This device combines four popular functions, Power-on Reset Control, Watchdog Timer, Supply Voltage Supervision, and Block Lock Serial EEPROM Memory in one package. This combination lowers system cost, reduces board space requirements, and increases reliability.

Applying power to the device activates the power-on reset circuit which holds $\overline{\mathrm{RESET}}$ active for a period of time. This allows the power supply and oscillator to stabilize before the processor can execute code.

The Watchdog Timer provides an independent protection mechanism for microcontrollers. When the microcontroller fails to restart a timer within a selectable time out interval, the device activates the $\overline{\text { RESET }}$ signal. The user selects the interval from three preset values. Once selected, the interval does not change, even after cycling the power.

The device's low $V_{C C}$ detection circuitry protects the user's system from low voltage conditions, resetting the system when $V_{C C}$ falls below the minimum $V_{C C}$ trip point. $\overline{\text { RESET }}$ is asserted until $\mathrm{V}_{\mathrm{CC}}$ returns to the proper operating level and stabilizes. Five industry standard $\mathrm{V}_{\text {TRIP }}$ thresholds are available, however, Intersil's unique circuits allow the threshold to be reprogrammed to meet custom requirements or to finetune the threshold for applications requiring higher precision.

## Pinouts

8 LD SOIC, 8 LD PDIP

## Features

- Low $\mathrm{V}_{\mathrm{CC}}$ detection and reset assertion
- Four standard reset threshold voltages $4.63 \mathrm{~V}, 4.38 \mathrm{~V}, 2.93 \mathrm{~V}, 2.63 \mathrm{~V}$
- Re-program low $\mathrm{V}_{\mathrm{CC}}$ reset threshold voltage using special programming sequence
- Reset signal valid to $\mathrm{V}_{\mathrm{CC}}=1 \mathrm{~V}$
- Selectable time out watchdog timer
- Long battery life with low power consumption
- <50 AA max standby current, watchdog on
- <1 $\mu \mathrm{A}$ max standby current, watchdog off
- $<400 \mu \mathrm{~A}$ max active current during read
- 8Kbits of EEPROM
- Save critical data with Block Lock ${ }^{\text {TM }}$ memory
- Block lock first or last page, any $1 / 4$ or lower $1 / 2$ of EEPROM array
- Built-in inadvertent write protection
- Write enable latch
- Write protect pin
- SPI Interface - 3.3MHz clock rate
- Minimize programming time
- 16 byte page write mode
- 5 ms write cycle time (typical)
- SPI modes ( $0,0 \& 1,1$ )
- Available packages
- 8 Ld TSSOP, 8 Ld SOIC, 8 Ld PDIP
- Pb-free plus anneal available (RoHS compliant)

## Applications

- Communications Equipment
- Routers, Hubs, Switches
- Set Top Boxes
- Industrial Systems
- Process Control
- Intelligent Instrumentation
- Computer Systems
- Desktop Computers
- Network Servers
- Battery Powered Equipment

## Typical Application

## Block Diagram

NOTE:

1. Intersil Pb -free plus anneal products employ special Pb -free material sets; molding compounds/die attach materials and $100 \%$ matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb -free soldering operations. Intersil Pb -free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
2. *Add "-T1" suffix for tape and reel.
*Pb-free PDIPs can be used for through hole wave solder processing only. They are not intended for use in Reflow solder processing applications.

## Pin Description

| $\begin{aligned} & \text { PIN } \\ & \text { (SOIC/ } \end{aligned}$ | $\begin{gathered} \text { PIN } \\ \text { TSSOP } \end{gathered}$ | NAME | FUNCTION |
| :---: | :---: | :---: | :---: |
| 1 | 3 | $\overline{\mathrm{CS}} / \overline{\mathrm{WDI}}$ | Chip Select Input. $\overline{\mathrm{CS}}$ HIGH, deselects the device and the SO output pin is at a high impedance state. Unless a nonvolatile write cycle is underway, the device will be in the standby power mode. $\overline{C S}$ LOW enables the device, placing it in the active power mode. Prior to the start of any operation after power-up, a HIGH to LOW transition on $\overline{C S}$ is required. <br> Watchdog Input. A HIGH to LOW transition on the WDI pin restarts the Watchdog timer. The absence of a HIGH to LOW transition within the watchdog time out period results in RESET going active. |
| 2 | 4 | SO | Serial Output. SO is a push/pull serial data output pin. A read cycle shifts data out on this pin. The falling edge of the serial clock (SCK) clocks the data out. |
| 5 | 7 | SI | Serial Input. SI is a serial data input pin. Input all opcodes, byte addresses, and memory data on this pin. The rising edge of the serial clock (SCK) latches the input data. Send all opcodes (Table 1), addresses and data MSB first. |
| 6 | 8 | SCK | Serial Clock. The Serial Clock controls the serial bus timing for data input and output. The rising edge of SCK latches in the opcode, address, or data bits present on the SI pin. The falling edge of SCK changes the data output on the SO pin. |
| 3 | 5 | $\overline{\mathrm{WP}}$ | Write Protect. When $\overline{\mathrm{WP}}$ is LOW, nonvolatile write operations to the memory are prohibited. This "Locks" the memory to protect it against inadvertent changes when $\overline{\mathrm{WP}}$ is HIGH, the device operates normally. |
| 4 | 6 | $\mathrm{V}_{\mathrm{SS}}$ | Ground |
| 8 | 2 | $\mathrm{V}_{\text {CC }}$ | Supply Voltage |
| 7 | 1 | RESET | Reset Output. $\overline{\text { RESET }}$ is an active LOW, open drain output which goes active whenever $\mathrm{V}_{\mathrm{CC}}$ falls below the minimum $V_{C C}$ sense level. It will remain active until $V_{C C}$ rises above the minimum $V_{C C}$ sense level for 250 ms . $\overline{\text { RESET }}$ goes active if the watchdog timer is enabled and $\overline{\mathrm{CS}}$ remains either HIGH or LOW longer than the selectable watchdog time out period. A falling edge of $\overline{C S}$ will reset the watchdog timer. $\overline{\text { RESET }}$ goes active on power-up at about 1 V and remains active for 250 ms after the power supply stabilizes. |

## Principles of Operation

## Power-on Reset

Application of power to the X5083 activates a power-on reset circuit. This circuit goes LOW at 1 V and pulls the RESET pin active. This signal prevents the system microprocessor from starting to operate with insufficient voltage or prior to stabilization of the oscillator. $\overline{\text { RESET }}$ active also blocks communication to the device through the SPI interface. When $\mathrm{V}_{\mathrm{CC}}$ exceeds the device $\mathrm{V}_{\text {TRIP }}$ value for 200 ms (nominal) the circuit releases RESET, allowing the processor to begin executing code. While $\mathrm{V}_{\mathrm{CC}}<\mathrm{V}_{\mathrm{TRIP}}$ communications to the device are inhibited.

## Low Voltage Monitoring

During operation, the X 5083 monitors the $\mathrm{V}_{\mathrm{CC}}$ level and asserts $\overline{\text { RESET }}$ if supply voltage falls below a preset minimum $V_{\text {TRIP. }}$ The $\overline{R E S E T}$ signal prevents the microprocessor from operating in a power fail or brownout condition and terminates any SPI communication in progress. The $\overline{\text { RESET signal }}$ remains active until the voltage drops below 1 V . It also remains active until $\mathrm{V}_{\mathrm{CC}}$ returns and exceeds $\mathrm{V}_{\text {TRIP }}$ for 200 ms .
When $\mathrm{V}_{\mathrm{CC}}$ falls below $\mathrm{V}_{\mathrm{TRIP}}$, any communications in progress are terminated and communications are inhibited until $\mathrm{V}_{\mathrm{CC}}$ exceeds $V_{\text {TRIP }}$ for $t_{\text {PURST }}$.

## Watchdog Timer

The watchdog timer circuit monitors the microprocessor activity by monitoring the WDI input. The microprocessor must toggle the $\overline{\mathrm{CS}} /$ WDI pin periodically to prevent a $\overline{\mathrm{RESET}}$ signal. The $\overline{\mathrm{CS}} / \mathrm{WDI}$ pin must be toggled from HIGH to LOW prior to the expiration of the watchdog time out period. The state of two nonvolatile control bits in the status register determine the watchdog timer period. The microprocessor can change these watchdog bits with no action taken by the microprocessor these bits remain unchanged, even after total power failure.

## $V_{\text {Cc }}$ Threshold Reset Procedure

The X 5083 is shipped with a standard $\mathrm{V}_{\mathrm{CC}}$ threshold ( $\mathrm{V}_{\text {TRIP }}$ ) voltage. This value will not change over normal operating and storage conditions. However, in applications where the standard $\mathrm{V}_{\text {TRIP }}$ is not exactly right, or if higher precision is needed in the $\mathrm{V}_{\text {TRIP }}$ value, the X5083 threshold may be adjusted. The procedure is described below, and uses the application of a high voltage control signal.

## Setting the $V_{\text {TRIP }}$ Voltage

This procedure is used to set the $\mathrm{V}_{\text {TRIP }}$ to a higher voltage value. For example, if the current $\mathrm{V}_{\text {TRIP }}$ is 4.4 V and the new $V_{\text {TRIP }}$ is 4.6 V , this procedure will directly make the change. If the new setting is to be lower than the current setting, then it is necessary to reset the trip point before setting the new value.

To set the new $\mathrm{V}_{\text {TRIP }}$ voltage, apply the desired $\mathrm{V}_{\text {TRIP }}$ threshold voltage to the $\mathrm{V}_{\mathrm{CC}}$ pin and tie the $\overline{\mathrm{WP}}$ pin to the programming voltage $V_{p}$. Then send a WREN command, followed by a write of Data 00 h to address 01 h . $\overline{\mathrm{CS}}$ going HIGH on the write operation initiates the $\mathrm{V}_{\text {TRIP }}$ programming sequence. Bring $\overline{\mathrm{WP}}$ LOW to complete the operation.

Note: This operation also writes 00h to array address 01 h .

## Resetting the $V_{\text {TRIP }}$ Voltage

This procedure is used to set the $\mathrm{V}_{\text {TRIP }}$ to a "native" voltage level. For example, if the current $\mathrm{V}_{\text {TRIP }}$ is 4.4 V and the new $\mathrm{V}_{\text {TRIP }}$ must be 4.0 V , then the $\mathrm{V}_{\text {TRIP }}$ must be reset. When $\mathrm{V}_{\text {TRIP }}$ is reset, the new $\mathrm{V}_{\text {TRIP }}$ is something less than 1.7 V . This procedure must be used to set the voltage to a lower value.

To reset the new $\mathrm{V}_{\text {TRIP }}$ voltage, apply the desired $\mathrm{V}_{\text {TRIP }}$ threshold voltage to the Vcc pin and tie the $\overline{\mathrm{WP}}$ pin to the programming voltage $V_{P}$. Then send a WREN command, followed by a write of data 00 h to address $03 \mathrm{~h} . \overline{\mathrm{CS}}$ going HIGH on the write operation initiates the $\mathrm{V}_{\text {TRIP }}$ programming sequence. Bring $\overline{\mathrm{WP}}$ LOW to complete the operation.
Note: This operation also writes 00 h to array address 03 h .

FIGURE 4. $\mathrm{V}_{\text {TRIP }}$ PROGRAMMING SEQUENCE

## SPI Serial Memory

The memory portion of the device is a CMOS serial EEPROM array with Intersil's block lock protection. The array is internally organized as $\times 8$. The device features a Serial Peripheral Interface (SPI) and software protocol allowing operation on a simple four-wire bus.
The device utilizes Intersil's proprietary Direct Write ${ }^{\text {TM }}$ cell, providing a minimum endurance of 100,000 cycles and a minimum data retention of 100 years.

The device is designed to interface directly with the synchronous Serial Peripheral Interface (SPI) of many popular microcontroller families.

The device monitors the bus and asserts $\overline{\text { RESET }}$ output if the watchdog timer is enabled and there is no bus activity within the user selectable time out period or the supply voltage falls below a preset minimum $\mathrm{V}_{\text {TRIP }}$

The device contains an 8-bit instruction register. It is accessed via the SI input, with data being clocked in on the rising edge of SCK. $\overline{\mathrm{CS}}$ must be LOW during the entire operation.

All instructions (Table 1), addresses and data are transferred MSB first. Data input on the SI line is latched on the first rising edge of SCK after $\overline{C S}$ goes LOW. Data is output on the SO line by the falling edge of SCK. SCK is static, allowing the user to stop the clock and then start it again to resume operations where left off.

## Write Enable Latch

The device contains a Write Enable Latch. This latch must be SET before a Write Operation is initiated. The WREN
instruction will set the latch and the WRDI instruction will reset the latch (Figure 7). This latch is automatically reset upon a power-up condition and after the completion of a valid Write Cycle.

## Status Register

The RDSR instruction provides access to the status register. The status register may be read at any time, even during a write cycle. The status register is formatted as follows.

## Status Register/Block Lock/WDT Byte

| $\mathbf{7}$ | $\mathbf{6}$ | $\mathbf{5}$ | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{1}$ | $\mathbf{0}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | WD1 | WD0 | BL2 | BL1 | BL0 |

## Block Lock Memory

Intersil's block lock memory provides a flexible mechanism to store and lock system ID and parametric information. There are seven distinct block lock memory areas within the array which vary in size from one page to as much as half of the entire array. These areas and associated address ranges are block locked by writing the appropriate two byte block lock instruction to the device as described in Table 1 and Figure 9. Once a block lock instruction has been completed, that block lock setup is held in the nonvolatile status register until the next block lock instruction is issued. The sections of the memory array that are block locked can be read but not written until block lock is removed or changed.

TABLE 1. INSTRUCTION SET AND BLOCK LOCK PROTECTION BYTE DEFINITION

| INSTRUCTION FORMAT | INSTRUCTION NAME AND OPERATION |
| :---: | :---: |
| 00000110 | WREN: set the write enable latch (write enable operation) |
| 00000100 | WRDI: reset the write enable latch (write disable operation) |
| 00000001 | Write status instruction-followed by: <br> Block lock/WDT byte: (See Figure 1) <br> $000 \mathrm{WD}_{1} \mathrm{WD}_{2} 000$--->no block lock: 00h-00h--->none of the array $000 \mathrm{WD}_{1} \mathrm{WD}_{2} 001$--->block lock Q1: 0000h-00FFh--->lower quadrant (Q1) <br> $000 \mathrm{WD}_{1}$ WD $_{2} 010$--->block lock Q2: 0100h-01FFh--->Q2 <br> $000 \mathrm{WD}_{1}$ WD $_{2} 011$--->block lock Q3: 0200h-02FFh--->Q3 <br> $000 \mathrm{WD}_{1} \mathrm{WD}_{2} 100$--->block lock Q4: 0300h-03FFh--->upper quadrant (Q4) <br> $000 \mathrm{WD}_{1}$ WD $_{2} 101$--->block lock H1: 0000h-01FFh--->lower half of the array (H1) <br> $000 \mathrm{WD}_{1} \mathrm{WD}_{2} 110$--->block lock P0: 0000h-000Fh--->lower page (P0) <br> $000 \mathrm{WD}_{1} \mathrm{WD}_{2} 111$--->block lock Pn: 03F0h-03FFh--->upper page (PN) |

| 00000010 | WRITE: write operation followed by address and data |
| 00000011 | READ: read operation followed by address |

## Watchdog Timer

The watchdog timer bits, WD0 and WD1, select the watchdog time out period. These nonvolatile bits are programmed with the WRSR instruction. A change to the Watchdog Timer, either setting a new time out period or turning it off or on, takes effect, following either the next command (read or write) or cycling the power to the device.

The recommended procedure for changing the Watch-dog Timer settings is to do a WREN, followed by a write status register command. Then execute a soft-ware loop to read the status register until the MSB of the status byte is zero. A valid alternative is to do a WREN, followed by a write status register command. Then wait 10 ms and do a read status command.

TABLE 2. WATCHDOG TIMER DEFINITION

| STATUS REGISTER BITS |  | WATCHDOG TIME OUT <br> (TYPICAL) |
| :---: | :---: | :---: |
| WD1 | WD0 |  |
| 0 | 0 | 600 ms |
| 0 | 1 | 200 ms |
| 1 | 0 | disabled (factory default) |
| 1 | 1 |  |

## Read Sequence

When reading from the EEPROM memory array, $\overline{\mathrm{CS}}$ is first pulled low to select the device. The 8-bit READ instruction is transmitted to the device, followed by the 16-bit address. After the READ opcode and address are sent, the data stored in the memory at the selected address is shifted out on the SO line. The data stored in memory at the next address can be read sequentially by continuing to provide clock pulses. The address is automatically incremented to the next higher address after each byte of data is shifted out. When the highest address is reached, the address counter rolls over to address $\$ 0000$ allowing the read cycle to be continued indefinitely. The read operation is terminated by taking $\overline{\mathrm{CS}}$ high. Refer to the read EEPROM array sequence (Figure 5).

To read the status register, the $\overline{\mathrm{CS}}$ line is first pulled low to select the device followed by the 8-bit RDSR instruction. After the RDSR opcode is sent, the contents of the status register are shifted out on the SO line. Refer to the read status register sequence (Figure 6).

## Write Sequence

Prior to any attempt to write data into the device, the "Write Enable" Latch (WEL) must first be set by issuing the WREN instruction (Figure 7). $\overline{\mathrm{CS}}$ is first taken LOW, then the WREN instruction is clocked into the device. After all eight bits of the instruction are transmitted, $\overline{\mathrm{CS}}$ must then be taken HIGH. If the user continues the write operation without taking $\overline{\mathrm{CS}}$ HIGH after issuing the WREN instruction, the write operation will be ignored.

To write data to the EEPROM memory array, the user then issues the WRITE instruction followed by the 16 bit address and then the data to be written. Any unused address bits are specified to be "0's". The WRITE operation minimally takes 32 clocks. $\overline{\mathrm{CS}}$ must go low and remain low for the duration of the operation. If the address counter reaches the end of a page and the clock continues, the counter will roll back to the first address of the same page and overwrite any data that may have been previously written.

For a write operation (byte or page write) to be completed, $\overline{\mathrm{CS}}$ can only be brought HIGH after bit 0 of the last data byte to be written is clocked in. If it is brought HIGH at any other time, the write operation will not be completed (Figure 8).

To write to the status register, the WRSR instruction is followed by the data to be written (Figure 9). Data bits 5, 6 and 7 must be " 0 ".

## Read Status Operation

If there is not a nonvolatile write in progress, the read status instruction returns the block lock setting from the status register which contains the watchdog timer bits WD1, WD0, and the block lock bits IDL2-IDL0 (Figure 6). The block lock bits define the block lock condition (Table 1). The watchdog timer bits set the operation of the watchdog timer (Table 2). The other bits are reserved and will return '0' when read. See Figure 6.

During an internal nonvolatile write operaiton, the Read Status Instruction returns a HIGH on SO in the first bit following the RDSR instruction (the MSB). The remaining bits in the output status byte are undefined. Repeated Read Status Instructions return the MSB as a ' 1 ' until the nonvolatile write cycle is complete. When the nonvolatile write cycle is completed, the RDSR instruction returns a ' 0 ' in the MSB position with the remaining bits of the status register undefined. Subsequent RDSR instructions return the Status Register Contents. See Figure 10.

## RESET Operation

The $\overline{\text { RESET output is designed to go LOW whenever } V_{C C} \text { has }}$ dropped below the minimum trip point and/or the watchdog timer has reached its programmable time out limit.

The $\overline{\text { RESET }}$ output is an open drain output and requires a pull up resistor.

## Operational Notes

The device powers-up in the following state:

- The device is in the low power standby state.
- A HIGH to LOW transition on $\overline{\mathrm{CS}}$ is required to enter an active state and receive an instruction.
- SO pin is high impedance.
- The write enable latch is reset.
- Reset signal is active for $t_{\text {PURST }}$.

## Data Protection

The following circuitry has been included to prevent inadvertent writes:

- A WREN instruction must be issued to set the write enable latch.
- $\overline{\mathrm{CS}}$ must come HIGH at the proper clock count in order to start a nonvolatile write cycle.
- When $\mathrm{V}_{\mathrm{CC}}$ is below $\mathrm{V}_{\text {TRIP }}$, communications to the device are inhibited.

| $V_{\text {OLRS }}$ | Reset Output LOW Voltage | $\mathrm{l}_{\mathrm{OL}}=1 \mathrm{~mA}$ |  |  | 0.4 | V |

## Power-Up Timing

| SYMBOL | PARAMETER | MIN | MAX |
| :---: | :--- | :---: | :---: |
| t $_{\text {PUR }}$ (Note 2) | Power-up to read operation |  | 1 |
| $t_{\text {PUW }}$ (Note 2) | Power-up to write operation |  | 5 |

Capacitance $T_{A}=+25^{\circ} \mathrm{C}, \mathrm{f}=1 \mathrm{MHz}, \mathrm{V}_{\mathrm{CC}}=5 \mathrm{~V}$

| SYMBOL | TEST | MAX | UNIT | CONDITIONS |
| :---: | :--- | :---: | :---: | :---: |
| $\mathrm{C}_{\text {OUT }}($ Note 2) | Output capacitance (SO, $\overline{\mathrm{RESET}, \mathrm{RESET})}$ | 8 | pF | $\mathrm{V}_{\text {OUT }}=0 \mathrm{~V}$ |
| $\mathrm{C}_{\text {IN }}($ Note 2) | Input capacitance $(\mathrm{SCK}, \mathrm{SI}, \overline{\mathrm{CS}}, \overline{\mathrm{WP}})$ | 6 | pF | $\mathrm{V}_{\text {IN }}=0 \mathrm{~V}$ |

NOTES:

1. $\mathrm{V}_{\mathrm{IL}}$ min. and $\mathrm{V}_{\mathrm{IH}}$ max. are for reference only and are not tested.
2. This parameter is periodically sampled and not $100 \%$ tested.

## Equivalent A.C. Load Circuit at 5V VCC

## A.C. Test Conditions

| Input pulse levels | $\mathrm{V}_{\mathrm{CC}} \times 0.1$ to $\mathrm{V}_{\mathrm{CC}} \times 0.9$ |
| :--- | :--- |
| Input rise and fall times | 10 ns |
| Input and output timing level | $\mathrm{V}_{\mathrm{CC}} \times 0.5$ |

AC Electrical Specifications (Over recommended operating conditions, unless otherwise specified)

| SYMBOL | PARAMETER | 2.7V-5.5V |  | UNIT |
| :---: | :---: | :---: | :---: | :---: |
|  |  | MIN | MAX |  |
| DATA INPUT TIMING |  |  |  |  |
| $\mathrm{f}_{\text {SCK }}$ | Clock frequency | 0 | 3.3 | MHz |
| $\mathrm{t}_{\mathrm{CYC}}$ | Cycle time | 300 |  | ns |
| $t_{\text {LEAD }}$ | $\overline{\mathrm{CS}}$ lead time | 150 |  | ns |
| $t_{\text {LAG }}$ | $\overline{\mathrm{CS}}$ lag time | 150 |  | ns |
| $t_{\text {WH }}$ | Clock HIGH time | 130 |  | ns |
| $t_{\text {WL }}$ | Clock LOW time | 130 |  | ns |
| $\mathrm{t}_{\mathrm{SU}}$ | Data setup time | 20 |  | ns |
| $t_{H}$ | Data hold time | 20 |  | ns |
| $\mathrm{t}_{\mathrm{RI}}$ (Note 3) | Input rise time |  | 2 | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\mathrm{Fl}}$ (Note 3) | Input fall time |  | 2 | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\mathrm{CS}}$ | $\overline{\mathrm{CS}}$ deselect time | 100 |  | ns |
| $\mathrm{t}_{\text {WC }}$ (Note 4) | Write cycle time |  | 10 | ms |
| DATA OUTPUT TIMING |  |  |  |  |
| $\mathrm{f}_{\text {SCK }}$ | Clock frequency | 0 | 3.3 | MHz |
| ${ }^{\text {DIS }}$ | Output disable time |  | 150 | ns |
| $t_{V}$ | Output valid from clock low |  | 130 | ns |
| $\mathrm{t}_{\mathrm{HO}}$ | Output hold time | 0 |  | ns |
| $\mathrm{t}_{\mathrm{RO}}$ (Note 3) | Output rise time |  | 50 | ns |
| $\mathrm{t}_{\text {FO }}$ (Note 3) | Output fall time |  | 50 | ns |

NOTES:
3. This parameter is periodically sampled and not $100 \%$ tested.
4. $t_{W C}$ is the time from the rising edge of $\overline{\mathrm{CS}}$ after a valid write sequence has been sent to the end of the self-timed internal nonvolatile write cycle.

| $\mathrm{~V}_{\text {TRAN }}$ | $\mathrm{V}_{\text {TRIP }}$ programmed voltage range | 2.0 | 5.0 | V |
| $\mathrm{~V}_{\text {tV }}$ | $\mathrm{V}_{\text {TRIP }}$ program variation after programming $\left(0-75^{\circ} \mathrm{C}\right) .\left(\right.$ programmed at $\left.25^{\circ} \mathrm{C}\right)$ | -25 | +25 | mV |

NOTES:
7. $V_{\text {TRIP }}$ programming parameters are periodically sampled and are not $100 \%$ tested.
8. For custom $V_{\text {TRIP }}$ settings, Contact Factory.

## Revision History

The revision history provided is for informational purposes only and is believed to be accurate, but not warranted. Please go to the web to make sure that you have the latest revision.

| DATE | REVISION |  |
| :---: | :---: | :--- |
| November 12, 2015 | FN8127.4 | Updated Ordering Information table on page 3. <br> Added Revision History and About Intersil sections. <br> Updated POD MDP0027 to POD M8.15E. |

## About Intersil

Intersil Corporation is a leading provider of innovative power management and precision analog solutions. The company's products address some of the largest markets within the industrial and infrastructure, mobile computing and high-end consumer markets.

For the most updated datasheet, application notes, related documentation and related parts, please see the respective product information page found at www.intersil.com.

You may report errors or suggestions for improving this datasheet by visiting www.intersil.com/ask.
Reliability reports are also available from our website at www.intersil.com/support.

## Package Outline Drawing <br> M8.15E <br> 8 LEAD NARROW BODY SMALL OUTLINE PLASTIC PACKAGE <br> Rev 0, 08/09

TOP VIEW

DETAIL "A"

NOTES:

1. Dimensions are in millimeters.

Dimensions in ( ) for Reference Only.
2. Dimensioning and tolerancing conform to AMSE Y14.5m-1994.
3. Unless otherwise specified, tolerance: Decimal $\pm 0.05$
4. Dimension does not include interlead flash or protrusions. Interlead flash or protrusions shall not exceed 0.25 mm per side.
5. The pin \#1 identifier may be either a mold or mark feature.
6. Reference to JEDEC MS-012.

Plastic Dual-In-Line Packages (PDIP)

Rev. B 2/99

NOTES:

1. Plastic or metal protrusions of 0.010 " maximum per side are not included.
2. Plastic interlead protrusions of 0.010 " maximum per side are not included.
3. Dimensions E and eA are measured with the leads constrained perpendicular to the seating plane.
4. Dimension $e B$ is measured with the lead tips unconstrained.
5. 8 and 16 lead packages have half end-leads as shown.

## Thin Shrink Small Outline Plastic Packages (TSSOP)

NOTES:

1. These package dimensions are within allowable dimensions of JEDEC MO-153-AC, Issue E.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15 mm (0.006 inch) per side.
4. Dimension "E1" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.15 mm ( 0.006 inch) per side.
5. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
6. " L " is the length of terminal for soldering to a substrate.
7. " N " is the number of terminal positions.
8. Terminal numbers are shown for reference only.
9. Dimension "b" does not include dambar protrusion. Allowable dambar protrusion shall be 0.08 mm ( 0.003 inch) total in excess of " $b$ " dimension at maximum material condition. Minimum space between protrusion and adjacent lead is 0.07 mm ( 0.0027 inch ).
10. Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact. (Angles in degrees)
