks (CK and CK\#)
- Differential input data clocks (DK and DK\#)
- Data valid signal (QVLD)
- Programmable burst length: 2 / 4 / 8 (x9 / x18)
- User programmable impedance output ( $25 \Omega-60 \Omega$ )
- JTAG boundary scan

## Pin Description

| Symbol | Type | Description |
| :---: | :---: | :---: |
| CK, CK\# | Input | Clock inputs: <br> CK and CK\# are differential clock inputs. This input clock pair registers address and control inputs on the rising edge of CK. CK\# is ideally 180 degrees out of phase with CK. |
| CS\# | Input | Chip select <br> CS\# enables the commands when CS\# is LOW and disables them when CS\# is HIGH. When the command is disabled, new commands are ignored, but internal operations continue. |
| WE\#, REF\# | Input | WRITE command pin, Refresh command pin: <br> WE\#, REF\# are sampled at the positive edge of CK, WE\#, and REF\# define (together with CS\#) the command to be executed. |
| A0-A21 | Input | Address inputs: <br> A0-A21 define the row and column addresses for READ and WRITE operations. During a MODE REGISTER SET, the address inputs define the register settings. They are sampled at the rising edge of CK. <br> In the x18 configuration, A21 is reserved for address expansion. This expansion address can be treated as address input, but it does not affect the operation of the device. |
| A22 | Input | Reserved for future use: <br> These signals should be tied to Vss or leave open. |
| BA0-BA2 | Input | Bank address inputs; <br> Select to which internal bank a command is being applied. |
| D0-Dxx | Input | Data input: <br> The D signals form the 18-bit input data bus. During WRITE commands, the data is referenced to both edges of DK. <br> $x 9$ device uses D0 to D8. <br> x18 device uses D0 to D17. |
| Q0-Qxx | Output | Data output: <br> The $Q$ signals form the 18 -bit output data bus. During READ commands, the data is referenced to both edges of QK. <br> $x 9$ device uses Q0 to Q8. <br> x18 device uses Q0 to Q17. |
| QKx, QKx\# | Output | Output data clocks: <br> QKx and QKx\# are opposite polarity, output data clocks. They are always free running and edgealigned with data output from the $\mu$ PD48576109/18. QKx\# is ideally 180 degrees out of phase with QKx. <br> For the x18 device, QK0 and QK0\# are aligned with Q0-Q8. QK1 and QK1\# are aligned with Q9Q17. For the x 9 device, QK0 and QK0\# are aligned with Q0-Q8. |
| DK, DK\# | Input | Input data clock; <br> DK and DK\# are the differential input data clocks. All input data is referenced to both edges of DK. DK\# is ideally 180 degrees out of phase with DK. <br> In both $x 9$ and $x 18$ configurations, all Ds are referenced to DK and DK\#. |
| DM | Input | Input data mask; <br> The DM signal is the input mask signal for WRITE data. Input data is masked when DM is sampled HIGH along with the WRITE input data. DM is sampled on both edges of DK. The signal should be Vss if not used. |
| QVLD | Output | Data valid; <br> The QVLD indicates valid output data. QVLD is edge-aligned with QKx and QKx\#. |

| Symbol | Type | Description |
| :---: | :---: | :---: |
| ZQ | Input /Output | External impedance [ $25 \Omega-60 \Omega$ ]; <br> This signal is used to tune the device outputs to the system data bus impedance. $Q$ output impedance is set to $0.2 \times R Q$, where $R Q$ is a resistor from this signal to $V_{s s}$. Connecting ZQ to $V_{s s}$ invokes the minimum impedance mode. Connecting $Z Q$ to $V_{D D Q}$ invokes the maximum impedance mode. Refer to Figure 2-5. Mode Register Bit Map to activate this function. |
| TMS , TDI | Input | JTAG function pins: <br> IEEE 1149.1 test inputs: These balls may be left as no connects if the JTAG function is not used in the circuit |
| TCK | Input | JTAG function pin; <br> IEEE 1149.1 clock input: This ball must be tied to Vss if the JTAG function is not used in the circuit. |
| TDO | Output | JTAG function pin; <br> IEEE 1149.1 test output: JTAG output. <br> This ball may be left as no connect if JTAG function is not used. |
| $V_{\text {ReF }}$ | Input | Input reference voltage; <br> Nominally $\mathrm{V}_{\mathrm{do}} \mathrm{Q} / 2$. Provides a reference voltage for the input buffers. |
| VExt | Supply | Power supply; <br> 2.5 V nominal. See Recommended DC Operating Conditions for range. |
| VDD | Supply | Power supply; <br> 1.8 V nominal. See Recommended DC Operating Conditions for range. |
| VodQ | Supply | DQ power supply; <br> Nominally, 1.5 V or 1.8 V . Isolated on the device for improved noise immunity. <br> See Recommended DC Operating Conditions for range. |
| Vss | Supply | Ground |
| VssQ | Supply | DQ ground; <br> Isolated on the device for improved noise immunity. |
| $V_{T T}$ | Supply | Power supply; <br> Isolated termination supply. Nominally, VDDQ/2. See Recommended DC Operating Conditions for range. |
| NF |  | No function; <br> These balls may be connected to Vss. |
| DNU |  | Do not use; <br> These balls may be connected to $\mathrm{V}_{\text {ss }}$. |

## 1. Electrical Characteristics

## Absolute Maximum Ratings

| Parameter | Symbol | Conditions | Rating | Unit |
| :--- | :---: | :---: | :---: | :---: |
| Supply voltage | $\mathrm{V}_{\mathrm{EXT}}$ |  | -0.3 to +2.8 | V |
| Supply voltage | $\mathrm{V}_{\mathrm{DD}}$ |  | -0.3 to +2.1 | V |
| Output supply voltage, <br> Input voltage, Input / Output voltage | $\mathrm{V}_{\mathrm{DD}}$ |  | -0.3 to +2.1 | V |
| Input / Output voltage | $\mathrm{V}_{\mathrm{IH}} / \mathrm{V}_{\mathrm{IL}}$ |  | -0.3 to +2.1 |  |
| Junction temperature | $\mathrm{T}_{\mathrm{j}} \mathrm{MAX}$. |  | 110 | V |
| Storage temperature | $\mathrm{T}_{\text {stg }}$ |  | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |

Caution Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

## Recommended DC Operating Conditions

$0^{\circ} \mathrm{C} \leq \mathrm{Tc} \leq 95^{\circ} \mathrm{C}$; $1.7 \mathrm{~V} \leq \mathrm{VDD} \leq 1.9 \mathrm{~V}$, unless otherwise noted.

| Parameter | Symbol | Conditions | MIN. | TYP. | MAX. | Unit | Note |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Supply voltage | Vext |  | 2.38 | 2.5 | 2.63 | V | 1 |
| Supply voltage | Vdo |  | 1.7 | 1.8 | 1.9 | V | 1 |
| Output supply voltage | VdoQ |  | 1.4 |  | VdD | V | 1,2,3 |
| Reference Voltage | VREF |  | $0.49 \times$ VddQ | $0.5 \times \mathrm{VDDQ}$ | $0.51 \times \mathrm{VdoQ}$ | V | 1,4,5 |
| Termination voltage | $V_{\text {TT }}$ |  | $0.95 \times$ VREF | $V_{\text {Ref }}$ | $1.05 \times \mathrm{V}_{\text {REF }}$ | V | 1,6 |
| Input HIGH voltage | $\mathrm{V}_{\mathrm{IH}}(\mathrm{DC})$ |  | $V_{\text {Ref }}+0.1$ |  |  | V | 1 |
| Input LOW voltage | VIL (DC) |  |  |  | Vref - 0.1 | V | 1 |

Notes 1. All voltage referenced to Vss (GND).
2. During normal operation, $V_{D D Q}$ must not exceed $V_{D D}$.
3. $V_{\mathrm{DD}} \mathrm{Q}$ can be set to a nominal $1.5 \mathrm{~V} \pm 0.1 \mathrm{~V}$ or $1.8 \mathrm{~V} \pm 0.1 \mathrm{~V}$ supply.
4. Typically the value of $V_{\text {REF }}$ is expect to be $0.5 \times V_{D D Q}$ of the transmitting device. $V_{\text {REF }}$ is expected to track variations in VmD.
5. Peak-to-peak AC noise on $V_{\text {ref }}$ must not exceed $\pm 2 \% V_{\text {ref }}(D C)$.
6. Vtt is expected to be set equal to Vref and must track variations in the DC level of Vref.

## DC Characteristics

$0^{\circ} \mathrm{C} \leq \mathrm{Tc} \leq 95^{\circ} \mathrm{C}$; $1.7 \mathrm{~V} \leq \mathrm{VDD} \leq 1.9 \mathrm{~V}$, unless otherwise noted

| Input leakage current | 1 l |  | -5 | +5 | $\mu \mathrm{A}$ | 1,2 |
| Output leakage current | ILo |  | -5 | +5 | $\mu \mathrm{A}$ | 1,2 |
| Reference voltage current | Iref |  | -5 | +5 | $\mu \mathrm{A}$ | 1,2 |
| Output high current | Іон | Vон $=\mathrm{VDDQ}^{\text {/ }}$ 2 | (VdoQ/2) / (1.15 x RQ/5) | (VddQ/2) / (0.85 x RQ/5) | mA | 3,4 |
| Output low current | loL | $V_{\text {OL }}=V_{\text {do }} / 2$ | (VdoQ/2) / (1.15 x RQ/5) | (VdoQ/2) / (0.85 x RQ/5) | mA | 3,4 |

Notes 1. Outputs are impedance-controlled. $\mid$ Iон $\mid=(\operatorname{VdD} / 2) /(R Q / 5)$ for values of $125 \Omega \leq R Q \leq 300 \Omega$.
2. Outputs are impedance-controlled. IoL $=(\mathrm{VDDQ} / 2) /(\mathrm{RQ} / 5)$ for values of $125 \Omega \leq \mathrm{RQ} \leq 300 \Omega$.
3. Іон and Iol are defined as absolute values and are measured at $\operatorname{VDD} Q / 2$. Ioн flows from the device, Iol flows into the device.
4. If MRS bit A 8 is 0 , use $\mathrm{RQ}=250 \Omega$ in the equation in lieu of presence of an external impedance matched resistor.

## Capacitance ( $\mathrm{TA}=25^{\circ} \mathrm{C}, \mathrm{f}=1 \mathrm{MHz}$ )

| Parameter | Symbol | Test conditions | MIN. | MAX. | Unit |
| :--- | :---: | :--- | :---: | :---: | :---: |
| Address / Control Input capacitance | $\mathrm{C}_{\mathrm{IN}}$ | $\mathrm{V}_{/ \mathrm{N}}=0 \mathrm{~V}$ | 1.5 | 2.5 | pF |
| I/O, Output, Other capacitance <br> (D, Q, DM, QK, QVLD) | $\mathrm{C}_{/ / \mathrm{O}}$ | $\mathrm{V}_{/ / \mathrm{O}}=0 \mathrm{~V}$ | 3.5 | 5.0 | pF |
| Clock Input capacitance |  |  |  |  |  |
| JTAG pins | $\mathrm{C}_{\mathrm{clk}}$ | $\mathrm{V}_{\mathrm{clk}}=0 \mathrm{~V}$ | 2.0 | pF |  |

Remark These parameters are periodically sampled and not $100 \%$ tested.
Capacitance is not tested on ZQ pin.

## Recommended AC Operating Conditions

$0^{\circ} \mathrm{C} \leq \mathrm{TC} \leq 95^{\circ} \mathrm{C}$; $1.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}} \leq 1.9 \mathrm{~V}$, unless otherwise noted

| Parameter | Symbol | Conditions | MIN. | MAX. | Unit | Note |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Input HIGH voltage | $\mathrm{V}_{\mathrm{H}(\mathrm{AC})}$ |  | $\mathrm{V}_{\text {REF }}+0.2$ |  | $\mathrm{~V}^{2}$ | 1 |
| Input LOW voltage | $\mathrm{V}_{\mathrm{IL}(A C)}$ |  |  | $\mathrm{V}_{\text {REF }}-0.2$ | V | 1 |

Note 1. Overshoot: $\mathrm{V}_{\mathrm{IH}(\mathrm{AC})} \leq \mathrm{V}_{\mathrm{dD}} \mathrm{Q}+0.7 \mathrm{~V}$ for $\mathrm{t} \leq \mathrm{tcK}^{2} / 2$
Undershoot: $\mathrm{V}_{\mathrm{IL}(\mathrm{AC})} \geq-0.5 \mathrm{~V}$ for $\mathrm{t} \leq \mathrm{tck} / 2$
Control input signals may not have pulse widths less than tckh (MIN.) or operate at cycle rates less than tck (MIN.).

## DC Characteristics

|  |  |  | Vext | 25 | 20 | 20 | 20 |  |

Remarks 1. Idd specifications are tested after the device is properly initialized. $0^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{C}} \leq 95^{\circ} \mathrm{C} ; 1.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}} \leq 1.9 \mathrm{~V}$, $2.38 \mathrm{~V} \leq \mathrm{Vext} \leq 2.63 \mathrm{~V}, 1.4 \mathrm{~V} \leq \mathrm{V}_{\mathrm{dd}} \mathrm{S} \leq \mathrm{V}_{\mathrm{dd}}, \mathrm{V}_{\mathrm{ref}}=\mathrm{VdDQ} / 2$
2. $\mathrm{t}_{\mathrm{CK}}=\mathrm{t}_{\mathrm{DK}}=\mathrm{MIN} ., \mathrm{t}_{\mathrm{RC}}=\mathrm{MIN}$.
3. Input slew rate is specified in Recommended DC Operating Conditions and Recommended AC Operating Conditions.
4. Idd parameters are specified with ODT disabled.
5. Continuous data is defined as half the D or Q signals changing between HIGH and LOW every half clock cycles (twice per clock).
6. Continuous address is defined as half the address signals between HIGH and LOW every clock cycles (once per clock).
7. Sequential bank access is defined as the bank address incrementing by one ever trc.
8. Cyclic bank access is defined as the bank address incrementing by one for each command access. For $\mathrm{BL}=4$ this is every other clock.
9. CS\# is HIGH unless a READ, WRITE, AREF, or MRS command is registered. CS\# never transitions more than per clock cycle.

| Data-in and data mask to DK | toh | 0.17 |  | 0.25 |  | 0.25 |  | 0.3 |  | ns |  |

Notes 1. Clock phase jitter is the variance from clock rising edge to the next expected clock rising edge.
2. Frequency drift is not allowed.
3. tекео is referenced to $\mathrm{Q} 0-\mathrm{Q} 8$ and tекQ1 is referenced to $\mathrm{Q} 9-\mathrm{Q} 17$ for a x 18 device. For a x9 device, $\mathrm{Q} 0-\mathrm{Q} 8$ are referenced to teке.
4. tеке takes into account the skew between any QKx and any Q .
5. tеке, tекех are guaranteed by design.

Remark All timing parameters are measured relative to the crossing point of CK/CK\#, DK/DK\# and to the crossing point with Vref of the command, address, and data signals.

Figure 1-1. Clock / Input Data Clock Command / Address Timings

## Temperature and Thermal Impedance

## Temperature Limits

| Parameter | Symbol | MIN. | MAX. | Unit | Note |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Reliability junction temperature | T | 0 | +110 | ${ }^{\circ} \mathrm{C}$ | 1 |
| Operating junction temperature | T | 0 | +100 | ${ }^{\circ} \mathrm{C}$ | 2 |
| Operating case temperature | T C | 0 | +95 | ${ }^{\circ} \mathrm{C}$ | 3 |

Notes 1. Temperatures greater than $110^{\circ} \mathrm{C}$ may cause permanent damage to the device. This is a stress rating only and functional operation of the device at or above this is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability of the part.
2. Junction temperature depends upon cycle time, loading, ambient temperature, and airflow.
3. MAX operating case temperature; $\mathrm{Tc}_{\mathrm{c}}$ is measured in the center of the package. Device functionality is not guaranteed if the device exceeds maximum Tc during operation.

## Thermal Impedance

| Substrate | Ball | 日ja ( ${ }^{\circ} \mathrm{C} / \mathrm{W}$ ) |  |  | $\begin{gathered} \theta \mathrm{jb} \\ \left({ }^{\circ} \mathrm{C} / \mathrm{W}\right) \end{gathered}$ | Өjc ( ${ }^{\circ} \mathrm{C} / \mathrm{W}$ ) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Air Flow $=0 \mathrm{~m} / \mathrm{s}$ | Air Flow $=1 \mathrm{~m} / \mathrm{s}$ | Air Flow $=2 \mathrm{~m} / \mathrm{s}$ |  |  |
| 4 - Layer | Lead | 21.49 | 17.33 | 16.15 | 10.29 | 1.22 |
| 4 - Layer | Lead free | 21.32 | 17.18 | 16.01 | 10.13 | 1.22 |

## 2. Operation

### 2.1 Command Operation

According to the functional signal description, the following command sequences are possible. All input states or sequences not shown are illegal or reserved. All command and address inputs must meet setup and hold times around the rising edge of CK.

Table 2-1. Address Widths at Different Burst Lengths

| Burst Length | Configuration |  |
| :--- | :---: | :---: |
|  | $\mathbf{x 9}$ | $\mathbf{x 1 8}$ |
| $B L=2$ | $\mathrm{~A} 0-\mathrm{A} 21$ | $\mathrm{~A} 0-\mathrm{A} 20$ |
| $\mathrm{BL}=4$ | $\mathrm{~A} 0-\mathrm{A} 20$ | $\mathrm{~A} 0-\mathrm{A} 19$ |
| $\mathrm{BL}=8$ | $\mathrm{~A} 0-\mathrm{A} 19$ | $\mathrm{~A} 0-\mathrm{A} 18$ |

Table 2-2. Command Table

| Operation | Code | CS\# | WE\# | REF\# | A0-An $^{\text {Note1 }}$ | BA0-BA2 | Note |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Device DESELECT / No Operation | DESEL / NOP | H | X | X | X | X |  |
| MRS: Mode Register Set | MRS | L | L | L | OPCODE | X | 2 |
| READ | READ | L | H | H | A | BA | 3 |
| WRITE | WRITE | L | L | H | A | BA | 3 |
| AUTO REFRESH | AREF | L | H | L | X | BA |  |

Notes 1. $\mathrm{n}=21$.
2. Only A0-A17 are used for the MRS command.
3. See Table 2-1.

Remark $\mathrm{X}=$ "Don't Care", $\mathrm{H}=\operatorname{logic} \mathrm{HIGH}, \mathrm{L}=\operatorname{logic} \mathrm{LOW}, \mathrm{A}=$ valid address, $\mathrm{BA}=$ valid bank address

### 2.2 Description of Commands

## DESEL / NOP ${ }^{\text {Note1 }}$

The NOP command is used to perform a no operation to the $\mu$ PD48576209/18/36, which essentially deselects the chip. Use the NOP command to prevent unwanted commands from being registered during idle or wait states. Operations already in progress are not affected. Output values depend on command history.

## MRS

The mode register is set via the address inputs A0-A17. See Figure 2-5. Mode Register Bit Map for further information. The MRS command can only be issued when all banks are idle and no bursts are in progress.

## READ

The READ command is used to initiate a burst read access to a bank. The value on the BA0-BA2 inputs selects the bank, and the address provided on inputs A0-A21 selects the data location within the bank.

## WRITE

The WRITE command is used to initiate a burst write access to a bank. The value on the BA0-BA2 inputs selects the bank, and the address provided on inputs A0-A21 selects the data location within the bank. Input data appearing on the D is written to the memory array subject to the DM input logic level appearing coincident with the data. If the DM signal is registered LOW, the corresponding data will be written to memory. If the DM signal is registered HIGH, the corresponding data inputs will be ignored (i.e., this part of the data word will not be written).

## AREF

The AREF is used during normal operation of the $\mu \mathrm{PD} 48576109 / 18$ to refresh the memory content of a bank. The command is non-persistent, so it must be issued each time a refresh is required. The value on the BA0-BA2 inputs selects the bank. The refresh address is generated by an internal refresh controller, effectively making each address bit a "Don't Care" during the AREF command. The $\mu$ PD $48576109 / 18$ requires 64 K cycles at an average periodic interval of $0.244 \mu \mathrm{~s}$ Note2 (MAX.). To improve efficiency, eight AREF commands (one for each bank) can be posted to $\mu \mathrm{PD} 48576109 / 18$ at periodic intervals of $1.95 \mu \mathrm{~s}{ }^{\text {Note3 }}$.
Within a period of 32 ms , the entire memory must be refreshed. The delay between the AREF command and a subsequent command to same bank must be at least trC as continuous refresh. Other refresh strategies, such as burst refresh, are also possible.

## Notes 1. When the chip is deselected, internal NOP commands are generated and no commands are accepted.

2. Actual refresh is $32 \mathrm{~ms} / 16 \mathrm{k} / 8=0.244 \mu \mathrm{~s}$.
3. Actual refresh is $32 \mathrm{~ms} / 16 \mathrm{k}=1.95 \mu \mathrm{~s}$.

### 2.3 Initialization

The $\mu$ PD48576109/18 must be powered up and initialized in a predefined manner. Operational procedures other than those specified may result in undefined operations or permanent damage to the device. The following sequence is used for Power-Up:

1. Apply power ( $\mathrm{V}_{\mathrm{ext}}, \mathrm{V}_{\mathrm{dd}}, \mathrm{V}_{\mathrm{dd}} \mathrm{Q}, \mathrm{V}_{\mathrm{ref}}, \mathrm{V}_{\mathrm{tt}}$ ) and start clock as soon as the supply voltages are stable. Apply Vdd and Vext before or at the same time as VddQ. Apply VddQ before or at the same time as $V_{\text {ref }}$ and $V_{\text {tt }}$. Although there is no timing relation between $V_{E x t}$ and $V_{D D}$, the chip starts the power-up sequence only after both voltages are at their nominal levels. VidQ supply must not be applied before Vdd supply. CK/CK\# must meet Vid(DC) prior to being applied. Maintain all remaining balls in NOP conditions.

Note No rule of apply power sequence is the design target.
2. Maintain stable conditions for $200 \mu \mathrm{~s}$ (MIN.).
3. Issue at least three or more consecutive MRS commands: two dummies or more plus one valid MRS. It is recommended that all address pins are held LOW during the dummy MRS commands.
4. tmRSC after valid MRS, an AUTO REFRESH command to all 8 banks must be issued and wait for $15 \mu \mathrm{~s}$ with CK/CK\# toggling in order to lock the PLL prior to normal operation.
5. After trc, the chip is ready for normal operation.

### 2.4 Power-On Sequence

Figure 2-1. Power-Up Sequence

Notes 1. Recommended all address pins held LOW during dummy MRS commands.
2. A10-A17 must be LOW.

Remark MRS : MRS command
RFp : REFRESH bank $p$
AC : Any command

### 2.5 Programmable Impedance Output Buffer

The $\mu$ PD48576109/18 is equipped with programmable impedance output buffers. This allows a user to match the driver impedance to the system. To adjust the impedance, an external precision resistor (RQ) is connected between the ZQ ball and Vss. The value of the resistor must be five times the desired impedance. For example, a $300 \Omega$ resistor is required for an output impedance of $60 \Omega$. To ensure that output impedance is one fifth the value of RQ (within 15 percent), the range of RQ is $125 \Omega$ to $300 \Omega$. Output impedance updates may be required because, over time, variations may occur in supply voltage and temperature. The device samples the value of RQ. An impedance update is transparent to the system and does not affect device operation. All data sheet timing and current specifications are met during an update.

### 2.6 PLL Reset

The $\mu$ PD48576109/18 utilizes internal Phase-locked loops for maximum output, data valid windows. It can be placed into a stopped-clock state to minimize power with a modest restart time of $15 \mu \mathrm{~s}$. The clock (CK/CK\#) must be toggled for $15 \mu \mathrm{~s}$ in order to stabilize PLL circuits for next READ operation.

### 2.7 Clock Input

Table 2-3. Clock Input Operation Conditions

| Parameter | Symbol | Conditions | MIN. | MAX. | Unit | Note |
| :--- | :---: | :--- | :---: | :---: | :---: | :---: |
| Clock Input Voltage Level | $\operatorname{VIN(DC)}$ | CK and CK\# | -0.3 | $V_{D D Q}+0.3$ | $V$ |  |
| Clock Input Differential Voltage Level | $V_{I D}(D C)$ | CK and CK\# | 0.2 | $V_{D D Q}+0.6$ | $V$ | 8 |
| Clock Input Differential Voltage Level | $V_{I D(A C)}$ | CK and CK\# | 0.4 | $V_{D D Q}+0.6$ | $V$ | 8 |
| Clock Input Crossing Point Voltage Level | $V_{I X}(A C)$ | CK and CK\# | $V_{D D Q} / 2-0.15$ | $V_{D D Q} / 2+0.15$ | $V$ | 9 |

Figure 2-2. Clock Input

Notes 1. DKx and DKx\# have the same requirements as CK and CK\#.
2. All voltages referenced to Vss.
3. Tests for AC timing, IDD and electrical AC and DC characteristics may be conducted at normal reference/supply voltage levels; but the related specifications and device operations are tested for the full voltage range specified.
4. AC timing and IDD tests may use a $\mathrm{V}_{\text {IL }}$ to $\mathrm{V}_{\text {IH }}$ swing of up to 1.5 V in the test environment, but input timing is still referenced to $V_{\text {Ref }}$ (or the crossing point for CK/CK\#), and parameters specifications are tested for the specified AC input levels under normal use conditions. The minimum slew rate for the input signals used to test the device is $2 \mathrm{~V} / \mathrm{ns}$ in the range between $\mathrm{V}_{\mathrm{IL}(\mathrm{AC})}$ and $\mathrm{V}_{\mathrm{IH}(\mathrm{AC})}$.
5. The AC and DC input level specifications are as defined in the HSTL Standard (i.e. the receiver will effectively switch as a result of the signal crossing the AC input level, and will remain in that state as long as the signal does not ring back above[below] the DC input LOW[HIGH] level).
6. The CK/CK\# input reference level (for timing referenced to CK/CK\#) is the point at which CK and CK\# cross. The input reference level for signal other than CK/CK\# is Vref.
7. CK and $\mathrm{CK} \#$ input slew rate must be $>=2 \mathrm{~V} / \mathrm{ns}(>=4 \mathrm{~V} / \mathrm{ns}$ if measured differentially).
8. VID is the magnitude of the difference between the input level on CK and input level on CK\#.
9. The value of $V_{I x}$ is expected to equal $V_{D D} Q / 2$ of the transmitting device and must track variations in the DC level of the same.
10. CK and CK\# must cross within the region.
11. CK and CK\# must meet at least $V_{\text {ID(DC) }}\left(M I N\right.$.) when static and centered around $V_{D D} Q / 2$.
12. Minimum peak-to-peak swing.

### 2.8 Mode Register Set Command (MRS)

The mode register stores the data for controlling the operating modes of the memory. It programs the $\mu$ PD48576109/18 configuration, burst length, and I/O options. During a MRS command, the address inputs A0-A17 are sampled and stored in the mode register. tMRSC must be met before any command can be issued to the $\mu$ PD48576109/18. The mode register may be set at any time during device operation. However, any pending operations are not guaranteed to successfully complete, and all memory cell data are not guaranteed.

Since MRS is used for internal test mode entry, bits A10-A17 must be set to all " 0 " at the MRS setting.

Figure 2-3. Mode Register Set Timing

Remark MRS : MRS command
AC : any command

Figure 2-4. Mode Register Set

Remark COD: code to be loaded into the register.

Figure 2-5. Mode Register Bit Map

Notes 1. Bits A10-A17 must be set to all ' 0 '. A18-An are "Don't Care".
2. $\mathrm{BL}=8$ is not available for configuration 1 and 4 .
3. $\pm 30 \%$ temperature variation.
4. Within $15 \%$.

### 2.9 Read \& Write configuration (Non Multiplexed Address Mode)

Table 2-4 shows, for different operating frequencies, the different $\mu \mathrm{PD} 48576109 / 18$ configurations that can be programmed into the mode register. The READ and WRITE latency (trL and $t_{w L}$ ) values along with the row cycle times (trc) are shown in clock cycles as well as in nanoseconds.

Table 2-4. Configuration Table

| Parameter | Configuration |  |  |  |  | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $1^{\text {Note2 }}$ | 2 | 3 | $4^{\text {Note2, } 3}$ | 5 |  |
| trc | 4 | 6 | 8 | 3 | 5 | tck |
| tRL | 4 | 6 | 8 | 3 | 5 | tck |
| twL | 5 | 7 | 9 | 4 | 6 | tck |
| Valid frequency range | 266-175 | 400-175 | 533-175 | 200-175 | 333-175 | MHz |

Notes 1. Apply to the entire table. $\mathrm{trc}_{\mathrm{Rc}}<20 \mathrm{~ns}$ in any configuration only available with -E24 and -E18 speed grades.
2. $\mathrm{BL}=8$ is not available.
3. The minimum trc is typically 3 cycles, except in the case of a WRITE followed by a READ to the same bank. In this instance the minimum trc is 4 cycles.

### 2.10 Write Operation (WRITE)

Write accesses are initiated with a WRITE command, as shown in Figure 2-6. Row and bank addresses are provided together with the WRITE command. During WRITE commands, data will be registered at both edges of DK according to the programmed burst length (BL). A WRITE latency (WL) one cycle longer than the programmed READ latency $(R L+1)$ is present, with the first valid data registered at the first rising DK edge WL cycles after the WRITE command.

Any WRITE burst may be followed by a subsequent READ command. Figure 2-10. WRITE Followed By READ: BL=2, RL=4, WL=5, Configuration 1 and Figure 2-11. WRITE Followed By READ: BL=4, RL=4, WL=5, Configuration 1 illustrate the timing requirements for a WRITE followed by a READ for bursts of two and four, respectively.
Setup and hold times for incoming input data relative to the DK edges are specified as tDs and toh. The input data is masked if the corresponding DM signal is HIGH. The setup and hold times for data mask are also tDs and tDH.

Figure 2-6. WRITE Command

RL : READ latency
Dpq : Data q to bank p
Qpq : Data q from bank p

### 2.11 Read Operation (READ)

Read accesses are initiated with a READ command, as shown in Figure 2-12. Row and bank addresses are provided with the READ command.
During READ bursts, the memory device drives the read data edge-aligned with the QK signal. After a programmable READ latency, data is available at the outputs. The data valid signal indicates that valid data will be present in the next half clock cycle.

The skew between QK and the crossing point of CK is specified as tскок. tокоо is the skew between QK0 and the last valid data edge considered the data generated at the Q0-Q8. tекQ1 is the skew between QK1 and the last valid data edge considered the data generated at the Q9-Q17. toкQx is derived at each QKx clock edge and is not cumulative over time.

After completion of a burst, assuming no other commands have been initiated, Q will go High-Z. Back-to-back READ commands are possible, producing a continuous flow of output data.
Minimum READ data valid window can be expressed as MIN.(tокн, tекг) - 2 x MAX.(t@кох)
Any READ burst may be followed by a subsequent WRITE command. Figure 2-16. READ followed by WRITE, BL=2, RL=4, WL=5, Configuration 1 and Figure 2-17. READ followed by WRITE, BL=4, RL=4, WL=5, Configuration 1 illustrate the timing requirements for a READ followed by a WRITE.

Figure 2-12. READ Command

Remark A : Address
BA: Bank address

Figure 2-13. Basic READ Burst Timing

Undefined
Note 1. Minimum READ data valid window can be expressed as MIN.(tqкн, tqкц) -2 x MAX.(tqкQx) $t_{\text {CKH }}$ and $t_{\text {CKL }}$ are recommended to have $50 \% / 50 \%$ duty.

Remarks 1. tекQо is referenced to Q0-Q8. tQKQ1 is referenced to Q9-Q17.
2. teкQ takes into account the skew between any QKx and any Q .
3. tСкек is specified as CK rising edge to QK rising edge.

### 2.12 Refresh Operation: AUTO REFRESH Command (AREF)

AREF is used to perform a REFRESH cycle on one row in a specific bank. The row addresses are generated by an internal refresh counter; external address balls are "Don't Care." The delay between the AREF command and a subsequent command to the same bank must be at least trc.

Within a period of 32 ms (tref), the entire memory must be refreshed. Figure 2-21 illustrates an example of a continuous refresh sequence. Other refresh strategies, such as burst refresh, are also possible.

Figure 2-20. AUTO REFRESH Command

/// Don't care

Remark BA: Bank address

Figure 2-21. AUTO REFRESH Cycle

Remarks 1. ACx : Any command on bank $x$
ARFx : Auto refresh bank x
ACy : Any command on different bank.
2. $t_{\text {RC }}$ is configuration-dependent. Refer to Table 2-4. Configuration Table.

### 2.13 On-Die Termination

On-die termination (ODT) is enabled by setting A9 to " 1 " during an MRS command. With ODT on, all the Ds and DM are terminated to $\mathrm{V}_{\text {тт }}$ with a resistance $\mathrm{R}_{\mathrm{t}}$. The command, address, and clock signals are not terminated. Figure 2-22. below shows the equivalent circuit of a $D$ receiver with ODT. ODTs are dynamically switched off during READ commands and are designed to be off prior to the $\mu$ PD48576109/18 driving the bus. Similarly, ODTs are designed to switch on after the $\mu \mathrm{PD} 48576109 / 18$ has issued the last piece of data. ODT at the D inputs and DM are always on.

Table 2-5. On-Die Termination DC Parameters

| Description | Symbol | MIN. | MAX. | Units | Note |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Termination voltage | VTT | $0.95 \times$ VREF | $1.05 \times$ VREF | V | 1,2 |
| On-Die termination | RTT | 125 | 185 | $\Omega$ | 3 |

Notes 1. All voltages referenced to Vss (GND).
2. Vtt is expected to be set equal to $V_{\text {ref }}$ and must track variations in the $D C$ level of $V_{\text {ref. }}$
3. The R ${ }_{\text {Tt }}$ value is measured at $95^{\circ} \mathrm{C} \mathrm{T}$.

Qpq : Data q from bank p

### 2.14 Operation with Multiplexed Address

In multiplexed address mode, the address can be provided to the $\mu$ PD48576109/18 in two parts that are latched into the memory with two consecutive rising clock edges. This provides the advantage that a maximum of 11 address balls are required to control the $\mu \mathrm{PD} 48576109 / 18$, reducing the number of balls on the controller side. The data bus efficiency in continuous burst mode is not affected for $\mathrm{BL}=4$ and $\mathrm{BL}=8$ since at least two clocks are required to read the data out of the memory. The bank addresses are delivered to the $\mu \mathrm{PD} 48576109 / 18$ at the same time as the WRITE command and the first address part, Ax.

This option is available by setting bit A5 to " 1 " in the mode register. Once this bit is set, the READ, WRITE, and MRS commands follow the format described in Figure 2-26. See Figure 2-28. Power-Up Sequence in Multiplexed Address Mode for the power-up sequence.

Figure 2-26. Command Description in Multiplexed

Remarks 1. Ax, Ay : Address
BA : Bank Address
2. The minimum setup and hold times of the two address parts are defined $t_{A s}$ and $t_{\text {AH. }}$.

Figure 2-27. Mode Register Set Command in Multiplexed Address Mode

Notes 1. Bits A10-A17 must be set to all ' 0 '.
2. $\mathrm{BL}=8$ is not available for configuration 1 and 4 .
3. $\pm 30 \%$ temperature variation.
4. Within $15 \%$.

Remark The address A0, A3, A4, A5, A8, and A9 must be set as follows in order to activate the mode register in the multiplexed address mode.

Figure 2-28. Power-Up Sequence in Multiplexed Address Mode

Notes 1. Recommended all address pins held LOW during dummy MRS command.
2. A10-A17 must be LOW.
3. Address A5 must be set HIGH (muxed address mode setting when $\mu$ PD48576209/18/36 is in normal mode of operation).
4. Address A5 must be set HIGH (muxed address mode setting when $\mu$ PD48576209/18/36 is already in muxed address mode).

Remark MRS: MRS command
RFp : REFRESH Bank p
AC : any command

### 2.15 Address Mapping in Multiplexed Mode

The address mapping is described in Table 2-6 as a function of data width and burst length.

Table 2-6. Address Mapping in Multiplexed Address Mode

| Data <br> Width | Burst Length | Ball | Address |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | A0 | A3 | A4 | A5 | A8 | A9 | A10 | A13 | A14 | A17 | A18 |
| x18 | $B L=2$ | Ax | A0 | A3 | A4 | A5 | A8 | A9 | A10 | A13 | A14 | A17 | A18 |
|  |  | Ay | A20 | A1 | A2 | X | A6 | A7 | A19 | A11 | A12 | A16 | A15 |
|  | $B L=4$ | Ax | A0 | A3 | A4 | A5 | A8 | A9 | A10 | A13 | A14 | A17 | A18 |
|  |  | Ay | X | A1 | A2 | X | A6 | A7 | A19 | A11 | A12 | A16 | A15 |
|  | BL=8 | Ax | A0 | A3 | A4 | A5 | A8 | A9 | A10 | A13 | A14 | A17 | A18 |
|  |  | Ay | X | A1 | A2 | X | A6 | A7 | X | A11 | A12 | A16 | A15 |
| x9 | $B L=2$ | Ax | A0 | A3 | A4 | A5 | A8 | A9 | A10 | A13 | A14 | A17 | A18 |
|  |  | Ay | A20 | A1 | A2 | A21 | A6 | A7 | A19 | A11 | A12 | A16 | A15 |
|  | $B L=4$ | Ax | A0 | A3 | A4 | A5 | A8 | A9 | A10 | A13 | A14 | A17 | A18 |
|  |  | Ay | A20 | A1 | A2 | X | A6 | A7 | A19 | A11 | A12 | A16 | A15 |
|  | $B L=8$ | Ax | A0 | A3 | A4 | A5 | A8 | A9 | A10 | A13 | A14 | A17 | A18 |
|  |  | Ay | X | A1 | A2 | X | A6 | A7 | A19 | A11 | A12 | A16 | A15 |

Remark X means "Don't care".

### 2.16 Read \& Write configuration in Multiplexed Address Mode

In multiplexed address mode, the READ and WRITE latencies are increased by one clock cycle. The $\mu$ PD48576109/18 cycle time remains the same, as described in Table 2-7.

Table 2-7. Configuration in Multiplexed Address Mode

| Parameter | Configuration |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{1}^{\text {Note2 }}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}^{\text {Note2,3 }}$ | $\mathbf{5}$ |  |
| tRC | 4 | 6 | 8 | 3 | 5 | tck |
| tRL | 5 | 7 | 9 | 4 | 6 | tck |
| twL | 6 | 8 | 10 | 5 | 7 | tck |
| Valid frequency range | $266-175$ | $400-175$ | $533-175$ | $200-175$ | $333-175$ | MHz |

Notes 1. Apply to the entire table. $\mathrm{trc}<20 \mathrm{~ns}$ in any configuration is only available with -E24 and -E18 speed grades.
2. $\mathrm{BL}=8$ is not available.
3. The minimum trc is typically 3 cycles, except in the case of a WRITE followed by a READ to the same bank. In this instance the minimum trc is 4 cycles.

### 2.17 Refresh Command in Multiplexed Address Mode

Similar to other commands, the refresh command is executed on the next rising clock edge when in the multiplexed address mode. However, since only bank address is required for AREF, the next command can be applied on the following clock. The operation of the AREF command and any other command is represented in Figure 2-29.

Figure 2-29. Burst REFRESH Operation

VA Don't care

Remark AREF : AUTO REFRESH
AC : Any command
Ax : First part Ax of address
Ay : Second part Ay of address
BAp : Bank $p$ is chosen so that trc is met.

Figure 2-30. WRITE Burst Basic Sequence: BL=4, with Multiplexed Addresses, Configuration 1

Figure 2-31. READ Burst Basic Sequence: BL=4, with Multiplexed Addresses, Configuration 1, RL=5

Remark WR : WRITE command
RD : READ command
Ax/BAp : Address Ax of bank p
Ay : Address Ay of bank p
Dpq : Data q to bank p
Qpq : Data q from bank p
WL : WRITE latency
RL : READ latency

### 2.18 Input Slew Rate Derating

Table 2-8 on page 39 and Table 2-9 on page 40 define the address, command, and data setup and hold derating values. These values are added to the default $\mathrm{tAS} / \mathrm{tCS} / \mathrm{tDS}$ and $\mathrm{tAH} / \mathrm{tCH} / \mathrm{tDH}$ specifications when the slew rate of any of these input signals is less than the $2 \mathrm{~V} / \mathrm{ns}$ the nominal setup and hold specifications are based upon.

To determine the setup and hold time needed for a given slew rate, add the $\mathrm{tAS} / \mathrm{tCS}$ default specification to the "tAS/tCS Vref to CK/CK\# Crossing" and the tAH/tCH default specification to the "tAH/tCH CK/CK\# Crossing to Vref" derated values on Table 2-8. The derated data setup and hold values can be determined in a like manner using the "tDS Vref to CK/CK\# Crossing" and "tDH to CK/CK\# Crossing to Vref" values on Table 2-9.
The derating values on Table 2-8 and Table 2-9 apply to all speed grades.

The setup times on Table 2-8 and Table 2-9 represent a rising signal. In this case, the time from which the rising signal crosses $\mathrm{V}_{\mathrm{IH}(\mathrm{AC})}$ MIN to the CK/CK\# cross point is static and must be maintained across all slew rates. The derated setup timing represents the point at which the rising signal crosses $V_{\text {ref(DC) }}$ to the CK/CK\# cross point. This derated valueis calculated by determining the time needed to maintain the given slew rate and the delta between $\mathrm{V}_{\mathrm{IH}(\mathrm{AC})}$ MIN and the CK/CK\# cross point. The setup values in Table 2-8 and Table 2-9 are also valid for falling signals (with respect to VIL[AC] MAX and the CK/CK\# cross point).

The hold times in Table 2-8 and Table 2-9 represent falling signals. In this case, the time from the CK/CK\# cross point to when the signal crosses $\mathrm{V}_{\mathrm{IH}(\mathrm{DC})}$ MIN is static and must be maintained across all slew rates. The derated hold timing represents the delta between the CK/CK\# cross point to when the falling signal crosses $V_{\text {ref( }}(\mathrm{DC})$. This derated value is calculated by determining the time needed to maintain the given slew rate and the delta between the CK/CK\# cross point and $\mathrm{V}_{\mathrm{If}(\mathrm{DC}) \text {. }}$ The hold values in Table 2-8 and Table 2-9 are also valid for rising signals (with respect to $\mathrm{V}_{\mathrm{IL[LC]}}$ MAX and the CK and CK\# cross point).

Note: The above descriptions also pertain to data setup and hold derating when CK/CK\# are replaced with DK/DK\#.

Table 2-8. Address and Command Setup and Hold Derating Values

| Command/ <br> Address Slew <br> Rate (V/ns) | tAS/tCS VREF to CK/CK\# Crossing | tAS/tCS VIH(AC) MIN to CK/CK\# Crossing | tAH/tCH CK/CK\# Crossing to Vref | tAH/tCH CK/CK\# Crossing to VIH(DC) MIN | Unit |

## 3. JTAG Specification

These products support a limited set of JTAG functions as in IEEE standard 1149.1.

Table 3-1. Test Access Port (TAP) Pins

| Pin name | Pin assignments | Description |
| :--- | :--- | :--- |
| TCK | 12 A | Test Clock Input. All input are captured on the rising edge of TCK and all <br> outputs propagate from the falling edge of TCK. |
| TMS | 11 A | Test Mode Select. This is the command input for the TAP controller state |
| TDI | 12 V | Test Data Input. This is the input side of the serial registers placed between <br> TDI and TDO. The register placed between TDI and TDO is determined by the <br> state of the TAP controller state machine and the instruction that is currently |
| TDO | 11 V | Test Data Output. This is the output side of the serial registers placed between <br> TDI and TDO. Output changes in response to the falling edge of TCK. |

Remark The device does not have TRST (TAP reset). The Test-Logic Reset state is entered while TMS is held HIGH for five rising edges of TCK. The TAP controller state is also reset on the POWER-UP.

Table 3-2. JTAG DC Characteristics ( $0^{\circ} \mathrm{C} \leq \mathrm{Tc} \leq 95^{\circ} \mathrm{C}, 1.7 \mathrm{~V} \leq \mathrm{VDD}^{\mathrm{C}} \leq 1.9 \mathrm{~V}$, unless otherwise noted)

Note 1. tcss and tchu refer to the setup and hold time requirements of latching data from the boundary scan register.

JTAG Timing Diagram

Table 3-4. Scan Register Definition (1)

| Register name | Description |
| :--- | :--- |
| Instruction register | The 8 bit instruction registers hold the instructions that are executed by the TAP <br> controller. The register can be loaded when it is placed between the TDI and TDO pins. <br> The instruction register is automatically preloaded with the IDCODE instruction at power- <br> up whenever the controller is placed in test-logic-reset state. |
| Bypass register | The bypass register is a single bit register that can be placed between TDI and TDO. It <br> allows serial test data to be passed through the RAMs TAP to another device in the scan <br> chain with as little delay as possible. The bypass register is set LOW (VSS) when the <br> bypass instruction is executed. |
| ID register | The ID Register is a 32 bit register that is loaded with a device and vendor specific 32 bit <br> code when the controller is put in capture-DR state with the IDCODE command loaded in <br> the instruction register. The register is then placed between the TDI and TDO pins when <br> the controller is moved into shift-DR state. |
| Boundary register | The boundary register, under the control of the TAP controller, is loaded with the contents <br> of the RAMs I/O ring when the controller is in capture-DR state and then is placed <br> between the TDI and TDO pins when the controller is moved to shift-DR state. Several <br> TAP instructions can be used to activate the boundary register. <br> The Scan Exit Order tables describe which device bump connects to each boundary <br> register location. The first column defines the bit's position in the boundary register. The <br> second column is the name of the input or I/O at the bump and the third column is the <br> bump number. |

Table 3-5. Scan Register Definition (2)

| Register name | Bit size | Unit |
| :--- | :---: | :---: |

Note Any unused balls that are in the order will read as a logic " 0 ".

## JTAG Instructions

Many different instructions $\left(2^{8}\right)$ are possible with the 8 -bit instruction register. All used combinations are listed in Table 3-8, Instruction Codes. These six instructions are described in detail below. The remaining instructions are reserved and should not be used.

The TAP controller used in this RAM is fully compliant to the 1149.1 convention. Instructions are loaded into the TAP controller during the Shift-IR state when the instruction register is placed between TDI and TDO. During this state, instructions are shifted through the instruction register through the TDI and TDO balls. To execute the instruction once it is shifted in, the TAP controller needs to be moved into the Update-IR state.

Table 3-8

| Instructions | $\begin{array}{l}\text { Instruction } \\ \text { Code [7:0] }\end{array}$ | Description |
| :--- | :--- | :--- |
| EXTEST | 00000000 | $\begin{array}{l}\text { The EXTEST instruction allows circuitry external to the component package to be } \\ \text { tested. Boundary-scan register cells at output pins are used to apply test vectors, while } \\ \text { those at input pins capture test results. Typically, the first test vector to be applied } \\ \text { using the EXTEST instruction will be shifted into the boundary scan register using the } \\ \text { PRELOAD instruction. Thus, during the update-IR state of EXTEST, the output drive is } \\ \text { turned on and the PRELOAD data is driven onto the output pins. }\end{array}$ |
| IDCODE | 00100001 | $\begin{array}{l}\text { The IDCODE instruction causes the ID ROM to be loaded into the ID register when the } \\ \text { controller is in capture-DR mode and places the ID register between the TDI and TDO } \\ \text { pins in shift-DR mode. The IDCODE instruction is the default instruction loaded in at } \\ \text { power up and any time the controller is placed in the test-logic-reset state. }\end{array}$ |
| SAMPLE / PRELOAD | 00000101 | $\begin{array}{l}\text { SAMPLE / PRELOAD is a Standard 1149.1 mandatory public instruction. When the } \\ \text { SAMPLE / PRELOAD instruction is loaded in the instruction register, moving the TAP } \\ \text { sontroller into the capture-DR state loads the data in the RAMs input and Q pins into } \\ \text { the boundary scan register. Because the RAM clock(s) are independent from the TAP } \\ \text { clock (TCK) it is possible for the TAP to attempt to capture the I/O ring contents while } \\ \text { the input buffers are in transition (i.e., in a metastable state). Although allowing the }\end{array}$ |
| TAP to sample metastable input will not harm the device, repeatable results cannot be |  |  |
| expected. RAM input signals must be stabilized for long enough to meet the TAPs |  |  |
| input data capture setup plus hold time (tcs plus tct). The RAMs clock inputs need not |  |  |
| be paused for any other TAP operation except capturing the I/O ring contents into the |  |  |
| boundary scan register. Moving the controller to shift-DR state then places the |  |  |
| boundary scan register between the TDI and TDO pins. |  |  |$\}$

## 5. Recommended Soldering Condition

Please consult with our sales offices for soldering conditions of these products.

Types of Surface Mount Devices

| $\mu$ PD48576109FF-DW1 | $: 144-$ pin TAPE FBGA $(18.5 \times 11)$ |
| :--- | :--- |
| $\mu$ PD48576118FF-DW1 | $: 144-$ pin TAPE FBGA $(18.5 \times 11)$ |

## Quality Grade

- A quality grade of the products is "Standard".
- Anti-radioactive design is not implemented in the products.
- Semiconductor devices have the possibility of unexpected defects by affection of cosmic ray that reach to the ground and so forth.

## Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or echnical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible fo the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: "Standard", "High Quality", and "Specific". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as "Specific" without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as "Specific" or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is "Standard" unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
"Specific": Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries. (Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.
(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
